SAVOIE (45° 25′ N., 6° 30′ E.), department, France, formed part of old duchy Savoie; mountainous; chief occupation, agriculture; capital, Chambéry. Pop. (1911) 247,890.

SAVONA (44° 19′ N., 8° 28′ E.) (ancient *Savo*), seaport, in the Riviera, Genoa, Italy; cathedral possesses some fine works of art; iron and steel manufactures. Pop. 59,000.

SAVONAROLA, GIROLAMO (1452–98), Ital. friar; b. Ferrara, of noble family; ascetic in youth, joined the Dominican Order at Bologna, 1474; prior of San Marco, Florence, 1491. S. preached vehemently against the paganism and worldliness of the time in Italy, denounced the Medici, the Papal Curia, and Pope Alexander VI. By his influence Florence became a kind of theocratic republic; and the moral life of the citizens was regenerated. S.'s support of the French king, Charles VIII., whom he looked upon as an avenger of God for the cleansing of the Church, more than anything else brought him under the censure of Rome, for the pope was with nearly all Italy opposed to France. Summoned to Rome, 1495, S. excused himself from going on the ground of ill-health and danger.

Forbidden to preach, he refused to obey, and was excommunicated for disobedience, May 1497. Challenged by the Franciscans to the ordeal by fire for the proof of error, he was subsequently brought to trial, imprisoned, tortured, and with two other Dominicans, Fra Domenico and Fra Silvestro, condemned to death, 'on account of the enormous crimes of which they had been convicted.' On May 25, 1498, the three were hanged and their bodies burned. Fanaticism, the constant thought of the approaching judgment of God, of a new era, and of the subsequent regeneration of the Church, drove him to refuse obedience to Rome. In matters of faith he was entirely orthodox, and he was not condemned as a heretic. An ardent social and political reformer, S. cannot be claimed as a 'forerunner of the Reformation.'

Villari, *Life and Times of S.*

SAVORY, SIR WILLIAM SCOVELL, Bart. (1826–95), Eng. surgeon, lecturer on anatomy and physiology (1859), and later surgeon (1867) and lecturer on surgery (1869) at St. Bartholomew's Hospital, London; pres. Royal Coll. of Surgeons (1885–88); author of papers on surgical subjects.

SAVOY, HOUSE OF.—First hist. member of house of Savoy is Humbert of the White Hands (*c.* 1025–51); his son Otto (d. 1060), through his wife Adelaide, added Piedmont to Savoy; Amadeus III. (1103–48) was called Count of Savoy, and like his descendants played prominent part in European affairs; many of them were staunch imperialists in struggle of Guelphs and Ghibellines; younger members, Boniface and Peter, played part in England in XIII. cent. Amadeus V., 'the Great' (1285–1322), was confirmed by the emperor as Duke of Chablais and of Aosta, Marquis of Italy, perpetual vicar and prince of the empire; he decreed indivisibility of Savoy and descent to males, 1307. Savoy became duchy, 1416; the counts had established parliament and courts of justice, and in 1430 the *Statuta Sabaudiæ* were promulgated; Amadeus of Savoy was pope, as Felix V., 1439–48; Charles I. became king of Cyprus, 1485.

The Reformation was introduced into the Vaudois, 1525; France sent aid to Geneva and became mistress of Savoy, 1536–59; Emmanuel Philibert, restored by Treaty of Câteau-Cambrésis, initiated cautious policy of future rulers, 'the Gatekeepers of the Alps'; frequently occupied by France in XVII. cent., when dukes won character of able, unscrupulous schemers. Victor Amadeus II. became king of Sicily, 1713–1718, when he exchanged Sicily for Sardinia; steady encroachment on Lombardy; Savoy occupied by Spain, 1742–48. Extortions of Victor Amadeus III. (1773–96) led to risings; the *légion allobroge* aided Fr. Revolution; the duke joined Austrian invasion of France, with result that he was defeated and deposed, 1792, while Savoy became Fr. department of Mont Blanc. Victor Emmanuel I. was restored by Treaties of Paris, 1814–15; constitution granted, 1848. Savoy was ceded to France, 1860, by almost unanimous popular vote of Savoyards and consent of king of Sardinia, Victor Emmanuel II., who was crowned king of Italy, 1861; Victor Emmanuel was succeeded, 1878, by son Humbert (assassinated, 1900), father of Victor Emmanuel III. See PIEDMONT, SARDINIA, ITALY (*History*).

Vitelleschi, *Romance of Savoy.*

SAW FISHES, see under RAYS.

SAWANTWARI (16° N., 74° E.), small native state, Bombay, India. Pop. 220,000. Capital, SAWANTWARI. Pop. 10,500.

SAW-FLIES (*Tenthredinidæ*), family of Hymenopterous Insects, the members of which are most common in temperate regions. The female is armed with a saw-edged ovipositor, with which it pierces leaves, fruits, etc., afterwards depositing an egg. The larvæ of some forms do considerable damage to gooseberry and currant bushes, to the shoots of trees, and to turnips.

SAXE, HERMANN MAURICE, COMTE DE (1696–1750), natural s. of Augustus II. of Poland; distinguished in Franco-Pruss. invasion of Bohemia, 1741; conquered Austrian Netherlands, 1744–46; defeated British and Dutch, 1747–48; wrote *Mes Rêveries*, on art of war, and introduced new methods; 'the Turenne of Louis XV.'

SAXE-ALTENBURG (50° 50′ N., 11° 40′ E.), duchy, in Thuringia, Germany; consists of two nearly equal portions separated by the Reuss; traversed in E. by offshoots of the Erzegebirge; in W. by the Thingerwald; agriculture and cattle-rearing; varied manufactures. Pop. (1910) 216,128. Capital, Altenburg.

SAXE-COBURG-GOTHA, sovereign duchy of central Germany, comprising the two separate duchies Coburg and Gotha and eight small detached fragments. Coburg is surrounded by Bavaria and Saxe-Meiningen; Gotha lies between Prussia and northern slopes of Thuringian Forest; leather industries; agriculture, cattle-rearing, etc.; capitals, Coburg (*q.v.*) and Gotha (*q.v.*). Coburg became an independent duchy, 1680; Gotha, 1641; they were united, 1826; ruled by branch of Ernestine line of house of Saxony (Wettin). Leopold, bro. of Duke Ernest I., was made king of Belgium, 1831; Ferdinand, Ernest's nephew, married Maria da Gloria, queen of Portugal, 1836; Ernest's son, Albert, married Queen Victoria, 1840; succession was renounced by Prince of Wales (Edward VII.) and Duke of Connaught; passed to Charles Edward, Duke of Albany (1900). Area, 764 sq. miles. Pop. (1910) 257,177.

SAXE-MEININGEN (*c.* 50° 45′ N., 10° E.), duchy of central Germany; area, 953 sq. miles; surface generally mountainous; capital, Meiningen; chief industries, agriculture and mining; live stock raised; fruit and vegetables cultivated; iron, coal, and marble produced; represented by one member in Bundesrat, two deputies in Reichstag; duchy is overwhelmingly Protestant. Pop. (1910) 278,357.

SAXE-WEIMAR-EISENACH (*c.* 50° 45′ N., 12° E.), grand-duchy, Germany; comprises the three divisions of Weimar, Eisenach, and Neustadt; area, 1397 sq. miles; great part of surface forested; watered by tributaries of Elbe; capital, Weimar; other important towns are Eisenach, with famous Wartburg, and Jena, an old-fashioned Univ. town; became an independent principality in 1641, and was created grand-duchy by Congress of Vienna, 1815; sends one member to Bundesrat, three to Reichstag; chief

industry, agriculture; manufactures woollens, pottery, beer. Prot. faith prevails. Pop. (1910) 417,554.

SAXHORN is the name, derived from Adolphe Sax, the inventor, of a family of musical instruments evolved from the old bugle-horn by the employment of valves instead of keys.

SAXICAVA, see under LAMELLIBRANCHIATA.

SAXICOLA, WHEATEAR, see under THRUSH FAMILY.

SAXIFRAGACEÆ, natural order of plants, having flowers generally of 5 sepals, 5 petals, 10 stamens; mountain-dwellers; a genus is *Saxifrage*, a species of which, London Pride, is a common Brit. garden flower.

SAXO GRAMMATICUS (*c.* 1150–1206), Dan. chronicler; completed great work, *Gesta Danorum*, *c.* 1208; little known of life; said to have been Zealander and a 'clerk'; chronicle is history and legend welded together.

SAXONS, see TEUTONIC PEOPLES.

SAXONY (50° 54′ N., 13° E.), kingdom and state of the Ger. Empire; bounded N. and E. by Prussia, S. by Bohemia, W. by Bavaria, Reuss, Saxe-Weimar, Saxe-Altenburg, and province of Saxony; length, 130 miles, breadth, 93 miles; total area, 5787 sq. miles. The country is flat in N.W., belonging to great North German plain; mountain ranges mainly in S. and S.E.; Erzgebirge, on Bohemian border, with Fichtelberg (3979 ft.); Elbsandsteingebirge, on both sides of Elbe, containing the picturesque Saxon Switzerland, Lausitzer, and Elstergebirge in S.E. and E. Chief rivers are Elbe, Mulde, Schwarze Elster, Pleisse, Spree, Neisse. Climate is generally healthy; severe winters in Erzgebirge, where mean winter temperature is from 23° to 24°. Mean January temperature of Dresden, 31° F. Saxony has extensive forests (mainly fir and pine), and fine arable and pasture-land.

History.—Old Saxony occupied a large part of N. Germany; conquered by Charlemagne, 804, and accepted Christianity; passed to Louis the German, 843; erected into a duchy, IX. cent.; Thuringia annexed, 908; Henry I., the Fowler, Duke of Saxony, became king of Germany, 919. Duchy passed (1453) to Margrave of Meissen, of house of Wettin, whose entire dominions came to be known as Saxony. On death of Elector Frederick the Mild, Saxony was divided (1485) between the brothers Elector Ernst and Duke Albrecht, from whom descended the Ernestine and Albertine lines. By capitulation of Wittenberg (1547), the larger part of electoral dominions was given to Albertine Duke Maurice, ancestor of present royal family. Lausatia was acquired at Treaty of Prague, 1635; several Swedish invasions occurred until 1650; Frederick August I. (1694–1733) became R.C., and accepted Polish crown as August II. Frederick August II. (1733–63), ultimately siding with Maria Theresa, was defeated, 1745, in War of Austrian Succession. Saxony was invaded by Frederick the Great in Seven Years War, 1756; lost Poland, 1763; defeated with Prussia at Jena, 1806; afterwards supported Napoleon, made a kingdom, 1806, and joined Confederation of Rhine. King Frederick August I. (1763–1827), formerly Elector Frederick August III., was captured by Allies at Leipzig, 1813, and N. part of Saxony ceded to Prussia by Congress of Vienna, 1815; joined Zollverein, 1834; sided with Austria against Prussia in Seven Weeks War, 1866; joined Prussia in Franco-German War, 1870–71, and became state of German Empire. Under Albert, 1873–1902, George (1902–4), and Frederick August III. (1904–), Saxony has enjoyed peace and prosperity.

Government.—Saxony is a constitutional hereditary monarchy, with Landtag (Parliament), consisting of Upper Chamber, comprising princes, officials, etc., and Lower Chamber (91 members, elected for 6 years); the kingdom sends 23 members to the Reichstag and 4 to Bundesrath. For local administration it is divided into 5 governmental divisions: Dresden, Leipzig, Chemnitz, Zwickau, Bautzen. Principal towns are Dresden (capital), Leipzig, Chemnitz, Plauen, Zwickau.

Religion is mainly Lutheran, although royal family are R.C.; in 1910 there were 4,500,000 Protestants, 234,000 Roman Catholics. Elementary **education** is compulsory; there is a celebrated univ. and Conservatoire of Music at Leipzig, famous mining academy at Freiberg, school of forestry at Tharandt, besides many industrial, agricultural, music, art, and other institutions.

For **defence**, see GERMAN EMPIRE.

Saxony is one of the greatest industrial centres of the Ger. Empire, and an important agricultural and mining country. Chief products are wheat, rye, barley, potatoes, oats, hay, vegetables, fruit, timber. Principal industries are textiles, machinery, porcelain, glass, chemicals, musical instruments, watches, printing, typefounding, lace, paper, toys, tobacco, beer, spirits, etc.; extensive cattle-rearing and fishing; coal, iron, zinc, lignite, silver, arsenic, copper, lead; numerous mineral springs (Schandau, Marienborn, Augustusbad, Tharandt, Elster, etc.). Saxony is the most densely populated country in Europe. Pop. (1910) 4,806,661.

SAXONY (51° 50′ N., 12° E.), province, Prussia, formed mainly of that portion of Saxony ceded to Prussia in 1815; watered by the Elbe; in W. are Harz mountains; produces cereals and sugar-beets; has salt, coal, and copper mines; extensive manufactures. Pop. (1910) 3,089,275. Capital, Magdeburg.

SAXOPHONE, modern musical instrument with conical brass tube and reed mouthpiece, invented by Adolphe Sax, 1840; the bore contains about twenty holes covered by keys; a transposing instrument, compass over two octaves.

SAY (13° 8′ N., 2° 5′ E.), town, Upper Senegal and Niger colony, Fr. W. Africa, on Niger. Pop. 9000.

SAY, JEAN BAPTISTE (1767–1832), Fr. economist; sec. to Clavière, Minister of Finance of Revolution; edited Liberal *La Décade*, 1794–1800; tribune, 1799; pub. *Traité d'économie politique*, 1803; opposed to empire, and retired, 1804; prof. of Industrial Economy at Conservatoire, 1819, of Political Economy at Collège de France, 1831; enthusiastic follower of Adam Smith, but expounded theories in new manner. His grandson **Léon** (1826–96) was Minister of Finance, 1872–73, 1875–79, 1882. A Liberal and free-trader, he lessened indirect taxation, and defeated attempt at income tax; pres. of Senate, 1880; editor of and contributor to *Dictionnaire des finances* and *Nouveau dictionnaire d'économie politique*.

SAYAN MOUNTAINS (52° 20′ N., 95° E.), range, between E. Siberia and N.W. Mongolia, Asia.

SAYBROOK (41° 18′ N., 72° 23′ W.), town, at mouth of Connecticut, summer resort, Middlesex County, Connecticut, U.S.A. Pop. (1910) 1907.

SAYCE, ARCHIBALD HENRY (1846–), Eng. philologist; deputy-prof. of Comparative Philology, Oxford, 1876; voluminous writer.

SAYE AND SELE, WILLIAM FIENNES, 1ST VISCOUNT (1582–1662), Eng. soldier and politician; the only Puritan peer; colonel of parliamentary regiment, 1642.

SAYRE (41° 58′ N., 76° 27′ W.), town, on Susquehanna, Pennsylvania, U.S.A.; car-works. Pop. (1910) 6426.

SBEITLA (35° 17′ N., 9° 4′ E.), ruined city, ancient *Sufetula*, Tunis, on Menasser.

SCABIES, ITCH, skin disease due to animal parasite, the *Sarcoptes scabei*, which burrows beneath the skin, most commonly at clefts of the fingers; it is treated by thorough cleansing, and then application of sulphur ointment.

SCABIOUS (*Scabiosa*), genus of plants, order Dipsaceæ; flowers have terminal head; the purple Devil's Bit or Primrose S. (*S. succisa*) is a common Brit. wild flower.

SCÆVOLA, Rom. patrician family. Chief members: (1) **Gaius Mucius**, attempted regicide in time of kings, and won patronymic (*Scævola* = 'left-handed') by destroying right hand as proof of constancy. (2) PUBLIUS MUCIUS, consul, 133, *pontifex maximus*, 130;

famous jurist. (3) **Quintus Mucius**, consul, 95; murdered by Marians, 82.

SCAFELL (54° 26′ N., 3° 14′ W.), mountain, Lake District, Cumberland, England.

SCALA, see Milan.

SCALA NUOVA, Turk. **Kush-Adasi** (37° 52′ N., 27° 15′ E.), seaport, Asia Minor. Pop. 7500.

SCALDS, see Burns and Scalds.

SCALE INSECTS (family, *Coccidæ*; order, *Hemiptera*), minute bugs, often injurious to fruit trees and plants; females are wingless and live beneath a scale composed of exuded matter, cast skins, etc. Many secrete valuable commercial products, such as Indian white wax and lac, and the manna of the Bible is probably the honeydew of a Mediterranean *Coccus*, while the body of another furnishes cochineal.

SCALES, see Weighing-Machines.

SCALIGER, JULIUS CÆSAR (1484–1558), prominent Ital. scientist and scholar; claimed to be son of Benedetto della Scala, of great Veronese family, but account of his own life not trustworthy; doctor at Agen, and engaged in learned disputes with Erasmus and Cardan, translated classics, and wrote Lat. verse. *Life*, by Mager (1880). **Josephus Justus Scaliger** (1540–1609), his son, the famous scholar, was firmly convinced of Scala connection, and in 1594 pub. *Epistola de vetustate et splendore gentis Scaligeræ*, to which Scioppius replied in *Scaliger Hypoloymœus*, feebly refuted by S. in *Confutatio stultissimæ Burdonis fabulæ*; prof. at Leiden, 1593, till death. Pamphlets *De emendatione temporum* and *Thesaurus temporum* mark epoch in science of chronology, as his criticisms of classical texts introduced new broader method of criticism in which intelligent interpretation assisted palæography; friend of Justus Lipsius, Grotius, Heinsius, Casaubon; praised by Mark Pattison as 'the most richly stored intellect which had ever spent itself in acquiring knowledge.' *Life*, by Bernays (1855).

SCALLOPS, see under Lamellibranchiata.

SCALP, term applied to the outer covering of the top of the skull, composed of *skin*, which is thick and has a great number of hair follicles; *superficial fascia*, with much fibrous tissue, containing arteries, which are very tortuous and bleed very freely when cut, veins, and nerves; a third layer comprising the anterior and posterior parts of the occipito-frontalis muscle with the flattened tendon or aponeurosis between them; a fourth layer of loose areolar tissue; and the external periosteum of the skull bones making a fifth layer. It was formerly considered that wounds of the scalp were especially liable to be followed by suppuration or erysipelas, but these conditions are due to the invasion of bacteria, and are prevented, as in wounds elsewhere, by treating all injuries strictly by aseptic and antiseptic methods. The most common tumours of the scalp are *Wens*, which are sebaceous cysts, and are treated by removal under a local anæsthetic.

SCAMMONY, a gum-resin from root of *Convolvulus Scammonia*, a plant of Asia Minor; a strong purgative and vermicide.

SCANDERBERG, 'Iskander (Alexander) Beg,' George Castriot (*c.* 1403–67), Albanian chief; kidnapped by Turks; he became a commander in Turk. army; renounced Islam and proclaimed independence of Albania; for over 20 years warred successfully against Turks.

SCANDEROON, Alexandretta (*q.v.*).

SCANDINAVIAN LANGUAGE, see Teutonic Languages.

SCANIA, S. part of Sweden (*q.v.*).

SCAPEGOAT, see Azazel.

SCAPHOID BONE, see Skeleton.

SCAPHOPODA, a class of Mollusca, including the miniature tusk-like Elephant's-Tooth Shell (*Dentalium*). The animal is comparatively simple, without distinct head, eyes, or heart, but the mantle-edges fuse to form a tube, which secretes the tubular shell, open at both ends. S. are entirely marine, and are found burrowing in sand usually some distance beneath the surface. They feed on microscopic organisms in sea water. Their fossil remains are found so far back as Devonian rocks.

SCAPOLITE, mineral group composed of aluminium, calcium, and sodium silicate; varieties: Wernerite of common s. and mizzonite. Colours: white and grey. Occurs generally in crystalline limestones, schists, and gneisses, and has metamorphic origin.

SCAPULA, see Skeleton.

SCARAB, Scarabæus, a species of dung-beetle, venerated by the Egyptians and engraved as a symbol of astronomical and mystic ideas on gems, etc.

SCARABÆIDÆ, see Chafers.

SCARBOROUGH (54° 16′ N., 0° 25′ W.), seaport, on North Sea, fashionable watering-place, N. Riding, Yorkshire, England; dominated by the ruins of its ancient castle; has churches, theatres, hospitals, aquarium, museum, and a fine promenade; mineral springs; fisheries. Pop. (1911) 37,204.

SCARLATINA, see Scarlet Fever.

SCARLATTI, ALESSANDRO (1659–1725), Ital. composer and teacher; b. Trapani; studied at Rome under Carissimi; lived at Naples, 1684–1702; app. *mæstro* to Santa Maria Maggiore, Rome, 1707. S. was the founder of the Neapolitan school; an intellectual musician with pure and vigorous style; prolific opera composer—*Mitridate Eupatore*, *Tigrane*, *Griselda*, etc.; chamber-cantatas, masses, and other works. His son Domenico (1683–1757) was also a composer of note.

SCARLET FEVER, Scarlatina, an infectious fever, characterised by sore throat, a red, diffuse eruption on the skin, followed by desquamation or shedding of the superficial part of the skin. The disease is caused by a micro-organism which is not yet known, and infection is conveyed by the breath, by discharges from the throat or nose, or by objects, or, very frequently, milk, which have come in contact with infected persons. It is believed that a micro-organism which causes a certain disease in cows causes scarlet fever in man, the infection being thus directly carried by milk.

The incubation period is short, two to three days, and the onset of the fever is usually sudden, with headache, shiverings, and sore throat, the face flushed, the pulse rapid, and the tongue coated with a thick, white fur. The eruption appears on the second day, as a red flush, in which are scattered small red pimples, first on the neck and chest, spreading over the body, and disappearing, with the fever, about the end of a week. Several varieties of scarlet fever are described, the *benign* type being a slight affection, the *malignant* characterised by very high temperature and very rapid pulse, and the *septic* or *ulcerative* type by ulceration of the throat and swollen glands of the neck, death often occurring in the last in the first or second week.

The treatment of the disease is rest in bed, a light, nourishing diet, gargling the throat with a boracic acid solution, cold packs for very high temperature; a patient must be isolated for six or seven weeks. The most important complications are inflammation of the kidneys and inflammation of the middle ear, both of which are treated as they arise.

SCARRON, PAUL (1610–60), Fr. comic writer; partly paralysed from age of twenty-eight; married, 1652, Françoise d'Aubigné, the future Mme de Maintenon; created a burlesque style partly imitated from Spanish; wrote the *Typhon* (1644), *Virgile travesti* (1648–52), in verse, and the *Roman comique* (1651) in prose—light, amusing burlesques from which Molière drew much.

SCAUP, see under Duck Family.

SCAURUS, MARCUS ÆMILIUS (*c.* 163–88 B.C.), Rom. consul, 115; involved in Jugurthine scandals, 112; censor, 109; built *Via Æmilia*. His son, of same name, was sent as quæstor to Judæa.

SCEPTICISM (Gk. *skeptomai*, I consider, reflect), strictly, the state of mind before reaching definite conclusions, but finally denying that knowledge is possible; not, as with Descartes, a preliminary step, but the last stage; found in the Sophistic antagonism to dogmatic philosophy, and more distinctly in Pyrrho,

who sought peace of mind by refraining from definite opinions and judgments, and in the Academics, under Arcesilaus and Carneades. Ancient arguments were based on differences in interpretation of same sense data at different times and by different men at the same time, dependence of appearance of objects on position and distance, variations in human customs and manners, and moral and religious beliefs, and the inadequacy of reason which bases demonstration on an endless chain of assumptions. Modern s. is a state of unrest and yearning; Hume shows it strongly; Reason powerless within as well as beyond experience; Kant denies knowledge of noumena; Hamilton's doctrine of Relativity of Knowledge leads to s. Of modern origin is s. in support of faith; thus Pascal (1623–62) introduces faith to warrant belief in cases where reason is full of insoluble contradictions.

SCEPTRE, oldest emblem of authority, borne by Hebrew kings and priests, by Persian eunuchs,—'bearers of the sceptre,'—Greek chieftains, Rom. kings, and consuls.

SCHADOW, the name of a distinguished family of Ger. artists. Johann Gottfried (1764–1850) executed numerous busts of great Germans. His son, Rudolf (1786–1822), produced several important works. Another son, Friedrich Wilhelm (1789–1862), succeeded Cornelius as head of the Düsseldorf School of Painting.

SCHÄFER, EDWARD ALBERT (1850–), Brit. physiologist; prof. of Physiology, Edinburgh Univ., since 1899; sec., Brit. Association, 1895–1900; as pres., 1912, he delivered, at Dundee, his famous address on the Origin of Life, anticipating an explanation of life on a physico-chemical basis. His publications include an edition of *Quain's Anatomy*, several text-books of physiology. A man of wide knowledge and deep research.

SCHAFF, PHILIP (1819–93), Amer. divine; ed. at Ger. univ.; prof. in Union Theological Seminary from 1869; tried to moderate rigorous Protestantism of Ger. reformed churches; wrote numerous works on theology, Church history, etc.

SCHAFFHAUSEN (47° 50′ N., 8° 40′ E.), canton, N. of Rhine, Switzerland; undulating, fertile; chief occupation, agriculture; joined the Swiss confederation in 1501. Pop. (1910) 46,097. Capital, **Schaffhausen** (47° 41′ N., 8° 38′ E.), on Rhine; contains castle of Munoth, cathedral, town hall, museum, and Imtherneum; manufactures iron and steel. Pop. (1912) 18,500.

SCHALL, JOHANN ADAM VON (1591–1669), Ger. missionary; became Jesuit, 1611; sent to China, 1622; revised Chin. imperial calendar.

SCHALMEI, see OBOE.

SCHANDAU (50° 55′ N., 14° 10′ E.), town, on Elbe, Saxony; tourist centre. Pop. (1910) 3413.

SCHARNHORST, GERHARD JOHANN DAVID VON (1755–1813), Pruss. soldier and military writer; Scharnhorst and Stein, though thwarted by Napoleon, were chief authors of reforms to which rise of Prussia was due; S. wrote much on art of war; taught at Military Academy, Berlin, and founded Berlin Military Association.

SCHÄSSBURG, see SEGESVÁR.

SCHAUMBURG-LIPPE (52° 10′ N., 9° E.), principality, Ger. Empire; capital, Bückeburg; area, 131 sq. miles. Pop. (1910) 46,652.

SCHEELE, KARL WILHELM (1742–86), Swed. apothecary who made great chemical discoveries; discovered oxygen; studied pyrolusite (MnO_2) and discovered chlorine; prepared phosphorus from bones, discovered hydrocyanic (Prussic) acid, arsenetted hydrogen and Scheele's green ($CuHAsO_3$), prepared glycerine and numerous organic acids from natural sources.

SCHEFFEL, JOSEPH VIKTOR VON (1826–86), Ger. poet and novelist; b. Karlsruhe; best works, *Trompeter von Säckingen* (epic), *Ekkehard* (historical novel).

SCHELDT, SCHELDE, ESCAUT (50° 10′ N., 3° 11′ E.), river, France, Belgium, and Holland; rises in Aisne department, and enters North Sea; passes Valenciennes, Oudenarde, Ghent, Antwerp; length, 250 miles; navigable to Cambrai; tolls imposed, 1648–1863.

SCHELLING, FRIEDRICH WILHELM JOSEPH VON (1775–1854), Ger. philosopher, founder of Objective Idealism; b. Württemberg; prof. at Jena, Munich, Berlin. His philosophy shows several stages of development; at first, an adherent of Fichte (*q.v.*); later, combined Subjective Idealism with Spinozism, producing a 'System of Identity.' The ego does not make the non-ego, nor the non-ego the ego; both are forms of the revelation of the Absolute Ego. The Absolute divides itself into polar opposites, positive, ideal, spirit, and negative, real, nature; reason being the 'Indifference Point.' Mind and matter are then two aspects of a higher unity; nature is visible spirit, spirit, invisible nature—an identity perceived by 'Intellectual Intuition.' Subject and object are in all things, combined in differing degrees. History shows three stages of development: a period of Nature, found in Gk. poetry and religion; of Fate, at end of the ancient world; and of Providence, commencing with Christianity. S.'s thought is influenced by Neo-Platonism, Boehme, and Bruno, and approximates to mysticism.

SCHENECTADY (42° 44′ N., 73° 59′ W.), city, on Mohawk; capital, Schenectady County, New York, U.S.A.; seat of Union College; knitted goods; agricultural implements; electrical machinery; burned by French and Indians, 1690. Pop. (1910) 72,826.

SCHENKEL, DANIEL (1813–85), Swiss Prot. divine; became advanced liberal in theology; prof. at Basel and Heidelberg; opposed Catholic tendencies.

SCHERER, EDMOND HENRI ADOLPHE (1815–89), Fr. scholar.

SCHEVENINGEN (52° 16′ N., 4° 18′ E.), fishing town, watering-place, on North Sea, S. Holland province, Netherlands; Brit. fleet defeated Dutch off S., 1653. Pop. 24,000.

SCHIEDAM (51° 54′ N., 4° 24′ E.), town, S. Holland province, Netherlands, at junction of Schie and Maas; manufactures gin. Pop. (1911) 33,235.

SCHILLER, JOHANN CHRISTOPH FRIEDRICH VON (1759–1805), Ger. poet and dramatist; b. Marbach; entered military school, Ludwigsburg, 1773, and Stuttgart, 1775; first drama, *Die Räuber*, appeared, 1781; followed by the tragedies, *Die Verschwörung des Fiesco zu Genua* (1783) and *Kabale und Liebe* (1784); visited Leipzig, 1785, then Dresden; formed intimate friendship with Körner. *Don Carlos* was completed, 1787; in the same year S. visited Weimar, where he began his two historical works on Thirty Years War, and Netherland's War of Independence. Prof. of History at Jena Univ., 1788; formed intimate and lasting friendship with Goethe, 1794. To S.'s last period belong fine ballads (*Der Ring des Polykrates*, *Der Taucher*, *Das Lied von der Glocke*, etc.), lyrics, the great classical drama *Wallenstein* (1800), and dramas *Maria Stewart*, *Die Jungfrau von Orleans* (1801), *Die Braut von Messina* (1803), *Wilhelm Tell* (1804); S. was unfortunate in money matters, and suffered from constant bad health during his latter years; a fine character and great dramatist, S. ranks next to Goethe in Sturm und Drang period.

Carlyle, *Life*; Nevinson, *Life*; Robertson, *S. after a Century*; Rea, *S.'s Dramas and Poems in England* (1906).

SCHILTBERGER, JOHANN (HANS) (1381–1440), Ger. traveller; captured by Turks while fighting for Hungarians, 1396, and travelled about for years as slave; finally escaped and wrote valuable, though occasionally untrustworthy, *Reisebuch*.

SCHIPKA PASS, SHIPKA PASS (*q.v.*).

SCHISM, separation from a church: GREAT S. was division between Gk. and Lat. Churches; WESTERN S. (XIV. and XV. cent's) was due to rival claims to papal chair. See ANTIPOPE, PAPACY.

SCHISTS (Gk. *schistos*, split), rocks of foliated

structure found in metamorphic or crystalline rocks as gneiss, mica-schist, hornblende-schist, and in such regions as Central Alps, Himalayas, Saxony, Scandinavia, Scot. Highlands, and N.W. Ireland. S. splits easily, hence name.

SCHIZOMYCETES, see BACTERIOLOGY.

SCHLAGINTWEIT, surname of five brothers (Germans) who became famous as scientific explorers :—HERMANN (1826–82), ADOLF (1829–57), EDUARD (1831–66), ROBERT (1833–85), and EMIL (1835–1904).

SCHLAN (50° 13′ N., 14° 3′ E.), town, Bohemia, Austria ; coal mines. Pop. (1911) 9683.

SCHLANGENBAD (50° 5′ N., 8° 5′ E.), watering-place, Hesse-Nassau, Prussia ; mineral springs.

SCHLEGEL, AUGUST WILHELM VON (1767–1845), famous Ger. critic and translator ; b. Hanover ; ed. Göttingen ; travelling companion to Madame de Stäel ; translated 17 of Shakespeare's plays ; celebrated for lectures delivered in Berlin and Vienna on lit. and art.

SCHLEGEL, KARL WILHELM FRIEDRICH VON (1772–1829), Ger. critic and poet ; b. Hanover ; wrote *Über die Sprache und Weisheit der Indier*, *Fragmente* (treatises), *Lucinde* (novel), etc.

SCHLEIDEN, MATTHIAS (1804–81), German botanist, devoted to plant histology.

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768–1834), Ger. theologian and philosopher ; b. Breslau ; s. of army chaplain ; ed. Moravian institutes at Niesky and Barby ; forsook orthodoxy and studied Plato, Spinoza, and Kant at Halle ; eminent preacher, critic, and translator of Plato ; champion of moral and political reforms ; brought about, in 1817, union of Lutheran and Reformed Churches in Prussia.

In epistemology, S. approximates to Kant, though with more practical interest. Knowledge implies a material factor from sense, and a formal, from the understanding. The highest knowledge, however, that of God, cannot be so derived, whence the supreme value of religion. Religion is to be considered not merely as a means to social order and individual morality, and as expressing certain views of nature and history, but as that feeling in which man becomes conscious of his own destination ; it is based on a feeling of absolute dependence on God, through which is revealed to man his own immortality. Historical religions depend on the communication to others of one's consciousness of God. This is particularly true of Christianity, which is essentially a religion to be realised through experience, centred in the personality of Christ the Redeemer. Faith in Christ depends on a pious disposition common to us and to Him ; through it we believe in the fundamental facts of Christianity. Doctrines of devil and of fall of wicked angels are rejected.

Munro, *Schleiermacher*.

SCHLEIZ (50° 34′ N., 11° 48′ E.), town, on Wiesenthal, principality of Reuss (younger line), Germany. Pop. (1910) 5564.

SCHLESWIG (54° 30′ N., 9° 34′ E.), town, seaport, on Schlei inlet ; capital of Schleswig-Holstein, Prussia ; has cathedral and ducal castle ; tanneries, flour-mills. Pop. (1910) 19,909.

SCHLESWIG-HOLSTEIN (54° 52′ N., 9° 9′ E.), province, Prussia, bordering on North and Baltic Seas ; area, 7338 sq. miles ; surface generally plains and moors ; drained by Eider and Elbe ; crossed by Kaiser Wilhelm Canal ; capital, Schleswig ; agriculture important ; live stock raised ; manufactures textiles, hardware, beer ; shipbuilding carried on.

History.—SCHLESWIG was inhabited in II. cent. B.C. by Cimbros. Afterwards Angles settled on E., Frisians on W., and Jutes on N. coast. Dan. inroads followed, and Dan. province of Schleiaswic or Hethaby founded. Henry I. of Germany established (934) mark of Schleswig in district wrested from Denmark between Eider and Schlei ; Otto I. formed bishopric of Schleswig, 849 ; reconquered by Canute, 1027, and became Dan. duchy. Gerhard, Count of Holstein, seized duchy, restored it, 1330, but stipulated that on death of Valdemar V. it should come to his family ; Gerhard VI. of Holstein was invested, 1386. HOLSTEIN, originally part of duchy of Saxony, had become separate county, 1106. When Christian I. succeeded to duchy and county, 1460, he promised to maintain union and observe liberties. Holstein, Schleswig, and Stormarn were erected into duchy by Emperor Frederick III., 1474. In partitions of possessions of house of Oldenburg (*q.v.*), 1544 and 1581, Schleswig became Dan. fief, while Holstein remained German, but they retained single administration under their respective rulers, the king of Denmark and Duke of Gottorp. Duke of Gottorp succeeded to Russ. empire as Peter III. (*q.v.*), 1762, and in 1767 Catherine II. renounced right in the duchy ; confirmed as Dan. state on dissolution of Roman empire, 1806, but Holstein with duchy of Lauenburg became member of Ger. Confederation by Treaty of Vienna, 1815.

Rise of national consciousness brought friction with Denmark ; claim was made that the duchies were not subject to feminine succession, and that if Denmark passed to female heir they should descend to male heir, Duke of Augustenburg ; revolt, 1848, sustained by Prussia, Schleswig being admitted into the Ger. Confederation. The Danes occupied Schleswig, were defeated by Prussian invaders, but forced Prussia to retreat, 1850, and stamped out revolt with aid of Austria. The powers agreed, 1852, that Prince Christian of Sonderburg-Glücksburg was heir of Denmark and the duchies. Renewed opposition caused Denmark to grant independence to Holstein and Lauenburg, 1863, but incorporate Schleswig. When king of Denmark died, 1863, a strong party supported Augustenburg's claims to duchies against Christian IX. of Denmark and installed him. Invasion of Prussia and Austria to enforce agreement of 1852 ended in subjugation of Denmark and cession of its rights in Holstein, Schleswig, and Lauenburg to Austria and Prussia, 1864 ; instead of establishing Augustenburg, they divided the duchies at Gastein, 1865, but soon quarrelled, and after great Prussian victory over Austria at *Königgrätz*, 1866, Prussia took all. The question of citizenship of Danes in the duchies was not settled till 1907, owing to Prussia breaking clauses of treaties of 1864 and 1866. Pop. (1910) 1,621,004.

SCHLETTSTADT, town, on Ill, Alsace-Lorraine, Germany ; centre of agricultural and vine-growing district. Pop. 10,610.

SCHLEY, WINFIELD SCOTT (1839–1911), Amer. admiral ; rescued Greely, 1884 (see POLAR REGIONS) ; second in command at *Santiago*, 1898 (see SPANISH-AMERICAN WAR).

SCHLIEMANN, HEINRICH (1822–90), Ger. archæologist, distinguished as the excavator of the sites of Troy and Mycenæ. The treasures he unearthed at Troy are now in the Ethnological Museum at Berlin, those from Mycenæ in the Polytechnic at Athens. The results of his work are described in *Schliemann's Excavations*, edited by Madame Schliemann.

SCHLOSSER, FRIEDRICH CHRISTOPH (1776–1861), Ger. historian ; b. Jever ; wrote *History of Iconoclastic Emperors of the East* ; *World History of the German People* ; *History of XVIII. Cent.*, etc.

SCHLÖZER, AUGUST LUDWIG VON (1735–1809), Ger. historian ; b. Gaggstedt, Württemberg ; best works are *Allgemeine Nordische Geschichte*, translation of Russian chronciler Nestor up to 980 ; *Weltgeschichte im Auszuge und Zusammenhang*.

SCHLÜSSELBURG (60° N., 32° E.), town, on Neva, St. Petersburg, Russia. Pop. 5600.

SCHMALKALDEN (50° 43′ N., 10° 28′ E.), town, summer resort, Hesse-Nassau, Prussia ; manufactures hardware ; scene of *Schmalkaldic League*, in defence of Protestantism, 1530. Pop. (1910) 10,020.

SCHMERLING, ANTON VON (1805–93), Austrian statesman and judge ; leader in attempted revolution, 1848 ; became pres. of diet, minister of

interior and of foreign affairs; resigned, 1851, and refused office till new constitution was granted, 1862; retired, 1865.

SCHNAPPER, THE AUSTRALIAN, see SEA BREAM.

SCHNEEBERG (50° 1′ N., 12° 10′ E.), town, kingdom of Saxony; embroidery and lace industries. Pop. 9200.

SCHNEEKOPPE (50° 46′ N., 15° 37′ E.), mountain (5200 ft.) in the Riesengebirge, Germany; meteorological station.

SCHNEIDEMÜHL (53° 9′ N., 16° 43′ E.), town, Posen, Prussia; iron manufactures. Pop. (1910) 26,129.

SCHNITZER, EDUARD, see EMIN PASHA.

SCHNORR VON KAROLSFELD JULIUS (1794–1872), Ger. painter; prof. at Munich and Dresden; and, among many other works, designed 180 pictures to illustrate Biblical narratives.

SCHOLASTICISM, a term applied to no fixed doctrine or school, but to philosophic work extending over several hundred years; an exposition of Christian dogma on Gk. principles, aiming at the reconciliation of faith and reason; according to some, commenced in VIII. cent.—so including the Britons Alcuin and Erigena (*qq.v.*)—according to others, as late as the mid-XI.; in either case, was most flourishing from this latter date till the middle of the XIV. The first scholastics had few Gk. philosophical writings. Plato was practically unknown to them, and the logical doctrines of Aristotle imperfectly understood till the XII. cent. In the XIII. his other works were available in Latin translations by Arabic and Hebrew scholars. See ARABS (ARABIAN PHILOSOPHY).

S. presents three points of view—the *theological*, dealing with Church dogma, the *mystical*, treating of personal piety, and the *classical*, referring to Gk. philosophy. From this third aspect, it was mainly the old problem of 'Universals' which occupied attention, the question of Realism and Nominalism (*qq.v.*). The issue once raised, its importance was immediately grasped, in its connection with the doctrines of the Trinity, the Real Presence, the Status of the Church. Discussion falls into three periods. First, the *Platonic*, in the XI.–XII. cent's, when ANSELM (1033–91), Abp. of Canterbury, affirms the real existence of the universal prior to the concrete things in which it exists. Anselm is the author of the doctrine 'Credo ut intelligam,' and of the 'ontological' argument for God's existence (see KANT). In this period also we find ROSCELLIN, an extreme Nominalist (general notions mere names, with no objective reality), ABELARD (1079–1142), intermediate between the opposing doctrines, BERNARD OF CLAIRVAUX, and PETER LOMBARD. The second period is the *Aristotelian*, the Stagirite's writings being now more widely known. THOMAS AQUINAS (1225–74) makes Aristotle a pillar of Christian dogma; reason is inadequate to discern the highest truths, *e.g.* of the Trinity and Incarnation, but is supplemented by revelation; the two are not opposed, but are different stages in the acquirement of knowledge. The third period, from the XIV. cent., shows this union of reason and faith broken. DUNS SCOTUS (1274–1308) contends that the Christian doctrine transcends reason and requires belief; he enlarges the sphere of authority and refers on many subjects to the will of God. The rival schools of *Thomists* and *Scotists* discuss which is greater, Will or Intellect. WILLIAM OF OCCAM revives the Nominalism of Roscellin; reason is powerless to establish any article of faith.

From the mystical aspect we find a movement towards the exaltation of personal holiness, most prominent in the later part of the period. Prominent are BERNARD OF CLAIRVAUX, BONAVENTURA the Seraphic Doctor, FRANCIS OF ASSISI (1182–1226), founder of the Grey Friars, and DOMINIC, founder of the Black Friars. The Christian ideal became the rapt contemplation of the sufferings of Christ, and a life of poverty and chastity. Later mystics were JOHN TAULER of Strassburg and THOMAS À KEMPIS (see IMITATION OF CHRIST).

The doctrine of S. was hastened by events outside the Church—the exploration of the East and the discovery of the West, the revolutionary Copernican theory of the heavens, the claim to the right of private judgment, the revival of learning after the fall of Constantinople, the

by the Italians TELESIO (*q.v.*) and BRUNO burnt, 1600). A period of transition extended from 1450 to 1600, and led up to the commencement of modern philosophy in the XVII. cent.

S. has been criticised as philosophising in support of a foregone conclusion, as exhibiting minute (and somewhat unjustly), puerile speculation, but making no advance on Aristotle, as neglecting history, experience, languages; it has been admitted, however, to be distinguished by great subtlety of thought and rare development of ontological notions. There has been a revival of S. among Roman Catholics, and there is a flourishing school of S. at Louvain Univ., where its adherents have shown that it is not averse to empiricism, and that only one of its sides is apologetic.

Father Rickaby, S.J., *Scholasticism*; De Wulf, *Scholasticism, Old and New.*

SCHOMBERG (SCHÖNBERG), DUKE OF, FRIEDRICH HERMANN (c. 1650–90), soldier; distinguished under Turenne and in Portugal, 1660–65; marshal of France, 1675, but fled at revocation of Edict of Nantes, 1685; second in command to Prince of Orange in invasion of England; captain-general of Eng. forces, 1689; slain at *Battle of the Boyne.*

SCHOMBURGK, SIR ROBERT HERMANN (1804–65), Eng. traveller of Ger. birth; sent by Royal Geographical Soc. to explore river Essequibo, he discovered lily *Victoria regia*; government surveyor of boundaries of Guiana, hence 'Schomburgk Line' between Guiana and Venezuela.

SCHÖNEBECK (52° 2′ N., 11° 44′ E.), town, Pruss. Saxony, on Elbe; manufactures chemicals. Pop. (1910) 18,305.

SCHÖNEBERG, town, Brandenburg, Prussia; suburb of Berlin. Pop. (1910) 172,823.

SCHÖNFELD, EDUARD (1828–91), Ger. astronomer; studied architecture, chem., and astron.; app. director Bonn Observatory, 1875.

SCHÖNINGEN (52° 8′ N., 10° 57′ E.), town, Brunswick, Germany; chemical works. Pop. (1910) 9773.

SCHOOLCRAFT, HENRY ROWE (1793–1864), Amer. traveller and ethnologist; lived for 30 years among Indians; married an Indian girl; discovered Mississippi source; wrote much on Indians and travels.

SCHOOLS, see EDUCATION.

SCHOPENHAUER, ARTHUR (1788–1860), Ger. philosopher; founder of modern pessimism; b. Dantzig; ed. Göttingen and Berlin; d. Frankfort; was morose, suspicious, egotistical; chief works, *The World as Will and Idea* (1819), *The Will in Nature* (1836).

S. reduces Kant's *à priori* sources of knowledge to one, and rejects the thing-in-itself. The essential form of thought is the principle of causation. The world of phenomena is an ideal representation, an appearance. The fundamental thing in us is will; intellect is secondary, and since what is essential to us is the ultimate principle of everything else, the entire universe is essentially a self-objectifying will. Will is to be taken in a wide sense, including every exertion of power with a purpose; it can exist without consciousness, and is shown in spontaneous animal actions, and in every force and power of the vegetable and inorganic worlds. Will expresses itself in forms equivalent to Plato's 'ideas,' inner essences of things forming a graduated series up to man, the highest form of life. Each member has its particular forces, and between individuals there is a perpetual conflict and the survival of the fittest. Hence pessimism; all willing comes from want and suffering, satisfaction is illusory; human life is endless pain, conflict, and struggle; the human 'virtues' are but

refined egoism, and pity is the sole virtue; the world contains infinitely more pain than pleasure, and is the worst possible world. Escape is provided (1) by dwelling in pure thought; (2) by overcoming the will-to-live; not suicide, but asceticism, and subduing of all bodily desires.

Wallace, *Life* (1890); Caldwell, *Schopenhauer's System* (1893).

SCHORL, compound of quartz and black tourmaline (*q.v.*); of igneous origin; occurs associated with granite and crystalline schists; is granular in texture and found in masses; colour grey; sometimes contains quantities of white mica and tinstone; fine-grained and splinters easily.

SCHOUVALOFF, see SHUVALOV.

SCHREIBERHAU (50° 40′ N., 15° 30′ E.), village, health resort, Silesia, Prussia; glass-works. Pop. (1910) 5656.

SCHREINER, OLIVE, MRS. S. C. CRONWRIGHT SCHREINER (1859–), S. African novelist; pseudonym, 'Ralph Iron'; became famous with her *Story of an African Farm* (1893).

SCHUBERT, FRANZ PETER (1797–1828), Austrian composer; b. and d. at Vienna. Having a fine voice, and being already well grounded in music, he obtained, in 1808, a place in the choir school of the Imperial Chapel, and his compositions soon figured in the concert programmes there. Later he had lessons from Salieri, the intimate of Mozart. For three years he assisted in his father's school, but this period produced some of his finest songs, including *The Erl King*, and music became his sole profession. For a time he was music-master in the household of Count Esterhazy, the only fixed appointment he ever held. Gradually his songs made an impression, and he extended his range, producing with feverish anxiety operas, cantatas, masses, symphonies, quartets, and chamber music of all kinds. His *forte*, however, was the *lied*. No fewer than 605 songs are credited to him, and in this department alone he was unquestionably the most fertile and original melodist who ever lived.

Life, by Frost (1885), Duncan (1905); Clutsam, *Schubert* (Masterpieces of Music).

SCHULTZE, MAX JOHANN SIGISMUND (1825–74), Ger. histologist; prof. of Anat. at Halle, 1854, and Bonn, 1859; most important work was on the cell theory.

SCHULZE-DELITZSCH, FRANZ HERMANN (1808–83), Ger. lawyer, politician, and philanthropist; established first Provident Soc. at Delitzsch, 1850; held first *Genossenschaftstag*, 1859; established *Genossenschafts-Bank*, 1865.

SCHUMANN, ROBERT ALEXANDER (1810–1856), Ger. composer; b. at Zwickau; d. at Endenich, near Bonn. Studying first for the law, he yielded to his musical leanings, and was in the way of becoming a pianoforte virtuoso when he lamed his hand by a self-contrived mechanism for producing suppleness of the fingers. Thenceforward he devoted himself almost entirely to composition and literary musical work. Beginning with songs, he gradually attempted larger forms, and his works include compositions for orchestra, chamber music, organ and pianoforte music, the latter of essential importance in its class. Among his vocal works should be mentioned the cantata *Paradise and the Peri* and the opera *Genoveva*. Latterly he became mentally unhinged, and after trying to drown himself, was confined in an asylum. His wife, CLARA SCHUMANN (1819–96), was a distinguished pianist.

Landon Ronald, *Schumann* (Masterpieces of Music, 1912); Fuller Maitland, *Life* (1884); Reissmann, *Life and Works* (1886). See also *Letters of Robert Schumann* (trans. by H. Bryant).

SCHÜRER, EMIL (1844–1910), Prot. divine; prof., Leipzig, 1873, Göttingen, 1895.

SCHURZ, CARL (1829–1906), Amer. statesman, general, and publicist. S. was expelled as revolutionary from Germany and France; became leader of Republican party in Wisconsin; important member of Republican National Convention, 1860; commanded Union division in Civil War; represented Missouri in U.S. Senate, 1869–75; Sec. of Interior in Hayes' Cabinet, 1877–81; reformed civil service; universally respected; author of excellent biographies and *Reminiscences*.

SCHUYLER, PHILIP JOHN (1733–1804), Amer. general and politician; commander of forces for invasion of Canada, 1776–77; owing to illness remained at Albany, but incurred blame for retreat from Crown Point and Ticonderoga; life written by GEORGE WASHINGTON SCHUYLER (1810–88), whose son, EUGENE (1840–90), was well-known author and diplomatist.

SCHWABACH (49° 20′ N., 11° 2′ E.), town, Bavaria, Germany; manufactures needles. Pop. (1910) 11,195.

SCHWÄBISCH-HALL, see HALL.

SCHWALBACH (50° 8′ N., 8° 4′ E.), watering-place, Hesse-Nassau, Prussia; mineral springs. Pop. (1910) 3211.

SCHWANN, THEODOR (1810–82), Ger. anatomist and physiologist; prof. of Anat. at Louvain, 1838, and later Liège, 1847; made important researches on nervous tissues, process of digestion, and initiated theory of the cellular origin and development of all the tissues.

SCHWANTHALER, LUDWIG MICHAEL (1802–48), Ger. sculptor; produced vast number of excellent works, including statues of Goethe, Jean Paul, and Mozart, and a colossal statue of Bavaria, 60 ft. high.

SCHWARZ, CHRISTIAN FRIEDRICH (1726–98), Prot. pastor; preached Christianity in India.

SCHWARZBURG-RUDOLSTADT (50° 40′ N., 11° 10′ E.), principality and state, in Thuringia, Germany; consists of several detached portions divided into upper and lower divisions. Pop. (1910) 100,702. Capital, Rudolstadt.

SCHWARZBURG-SONDERSHAUSEN (51° 20′ N., 10° 45′ E.), principality and state, in Thuringia, Germany; consists of two divisions, upper and lower. Pop. (1910) 88,917. Capital, Sondershausen.

SCHWARZENBERG, Ger. family founded by Erkinger von Seinsheim, who acquired Franconia, 1420, and became baron of empire. Chief member, ADAM (1587–1641), minister of George William of Brandenburg in Thirty Years War.

SCHWARZENBERG (50° 33′ N., 12° 34′ E.), town, kingdom of Saxony. Pop. (1910) 5367.

SCHWARZENBERG, KARL PHILIPP, PRINCE OF (1771–1820), Austrian general; fought against France, 1805–9; commanded Austrian contingent in Fr. invasion of Russia, 1812, but, perhaps purposely, gave little help; field-marshal, 1813; generalissimo of army of Allies; won battle of *Leipzig* and led two invasions of France.

SCHWARZERD, see MELANCHTHON.

SCHWARZWALD, see BLACK FOREST.

SCHWECHAT (48° 10′ N., 16° 30′ E.), town, Lower Austria; large brewery. Pop. (1911) 8501.

SCHWEDT (53° 3′ N., 14° 17′ E.), town, on Oder, Brandenburg, Prussia; tobacco, cigars. Pop. (1910) 9480.

SCHWEIDNITZ (50° 50′ N., 16° 28′ E.), town, on Weistritz, Silesia, Prussia; woollens. Pop. (1910) 31,320.

SCHWEINFURT (50° 3′ N., 10° 13′ E.), town, on Main, Lower Franconia, Bavaria; manufactures paint, 'Schweinfurt green.' Pop. (1910) 22,194.

SCHWEINFURTH, GEORG AUGUST (1836–), Ger. explorer and scientist; led expedition to E. Africa, 1869–71; discovered river Welle, but believed it to be tributary of Chad; contributed to knowledge of ethnology.

SCHWELM (51° 18′ N., 7° 20′ E.), town, Westphalia, Prussia; iron and steel goods. Pop. (1910) 20,432.

SCHWENKFELD, KASPAR (1490–1561), Ger. Prot. divine; a man of noble birth and refined

character; influenced by Luther's theology, but then diverged from it; tried, unsuccessfully, to mediate between Lutheran and Zwinglian views of Eucharist; later persecuted by Lutherans; his peculiar mystical theology made his Christology unorthodox.

SCHWERIN.—(1) (53° 38′ N., 11° 25′ E.) town, on Lake Schwerin; capital, Mecklenburg-Schwerin, Germany; chief buildings are the ducal palace and XV.-cent. cathedral; manufactures furniture. Pop. (1910) 42,519. (2) (52° 36′ N., 15° 30′ E.) town, on Warthe, Posen, Prussia; cigar factories. Pop. (1910) 7004.

SCHWERIN, KURT CHRISTOPH, COUNT VON (1684–1757), Pruss. general; entered army, 1720; commanded picked troops which overran Silesia, 1741, 1744, 1756–57; slain at battle of *Prague*; monument on field.

SCHWERTE (51° 27′ N., 7° 34′ E.), town, Westphalia, Prussia; iron goods. Pop. (1910) 13,702.

SCHWETZ (53° 24′ N., 18° 24′ E.), town, on Vistula, W. Prussia; manufactures sugar. Pop. (1910) 8045.

SCHWETZINGEN (49° 23′ N., 8° 35′ E.), town, Baden, Germany; cigars, beer. Pop. (1910) 7875.

SCHWIEBUS (52° 15′ N., 15° 30′ E.), town, Brandenburg, Prussia; manufactures cloth. Pop. (1910) 9333.

SCHWYZ (47° 5′ N., 8° 47′ E.), canton, Switzerland, bordering on Lakes of Zürich and Lucerne; area, 351 sq. miles; surface hilly, reaching extreme height of *c.* 9050 ft. in Kinzigkulm; S. was one of original cantons; formed league with Uri and Unterwalden in 1291, and defeated Austria, 1315; contains monastery of Einsiedeln; language is German; religion, R.C.; chief industry, agriculture; cattle, sheep, pigs, and goats raised. Pop. (1910) 58,428. Capital, Schwyz, has pop. 8100.

SCIACCA (37° 29′ N., 13° 6′ E.), seaport, Girgenti, Sicily; coral fisheries. Pop. 26,000.

SCIATICA, term applied to neuralgia of the great sciatic nerve, which passes from the pelvis down the back of the thigh to the foot. The neuralgia is often due to exposure to cold or wet, and may be associated with a constitutional tendency towards rheumatism or gout, while any pressure upon the nerve, as, for instance, by a tumour, may cause an attack. Pain is felt behind the hip-joint, increasing in severity and running down the back of the thigh, or, again, the pain may affect certain parts only, *e.g.* the knee; the pain is increased on moving the limb, and the nerve is tender to the touch. In regard to treatment, any constitutional cause must first be treated, while quinine or aspirin may be administered with benefit. Liniments containing belladonna or opium may be rubbed in to relieve pain, and counter-irritants and cupping are employed. Needling the nerve, injection of alcohol into the nerve, and cutting down upon the nerve and stretching it, and the employment of electricity are all measures which are carried out with good results.

SCIENCE is a systematic arrangement of demonstrative facts relating to the external world as recorded by our sense-impressions. The term is, however, variously employed. It is correctly used to denote the results of those inquiries into the phenomena of nature which can be pursued by means of observation, experiment, and disciplined reasoning founded thereon. It is also employed in connection with such studies as philology, ethics, religion, psychology, education, history, economics, and sociology. But the validity of the claim of such subjects to be seriously regarded as sciences depends on the extent to which the scientific method, referred to above, is applied to them; and in this respect they vary.

The question as to what constitutes, or is included within, the legitimate sphere of science is one which opens up the whole range of speculative discussion as to the nature of human knowledge, and cannot be more than indicated here. The method of science has been already pointed out. It collects facts, arranges them, attempts to establish the order of sequence among each group, and seeks for correlations between groups. It thus reaches conceptions which, embodying its results in abbreviated form, are termed scientific laws. Such expressions have, it is true, no greater validity than can be conferred upon them by the mass of particulars on which they are founded. But they have certain well-marked peculiarities which distinguish them from, or which are denied to, most other human judgments. In the first place, they are subjected to the severest criticism: the accuracy and sufficiency of the data, the method of their arrangement, and the rationality of the deductions made from them, can all be called in question by the numerous workers in the same field of inquiry. Secondly, the judgments so formed are impersonal and, as far as any product of the human mind can be, are free from bias. Thirdly, they command practically unanimous consent in all normally constituted minds which are capable of understanding the terms in which they are expressed. A sharp distinction has thus to be drawn between the region of ascertained data and that of speculation, more especially if the latter, by projecting pseudo-scientific methods into any possible realm beyond that of sense-impression, attempts to settle questions with which science has nothing in common. At the same time, the attempt to restrict scientific investigation must be resisted, for whatever is or claims to be positive knowledge falls legitimately within the scope of scientific method, and must justify its existence accordingly. It is impossible here to give any adequate illustration of the more particular methods of scientific inquiry. But much may be gleaned from a study of the genesis of such conclusions as Newton's laws of motion and gravitation, the method of spectrum analysis, Maxwell's electromagnetic theory of light, the conservation of energy, the conduction of electricity through gases and the electron theory, the kinetic theory of gases, the discovery of radioactive substances and their transformations, the investigations which led Darwin to the *Origin of Species* and the theory of natural selection, the rise of embryology and the manner in which it sheds light on the development of animal and vegetable forms, the germ theory of disease and especially the work of Pasteur, and the investigation of malaria and its mode of transmission.

SCILLITAN MARTYRS, twelve Christians martyred in N. Africa in persecution of 180 A.D.; contemporary account of their martyrdom is preserved.

SCILLY ISLES (49° 55′ N., 6° 20′ W.), group of several islands and numerous clusters of rocks lying 27 miles S.W. of Land's End, Cornwall, England; largest is St. Mary's, next in importance being Trescoe and St. Martin's; of granitic formation; mild climate; most of inhabitants employed in cultivating early vegetables and growing flowers for London market. St. Mary's contains the only town, Hugh Town. Pop. (1911) 2097.

Mothersole, *Isles of Scilly* (1910).

SCIPIO, Rom. family of *gens Cornelia*. Chief members: PUBLIUS, consul, 218, general against Hannibal, slain by Hasdrubal in Spain; the famous Elder and Younger PUBLIUS CORNELIUS SCIPIO, *Africanus* (*q.v.*); PUBLIUS, *Nasica Serapio*, consul, 138, led aristocracy against Gracchus; last of line, infamous PUBLIUS, consul, 56 A.D.

SCIPIO ÆMILIANUS, PUBLIUS CORNELIUS, AFRICANUS MINOR (185–29 B.C.), s. of Lucius Æmilius Paulus, adopted by P. Cornelius Scipio Africanus, son of Scipio Africanus the elder; destroyer of Carthage and conqueror of Numantia.

SCIPIO, PUBLIUS CORNELIUS, AFRICANUS MAJOR (237–183 B.C.), great Rom. general; restored Rom. courage after defeat by Hannibal, and finally defeated Carthaginians in 2nd Punic War; dau., CORNELIA, mother of the Gracchi.

SCISSOR-BILLS, see under GULL FAMILY.

SCISSORS, see CUTLERY.

SCIUROMORPHA, a sub-order of RODENTS (*q.v.*).

SCIURUS, SQUIRRELS (*q.v.*).

SCODRA, see SCUTARI.

SCOLIIDÆ, see WASPS.

SCOLOPAX, WOODCOCK, see PLOVER FAMILY.

SCOLOPENDRA, a genus of Centipedes; see MYRIAPODA.

SCOLYTIDÆ, see under RHYNCHOPHOROUS BEETLES.

SCOMBRIDÆ, see MACKEREL.

SCONE (56° 26′ N., 3° 26′ W.), village, 2 miles from Perth, Perthshire, Scotland; place of coronation of Scottish kings.

SCOPAS (fl. IV. cent. B.C.), Gk. sculptor; worked at Athens for 25 years, and assisted with the sculptures for the *Mausoleum* at Halicarnassus in Asia Minor.

SCORESBY, WILLIAM (1789–1857), Eng. Arctic explorer and scientist; s. of whale-fisher, William S., whom he succeeded as commander of *Resolution*, 1810; pub. *Arctic Regions*, 1820; explored east coast of Greenland, 1822; retired, wrote and preached; *Magnetical Investigations* important.

SCORPION FLIES (*Mecaptera*, or *Panorpidæ*), a separate order of Insects, long included with Neuroptera. The common name arises from the tail-like segments of the body, which in *Panorpa* can be curved over the back—Scorpion-wise—and which bear a terminal pair of pincer claws. They are carnivorous insects, furnished with a long beak, long antennæ, and four long wings, slightly net-veined. The larvæ are terrestrial and caterpillar-like. Two genera are British.

SCORPIONIDÆ, see SCORPIONS.

SCORPIONS (*Scorpionidæ*, an order of *Arachnida*), carnivorous, nocturnal Arachnids, which remain concealed during the day, but issue in search of prey at night. They feed on small creatures, insects, and spiders, which are seized by their huge 'nippers' or [illegible] and stung to death by means of the poison-laden sting which terminates the 'tail'; confined to tropical and subtropical countries.

SCOT AND LOT (old law term), rates paid by certain people; only payers had parliamentary and municipal franchise.

SCOT, MICHAEL (early XII. cent.), Scot. philosopher; studied in England, France, and Italy; learnt Arabic at Toledo, and trans. Aristotle into Latin; friend of Emperor Frederick II.; famed as wizard and astrologer. *Life*, by Brown (1897).

SCOT, REGINALD (1538–99), Eng. writer; wrote *The Discoverie of Witchcraft* (1584) to disprove existence of witches.

SCOTER, see under DUCK FAMILY.

SCOTISTS, see DUNS SCOTUS and SCHOLASTICISM.

SCOTLAND.—That part of Great Britain lying N. of England, embracing Outer and Inner Hebrides and other islands off the W. coast, also Orkney and Shetland in N.; bounded by England and Solway Firth on S., Atlantic Ocean on N. and W., North Sea on E.; greatest breadth, 154 miles; greatest length, 254 miles. Coast-line is *c.* 2300 miles and AREA 29,796 sq. miles (exclusive of some 600 sq. miles of inland waters). Capital is EDINBURGH (*q.v.*).

The COAST-LINE is exceedingly irregular—especially the W. coast, which is eaten away with estuaries and sea-lochs, of which the chief are: (from N. to S.) Lochs Broom, Torridon, Linnhe, Fyne, Long, and Firth of Clyde; on the S. is Solway Firth, on the N. is Pentland Firth; E. (from N. to S.) lie the large Dornoch, Cromarty, Beauly, and Moray Firths, also Firths of Tay and Forth. The principal CAPES on the W. are Mull of Galloway (most southerly point), Mull of Cantyre and Ardnamurchan Point (most westerly headland); in N. are Cape Wrath and Duncansby Head, with Dunnet Head (farthest N.) between them; on the E. are Tarbet Ness, Kinnaird Head, Buchan Ness (most easterly point), Fife Ness, and St. Abb's Head.

The coast is also dotted with numerous ISLANDS, especially the W. coast. Stretching almost the whole length of that coast lie the Hebrides or Western Isles, divided out into Outer and Inner Hebrides—the largest being Long Island (comprising Lewis with Harris, Benbecula, and N. and S. Uist), Skye, Mull, Jura, and Islay; farther S. in Firth of Clyde lie the islands Arran and Bute (together forming county of Bute). On the E. coast the islands are small and few—the Bass Rock, Inchkeith, and Isle of May in Firth of Forth. The islands on the N. are included in two groups—the Orkney Islands (with Pomona, the largest, and 67 small islands), separated from the mainland by Pentland Firth, and (some 55 miles farther N.) Shetland—a group of 28 islands (of which Mainland is the principal) and some 70 islets; both these groups constitute separate counties.

The INTERIOR of Scotland is divided into three natural geographical divisions—the Highlands, the Central Lowlands, and the Southern Uplands; these divisions are also in accordance with the geological structure of the country. The **Highlands** is the name given to the mountainous and picturesque region to the N. and W., occupying nearly one-half of the area of Scotland. Their southern boundary is roughly a line drawn N.E. from Dumbarton to Stonehaven. They consist of a succession of more or less parallel confluent ridges, cut by longitudinal and transverse valleys, the portions thus isolated rising as separate mts. The surface is exceedingly rugged—heather moors, woodlands, stony wastes, and rugged crags and rocks, and in many parts wild and even inaccessible. In the N.W. the watershed lies very near the shore. The heights are exceedingly uniform, with an average of some 1500 ft. in height. The loftiest MOUNTAINS are: Ben Nevis (4406 ft.), in Inverness, the highest mt. in the Brit. Isles; Ben Macdhui (4296 ft.), in Aberdeen; Brairiach (4248 ft.), in Aberdeen and Inverness; Cairntoul (4241 ft.), in Aberdeen; Cairngorm (4048 ft.), in Aberdeen and Inverness; Aonach Beag (4004 ft.) and Aonach Mor (3999 ft.), in Inverness. There are 46 other peaks over 3500 ft. in height (the word *Ben* is the Gaelic for mountain). For linguistic and other reasons low-lying coastal regions of Kincardine, Aberdeen, Moray, and Banff (E. of the Grampians), flat Caithness, and Orkney and Shetland Is. are reckoned as belonging to Lowland Scotland as opposed to Gaelic-speaking Celtic Highlands.

The second division is the **Central Lowlands**, lying immediately S. of the Highlands. The general elevation of the Central Lowlands does not exceed 350 or 400 ft. They include such heights as the Sidlaw or Ochil Hills, in Perth and Forfar, the Lomonds in Fife, and the Pentland Hills near Edinburgh. The principal hills form two interrupted belts which may be called the Northern and Southern Heights, with the low tract drained by the Forth and Clyde lying between. The two highest points are Ben Clough (2352 ft.), one of the Ochils, and Tinto (2335 ft.).

The third division, the **Southern Uplands**, lies S. of a line drawn N.E.-wards across Scotland from Irvine to Dunbar; for the most part, somewhat tame and monotonous; includes the Lammermuirs (chiefly in Haddingtonshire) and to the W. the Moorfoots (with two heights over 2000 ft.); the Moffat Hills, with Broad Law (2764 ft.); the Lowthers; and then mountain-masses (with Merrick, 2764 ft.) in Galloway; and the Cheviots—a belt of hills, rising along the Eng. border.

There are, properly speaking, no mountain 'ranges' in Scotland. The mountains are caused by denudation. The harder rocks (slates, schists, etc.) of the Highland regions have resisted erosion far more than the softer rocks (sandstone, etc.) of the Lowlands. The tablelands of the Highlands and Southern Uplands are of immense antiquity, valleys having been formed in them long before the Old Red Sandstone period.

An exceedingly important feature of Scotland is its VALLEYS, which run, generally, N.E. and S.W. longitudinally, and which have their trend defined by geo-

logical structure. The largest valley or geological fracture is the Great Glen (or Glen More) stretching from Loch Linnhe to Inverness. Other valleys are those of the Garry and Tay, in the S.E. Highlands; also the valleys of the Forth in S.E. and the Clyde in S.W., and many other glens and *straths* (Gaelic for a broad valley).

The principal RIVERS are the Tay (119¾ miles in length), flowing through Fife and Forfar, and for scenery one of the most beautiful valleys in Scotland; spanned at mouth by Tay Bridge (2 miles long); the Forth, farther S. (116½ miles long and tidal as far as Stirling, over 52 miles), with wide estuary crossed by stupendous steel cantilever bridge; the Clyde in S.W. (106 miles long, with Glasgow 14 miles from its mouth); the romantic Tweed (97 miles); the swift Spey, in the N. (110 miles); the Dee (87 miles), Don (82 miles), the Nith (over 70 miles), and the picturesque river Findhorn (62¼ miles).

The largest inland LOCHS include the famous and beautiful Loch Lomond (17,420 acres in area), situated in Stirling and Dumbarton; Loch Ness (12,355 acres in area, mean depth of 433 ft., and with the greatest volume), in Inverness; Loch Awe, in Argyll; and Lochs Shin, Maree, Tay, Arkhaig, Shiel, Lochy, Earn, Leven, Katrine, St. Mary's Loch, and (the deepest loch in the Brit. Isles) Loch Morar, with a maximum depth of 1017 ft.

Only about 5% of Scotland is covered with FOREST; the best-wooded shires are Aberdeen, Inverness, and Perth—Scots firs predominating. Animals and plants are mostly the same as those found in England; the wild cat may yet be seen in the Highlands, and also, occasionally, the golden and white-tailed eagle. Deer forests and grouse moors occupy many acres.

The **Climate** of Scotland is healthy, the temperature hovering for the greatest part of the year at about 50° or 60°. The prevailing wind is S.W., from which direction it blows very much oftener than from N.E., except in spring. This S.W. wind, and oceanic currents to N.E. resulting therefrom, give Scotland a much higher temperature than is due to its position on the globe. This is especially felt in winter, when the coast escapes many severe frosts experienced inland. Owing to the position of the mts. the climate on W. coast is wet, and on E. dry.

HISTORY.

The history of Scotland begins with the invasion of AGRICOLA (80 A.D.). The departure of the Romans from Britain again plunges the history of Scotland into obscurity till the close of the VI. cent. At that period the PICTS dwelt N. of the Firths of Forth and Clyde, the SCOTS from Ireland occupied *Dalriada* (Argyllshire), the Brit. kingdom of *Strathclyde* stretched southwards from Dumbarton, and the Anglian kingdom of *Bernicia* from the Forth to the Tees. Christianity was the main unifying force. The Scots were already Christians. ST. COLUMBA converted the Picts (*c.* 565), ST. MUNGO the Britons, and ST. CUTHBERT the Angles of Lothian, between the Forth and the Tweed.

The second impulse towards unity was furnished by the aggression, first of Northumbria, and later of the Northmen, who eventually settled in the N. and the Western Isles. In 844 KENNETH MACALPIN, king of Scots, became ruler of the Picts and Scots. His successors strove to extend their territory southwards. In 1018 MALCOLM II. (1005–34) by his victory at *Carham* acquired Lothian, and in the same year his grand-

son succeeded to the throne of Strathclyde. Thenceforward Strathclyde belonged to the Scot. Crown, though the southern part (Cumbria) was conquered by England in 1092.

Under MALCOLM III. (1057–93) Scotland was influenced by the Norman Conquest of England. Refugees from Northumbria rendered the Teutonic element in the Lowlands preponderant. Malcolm's marriage with the fugitive Eng. princess, MARGARET, began a process whereby the Scot. monarchy became detached from Celtic, and identified with Teutonic interests. This policy was furthered by Margaret's reform of the Celtic Church, and continued by her sons EDGAR (1097–1107), ALEXANDER I. (1107–24), and DAVID I. (1124–53). Under David, feudalism took root in Scotland. Norman officials, laws, and customs were introduced, and towns multiplied. Bishoprics were increased, parishes erected and tithes enforced. Celtic monastic bodies were expelled, and lavishly endowed abbeys were founded. David made good his claim to Northumberland, but his grandson, MALCOLM IV. (1153–65), was forced to surrender it. In an attempt to regain it, WILLIAM THE LION (1165–1214) was captured at Alnwick, and forced by the Treaty of Falaise (1174) to acknowledge Henry II. as his feudal superior; but he redeemed his independence from Richard I., and down to 1290 relations between the two countries remained friendly. The feudal organisation of Church and State became fully developed, and the Scot. monarchs were able to consolidate their kingdom. ALEXANDER II. (1214–49) reduced Argyll, and ALEXANDER III. (1249–86) recovered the Western Isles by the battle of *Largs* (1263).

On the death of the MAID OF NORWAY (1290), heiress of Alexander III., the succession was disputed. Edward I. of England decided in favour of BALLIOL (1292–96), all the claimants having acknowledged Scotland a fief of England. Edward, by exacting his feudal rights, provoked the Scots to resistance. WALLACE for a time maintained the struggle for independence, and finally under BRUCE (1306–29) it was won at *Bannockburn* (June 24, 1314), and recognised by the Treaty of Northampton (1328). In Bruce's reign the Scot. Estates, consisting of prelates, barons, and burghs, met for the first time. England's absorption in the Hundred Years War secured Scot. independence during the reign of DAVID II. (1329–71).

The accession of ROBERT II. (1371–90), the High Steward, son of Bruce's dau., begins the *House of Stewart*. His reign initiates the struggle between the Crown and the Barons, rendered too powerful by large grants of land by Bruce. At the death of ROBERT III. (1390–1406) the land was ruled by his bro., the Duke of Albany, James, Robert's s. and heir, having been captured by the English. JAMES I. (1424–37), on his return, overthrew the house of Albany, and repressed the barons by drastic punishments and forfeitures. These arbitrary measures led to the murder of the poet king. JAMES II. (1437–60) crushed the Douglases. JAMES III. (1460–88), in whose reign the Orkney and Shetland Islands were acquired, surrounded himself with unworthy favourites, and was defeated and killed at Sauchieburn. Under JAMES IV. (1488–1513) justice was reformed, commerce increased, a navy was built, and the introduction of printing and the rise of a Scot. lit. signalised the intellectual expansion of the country. In 1503 James married Margaret, dau. of Henry VII., but in the contemporary international struggles, James, true to the Auld Alliance dating from 1295, sided with France. This led to the battle of *Flodden*, where James and most of the nobility were slain. With the aid of the clergy JAMES V. (1513–42) maintained the Franco-Scot. alliance. The rout of the Scots at *Solway Moss* caused his death a few weeks later.

The reign of his dau., MARY STEWART (1542–67), is marked by the triumph of the REFORMATION. Scot. Protestants, owing to their Eng. sympathies, were at first deemed unpatriotic, and for a time the clerical Fr. party retained the ascendancy. Scotland tended to become an appanage of the Fr. crown, especially after the marriage of Mary with the Dauphin. Dread of Fr. domination swelled the ranks of the Protestants, who, aided by Elizabeth of England, were assured of victory by the Treaty of Edinburgh (1560). The religious revolution was accomplished in the same year. A confession of faith drawn up by KNOX and his colleagues was ratified by Parliament, and all connection with Rome severed. When Mary returned from France (1561) she was obliged to accept the situation. Her marriage with Bothwell, the reputed murderer of her second husband, Darnley, ruined her schemes for restoring Catholicism. She was imprisoned and forced to abdicate in favour of her infant s., JAMES VI. (1567–1625). Although she escaped, her adherents were defeated at *Langside* (1568), and she fled to England.

When James began his personal government Protestantism was the established religion. For the next hundred years the struggle lies between the Kirk and the Crown. In 1592 James, unable to control the nobles, sanctioned an Act confirming Presbyterianism. By 1600, however, the barons, enriched by crown grants of church lands, had sided with the monarchy, the power of the kirk had been checked, and three bp's had been appointed by the king, who regarded Episcopacy as more compatible with the royal prerogative. His accession to the throne of England (1603), through descent from Margaret, wife of James IV., increased his prestige, and before his death he had established Episcopacy. CHARLES I. (1625–49) estranged the baronage by the Act of Revocation annexing all crown and church lands alienated since 1542, and his attempts to impose an Eng. Service Book on the kirk roused an opposition which found expression in the National Covenant (1638). By the Bishops' War, Charles was forced to concede the demands of the Covenanters, and Episcopacy was abolished. In the Civil War the Scots, doubtful of the king's sincerity, joined the Parliamentarians by the Solemn League and Covenant (1643). Scot. hopes of establishing Presbyterianism in England were frustrated by the rise of the Independents, and mutual distrust ensued. Charles's partisans were thus enabled to raise a Scot. army in his support, but it was cut to pieces at *Preston* (1648) by Cromwell, who came to an understanding with the Covenanters. The execution of Charles dissolved this compact. After MONTROSE'S unsuccessful efforts on his behalf, Charles II. signed the Covenant and arrived in Scotland, but the defeat of the Scots at *Dunbar* (1650) and *Worcester* (1651) placed Scotland for nine years under the domination of the Protectorate and Commonwealth.

The Restoration was enthusiastically welcomed in Scotland. The nobles now supported the Crown, and Episcopacy was restored. The Covenanters refused to conform, and the history of the reigns of CHARLES II. (1660–85) and JAMES VII. (1685–88) is mainly concerned with their attempts to subdue the recusants. Administrative severities led to the Pentland Rising (1666), *Drumclog* (1679), and *Bothwell Bridge* (1679). A remnant held out against all 'Indulgences,' and were subjected to the cruelties of the *Killing Time*. Both Presbyterians and Episcopalians alike resisted James's attempts to restore Catholicism, and the flight of James found Scotland ripe for revolution. The Estates declared the crown forfeited, and offered it to William of Orange and his wife, Mary. Presbyterianism was re-established, and the Estates secured legislative independence by the abolition of the Lords of the Articles, a committee which had rendered Parliament an instrument of the royal will.

Ecclesiastical disputes having been settled, the nation became absorbed in commerce. The Darien Scheme evoked national enthusiasm. Its failure was ascribed to WILLIAM and the Eng. Parliament, and the disaster convinced statesmen that two independent legislatures under one Crown were impossible in view of foreign relations. Under ANNE (1702–14) the two

Parliaments were joined (1707), free trade being established between the two kingdoms. The consequent commercial prosperity during the next fifty years silenced Scot. objections to the UNION, and rendered abortive the Jacobite Risings of 1715 and 1745. From 1750 to 1800 industrial development coincided with an intellectual revival during which Scotsmen made important contributions to lit. and science. Since the Reform Bill (1832), Scotland, while preserving its own church, law, and educational systems, has become more closely assimilated to England, and Scotsmen have played an active part in the development of the Brit. Empire.

Hume Brown, *History of Scotland to the Present Time* 1911; also histories by Hill Burton, Mackintosh (1890), Andrew Lang (1900), Rait (1911), Macmillan (1911); Thomson, *Scotland's Work and Worth* (1910).

Products.—The staple CROPS grown in Scotland are, in order of importance, oats, barley, wheat, beans, rye. The total area under crops and grass is 4,845,835 acres; area of arable land, 3,348,568 acres, chief shires being Aberdeen, Forfar, and Kincardineshire; permanent grass, 1,497,267 acres; total corn crop, 1,218,055 acres, the principal shires being Aberdeen, Forfar, Perth, and Fife. As regards LIVE STOCK, the total number of cattle (in 1911) was 1,200,017, the chief shires being Aberdeen and Ayrshire; total number of horses, 206,474, including Shetland ponies and Clydesdale draught horses; of sheep, 7,164,342, notably Shetland, Highland blackfaced, and Cheviot breeds; of pigs, 171,115.

The principal MINERALS are coal, iron, shale, sandstone, granite, lead, etc., but especially coal and iron. The chief coal-fields are in Lanark and Fife, Ayr, Stirling, Midlothian, and Linlithgow. Iron is also found in these counties as well as in Renfrew and Dumbarton. Shale abounds in Linlithgow and Midlothian. Lead is found in the Lead Hills and elsewhere. Granite is extensively quarried—especially in Aberdeen. Limestone is also general, but is most abundant in Midlothian and Fife. Sandstone and freestone are quarried in nearly all parts of the country, and notably in Lanark, Dumfries, Ayr, and Forfarshire. Alumina is treated at works near Foyers in Inverness-shire. Vast numbers of people are employed in coal, iron, and shale mining; also in connection with the working of other metals and in quarrying operations.

Manufactures and Industries.—All great iron and steel foundries and engineering works are in close proximity to coal-fields and shipbuilding yards. Iron and steel goods and machinery are manufactured in Glasgow, Falkirk, and surrounding districts. Iron and steel shipbuilding—an industry of the greatest importance in Scotland—is carried on mainly on the Clyde (Glasgow, Renfrew, Clydebank, Dumbarton, Port-Glasgow, Greenock, etc.); there are also shipbuilding yards at Leith, Aberdeen, and Dundee. There are paraffin works in Bathgate neighbourhood. The manufacturing of cloth forms another extensive and important industry; tweeds are made in Tweed district—Galashiels, Hawick, Innerleithen, and Selkirk—and in various other towns, such as Aberdeen, Elgin, Inverness, etc.; tartans are mostly manufactured at Tillicoultry, Bannockburn, and Kilmarnock. Kilmarnock was the original producer of carpets, now also manufactured at Aberdeen, Ayr, Bannockburn, Glasgow, Paisley. Glasgow and Paisley and neighbouring towns are centres for cotton factories and seats of silk manufacture. An important Border manufacture is hosiery—the principal town being Hawick.

Other industrial centres are Dundee, for jute and hemp; Kirkcaldy, for linoleums and floorcloths; Alloa, for fingering and other woollens; Forfar, Perth, and Fife and Aberdeen, for linen; Dunfermline, for finer linen; Dundee, for coarser fabrics; Paisley, for sewing threads. Lanark and Renfrew are in the front rank in the cotton industry. Greenock is the chief seat for the refining of sugar. Preserves and confectionery are manufactured in Dundee, Aberdeen, Paisley, and Edinburgh. Glasgow is the centre for the production of chemicals. Paper, stationery, and printing are also important industries. Midlothian is the leading paper-producing county; stationery is manufactured at Glasgow; Edinburgh is famous for its printing. Brewing and distilling are valuable industries, although they do not give employment on any great scale; the foremost distilling counties are Argyll, Banff, Elgin, Inverness, Aberdeen, and Ross and Cromarty, and many others; a very large proportion of distilleries in the U.K. are in Scotland; the principal breweries are situated in Edinburgh neighbourhood.

The FISHING industry of Scotland is exceedingly extensive and important, and gives considerable employment; the seaboard is divided into 27 fishing districts, the most prolific being Shetland (N.), Fraserburgh, Peterhead, Aberdeen, Wick, and Anstruther (E.), and Stornoway (W.). Herring are caught off E., N., and W. coasts, as well as large quantities of haddock, whiting, sole, etc. There are also valuable coast and river salmon fishings. A few ships still go from Dundee to the Arctic Ocean for whale and seal fishing.

Shipping and Communications.—The principal PORTS in Scotland are Glasgow, Greenock, Leith, Grangemouth, Dundee, Methil, and Burntisland; much importation, however, is transacted through London. The chief imports are grain, raw fibres (flax, cotton, jute, hemp), timber, and tropical products such as tea, sugar, etc.; the exports include manufactured goods, coal, pig-iron, fish, live stock, granite, paving-stones.

The ROADS in Scotland are excellent, well-engineered, and with good general surface, although remarkably hilly. The RAILWAYS are also good; the principal companies are the *Caledonian*, the *North British*, the *Glasgow and South-Western*, the *Highland*, and *Great North of Scotland*. There are several CANALS, of which the chief are the Caledonian, stretching N.E. slantwise from Fort William to Inverness, and, like the Forth and Clyde Canal, uniting the North Sea and Atlantic Ocean; the Crinan Canal, which joins Loch Fyne and Jura Sound; and the Union Canal, which connects Edinburgh and Glasgow.

Religion.—The bulk of the population is Presbyterian a form of Church government accepted by the Established Church of Scotland, the United Free and Free Churches—all the clergy being equal. There are 84 presbyteries grouped into 16 synods; a General Assembly—attended by over 700 members—is held in Edinburgh annually. Roman Catholicism has a holding, especially in the Highlands; and there is also the Episcopal Church in Scotland.

Education.—There are four univ's—St. Andrews, Glasgow, Aberdeen, Edinburgh (see UNIVERSITIES). Elementary education is compulsory between 5 and 14. There are over 3000 public schools and several hundred denominational and private schools. The School Board system is in force. Attendance figures are remarkably high, and Scotland enjoys an enviable reputation for the standard and widespread distribution of its education (see EDUCATION).

About 200,000 persons speak Gaelic as well as English, and several thousands (a dwindling number) Gaelic only.

Government.—Scotland is represented by 16 peers in the House of Lords and 72 members in the House of Commons. The management of Scot. business is under the charge of the Sec. for Scotland. At the Anglo-Scottish Union (1707) Scotland retained many institutions of its own, and its old system of LAW, which, however, has gradually approximated to Eng. Law. The Supreme Court in civil cases is the Court of Session—with 13 judges, acting in an Inner and an Outer House; the Inner, with two divisions of 4 judges each, and the Outer with 5 judges, called Lords Ordinary and sitting in separate courts; appeals may be made from the Lords Ordinary to either

division of the Inner House, and decision is held as decision of Court of Session, from which appeals may be made only to the House of Lords. A High Court of Justiciary sits at Edinburgh, and is formed by the lord justice general, the lord justice clerk, and the other judges of the Court of Session. Circuit Courts meet in various towns throughout the country. Another court with criminal jurisdiction is the Sheriff's Court. The principal law officer for the Crown is the Lord Advocate, who is assisted by a Solicitor-General and Advocates Depute. Practical administration of law is under the control of Sheriff-Depute. The public prosecutor for counties is called the procurator-fiscal.

For LOCAL GOVERNMENT purposes Scotland is divided into 33 shires (or counties), viz.—Aberdeen, Argyll, Ayr, Banff, Berwick, Bute, Caithness, Clackmannan, Dumbarton, Dumfries, Edinburgh, Elgin (or Moray), Fife, Forfar, Haddington, Inverness, Kincardine, Kinross, Kirkcudbright, Lanark, Linlithgow, Nairn, Orkney, Peebles, Perth, Renfrew, Ross and Cromarty, Roxburgh, Selkirk, Shetland, Stirling, Sutherland, Wigtown. The cities of Edinburgh, Glasgow, Aberdeen, Dundee, are each a county of a city.

Scenery, Historic, and Literary Attractions.—Scotland is exceedingly popular as a holiday resort, and the Highlands afford splendid shooting, deer-stalking, fishing, etc., to a great number of summer and autumn visitors from England and abroad. The Royal Family resides at Balmoral when in the Scot. Highlands. Scotland also affords much interesting country for the tourist—the wild and picturesque Highlands, the romantic vale of the Trossachs, the Scott country in the Borders, Burns's country in Ayrshire. There are many ancient battlefields and ruined castles to attract the historian and much to interest the antiquary, including among other things a circle of standing stones in Orkney, and several ancient cathedrals, of which four have been restored or are in use—St. Mungo's, Glasgow; St. Machar's, Aberdeen; St. Magnus, Kirkwall (Orkney); St. Giles, Edinburgh, was erected as a collegiate church and became a cathedral in the XVII. cent. for a short time.

Groome, *Ordnance Gazetteer of Scotland* (1901); Geikie (Sir Arch.), *Scenery of Scotland viewed in connection with Physical Geology* (1901); Atkinson, *Local Government in Scotland* (1904); Dron, *The Coal-fields of Scotland* (1902); Murray's Handbook *Scotland* (1906); Henderson and Watt, *Scotland of To-day* (1907); Palmer and Moncrieff, *Bonnie Scotland* (1904); Eyre Todd, *Scotland, Picturesque and Traditional* (1906); Lauder, *Scottish Rivers* (1874); Dean Ramsay, *Reminiscences of Scottish Life and Character*; Census (1911) Bluebook.

Population.—Census of 1911: male, 2,307,603; female, 2,451,842—total for Scotland, 4,759,445. In 1707 (estimated), 1,050,000; census pop., 1811, 1,805,864; in 1861, 3,062,294; in 1901, 4,472,103.

Scotland, Church of, is Presbyterian, as have remained the offshoots from it. This type of Church government seems to be essentially Scottish; it has never flourished to the same extent elsewhere. It dates from the Reformation, and the Scot. Church was modelled on that of GENEVA, with CALVINISM as its doctrine. In 1557 the attack on Roman Catholicism was begun, and the first Covenant signed; and in 1560 the First Book of Discipline was published, which cleared all Catholic observances and laid great emphasis on preaching the Word. The Church was at first under the leadership of KNOX.

In 1578 appeared the Second Book of Discipline; the moderate episcopacy which existed was abolished, and PRESBYTERIANISM established. James I. tried to introduce Eng. ecclesiasticism into Scotland, episcopacy was reintroduced, 1592, but opposition was provoked by the Articles of Perth, drawn up in 1618, which commanded the observance of Christmas and Easter, kneeling, communion, etc. Charles I. did little at first, but in 1636 a liturgy was ordered. When this was read in St. Giles's, Edinburgh, in July 1637, an uproar, in which JENNY GEDDES figured, was provoked. In 1638 the NATIONAL COVENANT was drawn up, in which the nation bound itself to defend Presbyterianism, and the Articles of Perth and liturgy were abolished. Presbyterianism was now dominant in Scotland, and was also beginning to affect England, and in 1643 a SOLEMN LEAGUE AND COVENANT was entered into by the two countries, and a Confession was drawn up by the Westminster Assembly and accepted by Scotland too.

The Restoration produced the inevitable reaction, and the COVENANTERS were bitterly persecuted. With the accession of William and Mary persecution was at an end, and the Presbyterian Scot. Church once more on a safe footing. The House of Hanover was Protestant, hence Presbyterians were more favoured than Episcopalians.

A standing difficulty in the Church was the existence of lay patronage; unsuitable men were appointed to livings, and those of the parishioners who refused to recognise them founded meeting-houses. Hence a large number of dissenting chapels were founded in the XVIII. cent. The Secession Church formed by Ebenezer Erskine (*q.v.*), deposed in 1733, was the nucleus of the UNITED PRESBYTERIAN CHURCH. In the Highlands the churches were very poor, and much was done to strengthen them. At the end of the XVIII. cent. there came an evangelic revival and reaction against the 'Moderate' party. In 1843 took place the DISRUPTION and founding of the FREE CHURCH OF SCOTLAND, when 451 out of 1203 ministers went out. Patronage was abolished in 1874, and in the XIX. cent. the Church has improved its services with music, liturgy, etc., to which at first there was considerable opposition. Modern developments are a Disestablishment movement, and more recently negotiations for Union of the Presbyterian Churches in Scotland. In theology the Scot. Church has produced religious philosophers rather than Biblical critics.

Cunningham, *History of the Church of Scotland.*

Scotland, Episcopal Church in, the 'Church of England in Scotland'; but though in communion, the two are separate in organisation. Scot. bishops were consecrated in 1661, but Episcopalianism never predominated, and after the Revolution not immediately tolerated.

SCOTS FIR, see FIR, PINE.

SCOTS GUARDS, see GUARDS, THE.

SCOTS, MIDDLE, a purely artificial literary language used by Scot. poets from Barbour to Lyndsay; called by users 'Inglis' as opposed to Gaelic ('Scots').

SCOTT, DAVID (1806–49), Scot. artist; hist. pictures include *Queen Elizabeth at the Globe Theatre.*

SCOTT, ROBERT (1811–87), master of Balliol Coll., Oxford, 1854; dean of Rochester, 1870; famous for Gk. Lexicon he compiled together with Liddell.

SCOTT, ROBERT FALCON (1868–1912), see POLAR REGIONS.

SCOTT, SIR GEORGE GILBERT (1811–78), architect, a leading spirit in the Gothic revival; built or restored a vast number of cathedrals, abbeys, and churches; buried in Westminster Abbey.

SCOTT, SIR WALTER (1771–1832), Scot. novelist, poet, and man of letters; b. Edinburgh (Aug. 15); s. of Walter Scott, W.S.; sickly as a child, but later an active man, though lame; ed. Edinburgh High School and Univ., studying for Bar. Poetry and Romance, however, fascinated him early. His first literary work consisted in translating Goethe, Bürger, and other Ger. poets and collecting Scot. ballads (*Minstrelsy of the Scottish Border*, 1802). In 1797 he married Charlotte Charpentier (d. 1826), a Fr. refugee's dau.; app. sheriff-depute of Selkirkshire, 1799; lived at Ashestiel, 1804–12; removed to Abbotsford (*q.v.*), 1812. The *Lay of the Last Minstrel* (1805), followed by *Marmion* (1808), *Lady of the Lake* (1810), *Rokeby* (1813), *Lord of the Isles* (1815), etc., placed S. in the front rank of narrative poets.

Finding his place in popular favour threatened by

Byron, S. now turned to prose romance and published *Waverley* anonymously (1814). Other 'Waverley Novels' appeared with phenomenal success in quick succession, some being grouped as 'Tales of My Landlord': *Guy Mannering* (1815, written in six weeks), *Antiquary*, *Old Mortality*, *Black Dwarf* (1816), *Rob Roy* (1817), *Heart of Midlothian* (1818), *Bride of Lammermoor*, *Legend of Montrose*, *Ivanhoe* (1819), *Monastery*, *Abbot* (1820), *Kenilworth* (1821), *Pirate*, *Fortunes of Nigel*, *Peveril of the Peak* (1822), *Quentin Durward* (1823), *St. Ronan's Well*, *Redgauntlet* (1824), *Talisman*, *The Betrothed* (1825), *Woodstock* (1826), *Fair Maid of Perth* (1828), *Anne of Geierstein* (1829), *Count Robert of Paris*, *Castle Dangerous* (1831). Other works include *Life of Napoleon* (1827), *History of Scotland* (1830), *Tales of a Grandfather* (1828–31), editions of Dryden, Swift, etc., a *Journal* (1825–32: pub. 1890), and *Familiar Letters* (pub. 1894). In 1825 the failure of his printers and publishers, Ballantyne and Constable, involved S. as partner in debt amounting to *c.* £120,000, most of which he cleared ere his death (through overwork) on Sep. 21, 1832. He was buried at Dryburgh Abbey (*q.v.*).

His courageous, generous, healthy, genial character endeared S. to friends and fellow-countrymen; his works, especially his novels, won him lasting world-wide fame. 'He created the historical novel,' says Saintsbury. S. was an indefatigable and extraordinarily rapid writer, with an inexhaustible gift for character-drawing and wonderful narrative powers; his style is easy and careless, his plots diffuse. His master-pen vivified scenes, outdoor and indoor, Highland and Lowland, characters heroic and lowly, humorous and pathetic, History and Romance, Middle Ages and Modern Times. He exalted and purified the Novel. He made Scotland known throughout the world.

Many biographies (Hutton, Lang, Saintsbury, etc.) and editions. Standard *Life*, by Scott's son-in-law, Lockhart (*q.v.*); Husband, *Concordance of Waverley Novels*.

SCOTT, WILLIAM, see STOWELL.

SCOTT, WILLIAM BELL (1811–90), Scot. artist and poet; painted series illustrating *King's Quair* on Penkill Hall staircase; wrote *Hades, an Ode* (1846), *Poems of a Painter* (1854), *Autobiography* (ed. 1892).

SCOTT, WINFIELD (1786–1866), Amer. soldier; captured Fort Erie, commanded at *Chippewa* and *Lundy's Lane*, 1814; commander-in-chief, 1841; captured Vera Cruz, and took Mexico, 1847; military treatises still used in U.S.A. army.

SCRANTON (41° 22′ N., 75° 46′ W.), city, on Lackawanna; capital, Lackawanna County, Pennsylvania, U.S.A.; coal region; silk fabrics; iron-ware. Pop. (1910) 129,867.

SCREAMERS (*Palamedeidæ*), a family of Aquatic Birds with spurs on the wings; found in forest regions of S. America. The CHAJA or CRESTED S. is domesticated and trained to herd flocks of geese.

SCREW, a cone or cylinder of wood or metal having a spiral ridge (*thread*) running round it so as to form a uniform spiral groove. The distance apart of the turns of the thread is called the *pitch*. An external s. is a *male* s., an internal one (as in a nut), a *female* s. The s. is a modified form of the inclined plane, and may be called a mechanism for transforming rotatory motion into translatory motion, or *vice versa*. For this purpose two elements are required, a s., as ordinarily so called, and a nut, the spiral ridge of the former corresponding with the groove inside the latter. Then, if either element be fixed, the other will move forwards or backwards according to the direction in which it is rotated round the common axis. The most important application of the s. lies in the production of great pressure, as in the *screw-press* and *screw-jack*. It is also largely used for boring purposes, *e.g.* gimlet, augur, corkscrew, and common *screw-nail*. The fact that the distance traversed in one rotation may be varied through a wide range by altering the distance between the threads makes the s. of particular value in obtaining the delicate adjustments required in micrometers, microscopes, etc. The principle is also employed in the *screw propeller*. At one time there was no uniformity in s's, and those of one maker did not fit those of another. Chiefly owing to the efforts of Sir Joseph Whitworth, s. threads are now made to certain standards, identical all over the world.

SCREW PINE (*Pandanus*), genus of tropical plants, order Pandanaceæ, having aerial roots.

SCRIBE, AUGUSTIN EUGÈNE (1791–1861), Fr. playwright; wrote (with collaborators) about 400 plays of all kinds; little style and power of observation. Best-known works, *Bertrand et Raton*, *Adrienne Lecouvreur*, and *Bataille de Dames*, also libretto of *Les Huguenots*, *Le Prophète*, *L'Africaine*, and other operas.

SCRIBES, originally military tax-gatherers among the Jews, but subsequently copyists of the law and in New Testament times exegetists of the law. Some rose to important positions in the Temple, or made a livelihood by copying out the law and drawing up legal documents. They were for the most part Pharisees, holding to the letter of the law and impatient of foreign influence. Christ condemns their hypocrisy.

SCROFULA, term formerly applied to tuberculosis (*q.v.*), specially of lymphatic glands and of bones; *king's evil* (q.v.), old popular name for same condition.

SCROGGS, SIR WILLIAM (*c.* 1623–83), Eng. lord chief justice; s. of butcher; of extraordinary coarseness and corruption; presided at trial of persons denounced by Titus Oates; impeached for illegally discharging grand jury, 1681, but saved by king.

SCROPES OF BOLTON.—Sir Henry le Scrope (d. 1336), Eng. judge; Chief Justice of King's Bench, 1317–23; Chief Baron of Exchequer, 1330–36.—His bro., **Sir Geoffrey le Scrope** (d. 1340), was Chief Justice of King's Bench, 1324–27, 1328–38.—Sir Henry's s., **Richard le Scrope, 1st Baron** (*c.* 1326–1403), distinguished himself in Fr. and Scot. wars; Lord Treasurer, 1371; Lord Chancellor, 1378. WILLIAM, his c. s., was created Earl of Wiltshire (*q.v.*).—**Henry le Scrope, 9th Baron** (1534–92), was warden of West Marshes, 1562–92; Keeper of Queen of Scots, 1568; put down Rising of the North, 1569.

SCROPES OF MASHAM.—Richard le Scrope (*c.* 1350–1405), s. of 1st Lord Scrope of Masham; abp. of York (1398); shared in Revolution, 1399, and Percy revolt; surrendered at *Shipton Moor*; executed.—**Henry, 3rd Baron** (*c.* 1374–1415), Lord Treasurer, 1409; executed for treason.

SCROPHULARIACEÆ, herbaceous dicotyledons, including many familiar forms such as foxglove, snapdragon, speedwell, and calceolaria. Many are semi-parasites deriving nourishment from the roots of other plants (*e.g.* Euphrasia, Rhivanthus). The flower is pentamerous and usually zygomorphic, with from two to four stamens and a bilocular ovary with an immense placenta. Verbascum is exceptional in having an actinomorphic flower with five stamens.

SCROTUM, see REPRODUCTIVE SYSTEM.

SCRUB-BIRDS (*Atrichornithidæ*), a family of two small Perching Birds (*Atrichornis*) found only in Australia. They live in dense undergrowth or in grassy places, and are excellent mimics.

SCUDÉRY, MADELEINE DE (1607–1701), Fr. *précieuse* novelist; author of *Artamène, ou le Grand Cyrus* (1649–53), in 10 vol's, and *Clélie* (1656), in 10 vol's, much admired in their time; depicted contemporary Fr. society; wrote under the name of her bro., GEORGES DE SCUDÉRY (1601–67), writer of a forgotten epic and plays.

SCULPTURE, the most enduring medium of art, has always served as a faithful and a lasting record of the lives of nations. At even so remote a time as the early Egyptian dynasties s. had attained to an excellence remarkable. Though their implements were of flint, or of metal no harder than bronze, the

technical proficiency of the Egyptians was truly marvellous and their works gigantic.

Egypt.—Though we have no proof that the great *Sphinx* at Gizeh is the oldest example of s. extant, it has been considered as such, and it is undoubtedly the most ancient of colossal figures, and, beyond dispute, it is the largest in the world. Egypt, the cradle of the art, is strewn from end to end with the sculptured fragments of 6000 years, from the 1st dynasty, about 4777 B.C., up to the Middle Ages. Until the close of the XVIII. dynasty, about 1300 B.C., Egyptian s. had, like the country's civilisation, developed and declined, reviving with renewed vitality from time to time; but from this point the few short periods of renaissance that she enjoyed were stimulated by the administration of some foreign power.

This period of decline was brought to a close by Cambyses, who conquered Egypt in 525 B.C., and s. developed under PERSIAN influence until the entry of Alexander the Great two cent's later. The vigorous character of the Persians came as a revivifying element into the life of the nation. Through the preceding 4000 years, though suffering defeat and change of rulers, the Egyptian had proved adamant to the newcomers' influence in his arts, the defeated absorbing the conquerors and retaining their own art, but little modified. But to the overbearing Persian, Egyptian custom, for the first time in her history, bowed; the dominating character subdued the weaker and forced upon the decadent nation's art her own traditions.

With Alexander's conquest in 332 B.C. followed a GRÆCO-EGYPTIAN period, during which the influence of the Greeks is strongly marked. In particular this is so in the introduction of the naturally modelled eyes and mouth of their statues in place of the flat representations that characterised the traditional Egyptian work. This period, which is covered by the reign of Alexander and the dynasty founded by Ptolemy I., one of his leaders, terminated at the coming of Julius Cæsar in 48 B.C. and the importation of Roman ideas. At the death of Cleopatra VI., last of the Ptolemaic dynasty, in 30 B.C., Egypt was given over entirely to Roman administration, and its s., so far as it had been a world-wide influence, died, and for the succeeding seven hundred years the Græco-Roman and Byzantine took its place.

During the rule of Nero, 54–68 A.D., CHRISTIANITY became a new influence, and, with the subsequent growth of the religion and of monasticism, s. was enriched with forms and emblems pertaining to the new faith. This fusion continued until the close of the Roman Empire in Egypt and the Arab invasion of 639 A.D. With the withdrawal of the Romans in 642 and the establishment of the Saracens, s. practically ceased to exist. The coinage and metal-work for weapons and utilitarian purposes, which alone represented the art, were purely Saracenic, and as far as s. is concerned little interest attaches to these conditions, which continued to the Middle Ages and remain practically unchanged to-day.

Greece.—The Asiatic nations that occupied the countries watered by the Tigris and the Euphrates, and which were contemporary with dynastic Egypt, are so intimately allied that it would be difficult to discriminate between Babylonian and Chaldæan art, Assyrian, or Persian; nor is it necessary to do so, in a general survey of the history of s. Hence the work of China also and of India may be passed over together with the Jap. and Buddhist, for only in a limited measure are their effects felt in Western styles. What Asiatic or Egyptian influences can be detected in subsequent European s. have been transmitted through the Greeks.

The earliest records of Gk. s., which may be considered in the least reliable, refer to the works of a group of sculptors for whom may stand the names of DIPŒNUS and SCYLLIS, who came from Crete and settled on the Gulf of Corinth. The works of these men and their immediate followers in Corinth, Sparta, and Ægina, in Samos, Chios, and in Athens, were but attempts to make more lifelike the rude forms till then employed, by disengaging the limbs from the mass of the figure, an advance that was astonishing to those accustomed to a figure in one mass with limbs close joined to its sides.

These early sculptors advanced the art during the VI. and following cent's before Christ, working in wood, ivory, and gold. Fine marble was quarried in Chios and other spots, and this also served as the material for the sculptors. There is a legend that tells how, at this time, clay was first used by BUTADESA, sculptor of Corinth, in Greece for modelling, and tradition immortalises the names of RHŒCUS and THEODORUS, sculptors of Samos, in crediting them with the invention of bronze-casting.

As in all countries and in every age, art is affected by the three great factors, religion, climate, and materials at command, so was the s. of the Greeks confined almost entirely to figure-work representing their gods, their ideals, and their heroes, and as fresh marble districts were explored, so did the use of this material become more general. With ever-growing energy and refinement, s. emerged from the archaic period, and, with the impetus lent by the enthusiasm of Olympian games, it was advanced by PYTHAGORUS, CALAMIS, and MYRON at the close of the VI. cent. B.C., which at its death gave birth to PHEIDIAS and the finest period of s. the world has known. Pheidias was born at Athens about 500 B.C. This was ten years before the victory of *Marathon*, a circumstance that should be well remembered in view of the strenuous life of the Gk. nation at this time. That the best period of s. should coincide with that in which Greece reached the zenith of her greatness is not surprising. Hardship was present in the form of the attacking Persians, and at their final overthrow in 480 B.C., Athens, the greatest of Gk. cities, was left endowed with the energy and culture that produced the *Parthenon*. Argos, the school of the athletic type, produced the sculptor POLYCLEITUS, who reached his prime about the year 440 B.C., and in the following cent. s. was further enriched by the works of PRAXITELES and SCOPAS, by LYSIPPUS, the naturalistic sculptor, and DEMETRIUS.

Here began the decadence. With Alexander came the Hellenistic Age, which may be counted from 330 B.C. to 100 B.C., and which brought the art of Greece into contact with that of the East. It is amazing that two of the finest sculptured works of man should be produced in an age of decadence such as the II. cent. B.C. Yet to this period is ascribed the magnificent *Venus of Milo*, and the still more amazing *Victory of Samothrace* which, it is believed, was set up to commemorate a sea-fight of 306 B.C. It is improbable that the beauty of these works has ever been equalled, except by the sculptures on the Parthenon of Pheidias. At the decline of art in Greece a weakly wave of energy moved east, and Rhodes and Pergamum produced some fine examples.

Rome.—The balance of political power, however, now took a westward direction. Rome conquered Greece, and in 146 B.C. made of her a Roman province. To Rome were carried many fine examples of Gk. art, and towards the end of the II. cent. B.C. began the GRÆCO-ROMAN Age, a pale reflection of the Golden Age of Greece. One advance may be credited to Rome. Sculptured portraiture, seldom practised in Gk. art, was now developed, and by the many fine examples left to us we judge the Romans to have been supreme in this respect. Throughout the Roman Empire the influence of her s. spread to Egypt and Tripoli and the shores of the Mediterranean, over Central Europe, and westward to England at the close of the pre-Christian era.

Westward Movement.—In the IV. cent. the encouragement given to the Christian faith by the Emperor Constantine gave rise to the new forms in architectural and statuary s. that are characteristic of the Early Christian and Byzantine work. It may be said that geographically with the spread of Christianity s. advanced westward. The greatest centres of activity followed the Church with the cathedral-builders through the shores of the Mediterranean to Spain, where the Saracenic style seems to have proved

too strong to give the remnants of the Classic style fair footing, and by the north of Italy moved through France to the Rhine provinces and to England.

With the approach of the XI. cent., s. suffered in the general depression at the expectation of the world's demise, but, with the dawn of another age, the building and embellishing of cathedrals and palaces received fresh impetus, and, though no individual names have survived, the period between the XII. and XV. cent's is rich in the charming and ingenuous work of the GOTHIC sculptors. With the XV. cent. came the RENAISSANCE, that spread from Italy throughout the whole of Europe. While in the rest of Europe its effect on s. was immense, in England the movement found a more natural expression in lit., and, though the Renaissance affected in a small degree the country's s., it was but as the extremest ripple spent in its ever-widening progress from the centre.

Italy.—DONATELLO, VERROCCHIO, LEONARDO DA VINCI, MICHELANGELO, and CELLINI, each in his turn a master of the Renaissance, have left their masterpieces to influence in no mean measure the s. of succeeding cent's. Soon after the death of Cellini, the inevitable decadence set in. Least of the Renaissance sculptors from an artistic point of view, Cellini has never been excelled as a metal worker and goldsmith, and it is probable that to the debased and extravagant mannerisms of his followers, who admired and unintelligently copied him, was due much of the technically brilliant but decadent work of the Louis periods that followed.

Modern Revival.—At Possagno, Italy, in 1757, was born ANTONIO CANOVA, who, at the age of twenty-five, gave the first movement to a second Renaissance. Though the s. of his school was but a bare and lifeless imitation of the Greek, his work aroused that interest that gave to s. the encouragement it needed. Thirty years later he was followed by FRANCIS CHANTRY, the Derbyshire sculptor, who belongs more truly to the school of naturalism that now sprang up rather than to the pseudo-classic style of Canova, who inspired him. The naturalistic teaching provoked into activity sculptors in Italy, France, and Belgium, in Germany, England, and in North America. This phase, during which lived the great Frenchmen HOUDON, RUDE, and CARPEAUX, waned at the death of CARRIER-BELLEUSE in 1887, and with the rise to fame of AUGUSTE RODIN came a general rebellion that hugged the principle of free thought in art, and flung tradition to the winds.

Lübke, *History of Sculpture* (2 vols., 1872); Mrs. Bell, *Elementary History of Art, Architecture, Sculpture, and Painting* (1895); Marquand and Frothingham, *Text-Book of the History of Sculpture* (1896); Radcliffe, *Schools and Masters of Sculpture* (1902); Toft, *Modelling and Sculpture* (1910); Ruskin, *Aratra Pentelici* (1872).

SCURVY, SCORBUTUS, constitutional disease due to lack of fresh animal and vegetable food, characterised by anæmia, great weakness, spongy and swollen gums, and hæmorrhages. The symptoms come on gradually, with headache and a growing feeling of weakness and pains in the back, the gums then become swollen, bleed easily, the teeth are loosened, the breath is offensive, and there may be constipation or diarrhœa; swellings develop in different parts of the body, especially about joints, due to hæmorrhage into the subcutaneous tissue and muscles, and there is anæmia, with palpitation and breathlessness. The treatment is rest, a diet including fresh meat, green vegetables, and diluted lime or lemon juice (lime juice is served out to sailors to prevent scurvy), and the mouth should be washed out with dilute Condy's fluid or potassium chlorate solution. S. is a terror to explorers in polar regions.

SCURVY GRASS (*Cochlearia*), genus of plants, order Cruciferæ; Common S. G. (*C. officinalis*), a Brit. seaside plant, bears white flowers.

SCUTAGE (Lat. *scutum*, shield), feudal payment, introduced soon after Conquest, equivalent to military service due from knight's fee; forty days' service, or payment, were due from tenant of whole fee; encroachments of Crown were forbiddon by Magna Carta; s. died out, XIV. cent.

SCUTARI (41° 3′ N., 29° 2′ E.), town, on Bosporus; famous cemetery; manufactures silk; garrison town. Pop. 100,000. S. is built on the site of *Chrysopolis*.

SCUTARI, SCODRA (42° 1′ N., 19° 28′ E.), town, on Lake Scutari, capital, vilayet of same name, Albania; manufactures small-arms and exports grain and wool. Besieged by the Romans, 168 B.C., it fell during the Middle Ages into the possession of the Servians, who lost it to the Venetians; acquired by Turkey, 1479. During the TURKO-BALKAN WAR (*q.v.*) S. was besieged by Montenegrins and Servians, and the refusal of Montenegro to raise the siege led to an international naval demonstration at first ignored by Montenegro; the town fell, May 1913, and was handed over to the Powers.

SCUTIGERA, a genus of Centipedes; see MYRIAPODA.

SCYLLA AND CHARYBDIS (classical myth.), sea-monsters who dwelt on opposite sides of Messina Strait; allegory arose from dangerous navigation there.

SCYLLARIDEA, see LOBSTERS.

SCYLLIUM, see under SHARKS AND DOG-FISHES.

SCYPHOMEDUSÆ, ACALEPHÆ.—The Scyphomedusæ (Lat. *scyphus*, from Gk. *skuphos*, 'cup' or 'goblet,' and Gk. *Medousa*) or Acalephæ (from Gk. *akalepha*, 'nettle') form the second of the three great classes of Cœlenterates. They are jelly-fishes, and are generally relatively large in size, some forms attaining a diameter of 4 ft.; from Hydrozoon Medusæ they are distinguished by the presence of genital products situated in the endoderm, and by the absence of a *velum* or *craspedon* (hence the name ACRASPEDA, sometimes given to the group); while from the Actinozoa they are distinguished by the absence of a gullet and of mesenteries. The jelly-fishes consist in general of a disc-like mass of transparent jelly substance, phosphorescent in some species, within which the digestive cavity, the genital organs, and radial canals are visible. The edge of the disc is fringed with tentacles, and the mouth is placed at the end of a long process (the *manubrium*) which hangs from the centre of the under-surface and is often fringed with delicate filaments. On the margin between the tentacles are placed sense-organs, *tentaculocysts* or *statorhabs*, which are associated with a simple nervous system, and have to do with the balancing of the animal. Jelly-fishes swim slowly by gentle pulsations of the disc. They are extremely voracious, and capture with their tentacles prey varying from minute swimming-bells to comparatively large crustaceans and fishes. The sexes are separate, and the sexual products pass into genital sacs and thence into the gastric cavity, whence they escape to the exterior by the mouth. The life-history is complicated, the egg developing into a free-swimming embryo which develops into a sedentary polyp-like *hydratuba*. This may give rise to a larva like itself, but usually it divides horizontally into a pile of larvæ or Ephyræ, which float away and develop into adult sexual medusæ.

Jelly-fishes are marine animals occurring in all seas, and generally found in the open, most frequently in large shoals near the surface. A few occur in deep water, and some forms, included in the order STAUROMEDUSÆ, are temporarily attached to seaweeds and stones by means of a short stalk.

The shoals of jelly-fishes frequently cast on shore after a storm have been used by farmers as dressing for their fields. In China and Japan some are served as food; others are used as bait for fishes. On account of their stinging powers, many are obnoxious to bathers and divers.

A peculiar relationship exists between the larger individuals and small fishes, such as young whiting or horse mackerel. These swim in the neighbourhood of the jelly-fish, and at the least sign of danger seek shelter underneath the disc.

SCYROS (38° 50′ N., 24° 35′ E.), modern SKYRO, island, in Ægean Sea, ancient Greece; connected with Achilles myth.

SCYTHIA, name applied in ancient times to the steppe region between Caucasus and Danube; inhabited by nomadic and pastoral race, who acquired some measure of civilisation from the Greeks; authorities differ as to whether they were of Mongoloid or Aryan race. They invaded Media with success in the VII. cent. B.C., but were eventually expelled by Cyaxares; they repulsed the attempt at conquest of Darius late in the VI. cent. B.C.; decimated by the Sarmatians (*q.v.*), IV. cent. B.C. The eastern tribes established themselves by conquest in Persia in the II. cent. B.C., and in N. India in the I. cent. B.C.; and here they held sway for several cent's. The people are described by Herodotus, and seem to have been a degenerate race of unhygienic habits and addicted to cruelty when engaged in warfare; apparently subdivided into tribes, of which the Royal S's was most important and exercised suzerainty over the rest. They worshipped a number of gods and goddesses, and in India professed Buddhism.

SEA ANEMONE, a type of large solitary polyp found in the sea attached to rocks, in crevices or clefts, or burrowing in the sand of the seashore; may be readily distinguished by the brilliantly coloured tentacles, sometimes numbering 150, which surround the mouth, and to which is due their likeness to garden flowers. They may be minute creatures, but the PLUMOSE ANEMONE, or *Carnation Anemone* of British coasts, may reach a height of 9 inches. They are voracious feeders, killing minute shrimps or larger prey by means of the stinging cells in their tentacles, and engulfing the morsel in their capacious sac-shaped stomach. Some of them live in constant association with particular species of crabs. S. A's are enjoyed as delicacies on the coasts of Italy and South America; they belong to the *Zoantharian* group of the class ACTINOZOA (*q.v.*) amongst Cœlenterate animals.

SEA BEARS, see SEALS.

SEA BREAMS, PORGIES, etc. (*Sparidæ*), broad, compressed, 'bony' fishes, found inshore in all the oceans. Many are excellent food fishes, the most valuable being the AMER, SHEEPSHEAD and the AUSTRALIAN SCHNAPPER.

SEA BUTTERFLY, see under GASTEROPODA.

SEA CUCUMBERS, see ECHINODERMATA.

SEA EAGLE, a member of the HAWK FAMILY (*q.v.*).

SEA LILIES, see ECHINODERMATA.

SEA LIONS, see SEALS.

SEA LIZARD, see under LIZARDS.

SEA MAT, see POLYZOA.

SEA MOSSES, see POLYZOA.

SEA PERCHES, see BASSES.

SEA POACHER, see ALLIGATOR FISHES.

SEA SQUIRTS, TUNICATA (*q.v.*).

SEA SWALLOWS, TERNS, see under GULL FAMILY.

SEA TROUT, see under SALMON FAMILY.

SEA URCHINS, see ECHINODERMATA.

SEA WORMS, see under CHÆTOPODA.

SEABURY, SAMUEL (1729–96), Anglo-Amer. divine; originally Congregationalist, then took Anglican orders; went to America, 1754; Prot. Episcopal bp. of Connecticut, 1783, and of Rhode Island, 1790; an able ecclesiastical statesman and administrator.

SEA-CAT, name applied to various fishes, *e.g.* Wolf-Fish, Chimæra.

SEADIAH, BEN JOSEPH, SAADIA (892–942), Jewish scholar; first attained fame in long controversy, defending Rabbanite calendar against Qaraites; app. chief of school of Sura as reward, but quarrelled with exilarch; was dismissed, 930, and, refusing to submit, was commanded by caliph to retire, 933; restored, 938; much of his work is lost; rest, written in Arabic, had small circle of readers, and was unknown in mediæval Europe; valuable translation of books of Bible into Arabic; theological treatises of importance.

SEA-ELEPHANT, see under CARNIVORA.

'SEA-FIG,' see under SPONGES.

SEAFORD (50° 47′ N., 0° 5′ E.), watering-place, on English Channel, Sussex, England. Pop. (1911) 4787.

SEA-GULL, see GULL FAMILY.

SEAHAM HARBOUR (54° 50′ N., 1° 20′ W.), seaport, on North Sea, Durham, England; exports coal. Pop. (1911) 15,759.

SEA-HARE, see under GASTEROPODA.

SEA-HEDGEHOG, name given to Sea-Urchin, Globe-Fish, Porcupine Fish.

SEA-HORSE, see under PIPE FISHES.

SEA-KALE (*Crambe maritima*), a hardy perennial with succulent leaves, growing on Brit. coast. The young foliage is used as a vegetable.

SEAL (Lat. *sigillum*) was used in early Eastern civilisations as an authoritative stamp, but in the West the form has always been the impression of a design on some soft material, clay or wax, by an instrument of hard metal—commonly lead, gold, or silver. Without the s. in important documents the signature was usually considered worthless. The royal s. was formerly placed on the face of the document, but in the XI. cent. it became customary for the s. to be appended by thongs, and subsequently to be engraved on both sides. While some of the Anglo-Saxon kings certainly used s's, Edward the Confessor's is the first of the *Great Seals* of England which pertain to the sovereign. The idea of the s. was that it witnessed to the personal presence of the writer of the document, or at least to his or her personal authority for all that the document contained. From the time of the Middle Ages not only has the king had his private s., in addition to the 'Great Seal' of the Crown, but nobles and higher clergy, law courts, public bodies, cathedral chapters, monasteries, municipalities, and government officers all have had their s's to render legal documents authentic. Many of these s's were things of exceptional beauty and the rare creations of artists and craftsmen, especially from the XII. to the end of the XIV. cent's, the great period of s's. The ordinary shape was round or pointed oval. Bronze was the common material of the s. (or matrix)—silver being the choice of the wealthy, and lead of the poorer officials.

W. de G. Birch, *Catalogue of Seals in the British Museum*: A. Wyon, *Great Seals of England*.

SEAL-FISHERIES are prosecuted with two objects—the obtaining of the 'seal-skin' of commerce, valued at from £2 to £10 a hide, and the collection of oil. In the former case, the Fur or Eared Seals (*Otariidæ*) are the victims, and the fisheries, owing to the limited distribution of such seals, are confined mainly to the N. Pacific in the neighbourhood of Bering Sea and Alaska, and to the S. Pacific about Cape Horn and the sub-Antarctic islands to the south thereof. Oil fisheries are more widely distributed, for the majority of seals possess a valuable supply of blubber underneath the skin. The Earless Seals (*Phocidæ*) are killed in enormous numbers on the coasts of Newfoundland and Labrador, of Greenland, Spitzbergen, Novaia Zemlia, and almost all the shores bordering the Arctic Sea, as well as in several Antarctic islands. In addition to their oil supply, used for lighting and lubricating, and reaching an annual production of 90,000 barrels, Earless Seals also furnish hides, which are manufactured into leather.

SEALKOTE, see SIALKOT.

SEALS form two distinct families—the TRUE SEALS (*Phocidæ*) and the EARED SEALS (*Otariidæ*)—in the Pinnipedia group of CARNIVORES (*q.v.*). Their life is chiefly passed in the sea, for they come ashore only for repose or for breeding purposes. They feed mainly on fishes, crabs, and molluscs, but some Antarctic species catch and devour Penguins. The most salient distinctions between True and Eared Seals are that the former have no external ear, have hairy palms and soles, and hind-limbs permanently stretched behind; while the latter, which include FUR SEALS, HAIR SEALS, SEA

BEARS, and SEA LIONS, have a small external ear, naked palms and soles, and can turn their hind-limbs forwards in normal fashion. Seals are found in almost all seas, but are absent from the tropics, and Eared Seals from the North Atlantic.

SEAMAN, OWEN (1861–), Eng. journalist; edit. of *Punch* since 1906; writer of humorous verse.

SEAMANSHIP, see SHIP (SEAMANSHIP).

SEA-MEW, the sea-gull. See GULL FAMILY.

SEA-OWL, name for LUMP-SUCKER (*q.v.*).

SEA-PIES, see under PLOVER FAMILY.

SEA-PINK, see THRIFT.

SEA-SCORPION, see BULLHEADS.

SEA-SERPENT, name sometimes applied to the exceedingly poisonous aquatic Sea-Snakes belonging to the Reptilian family Hydrophidæ, which are found in tropical waters, especially of Indian and Pacific Oceans; but more often to an unidentified and perhaps non-existent monster alleged to have been seen, generally with small head, long neck, and body in loops, in the open sea. Such forms may exist, but rumours of sea-serpents are often due to inaccurate observations of such things as a school of Porpoises at play, the arms of some gigantic Cuttlefish (specimens of *Architenthis* more than 50 ft. in length have been captured), the 8-foot long Wolf-Eel of California (*Anarrhichthys*), the 15-foot Oar- or Ribbon-Fish (*Regalecus*), a phosphorescent chain of pelagic Tunicates or Salpæ, or even a flight of Ducks.

SEA-SICKNESS, conditions due mainly to disturbance of the nervous system by the pitching or rolling of a vessel at sea, the chief symptoms being giddiness, nausea, and intense vomiting; nerve sedatives, *e.g.* potassium bromide, and nerve stimulants, *e.g.* strong coffee, have both been found useful in preventing sea-sickness.

SEA-SLATERS, see under MALACOSTRACA.

SEA-SLUG, see under GASTEROPODA.

SEA-SNAILS, see LUMP-SUCKERS.

SEA-SNAKES, see NEMERTINE WORMS.

SEA-SPIDERS, see PYCNOGONIDA.

SEATTLE (47° 40 N., 122° W.), principal seaport of Washington, U.S.A.; has fine public buildings and many beautiful parks; seat of Washington State Univ. (founded, 1855); R.C. episcopal see; has fine cathedral; many educational and charitable establishments. S. has excellent communications by North Pacific and other railways, and a fine harbour; shipbuilding, fish-canning, glass-making, and lumber trade; coal found in district. Pop. (1910) 237,194.

SEA-UNICORN, the Narwhal. See under DOLPHIN FAMILY.

SEAWEED, see ALGÆ.

SEA-WOLF, WOLF-FISH (*Anarhichadidæ*), a family of large, voracious, blenny-like fishes, with strong, sharp teeth, and body sometimes 6 to 8 ft. long; occur in northern seas, the Common Wolf-Fish (*Anarhichas lupus*), 4 to 6 ft. long, being a common inhabitant of Brit. waters.

SEBASTIAN (1554–78), king of Portugal (1557); romantic figure; drove advisers to desperation by unworldliness; slain in crusade against Moors of Africa.

SÉBASTIANI, HORACE-FRANÇOIS-BASTIEN, COUNT (1772–1851), Fr. soldier of lowly birth; advanced by Napoleon, who employed him as diplomat; Naval and Foreign Minister, 1830.

SEBASTIANO DEL PIOMBO (1485–1547), Ital. painter; pupil of Giovanni Bellini and Giorgione; became intimate with Michelangelo, and collaborated with him in three famous pictures—*The Raising of Lazarus*, now in the National Gallery, London, and two scenes from the last days of Christ, in St. Peter's Church, Montorio, Rome.

SEBASTOPOL, see SEVASTOPOL.

SEBENICO (43° 44′ N., 15° 33′ E.), city, on Adriatic, Dalmatia, Austria; cathedral; active trade. Pop. (1910) 29,579.

SEBORRHŒA, condition of the skin, in which there is excessive secretion by the sebaceous glands, forming crusts with scales from the skin and dirt; the treatment is thorough cleansing of skin, and then application of sulphur ointment.

SEBZAWAR (33° 15′ N., 62° 15′ E.), town, Afghanistan. Pop. 16,000.

SEBZEWAR (36° 10′ N., 57° 40′ E.), town, Khorassan, Persia; trade in wool. Pop. 21,000.

SECKENDORF, FRIEDRICH HEINRICH, COUNT VON (1673–1763), Ger. general and diplomatist; commanded for Holland, Poland, Saxony, and Austria successively; Austrian envoy to Prussia, 1726–35, and earned enmity of crown prince, afterwards Frederick the Great; Bavarian field-marshal in War of Austrian Succession.

SECKENDORF, VEIT LUDWIG VON (1626–92), Ger. statesman and author; wrote *Commentarius historicus et apologeticus de Lutheranismo*.

SECKER, THOMAS (1693–1768), bp. of Bristol, 1735, Oxford, 1737; abp. of Canterbury, 1758.

SECOND ADVENTISTS, see ADVENTISTS.

SECOND SIGHT, the power of foreseeing the future, claimed by many persons, particularly the Scot. Highlanders; often believed to be a superstition, but, like other psychic phenomena, now thought by many to have a basis in fact. It often takes the form of an apparition of some one who is living, but whose death is imminent.

SECRETARY OF STATE, officer of Brit. government; originally 'secretary of the king'; duly recognised official by time of Edward III.; present five Sec's of State retain original position of go-between of Crown and Parliament. In U.S.A. S. of S. is Foreign Minister. There is a papal official so-called who deals with politico-ecclesiastical affairs.

SECRETARY BIRD (*Serpentarius sagittarius*), so named on account of the pen-like tuft of feathers stuck clerk-wise at the back of the head; crane-like African birds which feed on insects and reptiles.

SECULAR GAMES, held in Rome at beginning of new generation (*sæculum*), Etruscan in origin; lasted three days; first celebrated 249 B.C.

SECULARISM.—Any view which confines interest to present life, ignoring religion, and especially that which dissociates morals from religion, is called secularist.

SECUNDERABAD (29° 59′ N., 71° 24′ E.), military station, Hyderabad, India. Pop. 86,000.

SEDALIA (38° 43′ N., 93° 11′ W.), city, capital, Pettis County, Missouri, U.S.A.; railway shops; iron foundries. Pop. (1910) 17,822.

SEDAN (49° 42′ N., 4° 57′ E.), town, on Meuse, Ardennes, France; has remains of XV.-cent. castle, Prot. church (1593), statue of Turenne, etc.; great Prot. centre in XVI. cent.; annexed to France, 1642. Great battle of S. took place, Aug. 31, 1870, resulting in total defeat of French under Marshal Macmahon by Germans under king and crown prince of Prussia and crown prince of Saxony. Confusion arose in Fr. army by contradictory orders issued by Ducrot and General Wimpffen. Napoleon III. surrendered with over 80,000 men, guns, supplies, etc., capitulation being arranged at Château Bellevue, 3½ miles from S. Fr. casualties totalled 17,000, Germans about 10,000. Chief industries are machinery, metalware, woollens, flour, weaving, chocolate. Pop. 21,000. See FRANCO-GERMAN WAR.

SEDBERGH (54° 19′ N., 2° 31′ W.), town, W. Riding, Yorkshire, England; grammar school.

SEDGEMOOR, battlefield, Somerset. See MONMOUTH, JAMES SCOTT, DUKE OF.

SEDGLEY (52° 33′ N., 2° 8′ W.), town, Staffordshire, England; coal and iron mines. Pop. (1911) 16,529.

SEDGWICK, ADAM (1785–1873), Eng. geologist; Woodwardian prof. of Geol., Cambridge, 1818; mapped rocks of Lake District, 1822; elected pres., Geol. Society, 1829–30, and in 1831 began study of rocks in Wales. S. founded the Cambrian system at same time as Murchison (*q.v.*) founded Silurian; great controversy raged between the two, 1833.

SEDIMENTARY ROCKS, see PETROLOGY.

SEDITION is not known as offence in itself; but seditious intention is the intention to bring into hatred or contempt king, Parliament, and administration of justice, or to incite to alter the government other than by lawful means, or to disturb peace. There are also seditious libels, conspiracies, and meetings.

SEDLEY, SIR CHARLES, SIDLEY (1639–1701), Eng. poet and dramatist; plays are poor but lyrics are fine, cf. 'Phillis is my only joy'; figures in Dryden's *Essay on Dramatic Poetry*.

SEELAND, see ZEALAND.

SEELEY, SIR JOHN ROBERT (1834–95), Eng. essayist and author of *Ecce Homo*, a magnificent study of the humanity of Jesus; also wrote *Natural Religion*.

SEELY, COLONEL RIGHT HON. JOHN EDWARD BERNARD (1868–), Eng. Liberal statesman; Under-Sec. for Colonies, 1908–10; Under-Sec. of State for War, 1911; Sec. of State for War, 1912– .

SEES (48° 36′ N., 0° 10′ E.) (ancient *Saium*, or *Sagium*), town, on Orne, Orne, France; bp.'s see; cathedral. Pop. (commune) 4200.

SEGESTA (38° N., 13° E.) (Gk. *Egesta*), ancient town, Sicily; founded by Trojans; Rom. colony, 206 B.C.

SEGESVAR, SCHÄSSBURG (46° 10′ N., 24° 47′ E.), town, capital, Nagy-Küküllö, Hungary; textiles. Pop. 11,500.

SEGOVIA, province, Old Castile, Spain. Pop. (1910) 167,744. Capital, **Segovia** (40° 56′ N., 4° 8′ W.), was a Rom. town; interesting features are Trajan's aqueduct, mediæval walls and fortress, XVI.-cent. cathedral; manufactures paper. Pop. 15,700.

SEGRAVE, BARONY OF, Nicholas de Segrave of Segrave, Leicester, was summoned to Parliament in 1264, 1283, and 1295; his descendant Elizabeth (d. 1375 ?) m. John de Mowbray; the barony descended to MOWBRAYS and HOWARDS, and after long abeyance was revived, 1878, for STOURTONS, co-heir of last baron.

SEGREGATION, HYPOTHESIS OF, see MENDELISM.

SÉGUIER, PIERRE (1588–1672), chancellor of France (1635); master of Court of Requests, 1620; *président à mortier* of *parlement* of Paris, 1624–35; as chancellor infringed liberties of *parlement*, and Fronde obtained his dismissal, 1650.

SÉGUR, Fr. family; settled in Limousin in early Middle Ages; chief members: **Henri-François** (1689–1751), Comte de S., general in War of Austrian Succession; **Philippe-Henri** (1724–1801), Marquis de S., marshal of France, 1783; **Louis-Philippe** (1753–1830), Comte de S., *philosophe*; **Paul-Philippe** (1780–1873), general and author.

SEGURA (38° 20′ N., 2° 20′ W.) (ancient *Tader*), river, S.E. Spain; flows into Mediterranean.

SEGUSIO (45° 5′ N., 7° E.), modern SUSA, ancient city, *Liguria*; capital of the Cottian Alps.

SEHESTED, HANNIBAL (1609–66), Dan. statesman; m. king's dau. Christine, 1642; viceroy of Norway, 1642; won considerable autonomy for Norway, till death of Christian IV., 1648; exiled on conviction of peculation, 1651; troubles of Swed. War led to recall, 1660; negotiated Treaty of Copenhagen.

SEHORE (23° 12′ N., 77° 12′ E.), town, Brit. military cantonment, Bhopal, India; manufactures muslins; active commerce. Pop. 17,000.

SEIDLITZ POWDERS, see MINERAL WATERS.

SEIGNIORAGE.—In feudal times the king made a charge for the work of turning bullion into coin, and this charge, called 'seigniorage' (Norman-French word), was an important part of the royal revenue. It was not till Charles II.'s reign that the Crown ceased to take toll of all money coined, and coinage charges were abolished at the Mint.

SEINE (48° 50′ N., 2° 20′ E.), department of France; part of old province Île-de-France (*q.v.*); capital, Paris; area, 185 sq. miles. Pop. (1911) 4,154,042.

SEINE (49° 28′ N., 0° 15′ E.) (ancient *Sequana*), river, France, rises in Côte D'Or, flows with a winding course to N.W.; enters Eng. Channel at Havre; receives the Aube, Marne, Oise, Yonne, Loing, Essone; length, 470 miles; navigable for about 380 miles.

SEINE-ET-MARNE (48° 40′ N., 3° E.), department, France, formed from parts of Brie and Gâtinais; drained by the Seine; produces grain and 'Brie' cheese. Capital, Mélun. Pop. (1911) 363,561.

SEINE-ET-OISE (48° 50′ N., 1° 55′ E.), department, France, formed from part of old province Île-de-France; surface in parts hilly and forest covered; vineyards and good pastures; wheat, fruit, vegetables grown. Capital, Versailles. Pop. (1911) 817,617.

SEINE-INFÉRIEURE (49° 40′ N., 1° E.), maritime department, France, formed of part of old Normandy; undulating; generally fertile; drained by Seine; important textile industries; contains ports of Havre and Dieppe. Capital, Rouen. Pop. (1911) 877,383.

SEINING is fishing with a movable net—the seine—and is the oldest form in use amongst civilised peoples. A long strip of netting, with pockets, weighted at the bottom, and buoyed at the headline, and attached either to a boat at sea or to the beach, is the instrument of capture for smelts, pilchards, eels, plaice, and mackerel. Two boats go out with seines for a shoal of pilchards off the Cornish coast. The Dan. fisherman uses seines for catching eels and plaice, while in U.S.A., where the seine is used far more than it is in Britain, mackerel is the chief catch.

SEISIN, SASINE, old law term for 'possession.' See FEOFFMENT.

SEISMOLOGY, the scientific study of earthquakes, which may be earth tremors so slight as only to be detected by delicate seismographs. Earthquakes so recorded may last but a few seconds or persist for hours, or the earth may be shaken by successive shocks for days. Large earthquakes are recorded by seismographs, however distant they may be from the centre of disturbance. Such earthquakes commence by tremors (*preliminary tremors*), giving place to large waves which work up to a maximum. The preliminary tremors are thought to travel through the centre of the earth, and their speed (about 20 minutes from the Antipodes) proves the earth's effective rigidity to be about the same as that of the hardest steel. The large waves are supposed to traverse the circumference of the earth, and from the difference in time of arrival of the preliminary tremors and the largest waves (maximum) is deduced the distance of origin.

The simplest instruments are the seismoscope and seismometer. The *seismoscope* may be a column so balanced that it falls when earthquake occurs and shows direction of earth-waves. An early seismoscope was invented by Chinese, used at Chôko in 136 A.D. *The seismometer* measures intensity of shock.

The *seismograph* is the form of instrument mostly used at present day. Professor John Milne is the founder of modern seismology, and instruments of his design are generally used. The Milne seismograph consists of an upright column supporting without friction a horizontal boom, which, being therefore free to move, sways according to the intensity of earth movement communicated to it. A needle at the end of the boom is slit to allow a spot of light to fall on sensitised paper, which therefore shows a straight line when the instrument is at rest. The column is built into concrete sunk into the ground. The newest seismograph, the Galitzin, involves electromagnetic principles and gives both distance and direction of the shock.

Earthquakes are thought to be due to the shrinkage of the earth's crust and the necessary adjustments to the inner nucleus. About 60 great earthquakes are recorded annually. Among the great earthquakes of recent years are those of Valparaiso (following one off Alaska a few minutes earlier) and San Francisco (1906), Jamaica (1907), and Messina (1908).

Milne, *Earthquakes* and *Seismology*.

SEISTAN, SISTAN (31° N., 62° E.), region in S.W. Asia, deriving its name from Lake S., or *Hamun*, a large

swamp in W. of Afghanistan, near Khorassan, province of Persia; total area, 7000 sq. miles, of which considerably more than half belongs to Afghanistan, the remainder to Persia; surface is chiefly steppe-land, but large area is rendered fertile by periodic floodings of Lake Hamun; produces cereals, pulse, cotton, fruits; inhabited by various native tribes, some of which are nomadic. Persian S. is divided into the two districts of S. proper and Outer S., and has a total pop. of *c.* 250,000.

SEJANUS, Rom. soldier who aspired to be emperor. See TIBERIUS, CLAUDIUS NERO.

SEKONDI (4° 55′ N., 1° 45′ W.), port, on Gold Coast, W. Africa. Pop. 5500.

SELACHIANS (SELACHII, PLAGIOSTOMI), DOG-FISHES, SHARKS, and RAYS; an order of Cartilaginous or Elasmobranch Fishes (see under FISHES) with a transverse mouth on the under surface, furnished with highly specialised separate teeth, with a rostrum projecting in front of the mouth, 5, 6, or 7 external gill-clefts, claspers, and a heterocercal tail. The order is generally divided into two groups: the DOG-FISHES and SHARKS (*q.v.*), or SELACHOIDEI, with bodies almost cylindrical, lateral gill-clefts, and free fins; and the RAYS (*q.v.*), or BATOIDEI, with compressed bodies, ventral gill-clefts, and pectoral fins united with the head. Although in modern seas Bony Fishes far outnumber the Selachians, in prohistoric times the latter were more abundant. Fossil forms have been found in Silurian rocks, and are numerous in the Carboniferous and succeeding systems.

SELAGINELLACEÆ, see PTERIDOPHYTA.

SELANGOR, see MALAY STATES.

SELANIK, SALONIC (*q.v.*).

SELBORNE (51° 6′ N., 0° 57′ W.), village, Hampshire, England; birthplace of Gilbert White.

SELBORNE, 1ST EARL OF, ROUNDELL PALMER (1812–95), Eng. lord chancellor; s. of Rev. Wm. Jocelyn Palmer, rector of Mixbury; carried away by Oxford movement and remained pious High Churchman; Q.C., 1849; knighted, 1861; Solicitor-General, 1861–63; Attorney-General, 1863–66; refused chancellorship, 1868, disapproving of Irish disestablishment proposed by Gladstone; strongly opposed bill, 1869; opposed abolition of religious tests in univ's; P.C., 1872; Lord Chancellor, 1872–74, 1880–85; cr. Earl of S., 1882; author of Judicature Act, 1873, establishing supreme law court and principle that when case-law is contradictory question shall be settled by equity; author of ecclesiastical treatises and editor of hymn-books; eulogised as 'a pattern and standard of high-minded dignified public life.'

SELBORNE, 2ND EARL OF, WILLIAM WALDEGRAVE PALMER (1859–), Brit. statesman (Unionist); Under-Sec. for Colonies, 1895–1900; First Lord of Admiralty, 1900–5; high commissioner for S. Africa and gov. of Transvaal, 1905–10; gov. of Orange River colony, 1905–7; by moderation and good sense helped to pacify and unify S. Africa and mitigate racial feeling.

SELBY (53° 47′ N., 1° 4′ W.), town, on Ouse, W. Riding, Yorkshire, England; fine abbey church. Pop. (1911) 9049.

SELBY, VISCOUNT, see GULLY, WILLIAM COURT.

SELDEN, JOHN (1584–1654), Eng. lawyer and writer; b. Salvington, Sussex; M.P., 1623, and again, 1626; supported impeachment of Buckingham; imprisoned for share in tonnage and poundage incident, 1629, when Hollis and Strode held Speaker in his chair; sat in Long Parliament. His best work, *Table Talk*, compiled by his sec., is pioneer of Essay vogue; other books, *Titles of Honour* and *History of Tithes*, show great erudition, but laboured literary style; Selden Society (1887) promotes study of history of law.

SELENE, PHŒBE (classical myth.), goddess of Moon; dau. of Hyperion, and sister to Helios and Eos; drove in chariot with two white horses.

SELENGA-ORKHON (49° N., 103° E.), river, N. Mongolia and E. Siberia; flows into Lake Baikal.

SELENITE, see GYPSUM.

SELENIUM (Se = 79·2), non-metallic element, allied to sulphur, with which it occurs in pyrites; deposited in flues and chambers of sulphuric acid works in which pyrites is burnt. Selenic acid is thence obtained, and reduced thus: $H_2SeO_4 + 2HCl = H_2SeO_3 + H_2O + Cl_2$; $H_2SeO_3 + 2SO_2 + H_2O = Se + 2H_2SO_4$; known in three allotropic forms: amorphous red, S.G. 4·26; 'metallic' black, S.G. 4·8, M.P. 217° C.; used for photometric purposes; crystalline red, S.G. 4·47. Compounds: H_2Se (gas); SeO_2 (solid) and selenites; (SeO_3 unknown), selenates isomorphous with sulphates.

SELEUCIA.—(1) (36° 12′ N., 36° E.) ancient town, on Orontes, Syria, founded by Seleucus I., Nicator; important during war between Ptolemies and Seleucidæ. (2) (*c.* 33° N., 44° 35′ E.) ancient town, on Tigris, also founded by Seleucus I., Nicator; was important trading town and eastern capital of Seleucidæ. (3) (36° 22′ N., 33° 42′ E.) ancient town, in Cilicia; also founded by Seleucus; had famous oracle of Apollo; modern SELEFKEH.

SELEUCIDÆ, Macedonian rulers (312–65 B.C.) over Asiatic dominions formerly belonging to Alexander the Great; named from **Seleucus I.,** NICATOR, who, on second partition of Alexander's empire, obtained satrapy of Babylonia and acquired Susiana; secured possession, 312; assumed title of king, 306; always retained Gk. character. His s., **Antiochus I.** (*c.* 324–262), fought first Syrian War with Ptolemy; succ., 261, by s., **Antiochus II.,** who waged second Syrian War with Egypt. **Antiochus III.,** *the Great* (242–187), recovered revolted provinces of Asia; wrested Palestine from Ptolemies, 198; defeated at *Thermopylæ*, 191, by Romans, who drove him from Asia Minor, 190–88. **Antiochus IV.,** EPIPHANES (*i.e.* the Illustrious) (176–64), conquered Egypt, but was expelled by Romans, 168; his persecution of Jews and defilement of the Temple at Jerusalem by setting up therein an image of Jupiter caused revolt of the Maccabees. **Antiochus VII.** (138–29) once more crushed the Maccabees. The male line died out with murder of **Antiochus XIII.,** 65, and Syria became Rom. province, 64.

Bevan, *House of Seleucus* (1903).

SELF-CONSCIOUSNESS.—(1) perception of, or reflection on, oneself as distinct from objects not oneself; (2) popularly, a flustered condition, or sometimes a 'swaggering' attitude, due to concentrating attention on oneself.

SELF-DENYING ORDINANCE, see CROMWELL, OLIVER; GREAT REBELLION.

SELIM I., 'THE FEROCIOUS' (1467–1520), sultan of Turkey, 1512; conquered Persians and Armenians; annexed Egypt, 1517, and obtained from last Abbaside caliph renunciation of rank of Defender of the Faithful. —**Selim II.** (*c.* 1524–74), succ., 1566; worthless; Turks defeated at *Lepanto* (q.v.), 1571.—**Selim III.** (1761–1808), succ., 1789; unfortunate reformer; army, newly organised on European lines, defeated by Russia and Austria; badly treated by ally, Napoleon; deposed and murdered.

SELINUS (37° 36′ N., 12° 48′ E.), ancient town, S.W. Sicily; ruins remain, including those of a number of Doric temples, one of which is said to be the largest ever constructed. The town was originally a settlement of Dorian colonists, dating from *c.* 630 B.C.; ruined by the Carthaginians, 409 B.C., and again, 249 B.C.

SELJUKS, name of Turkish dynasties which ruled in Asia and claimed descent from **Seljuk,** a Turk, who belonged according to one tradition to tribe of Oughouz. Seljuks first appear as tribe of marauders in Transoxiana, whither they came from Turkestan in year 1000 of Hegira; under TOGHRIL BEG and DJAGHRI BEG attack on Ghaznevid dynasty of Persia commenced, 1037; Toghril became sultan of Bagdad, 1055, and chief power in empire; his nephew,

ALP ARSLĀN, captured Gk. emperor, Romanus Diogenes, 1071, and founded Seljuk empire of Roum. MALIK SHĀH came into contact with crusaders; his son and heir, BARKYAROUK (1092–1104), was so beset with rebellions that Antioch and Jerusalem fell in First Crusade, 1097. On death of Malik Shāh, his large empire had broken up among three Seljukian rulers: (1) KILIJ ARSLĀN turned his province of Roum into a sovereignty; he opposed crusaders who wished to traverse his territories, but his son, KILIJ ARSLĀN II., was completely subjugated by Frederick I., 1190. KAIKAOUS captured Emperor Alexius Comnenus in Sinope, 1214. KAIKOBĀD *the Great* ruled, 1219–34; wealth, conquests, and brilliant civilisation famed east and west; son, KAIKHOSRAN, became vassal of Mongols, and, its glories shorn by invader and rebel, the dynasty ended, 1300–15. (2) KERMAN dynasty founded by kinsman of Malik Shāh expired in XII. cent. (3) SYRIAN ended, 1118.

SELKIRK (55° 33′ N., 2° 51′ W.), town, on Ettrick, capital, Selkirkshire, Scotland; contains statues of Sir Walter Scott and Mungo Park; tweed manufactures. Pop. (1911) 5886.

SELKIRK, ALEXANDER, SELCRAIG (1676–1721), prototype of Robinson Crusoe; born at Largo, Fifeshire, where there is a life-sized statue of him as Crusoe; lived alone on Juan Fernandez from 1704–9.

SELKIRK MOUNTAINS (50° 30′ N., 118° W.), group of mountains, Brit. Columbia; highest peak, Sir Donald, 10,645 ft.

SELKIRKSHIRE (55° 30′ N., 3° W.), inland county, S.E. Scotland; area, 267 sq. miles; surface generally mountainous, highest points, Broad Law and Lochcraig Head; contains St. Mary's Loch and the old Forest of Ettrick; beautiful pastoral scenery; drained by Tweed, Ettrick, Yarrow; county town, Selkirk; has extensive sheep-farming and manufactures of woollen cloth; was scene of continuous warfare in XIV. and XV. cent's, and a stronghold of Covenanters in XVII. cent. Pop. (1911) 24,600.

SELLAR, WILLIAM YOUNG (1825–90), Scot. scholar; prof. of Greek, St. Andrews (1859), of Lat., Edinburgh (1863); uncle of Andrew Lang; great critic of Rom. poets.

SELMA (32° 26′ N., 87° 8′ W.), city, on Alabama, capital, Dallas County, Alabama, U.S.A.; cotton manufactures. Pop. (1910) 13,649.

SELMECZBANYA, SCHEMNITZ (48° 27′ N., 18° 52′ E.), town, Hungary; silver mines. Pop. 17,500.

SELOUS, FREDERICK COURTNEY (1851–), Eng. explorer and sportsman; guide to expedition of Brit. S. Africa Co. to Mashonaland, 1890; authority on big game shooting.

SELWYN, GEORGE AUGUSTUS (1809–78), bp. of New Zealand, 1841, of Lichfield, 1868; father of **John Richardson Selwyn** (1844–98), bp. of Melanesia; master of Selwyn Coll., Cambridge (erected in memory of his f.).

SEMAPHORE (34° 51′ S., 138° 32′ E.), town, watering-place, Adelaide County, S. Australia. Pop. 8500.

SEMAPHORE SIGNALLING, system by which the arms, with or without flags, convey messages; originally a s. was a tower with three pairs of arms on a pole.

SEMELE (classical myth.), mother of Dionysus (*q.v.*) by Zeus, whose wife Hera persuaded her to ask Zeus to reveal himself in all his glory; he came as the thunder god, and S. was consumed in flame; extensively worshipped in classical times.

SEMEN, see REPRODUCTIVE SYSTEM.

SEMENDRIA, Servian SMEDEREVO (44° 39′ N., 20° 53′ E.), town, on Danube, Servia; exports wine and cereals. Pop. 6800.

SEMINOLES, 'Wanderers,' N. Amer. tribes, branch of Creek Indians; led by Osceola (*q.v.*), warred against whites, 1835–42; now in Indian Territory, c. 3000 in number.

SEMIPALATINSK (50° 26′ N., 80° 13′ E.), province, Asiatic Russia, forming part of gen. governorship of the Steppes; traversed by several mountain ranges; watered by the Irtish; contains numerous lakes; cattle and horses are reared; some gold and silver mined. Pop., chiefly Kirghiz and Russians (1910), 842,200. Capital, **Semipalatinsk,** on Irtish. Pop. (1910) 32,000.

SEMIRAMIS (*c.* 800 B.C.), semi-mythical queen of Assyria; traditional dau. of fish goddess, Derceto; wife of Ninus; foundress of Babylon and many other Eastern cities; heroine of legendary luxury and military achievements; her tradition confused with that of Astarte; historical nucleus; ruled as regent for her son Ninyas.

SEMIRYECHENSK (44° N., 78° E.), province, Russian Turkestan; includes steppes and branches of various mountain ranges; contains several large lakes; traversed by the Ili, Chu, and Naryn; population mainly Kirghiz; chief occupation, cattle-breeding and agriculture. Pop. (1910) 1,188,200. Capital, Vyernyi.

SEMITES, see RACES OF MANKIND.

SEMITIC LANGUAGES.—The term 'Semitic' (according to some, *Shemitic*) is derived from Shem, one of the sons of Noah whose descendants are said to have spoken these languages. Though not scientific, this origin may be assumed to be correct. The Phœnician branch, however, traces its origin to Ham. It is usual to divide S. l's into various subdivisions.

(*a*) *S. Semitic.*—This includes Arabic, both classical and vulgar, and Ethiopic. Arabic developed and came into prominence later than the other languages. Muhammadan literature is chiefly Arabic, and many of the valuable philosophical and geographical books of the Middle Ages are written in this tongue.

(*b*) *Middle Semitic,* including *Hebrew* of the Bible, *Later Hebrew* (*i.e.* Mishna, etc.), Phœnician, etc., and inscriptions, cf. Moabite Stone. Bible Hebrew exhibits a language in process of development, *e.g.* the pure Hebrew of Deuteronomy and that of Ecclesiastes, when compared, will illustrate the change. The gradual development is more pronounced in post-Biblical, *i.e.* the Mishna and Rabbinic Hebrew generally. This is due partly to the spread of Aramaic as the popular tongue, and the introduction of foreign words. The grammar of post-Biblical Hebrew differs in many respects from that of Biblical.

(*c*) *N. Semitic.*—Under this heading are (1) E. Aramaic, *i.e.* Syriac, the language of the Syrian Christians, chiefly theological and, as Renan said, mediocre. Some consider the Aramaic of the Talmud to be akin to this. (2) W. Aramaic—this includes (*a*) two words in *Genesis* 31^{47}, a verse in *Jeremiah* 10^{11}, parts of the Books of Daniel and Esra; (*b*) Jewish literature—Targums, Palestinian Talmud, and included, too, is Samaritan (with its Pentateuch). Here we also class Nabatæan and Palmyrene inscriptions, etc.

(*d*) *E. Semitic,* i.e. Assyriological and Babylonian cuneiform inscriptions.

The S. l's are written from right to left. The existing form of writing is the development from an original crude state, when pictures expressed objects. S. l's are alike in exhibiting the triliteral root, the letters being all consonants. The vowels play a secondary part, merely expressing modification of the meaning. Other distinctive peculiarities are: (1) that there are guttural sounds difficult for a Western to produce; (2) the verb can really be reduced to two tenses, *i.e.* an action completed or incompleted; (3) there are only two genders (masc. and fem.); (4) the frequent use of case endings and inflections; (5) the adaptability of the pronouns and the suffixes; (6) the simplicity of construction, seen in the small number of particles, etc.; (7) the pronunciation is determined by vowel marks placed under or over the consonants. This is the work of the Massoretes (perhaps following the example of the Arabs).

The *age* of the extant literature of the S. l's varies. The cuneiform inscriptions are probably the oldest,

and in Old Testament there are fragments of very early date. The earliest non-Jewish Aramaic inscriptions are those of the king of Hamath, *c.* 800 B.C. Jewish Aramaic begins *c.* 500 B.C., *i.e.* time of Cyrus. In this connection the papyri recently discovered at Assuan, dated *c.* 471-411 B.C., and those three others of 407 B.C. (all of which are now edited), are important. The Babylonian Talmud was completed about the VI. cent. A.D. Hebrew has continued, and is spoken still, though it has kept pace with modern development by the introduction of words to express modern ideas.

It is interesting to note how the various dialects came into prominence. There is the Bible with its early fragments, and the highest development of the language is reached in the time of the Kingdom. Then gradually the classical Hebrew ceased almost to be spoken, and was displaced by language of populace —a sort of Aramaic. The Targums, or translations into Aramaic, soon became necessary, cf. Daniel, which has both Hebrew and Aramaic. This Aramaic developed till in the Talmud it becomes almost unrecognisable. The Aramaic of Syria assumes a different aspect, and gives birth to a vast literature. Arabic, as we have said, reached its culmination after the rise of Islam.

The difference between Moabite and Hebrew on the one hand and Phœnician on the other is very slight. The Moabite Stone, recording the wars of Mesha, king of Moab, dating from the IX. cent. B.C., substantiates this. Both in this inscription and that of Siloam (referring to Hezekiah's conduit of water) the words are divided by dots. There are innumerable books on the Semitic languages by Wright, Kautzch, Nöldeke, Dillmann, etc. etc.

SEMLER, JOHANN SALOMO (1725–91), Ger. theologian; prof. of Theol., Halle, 1751; director of theological institution, Halle, 1757; one of earliest Ger. rationalists; work now antiquated, but made important contributions to higher criticism.

SEMLIN (44° 55′ N., 20° 25′ E.), town, on Danube, Croatia-Slavonia, Hungary; transit trade. Pop. 15,500.

SEMMELWEISS, IGNATZ PHILIPP (1818–65), Hungarian physician and obstetrician; discovered cause of 'puerperal fever' in maternity hospitals to be septic infection, which he prevented by antiseptic methods, thus anticipating the discoveries of Lister (*q.v.*); his discovery was ignored; d. in an asylum.

SEMMERING PASS (47° 39′ N., 15° 48′ E.), Alpine pass (3219 ft.), on borders of Styria and Lower Austria.

SEMNAN, see SAMNAN.

SEMNOPITHECUS, see under CERCOPITHECIDÆ.

SEMO SANCUS, ancient Ital. god.

SEMOIS (49° 50′ N., 5° E.), river, Belgium; joins Meuse near Mouthermé.

SEMPACH (47° 8′ N., 8° 11′ E.), town, on Lake Sempach, Lucerne, Switzerland; scene of victory of Swiss over Austrians, 1386.

SEMPRINGHAM, see GILBERT OF SEMPRINGHAM.

SEMUR-EN-AUXOIS (47° 28′ N., 4° 20′ E.), town, on Armancon, Côte D'Or, France. Pop. 3400.

SÉNAC DE MEILHAN, GABRIEL (1736–1803), Fr. moralist, publicist, and literary man. In Paris at beginning of Revolution; went to London (1790), Aix-la-Chapelle, Russia (1792), Hamburg, and Vienna; chief work, novel, *L'Émigré* (1797), on the Revolution.

SÉNANCOUR, ETIENNE PIVERT DE (1770–1846), Fr. writer; ruined by Fr. Revolution; unhappy life gave melancholy tinge to writings; chief work, *Obermann*, trans. into Eng. by A. G. Waite, 1903; praised by Sainte-Beuve and Matthew Arnold.

SENATE (Lat. *senatus*, originally council of elders —*patres*).—(1) Rom. governing body in existence in time of earliest tradition; royal council of patricians whose duty was to protect *mos maiorum*, to give *auctoritas patrum* (sanction of the fathers, *i.e.* Senate) to decisions of popular assemblies, and to nominate the temporary ruler in *interregna*; became council of consuls on establishment of Republic, 509 B.C.; lost purely patrician character when plebeian magistrates passed into it; exercised almost entire control over consuls and magistrates until development of plebeian power and overthrow (except in name) under Empire. (2) applied by U.S.A. to Upper House of Legislature of the Union and different States, 1787–89. The present Senate of the Union consists of 96 members, 2 from each State, elected for 6 years; it has large control of executive. Name has been adopted by France, Italy, self-governing Brit. Colonies, and other countries for Upper Legislative Chamber. (3) name of governing body in some Brit. univ's; senate of Amer. College is associated with student self-government movement.

SENEBIER, JEAN (1742–1809), Swiss botanist, interested in plant physiology.

SENECA.—(1) ANNÆUS (*c.* 54 B.C.–*c.* 39 A.D.), Rom. rhetorician; b. Corduba; ed. in rhetoric, Rome; chief works, *Suasoriæ* and *Controversiæ*, rhetorical exercises. (2) **Lucius Annæus** (*c.* 3 B.C.–65 A.D.), statesman and writer; s. of above; ed. Rome; banished, 41; recalled, 49; became Nero's tutor; suspected of treason and ordered to commit suicide. Best-known works are the *Tragedies*, intrinsically of little importance, affected and pompous in style; *On Clemency*, *On Benefits*, and *Letters to Lucilius*. These latter works expound a lofty ethical system, the high-water mark of Stoicism, which in S. has, moreover, a religious trend.

SENECA FALLS (42° 56′ N., 76° 50′ W.), village, on Seneca, Seneca County, New York, U.S.A.; manufactures pumps. Pop. (1910) 6588.

SENEFELDER, ALOIS (1771–1834), Ger. inventor of lithography.

SENEGA, drug consisting of root of a plant, *Polygala Senega*, used as an expectorant and diuretic.

SENEGAL (10° 30′ to 20° N., 10° E. to 17° W.), region in Fr. W. Africa; includes colony of S. and colony of Upper S. and Niger. Senegal was visited by the Normans in the XIV. cent., and from 1446 onwards a number of trading posts were established by the Portuguese; but the country was first permanently colonised by the French, whose settlements were subsequently captured by the English at various dates, but were finally recovered by France in 1814. During Faidherbe's administration much of the surrounding country was conquered, and explorations in the Niger basin were carried out. The last two decades of the XIX. cent. were marked by frequent hostilities against some of the native chiefs, the most important of whom, Samory, chief of Wassulu, was finally defeated in 1898. In 1902 the protectorate dependent on Senegal was united with the territories of Upper Senegal and Middle Niger under one administration, and called the Territories of Senegambia-Niger; these were reorganised in 1904, when the colony of Upper Senegal and Niger was formed out of all these territories except the protectorate, which was restored to Senegal. Boundary between French and British possessions was fixed in 1904 and 1906. The two colonies are administered by lieut.-gov's under supervision of gov.-general of Fr. W. Africa.

The Colony of **Senegal** lies between Mauretania and Guinea, and comprises the communes of St. Louis, Dakar, Rufisque, and Goree, the district of Tivonano and other territories, and an extensive protectorate; area, 74,000 sq. miles; surface mountainous in E., flat in W.; watered by Senegal and Gambia; produces rubber, ground-nuts, oil-seeds, millet, maize, rice. Natives are of Berber or Negroid race. Pop. (1911) 1,247,000.

Upper Senegal and Niger lies to E. of Senegal; area, *c.* 300,000 sq. miles; surface generally tableland; drained by Senegal, Niger, and other rivers; chief towns, Bobo-Dioulasso, Bamako, Segou, Gao, Jenné, Timbuktu; produces cereals, fruit, timber; live stock raised; inhabited by Berbers and Negroids. Pop. (1910) 4,471,031; including 'Territoire militaire du Niger' (1911), 6,035,090. See FRENCH WEST AFRICA.

Haywood, *Through Timbuktu and Across the Great Sahara* (1912); Olivier, *Le Sénégal* (1908).

SENEGAL (12° N., 10° W.), river, Fr. W. Africa; flows through the colony of Senegal, to which it gives

its name, and empties itself into Atlantic near Fort St. Louis; has large number of tributaries from the southern Sudan; length, c. 1000 miles; navigation interrupted by Kayes rapids.

SENEGAMBIA (15° N., 15° W.), region between rivers Senegal and Gambia, W. Africa. See SENEGAL.

SENESCHAL, steward or major-domo — a great office at Fr. court, XI.–XII. cent's; the second person in the kingdom; abolished at the Revolution; in England, the Lord High Steward, but the position was never so important as in France.

SENIGALLIA, SINIGAGLIA (43° 45′ N., 13° 10′ E.) (ancient *Sena Gallica*), city, seaport, watering-place, on Misa, Ancona, Italy; bp.'s see; birthplace of Pope Pius IX.; destroyed by Pompey, 82 B.C. Pop. 24,000.

SENIOR, NASSAU WILLIAM (1790–1864), Eng. lawyer and economist; prof. of Political Economy, Oxford, 1825–30, 1847–52; member of Poor Law Commission, 1832; subsequently of National Education Commission; has wide knowledge and polished style; besides articles on economics and lit., wrote interesting *Conversations with Distinguished Persons during the Second Empire* (pub. 1878).

SENLAC, see BATTLE.

SENLIS (49° 12′ N., 2° 35′ E.) (ancient *Augustomagus* and *Sylvanectes*), town, on Nonette, Oise, France; has Gallo-Roman walls and a fine mediæval cathedral; brick- and tile-works. Pop. 7200.

SENNA, drug consisting of the leaves of two varieties of a shrub, *Cassia acutifolia* and *Cassia angustifolia*, the former growing chiefly in Northern Africa (*Senna Alexandria*), and the latter in Arabia and Western India (*Senna Indica*); used as purgative.

SENNACHERIB, king of Assyria (705–681 B.C.); defeated Babylonians, Elamites, and Phœnicians; laid waste Palestine; turned back from Jerusalem by terrible plague, 701; destroyed Babylon, 689; murdered by his sons.

SENNAR (13° 45′ N., 33° 45′ E.), district, Sudan, Africa, lying between Blue and White Nile; produces durrha, wheat, sesame, and other cereals, cotton, tobacco, vegetables; was an independent empire under the Funj from XVII. to XIX. cent's. The population is extremely mixed, and mostly of negroid descent. Capital, **Sennar**, a decayed town of c. 8200 inhabitants.

SENONIAN, see CRETACEOUS SYSTEM.

SENS (48° 11′ N., 3° 16′ E.), town, Yonne, France; encircled by old walls; archiepiscopal see, has fine XII.-cent. Gothic cathedral and old archiepiscopal palace. S. was conquered c. 52 B.C. by Romans, who fortified it and built aqueducts, theatres, etc.; here Becket found refuge in 1164; taken by Germans in war of 1870–71; artificial manures. Pop. 13,700.

SENSATION, see PSYCHOLOGY.

SENSATIONALISM, theory that all knowledge is derived from sensations, or that it consists in sensations and combinations of sensations.

SENSITIVE PLANT, name generally given to Mimosa; leaves close up on being touched.

SENTINUM (c. 43° 27′ N., 12° 52′ E.), ancient town, Umbria, Italy; scene of Rom. victory over allied Samnites and Gauls, 295 B.C.; modern SENTINO.

SENTRY, soldier posted as watch. In war, **Group Sentries** are now the rule; one stands on guard while others sleep under cover close by; system eliminates nervousness due to solitude.

SENUSSI, name of Arab family which founded Muhammadan sect of **Senussites**. First to bear name was Algerian sheikh who claimed descent from Muhammad; he went to Mecca and won adherents to his new teaching, and founded monastery at Abu Kobeis, 1835; returned, 1843, and built White Monastery in Cyrenaica; died, 1860 (?), and was succeeded by equally noted son, SENUSSI EL MAHDI, who spread Senussite teaching over North Africa; the creed is founded on new interpretation of Koran and moral revival which has had beneficial effect; monasteries founded all over Sahara countries; Senussi el Mahdi opposed claims of Muhammad Ahmed to be the *Mahdi*, 1881, but abstained from interference; took up arms against Fr. expansion in southern Saharan border, but was defeated, 1902; succ. on death, 1902, by nephew, AHMED-EL-SHERIF; French captured great stronghold of Wadai, Abeshr, 1909, after several years' fighting.

SEONI.—(1) (22° 7′ N., 79° 34′ E.) town, Jubbalpore division, Central Provinces, Brit. India. Pop. 12,000. (2) (22° 28′ N., 77° 29′ E.) town, Hoshangabad district, Central Provinces, Brit. India. Pop. 7700.

SEOUL, SEUL (37° 33′ N., 127° 10′ E.), city, capital of Korea, on Han. Pop. (1911) 278,958. Its seaport is Chemulpo.

SEPAL, see FLOWER.

SEPHARVAIM (33° 28′ N., 43° 45′ E.), ancient city, on Euphrates, Babylonia; the *Sippara* of Assyrian inscriptions.

SEPIA, dark brown pigment obtained from cuttle-fish; used much for monochrome sketching. See under CEPHALOPODA.

SEPOY, native Indian as distinguished from European soldier.

SEPSIS (Gk. *sepo*, to make putrid), is caused by a number of micro-organisms, the most common of which are the *staphylococcus pyogenes aureus* and *albus*, and the *streptococcus pyogenes*, which may have a greater or less effect upon the body, depending on the virulence of the micro-organisms and the resisting power of the tissues. If the micro-organisms from the point of local infection reach the circulation and are carried throughout the body there are serious results, the micro-organisms continuing to produce toxins in spite of treatment of the site of infection, the condition being known as *septicæmia*; in *sapræmia* the micro-organisms are confined to the site of local infection, and the toxins alone are diffused in the blood, immediate improvement following on local treatment; and in *pyæmia*, which is a more dangerous condition than the two former, abscesses are formed in various tissues or organs through the blocking of the minute veins by clots which have formed in connection with the infected local lesion. The treatment in all cases consists in treatment of the local lesion by antiseptic methods; nourishing fluids and stimulants are given to keep up the patient's strength; where the condition is due to the *streptococcus pyogenes* a serum prepared from several different strains of streptococcus (polyvalent serum) is administered; if abscesses form they are opened, if possible.

SEPTEMBER, 7th month in Rom., 9th in Julian calendar; in O.E., *Gerstmonath*, 'barley month.'

SEPTICÆMIA, see PARASITIC DISEASES, SEPSIS.

SEPTUAGINT, THE (abbreviated, LXX), the earliest and most famous translation of the Old Testament into Greek, traditionally made by 72 elders by order of King Ptolemy II. (Philadelphus); and very likely actually begun about his reign (285–247 B.C.). The prophets were translated in the II. cent. B.C., other books I. cent. B.C., and *Ecclesiastes* not till the I. cent. A.D. The LXX is of considerable importance for the textual criticism of the Old Testament, but presents a complicated problem, as there were recensions by Origen, Lucian, and Hesychius. When the original text is recovered by comparison, it has then to be compared with the Massoretic, for the Hebrew from which the LXX was translated differed from the Massoretic.

Swete, *Introduction to Old Testament in Greek*.

SEPULCHRE, THE HOLY, the tomb in which was placed the body of Jesus Christ; its exact site is uncertain. It is clear from the Gospel it was a rock tomb, and the remains of such are still visible around Jerusalem. There seems to have been no attempt made at first by Christians to remember the place. In 325 Constantine the Great determined to recover it, and a temple built by Hadrian in 135 was believed to be on the spot; a rock tomb found beneath was identified as the tomb of Christ. Here was built the still surviving Church of the Holy Sepulchre, a shrine visited by pilgrims to Jerusalem. Meanwhile doubts were raised

from the VIII. cent. as to whether this was the site, for more probably the tomb was outside the city walls, though the position of the walls at the time of Christ is uncertain. Some declare for a rock tomb outside the city walls near Jeremiah's grotto—this was accepted by General Gordon. Baedeker, *Guide to Palestine.*

SÉQUARD, see BROWN-SÉQUARD.

SEQUOIA, a coniferous tree confined to the western part of N. America. There are only two species, *S. gigantea,* the familiar 'mammoth tree' of California, and *S. sempervirens,* the redwood, also an immense form. The mammoth tree is the largest known plant and attains a great age, some being estimated to be 1500 years old. *S. sempervirens* is a timber tree of very considerable value.

SERAGLIO, see HAREM.

SERAING (50° 37′ N., 5° 30′ E.), town, on Meuse, Liège, Belgium; machinery. Pop. (1910) 41,015.

SERAMPUR (22° 45′ N., 88° 25′ E.), town, Bengal, Brit. India; contains a Baptist Coll. Pop. 46,000.

SERANG, Ceram (*q.v.*).

SERAO, MATILDE (1856–), Ital. novelist; trained on *Mattino* newspaper, Naples; her best works are *Farewell Love, On Guard,* and an account of Palestine, *Nel paese di Gesù.*

SERAPION, IV.-cent. bp. of Thmuis in Egypt and orthodox controversialist. S. is specially remembered because of a liturgy (discovered, 1894) bearing his name; it gives Eucharist order and services for ordination, baptism, etc.; it comes historically between the earlier *Egyptian Church Order* and later rites.

SERAPIS, Egyptian deity whose worship was introduced into Greece and Rome. The Egyptian S. was a bull by which Osiris manifested himself on earth, but gradually S. became regarded as an independent deity—especially associated with the underworld, and having Isis as his wife.

SERENA, LA SERENA (29° 50′ S., 71° 20′ W.), city, capital, Coquimbo, Chile; copper mines. Pop. 16,500.

SERENADE, a musical composition, generally for wind instruments, in which the march and the minuet are prominent features.

SÉRES (41° 5′ N., 23° 34′ E.), town, on Lake Takhino, Macedonia, European Turkey; abp.'s see; cottons, woollens. Pop. 31,000.

SERFDOM, see SLAVERY.

SERGEANT, see SERJEANT.

SERGIEVSKY POSAD (56° 25′ N., 38° 10′ E.), town, pilgrimage resort, Moscow, Russia; built around the Troitsk monastery; holy pictures, toys. Pop. 29,900.

SERGINSK, UPPER AND LOWER (*c.* 56° 30′ N., 59° E.), two towns, Perm, Russia; ironworks. Pop. (united) 16,000.

SERGIPE (10° 57′ S., 37° W.), maritime state, on Atlantic, Brazil; chief product, sugar. Pop. 415,000. Capital, Aracajú.

SERGIUS, four popes: **Sergius I.,** pope, 687–701; **Sergius II.,** pope, 844–47; **Sergius III.,** pope, 904–11; **Sergius IV.,** pope, 1009–12.

SERGIUS, ST. (date uncertain), martyr of Early Church.

SERICITE, see MICA.

SERIEMA, CARIAMA (*Cariama* and *Chunga*), S. Amer. crane-like birds, found in open districts, where they feed upon small mammals, reptiles, and insects. Their peculiarities of structure have caused the two known species to be grouped in a family by themselves.

SERIES, a mathematical expression in which the successive terms are formed according to some regular law and are to be added in the order in which they are written. If the series terminates at some assigned term, it is called a *finite series*; if the number of terms is unlimited, it is called an *infinite series.* Writing $s_n = a_1 + a_2 + \ldots + a_n$, we obtain the sequence $s_1, s_2, \ldots s_n \ldots$ This sequence may tend to a finite limit s. When, and only when, this is the case, we say the series is *convergent.* Otherwise it is *divergent.* A necessary and sufficient condition for the convergence of Σa_n is that, corresponding to *every* positive number ϵ given in advance, there shall exist a positive integer μ, such that the absolute value of $a_{n+1} + a_{n+2} + \ldots + a_{n+p}$ shall be less than ϵ for every integer n equal to or greater than μ, and for every positive integer p; *i.e.* $| s_{n+p} - s_n | < \epsilon$ when $n \geq \mu$. Various simple rules exist in agreement with the above, by which convergency of given series may be tested; *e.g.* series is convergent if from and after some fixed term the ratio $\frac{a_n}{a_{n-1}}$ is numerically less than some quantity which is itself <1. A series is *absolutely* convergent when its terms can be rearranged without altering the limit. For a variable ξ, the series $\Sigma f_n(\xi)$ is *uniformly* convergent in an interval if for each ϵ we can select a positive integer μ which is independent of ξ and such that $| r_n(\xi) | < \epsilon$ when $n \geq \mu$, whatever be the value of ξ in that interval; $r_n = s - s_n$.

Hobson, *Plane Trigonometry*; Chrystal, *Algebra*; Whittaker, *Modern Analysis*; Forsyth, *Theory of Functions*; *Elementary*: C. Smith or Hall and Knight, *Algebra.*

SERINAGAR, see SRINAGAR.

SERINGAPATAM (12° 24′ N., 76° 41′ E.), town, on island in Cauvery, Mysore, India; formerly famous fortress. Pop. 9300.

SERINGHAM, see SRIRANGAM.

SERINUS, CANARY, see under FINCH FAMILY.

SERJEANT, SERGEANT, term used in Middle Ages for all servants and developed into different meanings, such as s.-at-law (*q.v.*), formerly the highest degree in the Common Law, giving monopoly of leading in Court of Common Pleas (abolished, 1849); no judge has taken the degree since 1868; s.-at-arms (domestic official of Crown, of Chancellor in House of Lords and of Speaker in House of Commons); s. in army (non-commissioned officer); and s. in police force.

SERJEANT-AT-LAW, formerly legal order of highest rank of barristers; Serjeants-Inn was dissolved, 1877.

SERJEANTY, land-holding under the feudal system; of two distinct species: (1) *Grand serjeanty,* by which a man held ground of the king in return for personal services; (2) *Petite serjeanty,* by which a man holds land in return for a small gift.

SERMON, used only ecclesiastically, the discourse or oration delivered in church; it may be extempore or read, but is generally supposed to be the preacher's own composition. In Protestantism s's occupy a more prominent place than in Catholicism, and in the mediæval church s's were comparatively rare. Among XVII.-cent. Puritans s's reached enormous lengths.

SEROW, SARAU, GOAT ANTELOPE, genus of shaggy goats (*Nemorhædus*) found in mountainous districts of E. and S.E. Asia, up to 12,000 ft. in the Himalayas. They are shy, solitary creatures, closely allied to the Himalayan Gorals (*Cemas*).

SERPA PINTO, ALEXANDRE ALBERTO DE LA ROCHA (1846–1900), Portug. explorer; wrote *How I crossed Africa* (1881); gov. of Mozambique (1889).

SERPENT WORSHIP, a form of devotion found in many countries, and characteristic of, or a survival from, a primitive stage of religion. The explanation is no doubt largely psychological. Thus, as serpents kept to the ground and were found in caves, they were associated with the chthonian deities in ancient Greece. A serpent, too, has to a savage mind something essentially mysterious about it, and, when found near his tomb, was believed to be the spirit of a dead ancestor appearing in physical shape. Another primitive association was with healing. Thus Æsculapius in Greece was represented with serpents. Again, serpents were associated with water — Poseidon, the Gk. equivalent of Neptune, was a reptile, as was also an earthquake deity.

Serpents are found in various mythological and symbolical narratives, *e.g.* in Genesis. Like other

animals they were totems and connected with the worship of clans. Like other supernatural beings (and the serpent seemed to have something supernatural about it), they were imagined sometimes to be the parents of human children. Serpents became guardian spirits of certain places. Their connection with the water seems also to have suggested connection with the weather. Various legends seem to point to human sacrifices being formerly offered to serpents. The greatest celebration with which they are connected at the present day is that of Dahomey, where snakes inhabit the temples and are venerated as sacred. As serpent worship existed mostly in the early stages of society, and was ousted by other cults, so there are myths of strife between the gods and older reptilian protagonists. Thus Hercules as a child fought with snakes.

Serpent worship could not exist in Christianity, but there are many traces of the destruction of them or their deities by Christian missionaries. Thus St. Patrick banished snakes from Ireland. In France there were similar stories told of the first preachers of the Gospel. St. George and the Dragon is only a materialised version of a spiritual conflict. The most remarkable observance still kept up is that of St. Domenico at Foligno: on the first Thursday in May men carry live snakes, and the statues of the saint are draped with them. This is near the home of the ancient Marsi—associated with snakes.

Ferguson, *Tree and Serpent Worship*.

SERPENTARIUS, SECRETARY BIRD (*q.v.*).

SERPENTINE, an abundant mineral composed of silica and magnesia, in equal proportions, and water; occurs massive and also in winding veins—hence name; colours: green, red, brown, and yellow. Surface: dull, smooth, and soft. *Common* s. is colourless; *precious* s. is coloured and is used for making ornaments.

SERPENTS, see SNAKES.

SERPUKHOV (54° 59′ N., 37° 33′ E.), town, on Nara, Moscow, Russia; textiles. Pop. 27,000.

SERPULA, a BRISTLE WORM; see under CHÆTOPODA.

SERRANO Y DOMINGUEZ, FRANCISCO, DUKE DE LA TORRE (1810–85), Span. soldier and statesman; took part in *coups d'état*, 1841, 1843; Minister of War, 1843; marshal, 1856; imprisoned for plot against *moderados*, 1868, but released, and drove Queen Isabella from Spain; regent, 1869; retired on failure of revolution; Pres., 1874.

SERRASALMO, see CARIBA FISH.

SERTORIUS, QUINTUS (murdered, 72 B.C.), Rom. general; took part in war between Marian and Sulla factions, 88; withdrew with Marians to Spain, where he had brilliant military career against Rome.

SERTULARIA, see under HYDROMEDUSÆ.

SERVAL, see under CAT FAMILY.

SERVETUS, MICHAELIS, MIGUEL SERVETO (1511–53), Span. physician and martyr; studed under Œcolampadius at Basel, and attended lectures of Bucer and Capito at Strasburg; denied doctrine of Trinity; pub. *De Trinitatis Erroribus*, 1531, *Dialogues*, 1532, and was forced to fly; studied med. under assumed name, Michael de Villanueva, at Paris, and again got into trouble through his inquiring intellect; his scientific studies led him to foreshadow discovery of circulation of blood; raised controversy with Calvin, and fled; under the protection of Paulmier, abp. of Vienne, wrote *Christianismi Restitutio*, pub. 1553, which roused storm of indignation among Reformers; seized by Calvin in passing through Geneva, tried and burned as heretic.

SERVIA (*c.* 41° to 44° 59′ N., 19° 7′ to 22° 59′ E.), kingdom in N. of Balkan peninsula, Europe; is bounded N. by Austria-Hungary (Danube and Save), E. by Rumania and Bulgaria, S. by Greece, W. by Albania, Montenegro, and Bosnia-Herzegovina. Area, *c.* 36,000 sq. miles. Surface, mountainous, with flat ground along Save and Danube, and in Morava valley in centre; highest mountain peaks are Midzor (*c.* 7168 ft.), Pobyezdin Potok (*c.* 6940 ft.). Drained by Morava and tributaries flowing to Danube, by Drina and other streams flowing to Save, and by Timok and other streams flowing to Danube. Chief towns, Belgrade (capital), Nish, Kragonyevatz, Leskovatz. Climate varies with elevation; temperature has great range, falling below zero in winter, and rising above 100° Fahr. in summer.

Servia was first settled in by the Serbs, from whom its name is derived, in VII. cent. A.D.; for several cent's they formed a number of politically independent communities, between which constant struggle for supremacy went on. In XII. cent. united kingdom was established by Stephen Nemanya, who flourished 1159–95, and founded a dynasty which held sway in S. until 1371. Two of his successors, Milutin and Stephen Dushan, conducted successful campaigns against Greeks, at whose expense they increased their dominions. Stephen Dushan conquered Albania, Bulgaria, Macedonia, and Thessaly, and established a new Serb empire in 1345; after his death in 1355, this fell to pieces; and with death of his son Urosh in 1371, Nemanyich dynasty came to an end. In next reign occurred a Turk. invasion, which ended with defeat and death of the Tsar, Lazar, at Kossovo in 1389, after which Servia became a Turk. province; at first governed by native rulers, it came directly under Turkish control in 1459.

For over three cent's people were terribly oppressed by Turks, who killed and enslaved great numbers of them. Not until 1804 did a national rising occur; in that year the Serbs, led by Kara George, rose in rebellion, and succeeded in banishing the Turks, who, however, reconquered the country in 1812; a second rising under Milosh Obrenovich, in 1815, had more lasting results, and in 1817 Servia was granted self-government; Milosh, the first prince, was acknowledged as hereditary ruler by the Porte in 1830. Revolution occurred in 1842, when Alexander Karageorgevich was placed on throne; he reigned until 1859, when he was deposed in favour of Milosh, whose family henceforth ruled until 1903. The absolute independence of Servia was recognised by Treaty of Berlin in 1878. Under King Milan in 1885–86 occurred war with Bulgaria, resulting in Servian defeat. In 1903, Milan's son Alexander, king of Servia, and his wife Draga were assassinated, upon which Peter I., son of Alexander Karageorgevich, became king. In 1908, on Austria's annexing Bosnia-Herzegovina, Servia was hostile and war almost ensued. For later history, see TURKO-BALKAN WAR.

Literature.—Most remarkable production of early Servian lit. is perhaps Stephen Dushan's *Zakonik*, or Code of Laws, dating from 1349. During Turk. period little was written, but in modern times great efforts have been made to revive national lit. A collection of national songs made by Yuk Karajich, *c.* 1815, is one of finest Servian literary monuments. Among best-known modern poets are Milutinovich (d. 1847), Peter II. of Montenegro (d. 1851), Radichevich (d. 1853), Preradovic (d. 1872), Yovanovich (d. 1904).

Government is limited monarchy; executive power held by king aided by eight ministers; legislative power vested in king and National Assembly, which consists of 160 representatives chosen by popular vote; there is a State Council, members of which are appointed either by king or National Assembly. Elementary education gratuitous and obligatory. State religion, Gk. Orthodox Church. Military service compulsory.

Servia is largely an agricultural country; leading grains are wheat and maize; considerable quantities of barley, rye, and oats are produced, besides fruits and vegetables. Minerals include gold, copper, antimony, silver, coal, and other metals, but their full development awaits an increase of rail and road communications. A large area is under wood, valuable trees including oak, beech, and fir. Principal industry is flour-milling; carpet-weaving, distilling, brewing, and

tanning also carried on. Exports agricultural produce, live stock, animal produce, etc. Imports textiles, machinery, paper, salt, wine. Railway mileage, over 600.

Inhabitants include, besides Servians themselves, persons of Hungarian, Turk., and Austrian nationality, Jews, and Gipsies. Pop. (1910) 2,911,701.

Mijatovitch, *Servia and the Servians* (1908); Vivian, *Servia* (1897).

SERVITES, 'Religious Servants of the Holy Virgin,' religious order founded by seven merchants of Florence, 1233; like Dominicans, adopted rule of St. Augustine, but added their own constitution; habit is black; have houses in Italy, England, and America.

SERVITUDE, burden on property by which owner allows another certain rights. *Personal s's* are those given to a person in his own right, *e.g.* terce and courtesy.

SERVIUS, HONORATUS MAURUS (fl. *c.* 400 A.D.), Rom. grammarian, known as a commentator on Virgil.

SERVIUS TULLIUS, legendary sixth king of Rome (578–534 B.C.); probably eponymous ruler, like Romulus, invented to explain social progress of plebeians before republic.

SERVO-BULGARIAN WAR (1885), Bulgaria overthrew *Treaty of Berlin* (1878) by annexation of Rumelia, 1885. Servia took Bulgaria at disadvantage as her troops were on Turk. frontier expecting Turk. interference; Bulgarian forces raced back; Servian main army had crossed frontier, and on Nov. 17 commenced vain attack on Slivnitza; before end of month Servians were expelled and Servia invaded, but Bulgaria was satisfied with *status quo*.

SESAME, annual plant, order Bignoniaceæ; yields Gingelly or Gingili oil, used in East as substitute for olive oil.

SESAMOID BONES are small bones in tendons about a joint; patella (knee-cap) is best example.

SESSA AURUNCA (41° 14′ N., 13° 58′ E.), town, Caserta, Italy; bp.'s see; wine. Pop. 23,000.

SESSHIU (1420–1506), Jap. artist; visited China (1468), and was hailed as the greatest painter of his day. He achieved his most notable successes in landscape.

SESTRI LEVANTE (44° 15′ N., 9° 30′ E.) (ancient *Segesta Tigulíorum*), seaport town, Genoa, Italy. Pop. 3200.

SESTRI PONENTE (44° 23′ N., 8° 50′ E.), seaport town, Genoa, Italy; shipbuilding yards; manufactures tobacco. Pop. 18,000.

SETH, according to Genesis, s. of Adam; his name resembles that of Egyptian and Hittite deities; there were many legends about S.—Jewish and Christian.

SETIA (41° 30′ N., 12° 5′ E.) (modern Sezze), ancient town, Latium, on S. slope of Volscian Mountains.

SETON, BARONY OF (1448), Scot. honour; the Setons of Seton, East Lothian, claimed descent from Norman David de Say, to whom, according to the chronicles, King David I. (1124–53) gave Seton (Saytoun). There was a connection between the Scot. house, the Seatons of Seaton Carew, Durham, and the Seatons of Seaton, a lost place on the Yorkshire coast. GEORGE SETON was cr. lord of parliament, 1448; GEORGE, 3rd baron, was slain at Flodden, 1513; Seton was burned in Hertford's invasion, 1544; GEORGE, 5th baron, ancestor of Earls of Dunfermline, was devoted adherent of Mary, Queen of Scots, and a daughter of this house was one of the maids of honour, known as the Four Maries; ROBERT, 6th lord, was cr. Earl of Wintoun, 1600. Younger branch became Barons of Gordon (*q.v.*).

SETTERS, see DOG FAMILY.

SETTLE (54° 4′ N., 2° 17′ W.), town, Yorkshire, England.

SETTLE, ELKANAH (1648–1724), Eng. poet and dramatist; wrote a 'heroic' play, *The Empress of Morocco*; the 'Doeg' of Dryden's *Absalom and Achitophel*.

SETTLEMENT, act of giving possession to another, as a jointure is granted to a wife. Also the transfer of property to trustees for the use of one person for his life, and after his death for the absolute use of another person.

SETTLEMENT, ACT OF, Act of Parliament (1701) settling succession of Eng. throne; provided that sovereign should always be of Established Church, have no power to pardon persons impeached by Commons, or remove judges, except after address of both houses.

SETUBAL (38° 32′ N., 8° 55′ W.), seaport, on Bay of Setubal, Estremadura, Portugal; important commerce; sardine fisheries. Pop. *c.* 25,000.

SEUL, see SEOUL.

SEVASTOPOL, SEBASTOPOL (44° 34′ N., 33° 28′ E.), seaport, on Black Sea, Taurida, Russia; important naval station for Black Sea fleet; famous for its siege by the allied British, French, and Turkish armies in 1854–55. Pop. (1910) 64,800.

SEVEN BISHOPS, the bishops who were tried (1687) for petitioning James II. of England against his order to read the Declaration of Indulgence during service; acquitted amid enthusiasm of the nation.

SEVEN CHAMPIONS OF CHRISTENDOM, name given by Richard Johnson in his book bearing that title (1597) to the patron saints of England, Scotland, Wales, Ireland, Italy, France, and Spain.

SEVEN SLEEPERS, seven Christians of Ephesus, who, fleeing from Decius's persecution, took refuge in a cave; the enemy built up the entrance, and they fell into a trance for 200 years, awaking in 447. They convinced Theodosius II. of life after death, and forthwith sank into sleep again to await the resurrection. A similar story obtains in many lands.

SEVEN WEEKS WAR, war between Austria (and German allies) and Prussia, June to July 1866. Bismarck, dissatisfied with Schleswig-Holstein arrangement of 1865, made offensive alliance with Italy, April 1866; practically forced on war against wish of his own state and every other power; Austrian ambassador recalled from Berlin, June 11; Moltke, Prussian chief of staff, divided forces into two divisions, larger to attack Austrians and Saxons in Bohemia, smaller under Falkenstein to deal with Germany; Hanoverians defeated at Falkenstein, June 29; larger force marched in two divisions, from Saxony under Prince Frederick Charles and General von Bittenfeld, and from Silesia under crown prince, towards Gitschin in Bohemia. Austrian commander-in-chief, Benedek, sent troops to repel crown prince, while he himself stopped progress of Prince Frederick; but former secured passage at Nachod, June 27; Skalitz and Burkersdorf, June 28; and latter won victories of Hühnerwasser, June 26; Münchengrätz, 27; Prodol, 28; and arrived at Gitschin, 30; retreated S.E. to Elbe; overtaken by the two Prussian armies at Königgrätz, and suffered fatal defeat of SADOWA, July 3.

Falkenstein occupied N. Germany as far as Main (July 16); France fiercely indignant at Napoleon's neutral attitude, but reconciled by Bismarck to Prussian aggrandisement; Napoleon agreed, July 22, to Prussia's annexation of Schleswig-Holstein, Hanover, Hesse-Nassau, Saxony, and dismissal of Austria from Germany; King William, however, refused to annex Saxony.

Armistice, July 22; preliminary treaty of Nikolsburg, July 26; Bismarck refused European arbitration; final *Treaty of Prague* with Austria, August 24; war went on with Ger. allies; individually defeated, and ended in Oct. Besides Prussians, Austria, during this war, had to face third Ital. War of Independence.

SEVEN WONDERS OF THE WORLD were Pyramids of Egypt; Hanging Gardens of Semiramis, at Babylon; Temple of Diana, at Ephesus; Statue of Jupiter, by Phidias, at Athens; Mausoleum, in Caria; Colossus, at Rhodes; Pharos lighthouse, at Alexandria. They are described by Philo of Byzantium.

SEVEN YEARS WAR, war primarily between Britain and Prussia on one side and France and Austria on the other, carried on in Europe, Asia, Africa, and America, 1756–63. Chief causes Brit. and Fr. colonial

jealousy and continental mistrust of Prussia. In 1754–55, Brit. and Fr. colonists warred on each other in N. America, but France hesitated to declare war; Prussia, expecting French to aid Austria to recover Silesia, made *Treaty of Westminster*, Jan. 1756, to aid Britain, should France attack Hanover; France replied by *Treaty of Versailles* with Austria, whereupon Frederick the Great, without declaring war, invaded Saxony, occupied Dresden in Sept., shut up Saxon army in Poina, and defeated Austrian force at Lobositz. Saxony was conquered, but Frederick was unable to proceed against Austria.

Britain and France had meanwhile declared war. French captured Minorca, 1756. France, Sweden, Austria, Russia, and Saxony signed treaties for partition of Prussia, May 1757, France neglecting danger from Britain, which proceeded to conquest of Canada. Louisbourg fell, 1758; Quebec, 1759; Montreal, 1760; while Boscawen, Hawke, and Rodney prevented invasion of Britain, and won crushing victories at *Lagos*, QUIBERON BAY, etc., and Clive (*q.v.*) overthrew Fr. supremacy in India. Prussia defeated coalition at Prague, but was defeated at Kolin and forced to retreat, June 1757; Hanover invaded; Cumberland defeated by Estrées and capitulated at *Kloster Seven*; Russians won victory of *Gross-Jägersdorf*, Aug., and fortunately for Prussia did not follow up advantage; Austrians occupied Berlin, Oct., and Silesia; Frederick recovered position at ROSSBACH; French expelled from Germany; Frederick recovered Silesia after battle of Leuthen, Dec.

Britain, inspired by Pitt, assisted Prussia with all her power. Russ. force occupied E. Prussia, Jan. 1758, but Frederick determined to strike at heart of coalition, which was now Austria; he failed in siege of Olmütz, May to July, on account of skill of Loudon, but performed skilful retreat, arrived in Brandenburg in time to face Russ. invasion and fought bloody battle of *Zorndorf*, Aug.; defeated at Hochkirchen, Oct.; Frederick retained Silesia.

Duke of Brunswick, who had aided in expulsion of French, was defeated at Bergen, but won victory of MINDEN, 1759; Frederick was defeated by double numbers of Russians and Austrians at *Kunersdorf*, Aug., but again victory was not followed up; Austrians merely occupied Saxony. Loudon, the only great general on that side, after several victories in Silesia was defeated at *Liegnitz*, Aug. 1760; Frederick recovered Saxony by victory of *Torgau*, Nov. Brunswick won fresh victory over French at *Villingshausen*, July 1761, but Prussia again lost Saxony and Silesia. Russia came over to side of Prussia after death of Czarina Elizabeth, Jan. 1762, and helped to drive Austrians from Silesia, while they retreated from Saxony after defeat at *Wilhelmstal*, June. Peace, 1763, gave Britain colonial and Prussia European preponderance.

SEVENOAKS (51° 17′ N., 0° 12′ E.), town, Kent, England. Pop. (1911) 9183.

SEVERIANA, VIA (41° 40′ N., 12° 20′ E.), ancient coast road, Italy, between Ostia and Terracina.

SEVERN (51° 55′ N., 3° W.) (Rom. *Sabrina*), river, England, rises on Plinlimmon, Montgomeryshire; traverses Shropshire, Worcestershire, and Gloucestershire; chief tributaries, Terne, Upper and Lower Avon, Teme, and Wye; length, 210 miles; navigable to Welshpool; noted for its 'eagre' or 'bore.'

SEVERUS, LUCIUS SEPTIMIUS (A.D. 146–211), Rom. emperor; prætor, 178; provincial governor of Gallia Lugdunensis and other provinces; on hearing of murder of Emperor Pertinax and accession of Julianus, 193, caused himself to be proclaimed emperor, marched to Rome at head of his legion; Julianus was put to death, and Severus made the dangerous Clodius Albinus Cæsar; defeated Pescennius Niger at Issus, 195; Byzantium fell after three years' siege; revolt of Clodius Albinus put down, 197; Parthians defeated and Ctesiphon sacked, 198; marched through Britain to stamp out revolt, 208; commenced wall which bears his name between Tyne and Solway, thus marking abandonment of much territory to Caledonians; d., York; strong ruler, but did nothing to check deterioration of Romans, keeping people in good humour by games and gifts, and showering rewards on all-powerful soldiery; f. of evil-famed Caracalla.

SEVERUS, SULPICIUS (363–425), Christian author; b. in Aquitaine, then seat of Lat. culture; friend of St. Martin, who induced him to lead life of piety and renunciation; wrote *Chronica*, valuable for his own times, as describing Priscillianism; *Life of St. Martin*, relating his miracles; *Dialogues*, describing monasticism, and some letters.

SEVIER, JOHN (1745–1815), Amer. general; fought against English, and led several expeditions against Indians; gov. of new state of Frankland, 1785–88, of Tennessee, 1796–1801, 1803–9.

SÉVIGNÉ, MARIE DE RABUTIN-CHANTAL, MARQUISE DE (1626–96), Fr. letter-writer; lost her parents at age of six; brought up by uncle, the abbot of Coulanges; sound education under Chapelain and Ménage, who taught her Italian and Spanish, then spoken at the Fr. court, as well as a little Latin; her favourite authors were Montaigne, Pascal, Virgil, Quintilian, and Tasso, as well as St. Augustine and Bossuet. At eighteen she married the Marquis of Sévigné, who was killed in a duel, and left her a widow at twenty-five, after having squandered great part of her fortune; very beautiful, and a great favourite at court, Mme de Sévigné devoted herself to bringing up of her children; her son entered army, and gave her great deal of trouble in spite of his affectionate nature; her daughter, most beautiful woman of France, though colder, was easier to manage; love for this dau., to whom large number of the famous letters were written, knew no bounds; accused of judging people according to the way they behaved to her daughter. Mlle de Sévigné married the Count de Grignan, and lived in Provence, while her mother lived in her place of *Les Rochers* in Brittany, or at abbey of Livry, near Paris, and therefore began the wonderful *Correspondence* which is so valuable for history of time; she relates the intrigues of court, news of church, theatre, war, receptions, feasts, dress; among most perfect ever written; style based on real genius of the Fr. language; to her dau. she said she let her pen trot with a loose bridle; to others it ploughed; hence those to her dau. have most of her characteristic fluency and felicity; she died of the smallpox at Grignan.

Miss Thackeray (Lady Ritchie), *Madame de Sévigné* (1881).

SEVILLE (37° 25′ N., 5° 35′ W.), province, Spain, traversed by the Guadalquivir. Pop. (1910) 597,194. Capital, Seville.

SEVILLE (37° 22′ N., 5° 52′ W.), town, on Guadalquivir, Spain, cap. of Andalusia; has many beautiful moorish buildings, finest of which is the Alcazar or Moorish royal palace, built in late XII. cent.; the Giralda tower is chiefly of Moorish architecture, and was begun in 1196, but the upper part was added in XVI. cent.; archiepiscopal see; has fine cathedral which dates from 1403, and is the largest in Spain, containing paintings by Murillo and other masters; univ. was incorporated in 1502; S. is centre of Span. sport of bull-fighting, and has large circus capable of accommodating 14,000 spectators; exports lead, quicksilver, olives, olive oil, cork, oats, wine, etc.; manufactures iron goods, machinery, pottery, silk, cotton, cigars. Pop. (1910) 158,366.

SÈVRES (48° 49′ N., 2° 12′ E.), town, Seine-et-Oise, France; porcelain. Pop. 8500.

SEWALL, SAMUEL (1652–1730), Anglo-Amer. judge; emigrated, 1661; chief justice of Superior Court of Boston, 1718–28; extreme Puritan; author of fervent theological works; fostered Indian missions.

SEWANEE (35° 12′ N., 85° 52′ W.), village, summer resort, Franklin County, Tennessee, U.S.A.; seat of univ. (Episcopal); coal mines. Pop. 1200.

SEWARD, WILLIAM HENRY (1801–72), Amer. lawyer and statesman; anti-masonic member of

New York senate, 1830–34; governor, 1839–43, and pursued ardent anti-slavery policy; member of U.S. senate, 1849; Sec. of State in Lincoln's administration, 1860, and at first opposed Civil War; made anti-slavery treaty with England, 1862; wounded, with several members of his family, 1865, by would-be assassin; carried out purchase of Alaska, 1867.

SEWELL, WILLIAM (1804–74), Anglican divine, fellow of Exeter Coll., and prof. of Moral Philosophy, Oxford; in early days associated with Tractarian movement.

SEWERAGE, term applied to the systematic collection and disposal of the fouled water, refuse liquids, and human and animal excrements of a community. In the country and in villages and small towns refuse is often collected in pails, transferred to ashpits or tank carts, and deposited upon the land; the dry-earth system, in which a quantity of thoroughly dried soil is thrown over the excreta in the pail, taking advantage of the deodorant and oxidising action of such a substance as dried earth, is a valuable and suitable means of sanitation in such circumstances where no system of water-carriage sewerage exists. The pneumatic method, which is in common use on the Continent, consists in draining the closets to a closed cesspit, which is emptied at intervals by suction, while in Liernus's method, employed in Amsterdam, St. Petersburg, and other low-lying continental cities, the cesspits are connected by pipes to a central reservoir, to which their contents are sucked by powerful suction engines.

The water-carriage system is, however, undoubtedly the best method of drainage; in the *separate system* one set of sewers conveys the sewage of houses and other buildings, while another set of drains carry off storm-water and surface water into a stream, this system being said to be more readily self-cleansing; in the *combined system*, which is the more usual and the most suitable for urban districts, the same sewers carry off both sewage and surface water.

House drains, or the pipes which join house soil-pipes and waste-pipes to the sewer, are usually made of glazed fire-clay, with a diameter of from 4 to 12 inches, and a length of 2 to 3 feet, the joints being secured with cement; cast iron pipes, 6 to 9 feet long, are also used, and are preferable, as they are stronger, while the joints, fastened with oakum and lead, are more secure. The drains must be water-tight, their interiors must be quite smooth, to prevent accumulations of solid matter, they must be laid in straight lines, with any junctions at acute angles, and they must have a uniform fall corresponding to ten times the diameter of the drain, *i.e.* a fall of 1 in 40 for a 4-inch drain. They should never be laid beneath a house, or, if this is absolutely necessary, iron drains should be used with disconnecting manholes at each side of the house. There must be complete disconnection, by means of manholes or traps, between the pipes inside and outside a house, and there must be thorough ventilation, by admission of air freely, of all parts of the drainage system.

Newly laid drains should be tested, before being covered in, by the *water test*, the different sections being plugged and filled with water and the level noted after an interval of an hour or two, or by the *smoke test*, the ends of the drain being plugged and smoke introduced by a smoke-producing machine, or by *air* or *scent tests*, carried out in much the same way.

Sewers are the larger pipes conveying the sewage from a number of drains, the smaller types being circular, those up to 18 inches in diameter made of earthenware, and those up to 42 inches in diameter of moulded concrete. Small sewers may be built of one layer of impervious bricks resting on a solid base and imbedded in hydraulic cement, while larger sewers should be two layers of thick bricks, made water-tight by a covering of Portland cement outside. While the circular form of sewer is cheaper to build and is a good form where the amount of sewage does not vary much in amount, the egg-shaped form of sewer is preferable if there is considerable variation in amount of sewage; the sewage, when there is only a small quantity, gravitates down to the narrow part, and, friction being diminished, the flow is more rapid.

The size of a sewer depends on the maximum discharge which is estimated, and also upon the fall which is available, as the larger the sewer the less the fall that is necessary. In order to avoid unnecessarily large sewers storm-water overflow pipes are connected, so that when the sewage is over a certain height, as after heavy rain, the water overflows into these pipes and is carried away into a stream or river. The velocity of the sewage should be between 2 feet and 4½ feet per second, and if it is greater than this the sewer should discharge into manholes at intervals, so as to break the force of the flow. Sewers should be flushed out periodically and should be well ventilated by shafts leading to gratings in the street or road above.

DISPOSAL OF SEWAGE.—Sewage contains, on an average, about 50 grains of suspended matter per gallon, about half the suspended matter being mineral and half organic. Towns situated upon the coast get rid of their sewage by pouring it into the sea, sufficiently far from the shore to prevent it being carried back towards it, and in sufficiently deep water to ensure adequate mixing and dilution by the sea-water, which has been shown to have a purifying effect upon sewage.

In the case of towns situated inland, or on an estuary some distance from the sea, there is greater difficulty in disposing of sewage, and various methods are employed. In London and Manchester, for instance, the sewage is led into large tanks, where the solid constituents sink to the bottom as sludge, which is afterwards carried by tank steamers out to sea and discharged there, the purified liquid being poured into the neighbouring estuary. A development of this method is the addition of chemicals to the sewage before it is led into the settling tanks, insoluble compounds being formed which precipitate with the suspended matter. Lime with alum, as is used in Glasgow, or with ferrous sulphate, are the most usual agents employed.

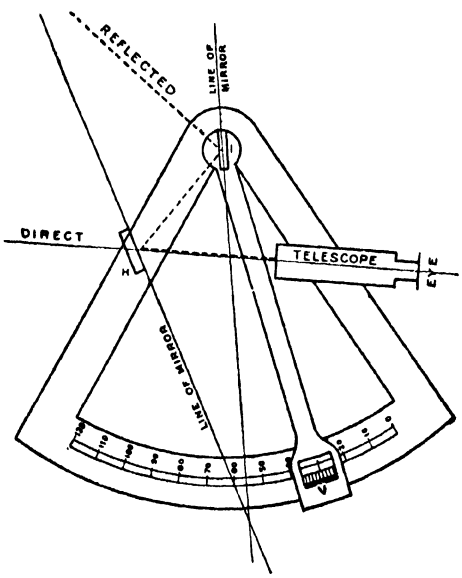
The land is frequently made use of as a purifying agent for sewage, the *broad irrigation system*, consisting in distributing the sewage over a large area of agricultural land, on which grasses and taproots for feeding cattle are grown. The soil should be sandy or loamy, and the surface should have a gradual slope, the sewage being distributed over it by narrow trenches. Purification is brought about by the sewage percolating through the soil, not by merely flowing over it. In the *downward intermittent filtration* method the flow of sewage is concentrated for a certain number of hours on a small area of land, and is then turned on for the same time to another equal area, and so on, each of the areas resting, while air enters it, during the time the sewage is filtering through the other areas.

The *bacterial method* of treating sewage is the method which is now becoming generally employed. The sewage is first conducted to a *septic tank*, where suspended matter sinks to the bottom, and is broken down by anaerobic organisms, and is then led to filter beds consisting of cement walls containing lumps of coke or stones with rough surfaces on which aerobic bacteria flourish and break down the organic matter into harmless products, the water flowing away through perforated tiles at the bottom of the filter beds.

Purification by *electrolysis* has been carried out experimentally with some success, and, as the effluent liquid is very pure after this treatment, it may yet come into more general use.

Parkes, *Sewerage and Sewage Disposal*; Folwall, *Sewerage*.

SEWIN, see under SALMON FAMILY.



SEWING-MACHINES.—The first s.-m's were based upon the idea of performing the operations of

ordinary hand sewing, and they failed because of their cumbersome movements. One of the first practical machines had a needle with a point at each end and an eye in the middle, and it produced what was known as the shoemaker's stitch. Later machines produced the chain-stitch, but the whole seam became undone if one end of the thread was pulled. A great improvement was made by the use of two threads, one passing through the eye of the needle and the other contained in a shuttle; each stitch was locked so that it could not come undone when the thread was pulled, and hence the name lock-stitch. This double-thread stitch is used in most modern machines.

Urquhart, *Sewing Machinery.*

SEX, the quality of maleness or femaleness possessed by many animals, and at a different level by many plants. Among animals, to which the term is most frequently applied, femaleness consists essentially in the harbouring of immobile, well-fed cells—eggs or ova—within the body, and maleness in the harbouring of minute, active spermatozoa, one of which unites with an egg, and, fertilising it, stimulates the growth of a new individual. Generally the sexes are separate (dioecious); but in some groups of animals, *e.g.* amongst Snails, Liver Flukes, and others, a single individual combines male and female functions—is monœcious or hermaphrodite. Since the essentials of sex are minute internal cells, it is obvious that there can be no primary and universal external difference between male and female individuals, and yet sex is almost always associated with distinctive external characters. These vary extraordinarily in various groups: the male may be the smaller (as in many Spiders and Worms) or the larger (as in most Mammals); he is generally more gaudily coloured, bears more magnificent appendages, often used to settle matrimonial battles with his fellows, and is almost always more active than the female. More essential than such secondary characters are those which have actual value in the sexual life: in males—the modified pedipalps of Spiders, the specialised arms of Cephalopods, the intromittent organs of Reptiles and Mammals all used in depositing spermatozoa within the female aperture, the claspers of Elasmobranch Fishes, and innumerable other modifications; such organs as the highly developed mammæ of Mammals are distinctively female in character.

SEXTANT, instrument for measuring angular

distance between two objects, by means of reflection; name derived from its form, a sector of a circle bounded by an arc of 60°; principle depends upon the optical theorem that if an object is seen by repeated reflection from two mirrors which are perpendicular to the same plane, the angular distance of the object from its image is double the inclination of the mirrors; s. employed for many purposes, notably for finding altitude of heavenly bodies, the images of which are brought into coincidence with the horizon viewed directly.

SEXTUS EMPIRICUS (II. and III. cent's A.D.), Gk. physician and philosopher; lived at Alexandria and at Athens; the greatest of the later Sceptic school of philosophers.

SEXUAL SELECTION, name given by Darwin to his theory that females' choosing gaudily coloured males (or, in some birds, males with great song-power) has great effect on evolution of animals.

SEYCHELLES (3° 45′ to 6° S., 53° to 57° E.), Brit. crown colony, comprising about 90 volcanic islands, situated in Indian Ocean to N. of Mauritius, and surrounded by coral reefs; total area, *c.* 160 sq. miles; principal island is Mahé, which has an area of 55½ sq. miles, and contains the capital Victoria, an important seaport and coaling station; surface generally mountainous, reaching an extreme height of about 3000 ft.; climate tropical but healthy; produces maize, manioc, cocoa-nuts, vanilla, cloves, fruit, rubber; in Praslin, the second largest island, hats and basket-work are produced by the natives. The S. have belonged to Britain since 1814; dependency of Mauritius till 1903, when they became crown colony; administered by governor, assisted by executive and legislative councils; principal religion, R.C. Pop. (1911) 26,000.

SEYDLITZ, FRIEDRICH WILHELM, BARON VON (1721–73), Pruss. general; famous cavalry leader; colonel (1755) of 8th Cuirassiers, which became noted regiment; commander-in-chief of cavalry in Seven Years War, and distinguished himself at Zorndorf, Hochkirch, Kunersdorf, Freiberg.

SEYMOUR, ST. MAUR, family name of Duke of Somerset; first heard of in XIII. cent.; Sir Roger m. coheir of Lord Beauchamp of Somerset (d. 1361) and became ancestor of later Dukes of Somerset; his grandson, Roger, m. heiress of Wolf Hall, Wiltshire, where Seymours then established themselves; Sir John Seymour, favourite courtier of Henry VIII., was father of Queen Jane, Protector Somerset, Thomas, Lord Seymour of Sudeley (Lord High Admiral of England, who m. Katherine Parr); Protector's grandson was made baronet, 1611; from him descended Sir Edward Seymour, who approved of Revolution, 1688, but became Tory and was Speaker; his grandson became Duke of Somerset; Protector's son by second marriage was cr. Lord Beauchamp and Earl of Hertford, 1559, and was grandfather of William, Duke of Somerset, and Francis, cr. Baron Seymour of Trowbridge, 1641.

SEYMOUR (38° 53′ N., 85° 48′ W.), city, Jackson County, Indiana, U.S.A.; railway workshops; manufactures woollens. Pop. (1910) 6305.

SEYMOUR, HORATIO (1810–86), Amer. statesman; governor of New York State, 1852–54, 1863–65; incurred unpopularity for vetoing Temperance Bill.

SEYNE-SUR-MER (43° 6′ N., 5° 52′ E.), seaport town, Var, France; shipbuilding yards. Pop. 19,750.

SFAX (34° 48′ N., 10° 46′ E.), seaport town, on Gulf of Gabes, Tunis; exports fruits, oil; taken by the French, 1881. Pop. *c.* 48,000.

SFORZA, Ital. family, important in XV. and XVI. cent's; founded by Giacomo Muzio (1369–1424), a peasant who rose as *condottiere* under Count Alberigo de' Barbiano, and obtained title SFORZA THE STRONG. His s., Francesco, m. dau. of Duke of Milan, and himself became duke, 1450; extinction of male line, 1535, when Austria annexed duchy.

SFORZA, CATERINA (1463–1509), Countess of Forlì; natural dau. of Galeazzo Maria Sforza (1444–76); m. Girolamo Riario, Count of Imola, s. of Pope Sixtus IV.; cruel and warlike; Girolamo was murdered, 1488; Caterina, after desperately defending Forlì, surrendered to Cesare Borgia, 1500.

SHABATS (44° 45′ N., 19° 43′ E.), town, on Save, Servia; bp.'s see; agricultural trade. Pop. 11,500.

SHACKLETON, SIR ERNEST HENRY (1874–), see POLAR REGIONS.

SHAD, see under HERRING FAMILY.

SHADDOCK, see CITRUS.

SHADOW, the figure of an opaque body projected as the result of its interception of light rays. An opaque body illuminated by a source of light like the sun—which is not a point of light—has numerous s's undistinguishable from one another which cause a *penumbra* or partial s. to be formed round the *umbra* or s. proper. *Astronomical* s's, cast by planets and their satellites in space from the sun's light, cause eclipses (*q.v.*).

SHADWELL, THOMAS (1640–92), Brit. playwright; succeeded Dryden as poet-laureate, and though successful as a dramatist in his day survives now by the stinging satire of Dryden, who nicknamed him 'MacFlecknoe.'

SHAFTESBURY (51° 1′ N., 2° 12′ W.), town, Dorsetshire, England.

SHAFTESBURY, ANTHONY ASHLEY COOPER, 1ST EARL OF (1621–83), Eng. politician; succ. father, Sir John Cooper, Bart., of Rockbourne, Hants, 1631; studied law; fought for king, 1643, but went over to Parliament, 1644, and captured Sturminster and Shaftesbury; councillor of state, 1653–60; member of Cromwell's council, 1653–54, but afterwards led opposition and aided in Restoration; actions under Commonwealth abused by both parties; Cromwell found him an obstacle, while Dryden calls him 'the loudest bagpipe of the squeaking train'; S. held high position under Charles II.; created baron, 1661; Chancellor of Exchequer, 1661–67; Lord of Treasury, 1667–72; member of Cabal, whose foreign policy was odious to country; earl and Lord Chancellor, 1672; finding feeling in country dangerously strong against Cabal, sought popularity by leading anti-popery movement; imprisoned, 1677–78; pres. of Council, 1679; imprisoned, 1681, but vindicated of treason by a jury reported to have been packed by his supporters; trial was subject of Dryden's *Medal*; escaped to Holland, where he died; character immortalised in Dryden's *Absalom and Achitophel*, where unstinted blame for the cynical schemer is mixed with admiration for the

> 'fiery soul, which, working out its way,
> Fretted the pigmy body to decay.'

Life, by Christie (1871), Traill (1886).

SHAFTESBURY, ANTHONY ASHLEY COOPER, 3RD EARL OF (1671–1713), moral philosopher. Grandson of the 1st earl; ed. under Locke's supervision, travelled abroad, was for a time M.P. for Poole, but was prevented by ill health from taking much part in politics. His collected Essays, entitled *Characteristicks of Men, Manners, Opinions, and Times*, were pub., 1711. Against the 'selfish' theory of Hobbes, S. argues that the individual is always a member of a social system, and has social affections as natural as 'self-affections.' Virtue lies in a proper balance of the affections, and Shaftesbury maintains (truly, but on rather shallow grounds) that the pursuit of the public good coincides with the private happiness. His well-known comparison of goodness with beauty, and his introduction of a moral sense apprehending goodness as the æsthetic sense does beauty, and leading to disinterested love of goodness, are characteristic of his attitude towards life. See ETHICS.—Rand, *Life* (1900).

SHAFTESBURY, ANTHONY ASHLEY COOPER (1801–85), 7TH EARL OF (1851), 'Liberal Conservative' politician; as member of Commons (from 1826) carried through Ten Hours Bill; author of many subsequent labour regulations.

SHAFT SINKING is employed in mining for working mineral deposits which cannot be reached by tunnelling. Shafts are generally cylindrical or rectangular in cross section, and are lined with steel, concrete, masonry, or timber. They may be either vertical or inclined, the latter invariably rectangular. Rectangular shafts may be divided into four or more compartments, but cylindrical shafts rarely have more than two. The sinking of a shaft in dry rock is not difficult, but where the ground is soft and wet the process is troublesome and expensive. Vertical shafts may be 5000 feet in depth, and inclined shafts are sometimes more than 6000 feet long. Shafts are used for hoisting and ventilating purposes, and for pumping and transmitting underground steam or other power.

SHAG, see CORMORANT.

SHAGIA, an African tribe of Hebrew origin inhabiting both banks of the Nile in the region of the third cataract. Their blood is now very mixed.

SHAGREEN, leather made from skin of sharks, rays, etc.; the nodules polish well and resist wear.

SHAH JEHAN (1592–1666), emperor of Delhi; built the Taj Mahal (see AGRA), a magnificent palace at New Delhi, and the Pearl Mosque at Agra; imprisoned, 1658–66, by his son Aurangzeb (*q.v.*).

SHAH NAMA, see FIRDAUSI.

SHAHABAD (25° N., 84° E.), district, Patna division, Bihar and Orissa, India; capital, Arrah. Pop. (1911) 1,969,696.

SHAHJAHANPUR (27° 53′ N., 79° 57′ E.), city, cantonment, United Provs., Brit. India; manufactures sugar. Pop. (1911) 71,778.

SHAHPUR (32° 16′ N., 72° 31′ E.), town, Rawal Pindi, Punjab, India. Pop. 9500.

SHAHRUD (36° 25′ N., 55° E.), town, Persia. Pop. *c.* 10,000.

SHAKERS, Amer. religious denomination, with full title, 'The United Society of Believers in Christ's Second Appearing.' The term Shakers was formally applied to the Quakers, from whom the S. split off. Their leader was Ann Wardley, who, with some followers, migrated to America, 1774. S. believe God to be bisexual, and they reject the deity of Christ; they practise communism and live industriously.

SHAKESPEARE, WILLIAM (1564–1616), Eng. dramatist and poet; generally regarded as the greatest imaginative and intellectual force the world has yet known; b. April 23, 1564, at Stratford-on-Avon, Warwickshire, S. grew up in the 'spacious times' of Elizabeth, an age of great national triumphs in literary as in other fields (see ENGLAND: *History* and *Literature*). S.'s father was JOHN SHAKESPEARE (d. 1603), a Stratford merchant and burgess; his mother, MARY ARDEN (d. 1608), a wealthy farmer's daughter. William was their eldest son, but third child; of his younger brothers, Richard died in 1613, and Edmund in 1607.

At Stratford Grammar School (*c.* 1570–78) S. acquired 'small Latin and less Greek'; he learned much of nature in his native county, and of man in London, whither he moved, *c.* 1586, having, it is said, offended the local landowner, Sir T. Lucy, by deer-stealing and lampoons. S. left behind him his wife, ANNE HATHAWAY (b. 1556), a local husbandman's daughter, whom he had married in haste, Nov. 1582. Their children were SUSANNA (b. May 1583; m. Dr. John Hall), and twins (b. 1585)—JUDITH (m. Thomas Quiney) and HAMNET (d. 1596), S.'s only son.

In London, S. found employment about the theatres, and had risen by 1592 from call-boy to actor, playadapter, and dramatist. In that year his position was such as to incur a savage attack by the jealous, dying Robert Greene. S. belonged to the company under the Burbages called Earl of Leicester's men, afterwards Lord Chamberlain's Company and King's Players.

Early Plays.—With Marlowe and others, S. revised or rewrote the three parts of *Henry VI.* and touched up *Titus Andronicus*, *c.* 1589–90. *Love's Labour's Lost* (*c.* 1590), probably the earliest of S.'s own plays, gives promise of the great romantic comedies of a later period. *Two Gentlemen of Verona* (1591) shows S.'s remarkable powers of giving fresh treatment to a borrowed plot. To the same date belongs a third comedy—the *Comedy of Errors*, which, abounding in

boisterous farce, follows classical models. In *Richard III.* (*c.* 1592) he returned to Eng. history, and achieved a great tragedy which still holds the stage; an even greater tragedy, *Richard II.*, followed, *c.* 1593.

From now onwards S. dares more and more to be himself; shaking off the influence of Marlowe he found expression in a great lyric outburst. Turning to non-dramatic poetry, he wrote *Venus and Adonis* (pub. 1593), followed, with equal success, by the *Rape of Lucrece* (1594); fine narrative poems, but cold in comparison with his plays. S.'s star was in the ascendant; he had become warmly attached to the Earl of Southampton, and in 1594 he had the honour of acting before the queen.

Second Period.—What is generally called S.'s second period lasted from *c.* 1594–1601. In 1597 he was sufficiently well-off to buy New Place in Stratford, among his sources of income being a share in the profits of the Globe Theatre. From 1598 onwards (according to evidence discovered by Prof. C. W. Wallace in 1909) he lived in London with a Huguenot family called Mountjoy, in Monkwell Street. In 1601 S. was deeply affected by his friend Southampton's imprisonment for complicity in the Essex Plot, as is reflected in the plays of his third and most serious period. The plays of his second period are full of exuberance; they include the beautiful *Romeo and Juliet* (in its maturer form *c.* 1594), three of S.'s greatest romantic comedies—*A Midsummer Night's Dream* (1594), *Merchant of Venice* (1595), and *As You Like It* (1599); the glorious dramatic histories, *Henry IV.* (2 parts: 1596–98) and *Henry V.* (1599), which showed Prince Hal as king; while Falstaff reappeared (tradition says at Elizabeth's command) in the *Merry Wives of Windsor* (1599). Other merry plays—*Taming of the Shrew* (*c.* 1596), *Much Ado about Nothing* (1599), *Twelfth Night* (1600), and *All's Well that Ends Well* (*c.* 1601)—also belong to this bounteous period, when S.'s art developed and his wonderful imagination found vent in sunny comedies and stirring patriotic plays.

Third Period.—The great Rom. tragedy of *Julius Cæsar* (*c.* 1601) fittingly ushers in the period of gloom and tragedy, to which belong such masterpieces as *Hamlet* (1602), *Othello* (1604), *King Lear* (*c.* 1605), *Macbeth* (1606). The blow of Southampton's imprisonment, combined with changing political conditions, the passing of the glowing Elizabethan age, and the poet's maturer years, to produce a mental struggle and crisis, clearly revealed in the plays mentioned and in others which are included in this short but extraordinarily fertile period (1601–9) of sublime and almost unrelieved tragedy—*Troilus and Cressida* (*c.* 1608), a cynical comedy, satirising Greek and Trojan heroes; *Measure for Measure* (*c.* 1603), another sombre comedy; *Timon of Athens* (1607), a bitter tragedy; *Pericles* (1608) with its loathsome scenes; *Antony and Cleopatra* (1608) and *Coriolanus* (1609), great tragedies both.

S.'s third period, or period of maturity, says Oliphant Smeaton in his *Life*, 'not only saw his genius at its zenith of power, but it saw him in consequence of that very fact driven, by the sheer propulsive force of imperious intellectual necessity, to grapple with the highest and the deepest themes, of life, death, and futurity, analysing the mysteries of being, the origin of evil, the law of human atonement for sin; all these, and other profound problems as well, were faced by him, during that soul-searing epoch of mental and moral self-examination and appraisal.' The public, it should also be added, seemed also to favour tragedy at this period, and S. gave them of his best.

Sonnets and Last Period.—In 1609 appeared S.'s *Sonnets*—poetical gems round which much controversy has raged. Critics have disagreed as to the identity of the poet's friend 'Mr. W. H.' (who is described as the 'onlie begetter' of the Sonnets), and of the 'dark lady' who inspired the second series; Southampton and Pembroke are among those identified with the former, while Mary Fitton is by many identified with the latter.

S.'s last period is marked by a calmer, happier atmosphere; the crisis is past. Prosperous days favoured the poet's closing years. His last plays, *Cymbeline* (1610), *A Winter's Tale* (1611), *The Tempest* (1611), are rich and mellow, beautiful and romantic, tinged with the sweet sorrow of one who has found peace when on the eve of parting with life. About 1611 S. was able to bring his business connection with the stage to an end, and retire, with prematurely failing health, to his native Stratford, where at New Place he resided till his death (April 23, 1616). He lies buried in Stratford Church. In addition to the plays mentioned, S. is known or believed to have collaborated with other dramatists in such plays as *Henry VIII.* (*c.* 1613) and *The Two Noble Kinsmen* (*c.* 1613).

The magnitude and inexplicability of S.'s genius, the diversity and depth of his knowledge, and the meagreness of the known details of his life have given rise not only to an enormous body of lit. dealing with the man and his work, but to an extraordinary theory, that the plays bearing S.'s name are not his, but the work of Francis Bacon. The contemporary evidence of his friends—and rivals—ought, however, to be sufficient answer to Baconians; men like Ben Jonson, who knew him well, while disapproving of much in S.'s methods and productions, could not but love and honour him 'this side idolatry.' And so with succeeding generations. There have been times, as in the XVIII. cent., when devotees of classical rules and models have frowned upon S.'s romantic irregularities; but S. has never lacked enthusiasts, and to-day he is firmly established as the greatest name in Eng. literature, if not in the literature of the world.

Since the *First Folio* of S.'s plays (now exceedingly rare and valuable) was issued by his old colleagues, Heminge and Condell, in 1623, down to the sumptuous and scholarly editions of the XX. cent., scores and scores of editions of S.'s works have been published, and the critics, not of Britain alone, but of the whole world, have united in paying tribute to the universality and splendour of his genius; while it has ever been the height of the ambition of the greatest actors and actresses to interpret fitly S.'s leading rôles.

The passing of three centuries has failed to make obsolete or antiquated the master-dramatist's works in tragic and in comic vein alike. No writer in English or any other language has furnished posterity with so many current lines and phrases. S.'s vocabulary was extraordinarily rich; his knowledge of Mankind and of Nature amazingly varied and profound. His plots are not original; but his treatment of the stories he borrowed from other writers was essentially his own. His boundless imagination rose triumphant over the limitations of the Elizabethan theatre, and refused to be restricted by classical unities and traditions. Blank verse, Shakespeare the poet used with a sublimity, a harmony, a dramatic fitness which others may at times have equalled, but have never excelled.

XX. cent. criticism of S. deprecates idolatry, and, while hailing him as a master, boldly proclaims his faults.

Life, by Sidney Lee (1898), Smeaton (1911); Herford, *Shakespeare* (1912: People's Books); Raleigh, *Shakespeare*; Goldwin Smith, *Shakespeare the Man*; Hudson, *Life, Art, and Characters of Shakespeare*; Bradley, *Shakespearian Tragedy*; Dowden, *Shakespeare's Mind and Art*; Hazlitt, *Characters of Shakespeare's Plays*; Gervinus, *Commentaries*; Mrs. Jameson, *Shakespeare's Heroines*; Seccombe and Allan, *The Age of Shakespeare*; Schelling, *The Elizabethan Drama*; *Concordance*, by Cowden Clarke and by Bartlett; and works by Coleridge, Lamb, Schlegel, and other critics.

SHALE, see CLAY.

SHALMANESER, name of kings of Assyria (*q.v.*).

SHAMANISM, religion of Tartar races.

SHAMASH, sun-god of Babylonia and offspring of Nannar, the moon-god, administer of justice and giver of laws to men.

SHAMO, see GOBI.

SHAMOKIN (40° 50′ N., 76° 36′ W.), town, North-

umberland County, Pennsylvania, U.S.A.; coal-mines. Pop. (1910) 19,588.

SHAMROCK, Irish national emblem; the name is given to Wood-Sorrel, Bird's Foot Trefoil, and Lesser Yellow Trefoil.

SHANGHAI (31° 15′ N., 121° 26′ E.), town, Kiang-su, China, near the mouth of the Yang-tse-kiang; chief commercial city of China; central and walled parts of town consist of narrow and dirty streets, but a number of well-built suburbs have grown up outside the walls, those in the N. forming the residential quarters of the foreign population, which numbers about 7000, chiefly English and French. S. is situated in midst of great plain, producing rice, cotton, and fruits, and is important centre of trade; it is a Treaty port, and was opened to foreign trade in 1842. Pop. (1910) 651,000.

SHANHAI-KWAN (40° N., 119° 50′ E.), frontier town, near the Great Wall, Chili, China. Pop. *c.* 33,000.

SHANKLIN (50° 37′ N., 1° 11′ W.), watering-place, Isle of Wight, England. Pop. (1911) 4751.

SHANNON (53° 6′ N., 8° 6′ W.), principal river of Ireland, flows through Loughs Allen, Ree, and Derg; enters Atlantic; length, 250 miles.

SHANNY, see BLENNIES.

SHANS, Mongol tribes of China, Burma, Siam; of same kin as Laos (*q.v.*); semi-barbarous; noted for chased work; many are under Brit. protection; resemble Siamese in institutions and religion.

SHAN-SI (37° 30′ N., 112° E.), province, N. China; mountainous; rich in coal, iron ore, salt. Pop. (approximate, 1911) 9,950,175. Capital, Tai-yuen-fu.

SHAN-TUNG (36° 30′ N., 118° 30′ E.), maritime province, China, bordering on Yellow Sea and Gulf of Pe-chi-li; mountainous in the E.; extensive deposits of coal, iron, and other minerals; produces grain, silk. Pop. (approximate, 1911) 26,889,360. Capital, Tsinan-fu.

SHAPUR I. (241–72), king of Persia; won great victories in Armenia and Syria, and captured Rom. emperor, Valerian, 260.—**Shapur II.**, king of Persia, 310–79; waged war with Rom. Empire, 337–63, in which Emperor Julian was slain, 363, and Romans driven from Armenia; recolonised Susa with Rom. captives.

SHAREHOLDER, see COMPANIES, LIABILITY.

SHARI (11° N., 16° E.), river, Central Africa; enters Lake Chad.

SHARKS AND DOG-FISHES.—These form the group Selachoidei among the SELACHIANS (*q.v.*). All can be easily recognised by the firm, round, tapering body with projecting snout and unsymmetrical tail, by the external gill-openings, the rough, sandpaper-like skin, and the strong, sharp, triangular teeth set in many rows, the hinder of which are ready to replace a worn or damaged series in front. All are carnivorous, devouring other fishes or offal, or occasionally man, but a few, like the Basking Shark, which feeds on seaweeds and medusoids, are harmless. The majority lay their eggs in horny 'purses,' sometimes attached to seaweeds, but several, such as the Hammer-Head and the Porbeagle, the 'Hounds,' the Piked Dog-Fish, bring forth living young.

There are many kinds of Dog-Fishes and Sharks, names which indicate no natural groups, but refer rather to size than to essential characters; it will suffice to mention a few typical examples. The Dog-Fishes proper (*Scylliidæ*) are mostly small in size, and occur in all seas. Two species of *Scyllium* are common in Brit. waters, and are sometimes used for food—the Nurse, Bounce, or Larger Spotted Dog-Fish, and Rough or Row Hound or Lesser Spotted Dog-Fish, the former reaching a length of 4 ft., the latter of 3½ ft. About the same size is the Picked or Piked Dog-Fish (*Acanthias vulgaris*), all common in Brit. waters. Rarer and less welcome are the Blue Shark (*Carcharias glaucus*), which every summer destroys many nets and fishing-lines off the Cornish coast; and the fierce Porbeagle (*Lamna cornubica*), 10-foot examples of which have been caught off Britain. Closely related to the last is the most vicious of all—the man-eating, or Great White Shark (*Charcharodon rondeletii*), a dreaded inhabitant of all tropical and subtropical seas, sometimes reaching a length of 40 ft. A great contrast is afforded by the Basking Shark (*Cetorhinus maximus*), which, equally large, is a lazy, inoffensive creature, useful on account of the oil in its liver, and an occasional visitor to Britain. One cannot omit another rare British wanderer, the Hammer-Head (*Sphyrna zygæna*),—characterised by remarkable lateral processes of the head, at the end of which the eyes are placed,—a vicious and voracious creature.

SHARON (41° 15′ N., 80° 32′ W.), town, on Shenango, Mercer County, Pennsylvania, U.S.A.; iron manufactures. Pop. (1910) 15,270.

SHARP, JAMES (1618–79), Scot. ecclesiastic; ed. Aberdeen; a man of ability, he soon rose to the front and joined the 'resolutioners,' as against the 'protestors' (uncompromising Covenanters); taken prisoner by Cromwell, he was kept some time in London, but in 1659 was selected by Monck to reconcile Presbyterians to the Restoration; he played a double game, and, being appointed abp. of St. Andrews, 1661, persecuted the Presbyterian Church; much hated; murdered on Magus Moor, near St. Andrews, by Balfour of Kinloch, Hackston of Rathillet, and other Covenanters.

SHARP, JOHN (1645–1714), abp. of York, 1691; intimate friend of Queen Anne.

SHARP, WILLIAM (1856–1905); Scot. poet, critic, and novelist; wrote also as FIONA MACLEOD.

SHARPSBURG (40° 30′ N., 79° 56′ W.), town, on Allegheny, Pennsylvania, U.S.A.; manufactures foundry products and paint. Pop. (1910) 8153.

SHASI, SHAHI (30° 17′ N., 112° 17′ E.), treaty port, on Yang-tse-kiang, Hupeh, China; cotton goods. Pop. (1911) 90,000.

SHAT-EL-ARAB, see EUPHRATES.

SHAW, GEORGE BERNARD (1856–), Brit. dramatist, critic, and socialist; b. Dublin; attained considerable success with dramatic criticisms in *Saturday Review*; became associated with the Fabian Society, of which he is one of the most brilliant members. Among his plays are: *Man and Superman, John Bull's Other Island, Candida, You Never Can Tell, Fanny's First Play.* Several (*Mrs. Warren's Profession, The Showing-up of Blanco Posnet*) have been banned by the censor, a circumstance which has given S. the opportunity for writing some brilliant prefaces. A remarkably clever dramatic critic, an advocate of the 'sanity of art,' a charming wit, and a truly ingenious theorist.

SHAW, RICHARD NORMAN (1831–), Scot. architect; built New Scotland Yard; R.A., 1877.

SHAW-KENNEDY, SIR JAMES (1788–1865), Scot. general and author; performed feats of bravery in Light Brigade in Peninsular War; pub. *Defence of Great Britain and Ireland*, 1859, *Notes on Waterloo.*

SHAWNEE (35° 18′ N., 96° 55′ W.), city, Oklahoma, U.S.A.; cotton. Pop. (1910) 12,474.

SHEAR, see ELASTICITY and STRENGTH OF MATERIALS.

SHEARWATER FAMILY (*Puffinidæ*), a family of strong-flying marine swimming-birds, with very long and slender beaks hooked at the tip. The SHEARWATER (*Puffinus*) is found all over the world, whereas the FULMAR is confined to the N. hemisphere, having fled within recent years to northern Scot. islands.

SHEATH-BILLS (*Chionis*), so called on account of a horny plate projecting over the base of the bill; 3 species of white pigeon-like birds which inhabit the coasts of Antarctic and sub-Antarctic seas.

SHEBIN EL-KOM, town, EGYPT (*q.v.*).

SHEBOYGAN (43° 43′ N., 87° 41′ W.), city, on Lake Michigan, capital, Sheboygan County, Wisconsin, U.S.A.; dairy-farming centre; manufactures furniture. Pop. (1910) 26,398.

SHECHEM (32° 11′ N., 35° 17′ E.) (modern Nablus), ancient city, between Mounts Ebal and

Gerizim, Palestine; became capital of the Samaritans; in early Christian times called Neapolis.

SHEE, SIR MARTIN ARCHER (1770–1850), Brit. portrait painter; b. Dublin; settled in London; attained some contemporary fame; made P.R.A., 1830.

SHEEP GROUP (*Caprinæ*), a sub-family of BOVIDÆ, in Pecora section (*q.v.*) of the Even-Toed Ungulates. The group includes the closely allied SHEEP (*Ovis*) and GOAT (*Capra*) with their connecting link—the curious MUSK OX (*Ovibos moschatus*). They are distinguished by the presence of ridged, curved, or spiral horns in both sexes, those of the female being small, a somewhat hairy muzzle, and a short and flattened tail. They are widely distributed over all the higher mountains of Southern Europe, Central Asia, and North Africa.

Of the Goats (*Capra*), which are recognised by their bearded chins, one of the best known is the ALPINE IBEX, or STEINBOK, living in herds on the Ital. side of Monte Rosa, the male having strongly ridged horns often 2 ft. in length, which curve boldly backwards from the forehead. More familiar is the DOMESTIC GOAT (*C. hircus*), with many forms found almost all over the world, including the valuable CASHMERE, ANGORA and COMMON varieties. The animal known as the MUSK OX (*Ovibos*), equalling in size small Welsh or Scotch cattle, and covered with long, thick, brown hair, is closely related to the Goats, and is confined to the most northern parts of North America.

The true Sheep (*Ovis*), distinguished from Goats by the absence of a chin beard, are in their wild state chiefly inhabitants of Asia, but representatives are also found in N. Africa and N. America. Though essentially an inhabitant of high mountainous parts of the world, the sheep as a domestic animal flourishes in the temperate regions of both hemispheres, the different breeds varying greatly in external characters. Horns may be present, as in Blackfaced Sheep of the Scot. Highlands of both sexes, or altogether absent in the female, as in the Whitefaced Welsh Mountain Sheep, the Soay of St. Kilda, and the MOUFFLON (*O. musimon*) of Corsica and Sardinia, or absent in both sexes, as in the heavy breeds of the Leicester, South, or Oxford Down Sheep of the Brit. Isles. Long-woolled sheep are usually distributed in mountain and heath districts, while the short, fine-fleeced animals, as the Lincoln and Leicester breeds of England, are reared on pastoral or arable land.

The Fat-tailed Sheep of Barbary, with long, pendulous ears, are well known. In common with many goats, sheep possess between the two front toes a small sac, which secretes an oily odorous substance, and this, tainting the tracks of the animal, enables other individuals to recognise by their strong sense of smell the presence of numbers of their species.

No other animal possesses relatively greater economic value than the sheep. Their flesh constitutes a large proportion of the food-supply of communities, while their fleeces supply the raw material for one of our greatest manufactures.

SHEEPSHEAD, AMERICAN, see SEA BREAM.

SHEERNESS (51° 27′ N., 0° 45′ E.), fortified seaport, dockyard, naval arsenal, at junction of Medway and Thames, on Isle of Sheppey, Kent, England. Pop. (1911) 17,494.

SHEFFIELD (53° 28′ N., 1° 28′ W.), town, W. Riding, Yorkshire, England; chief seat of Eng. cutlery trade, manufacturing every kind of cutting tool; other industries include conversion of iron into steel and the production of armour-plates, rails, Britannia metal, and electro-plated goods. Has fine public buildings, including municipal buildings and Cutlers' Hall. Its chief magistrate is now styled Lord Mayor, and in 1905 it received a charter for establishment of a univ. Mary, Queen of Scots, was confined in the castle (destroyed by order of Parliament in 1646) in 1570–84. Pop. (1911) 454,653.

SHEFFIELD PLATE is made by coating copper with silver, a process discovered by accident, 1742; silver first imposed directly on utensil, later sheets of silver and copper heated and rolled together, cooled and shaped; ornaments of S. p. were popular till discovery of electro-plating, 1837. The recent demand for S. p. has produced many imitations.

SHEIL, RICHARD LALOR (1791–1851), Irish lawyer, statesman, and author; produced successful plays, 1814–22; commenced *Sketches of the Irish Bar*, 1822; joined O'Connell's Catholic nationalist agitation; master of Mint, 1846; ambassador to Tuscany, 1850.

SHEKEL, Hebrew standard of weight for valuing metal; subsequently a gold, silver, or copper coin; the gold s. probably weighed 252⅜ grains troy (value, *c.* £2, 4s. 8d.), the silver s. 224½ grains troy (value, *c.* 2s. 10d.). S. OF THE SANCTUARY was possibly a post-exilic name for the silver s.

SHEKINAH, Hebrew word originally meaning 'the dwelling,' and which afterwards came to be used as a synonym for God. The use of such a synonym is the result of the Semitic fear of limiting God in space or time—hence the vagueness of the term.

SHELBYVILLE (39° 32′ N., 85° 45′ W.), city, on Big Blue River, capital, Shelby County, Indiana, U.S.A.; manufactures furniture. Pop. (1910) 9500.

SHELD-DUCK, see under DUCK FAMILY.

SHELDON, GILBERT (1598–1677), bp. of London, 1660; abp. of Canterbury, 1663.

SHELL, see AMMUNITION.

SHELLAC, see LAC.

SHELLEY, MARY WOLLSTONECRAFT (1797–1851), Eng. writer; dau. of William Godwin; second wife of the poet Shelley. As an author she is remembered chiefly for her novel *Frankenstein*.

SHELLEY, PERCY BYSSHE (1792–1822), Eng. poet; b. Field Place, Sussex; s. of a wealthy squire; ed. Eton and Univ. Coll., Oxford. Much of his early youth was devoted to writing worthless novels and poems, and he was expelled from Oxford for a pamphlet on atheism. Soon afterwards he eloped with Harriet Westbrook, a school-friend of his sister's, and dau. of a retired publican, and was disowned by his family. With her he led a wandering life, visiting Southey at Keswick, and taking part in various political and philanthropical undertakings in Ireland and Wales. In 1813 he pub. his first poem of promise, *Queen Mab*. In 1814 he fell in love with Mary Godwin, dau. of William Godwin, the philosopher, and Mary Wollstonecraft, and, being by now estranged from Harriet, eloped with Mary to the Continent.

On his return he pub. his first great poem *Alastor*, followed, in 1816, by the fine but tedious *Revolt of Islam* in Spenserian stanza. Various circumstances, bad health, the suicide of his first wife, and the decision in Chancery that he was unfit to bring up her children, drove him abroad to Italy in 1818. Here he wandered about for four years, to Venice, Rome, Naples, and Pisa, and here also his greatest poems were composed, *Prometheus Unbound* (1818–19), the finest lyrical drama in European lit., the magnificent but gloomy tragedy of the *Cenci* (1819), *Ode to the West Wind* (1819), *Witch of Atlas* (1820), *Epipsychidion* (1820), and *Adonais* (1821), an elegy on the death of Keats.

In the summer of 1822 he was drowned in the Gulf of Spezia; his body was afterwards burned in the presence of Byron, with whom he had been living, and the ashes were deposited in the Prot. Cemetery at Rome. Shelley's work is inspired by an ardent love of humanity, and contains the most purely and intensely lyrical poetry of all Eng. lit.

Life, by Symonds (Eng. Men of Letters, 1878), Sharp (1887), Dowden (1886), Clutton-Brock (1909).

SHELL-HEAPS, KITCHEN-MIDDEN, prehistoric mounds of refuse found in all parts of the world. They contain the shells of edible shell-fish, bones of animals, fragments of utensils made from stone and bone. Archæological evidence seems to prove that these heaps belong to the earlier half of the Neolithic Age.

SHELL-MONEY preceded use of metal in every

civilisation, and is still employed in central Africa; favourite form is *Cyprœa moneta* (cowry money). Superseded in Brit. possessions by metal currency, 1913.

SHEM, in Genesis, s. of Noah; term 'Semitic' derived thence.

SHEMAKHA (40° 35′ N., 48° 38′ E.), town, Baku, Russ. Transcaucasia; manufactures silks. Pop. 23,000.

SHENANDOAH (41° 50′ N., 76° 11′ W.), city, Schuylkill County, Pennsylvania, U.S.A.; coal-mining centre. Pop. (1910) 25,774.

SHENANDOAH VALLEY CAMPAIGNS (1862–65), Amer. Civil War.—Shenandoah Valley, between two chains of Appalachian Mountains, was of great importance in Virginia campaigns in War of Secession, as it formed protected route from Richmond to Washington, and supplied provisions; good turnpike road led from one end of valley to the other. Federal forces under Banks invaded the valley, 1862, while M'Clellan advanced on Richmond; Confederates, under Jackson, defeated at *Kernstown* and driven steadily up the valley, but received reinforcements, captured Front Royal, and would have trapped Banks in Newmarket had he not made skilful retreat; Jackson's pursuit stopped by M'Dowell and Frémont, but he defeated Federals at *Port Republic*. Jackson was called away, but returned to valley and drove Federals from *Harper's Ferry* and *Martinsburg*, 1862.

Ewell led Confederate troops in capture of Martinsburg and Winchester, 1863. When Grant prepared for capture of Richmond, 1864, Federal attacks were made on Staunton and Lynchburg; Hunter won victory at Piedmont, June 5, but was forced to retreat; Confederates under Early then marched down the valley towards Washington, but help came in time to save the panic-stricken city, July 13; Early withdrew into the valley, which became his base for raids; Unionists under Sheridan defeated Early at *Opequan*, Sept. 19, and at *Fisher's Hill*, Sept. 22, and then laid waste from S. to N.: attempt of Early to recover valley foiled by great defeat at CEDAR CREEK, Oct. 19; valley, no longer important, was finally secured for Union by victory of WAYNESBORO, March 1865.

SHENDI (16° 40′ N., 33° 26′ E.), town, on Nile, Nubia, Egypt. Pop. 12,000.

SHÊNG-KING (41° 30′ N., 123° 30′ E.), province, Manchuria, bordering on Gulfs of Korea and Liao-tung; includes the peninsula of Liao-tung. Pop. (1910) 5,830,819. Capital, Mukden.

SHEN-SI (36° N., 109° E.), inland province, China; mountainous; watered by the Wei-ho; has coal mines; produces wheat, cotton. Pop. (approximate, 1911) 8,037,220. Capital, Singan-fu.

SHENSTONE, WILLIAM (1714–63), Eng. poet; chiefly remembered for *The Schoolmistress*, a pleasing poem in the Spenserian stanza. His *Pastoral Ballad* is perhaps finer from a literary standpoint.

SHEPHERD'S PURSE (*Capsella bursa pastoris*), plant of order Cruciferæ; has pinnatifid root-leaves, white flowers; the 'purse' is its flat, heart-shaped seed-pouch.

SHEPPEY (51° 24′ N., 0° 50′ E.), island, between estuaries of Thames and Medway and the Swale, Kent, England. Pop. (1911) 4427.

SHEPSTONE, SIR THEOPHILUS (1817–93), Eng. S. African statesman; Brit. resident in Kaffraria, 1839; agent 1845, sec. for native affairs, Natal, 1856–77; proclaimed annexation of Transvaal at Pretoria, 1877; administrator of Transvaal, 1877–79; retired, 1880.

SHEPTON-MALLET (51° 12′ N., 2° 32′ W.), town, Somersetshire, England. Pop. (1911) 5011.

SHERATON, THOMAS (*c.* 1751–1806), one of the most celebrated Eng. furniture designers.

SHERBORNE (50° 57′ N., 2° 31′ W.), town, Dorsetshire, England; has a XII.-cent. abbey church, grammar school (founded 1550), and remains of an old castle; silk-mills. Pop. (1911) 5954.

SHERBROOKE (45° 25′ N., 71° 57′ W.), city, port of entry, capital, Sherbrooke County, Quebec, Canada; woollens, cottons. Pop. (1911) 16,455.

SHERBROOKE, ROBERT LOWE, VISCOUNT (1811–92), Eng. statesman; Chancellor of Exchequer and Lord of Treasury, 1868–73; Sec. of State, 1873–74; little political ability; his proposed tax on matches gave rise to riots of match-makers, 1871, and pun *ex luce lucellum*; chiefly famed as wit with bitter tongue.

SHERIDAN, PHILIP HENRY (1831–88), Amer. soldier; became commander of cavalry of army of the Potomac in Civil War, conducted Shenandoah campaigns, won final battle of Five Forks, and forced Lee to surrender; commander-in-chief of U.S.A. army, 1883–88; united dashing qualities of cavalry officer with capacity for organisation and discipline.

SHERIDAN, RICHARD BRINSLEY (1751–1816), Anglo-Irish dramatist, politician, and orator; b. Dublin; grandson of Swift's friend, THOMAS SHERIDAN, D.D. (1687–1738); son of Swift's biographer, THOMAS SHERIDAN (1719–98), elocution master; ed. Harrow; made romantic marriage with beautiful singer, Elizabeth Linley (*q.v.*) of Bath, for whom he fought two duels; removed to London from Bath, and with his father-in-law took Drury Lane Theatre, where *The School for Scandal* was produced (1777), and *The Critic* (1779). S. had already achieved fame with *The Rivals* (1775).

Turning politician, S. entered Parliament as a Whig; became Under-Sec. for Foreign Affairs, 1782; Sec. to Treasury, 1783. Of his eloquent speeches those impeaching Warren Hastings (1787) and vindicating the Fr. Revolution (1794) are specially memorable. But as a playwright his highest distinction lay. His is the last great name in XVIII.-cent. drama; his are among the few plays of the older comedy of manners still frequently acted; wit, humour, Irish sparkle have preserved their charm and freshness.

Careless, improvident, S. was a likeable character, despite his failings.

Sichel, *Life* (1909); monographs also by Fraser Rae (1896), Mrs. Oliphant (1883).

SHERIFF, chief official of a shire and subsequently of a borough which enjoyed special privileges. Relation of s. to earl is unsettled question; description of s. in mediæval Latin as *vicecomes* seems to point to his being representative of earl; this view is disapproved of by high authorities, as functions of pre-Conquest earl are not known, but is upheld by others who believe that when an caldorman (called earl, XI. cent. onwards) received several shires to administer he appointed a deputy—shire reeve—in each shire.

The name occurs in laws of Ina (XII. cent.), but, like earl, may then have had somewhat different significance. In historical times sheriff is king's deputy in shire; powers gradually transferred to lord-lieuts. and J.P.'s; sheriff's tourn long disused, abolished, 1887. See SCOTLAND (GOVERNMENT).

SHERIFFMUIR (56° 11′ N., 3° 55′ W.), battlefield, Stirlingshire; scene of indecisive battle between Royalists and Jacobites, 1715.

SHERLOCK, THOMAS (1678–1761), bp. of Bangor, 1728, Salisbury, 1734, London, 1748.

SHERLOCK, WILLIAM (1641–1707), dean of St. Paul's, 1691.

SHERMAN (53° 34′ N., 96° 23′ W.), city, capital, Grayson County, Texas, U.S.A.; cotton manufactures. Pop. (1910) 12,412.

SHERMAN, JOHN (1823–1900), Amer. statesman; younger bro. of General Sherman; chairman of Committee of Ways and Means, 1860; Senator, 1861–77; chairman of Committee of Finance, 1867; opposed paper money and brought in Resumption Bill; Sec. of Treasury, 1877; Sec. of State, 1897–98.

SHERMAN, ROGER (1721–93), Amer. politician; member of committee which drew up Declaration of Independence; belonged to Connecticut party which exercised important influence on U.S. Constitution.

SHERMAN, WILLIAM TECUMSEH (1820–91), one of greatest Amer. generals; retired from army, 1853; head of Louisiana 'State Seminary of Learning and Military Academy,' 1860–61; left to fight for

Union in Civil War; distinguished at Bull Run, 1861, Shiloh, 1862; as general of army of Tennessee took part in victory of Chattanooga, 1863; commander of Mississippi forces, 1864, and carried out brilliant campaign, marching through Georgia to Atlanta and the sea; marched, ravaging, through North Carolina, 1865, and secured Johnston's surrender.

SHERRY, see WINE.

SHERWOOD FOREST (53° 9′ N., 1° 7′ W.), forest, Nottinghamshire; traditional retreat of Robin Hood (*q.v.*).

SHETLAND (60° 15′ N., 1° 15′ W.), group of nearly 100 islands and rocks lying N.N.E. of mainland of Scotland, and forming with Orkneys a Scot. county; there are about 27 inhabited islands, of which largest are Mainland, Yell, and Unst; area, *c.* 352,889 acres, of which Mainland has *c.* 240,000; surface comparatively level, reaching extreme height of 1472 ft. in Ronas Hill in Mainland; chief town, Lerwick; principal industry is fishing (herring, cod, ling, tusk); sheep, cattle, and ponies are raised, and there are household industries in knitting shawls, stockings, etc. The islands were taken by Magnus of Norway in 1099, and remained in Scandinavian hands until 1468, when, on the marriage of James III. of Scotland to Margaret of Norway, they were transferred to Scotland as the dowry of the latter. Pop. (1901) 27,911.

Goudie, *The Celtic and Scandinavian Antiquities of S.*

SHEVAROY HILLS (11° 55′ N., 78° 30′ E.), hill range and plateau, Salem district, Madras, Brit. India.

SHIBERGHAN (36° 40′ N., 65° 35′ E.), town, Afghan Turkestan. Pop. *c.* 13,000.

SHIEL, LOCH (56° 47′ N., 5° 35′ W.), lake, on borders of Inverness and Argyll, Scotland; length, 18 miles.

SHIELD, see HERALDRY.

SHIELD SHRIMPS, see under ENTOMOSTRACA.

SHIELDS, see NORTH SHIELDS, SOUTH SHIELDS.

SHIFNAL (52° 41′ N., 2° 23′ W.), market town, Shropshire, England; ironworks.

SHIGATSE (29° 17′ N., 88° 42′ E.), sacred town, at junction of Nyang-chu and Sangpo, in vicinity of Tashilunpo monastery, Tibet. Pop. *c.* 13,000.

SHI'ITES (Arabic for 'sect'), name of one of the two sects into which Muhammadans have split; the others, Kharigites, declared the caliphate to be elective among all Arab Moslems, but the S. defended an absolute and hereditary caliphate in the descendants of Ali, the son-in-law of Muhammad. This caliphate descended among the Eastern Moslems from father to son till IX. cent. Shi'ite theology somewhat modified the original Islamic creed—the vicegerency of Ali is added. Several sects have split off from them, and the modern Babaiism is a Shi'ite movement.

Browne, *A Year among the Persians.*

SHIKARPUR (27° 57′ N., 68° 40′ E.), town, Sind, Brit. India. Pop. 51,000.

SHILDON (54° 38′ N., 1° 39′ W.), town, Durham, England; railway shops; coal-mines. Pop. (1911) 13,488.

SHILLONG (25° 33′ N., 91° 55′ E.), town, Khasi Hills district, Assam, India. Pop. 8500.

SHILOH, modern SEILUN (32° 3′ N., 35° 18′ E.), ancient town, Ephraim, Palestine; contained the sanctuary of the ark.

SHILOH, BATTLE OF, BATTLE OF PITTSBURG LANDING, 1862, incident in Amer. Civil War; named variously from Shiloh church, by which the battle was fought, and Pittsburg Landing, farther away; technically victory for Union, but both sides suffered terrible losses.

SHIMOGA (13° 55′ N., 75° 36′ E.), district, Mysore, India. Pop. 535,000. Capital, Shimoga, on Tunga. Pop. 6200.

SHINTOISM, see JAPAN (RELIGION).

SHIP.—The Development of Ships.

Ancient Ships.—The primitive boat, made by hollowing out a tree-trunk by fire or by rough tools, must have been among the first inventions of man. Upon the clumsy dug-out, the canoe of bark or skin marks a great advance, being light yet sufficiently strong. The construction of larger vessels, however, involves new difficulties—questions of strength to resist the strains that grow with increase of dimensions, and with the use of sails, difficulties in securing watertightness and the perfect jointing of many parts.

Yet the art of shipbuilding on this larger scale was known in ancient Egypt over 6000 years ago. The ships of the Egyptians were built of a great number of small pieces of wood dovetailed and bolted together or held by wooden pegs, the joints made watertight by caulking the seams with papyrus. They had no ribs, but beams were fitted across the top on which a deck was laid. A large sail was carried, but the principal means of propulsion was rowing. Some of these vessels were upwards of 100 ft. long, with high ornamented ends. In these ships they made adventurous expeditions to strange lands and carried home their merchandise; they had their ships of war also, and special barges to transport huge obelisks of stone for monumental work.

The ships of the Phœnicians, in which they made long ocean voyages, and those of the Greeks and Romans, are chiefly remarkable for the tendency to increase the number of oars by adding tier above tier of rowers.

Their warships were provided with formidable rams of hard wood to penetrate the enemy's ships.

A ship of the Vikings, unearthed in a wonderful state of preservation, has been described. It is of particularly 'fine' form, with waterlines curving gently to a sharp angle fore and aft; built of oak, and the sizes and disposition of the parts indicate a large experience.

Ships of the Middle Ages.—During the Middle Ages many improvements were effected in naval architecture owing to the keen rivalry among European nations in war and commerce. The oar remained for long a means of propulsion, particularly for manœuvring in battle, but the sail was relied upon for ocean voyages.

On the comparatively peaceful waters of the Mediterranean oar propulsion was perfected in the large galleys which were used by the nations of Southern Europe, but the northern countries tended more towards the sole use of sails.

In sail-propelled warships the ram was abandoned, only to be introduced when steam gave a means of propulsion more under control. Turrets, giving elevated platforms for the fighting men, were erected fore and aft, and no doubt they saved the ship from the inroads of high waves.

The modern form of rudder was introduced instead of the large side-oar formerly used. The number of masts was increased to three or four and the size of bowsprit was increased.

The introduction of cannon also influenced the form of ships largely. These being at first introduced in galleys, it was necessary to place them high in order to carry their fire clear over the men at the oars. The result of adding considerable weight so high in the ships tended to make them top heavy. This tendency was counteracted by increasing the breadth at the waterline to give greater stability, thus making the ship broad in beam. Moreover, as the extra breadth was only necessary on the region of the waterline, the deck remained narrow, the sides sloping inward. The effect of this was to reduce the top weight and also to give a stronger structure. This inward inclination of the sides, technically known as the 'tumble home,' remained a characteristic feature of ships up to modern times.

Ships, both of war and commerce, were formerly short in relation to their breadth, the length being usually from 3 to 4 times greater than the beam. It was not until the middle of the XIX. cent., when the

steamboat made its appearance, that a better proportioned ship was designed. The famous Amer. 'clippers' were nearly 6 times as long as broad, and this improvement enabled them to attain speeds which are still regarded as wonderful.

In all wooden ships, however, a limit of length was imposed by the weakness of the material. The length could not be increased without setting up severe strains on the ship, due to longitudinal bending. These ships suffered particularly from a tendency to arch upwards in the middle and droop at the ends. This tendency is known as hogging. The pointed ends of the ship are not fully supported by the water under them, and the full middle portion obtains more lifting force than it requires. While the length is thus restricted the breadth must be sufficient to give the required stability so that the ship may stand up under canvas.

The Introduction of Steamboats.—Towards the end of the XVIII. cent. many experiments were made on steam propulsion of ships in France, America, and Britain. Among the most successful of the early experimenters was WILLIAM SYMINGTON. In 1788 a little boat, produced by Miller & Symington, was propelled by steam power upon Dalswinton Loch, Scotland.

In 1801, under patronage of Lord Dundas, the famous *Charlotte Dundas* was built to the designs of Mr. Symington. She was intended to act as a tug on the Forth and Clyde Canal, and proved successful. These experiments attracted the attention of FULTON, an American inventor who was interested in steam propulsion of ships. He visited Scotland and sailed on the *Charlotte Dundas*, and in 1807 the *Clermont*, a much larger steamer, was built under Fulton's direction and sailed on the Hudson. About the same time the steamer *Phœnix* was built in America by STEVENS. This was the first steamer to navigate the open sea.

Another who noted with interest the experiments of Symington was HENRY BELL. He afterwards became the owner of the *Comet*, which, in 1812, began her regular daily sailings on the Clyde, carrying passengers between Glasgow and Greenock.

Steamboats soon began to be common on the Clyde and later on the Mersey and the Thames, and in 1816 the steamer *Hibernia* was built for service between Great Britain and Ireland. Many improvements were made in marine engineering by DAVID NAPIER of Glasgow. His engines were successful in the *Rob Roy* (1818), a Channel steamer, sailing at first to Ireland, but later in service between Dover and Calais. Previous to the building of this steamer, Napier made some experiments in the resistance and speed of models which led to the introduction of much sharper forward lines.

In 1819 the *Savannah*, a vessel with steam as auxiliary motive power, was built in America, and sailed across the Atlantic. She was fitted with an engine and paddles, but was quite independent, of these, being fully rigged as a sailing ship. She relied upon her sails to carry her across the Atlantic, as her engine was only moving for a fraction of the time of the voyage, and, indeed, the paddles, which could be unshipped, were, for the most part, carried on board. Other ships made the ocean voyage, partly under steam, but until 1838 no ship had steamed all the way across the Atlantic. This feat was accomplished by the *Sirius* and almost simultaneously by the *Great Western*—two British-built ships.

The Rise of the Turbine.—From these early days progress has been remarkably rapid, leading not only to higher speeds but to economy of fuel. The paddle became mainly restricted to river steamers, and twin screws came to be fitted in all the larger and faster liners and warships.

The introduction of the turbine has largely increased the speed possibilities of ships. This new engine was the invention of SIR CHARLES A. PARSONS. In 1894 the *Turbinia* (100 ft. long) was built to test the capabilities of the marine steam turbine, and after a number of experiments and improvements a speed of 34½ knots was obtained. In 1899 the British Admiralty built the torpedo-boat destroyers *Viper* and *Cobra*, and had them fitted with turbines. These proving satisfactory, it was not long before the larger classes of warships were being similarly engined. The turbine commended itself for use in these ships partly because of its small height as compared with reciprocating machinery. It could be kept low in the ship and thus easily protected.

The turbine is also well suited to the requirements of channel steamers which must make their runs at highest speed. The Clyde steamer *King Edward* (1901) was the first turbine merchant vessel. She was built by Messrs. Denny, at Dumbarton, and attained 20·48 knots speed. This firm also built the turbine channel steamer *Queen* (1903) for the Dover-Calais route, and this class of ship is now nearly always turbine-driven. In its earlier history the turbine was the subject of careful tests, and sister-ships were built—one with reciprocating engines and the other with turbines—to give comparative results. That these results were favourable to the newer engine is made evident by its adoption in all vessels of high speed. In the Allan liner, *Virginian*, it found its first application to this class of ship, and in the turbine Cunarders, *Lusitania* and *Mauretania* (26·6 knots), the liner has reached, for the present, its maximum of speed.

Oil Engines.—Of late oil engines have been fitted in several cargo vessels. In this engine the combustion of the fuel takes place in the engine cylinders, thus boilers are not required and valuable cargo space is gained. Compared with coal, oil has certain advantages in stowing, as it may be carried mainly in the double bottom.

Iron and Steel Ships.—Several causes led to the introduction of iron as a shipbuilding material. The tendency to increase the length of ships with increase of speed was checked by the inherent weakness of wood; the scarcity of suitable timber began to be felt, and the strains due to the working of the machinery (particularly at the sterns of screw steamers) could not be properly met with wooden structures.

A small iron canal boat, the *Vulcan*, had already been built in 1818, near Glasgow, but for some time an almost superstitious dislike existed to the use of such a 'heavy' material, and the progress of iron shipbuilding was slow at first. The superiority of iron gradually came to be recognised, however; its greater strength allowed the use of much thinner parts, so that the metal structure was actually lighter than the wooden one of the same size. The first iron vessels were indeed much stronger than was necessary, and in cases of accidental grounding proved their superiority over the wooden ships.

By the middle of the XIX. cent. iron became established in favour, and dimensions impossible before now became common. The capabilities of this material was demonstrated by the building of the *Great Eastern* (1858), 680 ft. long, under the direction of Messrs. I. K. Brunel and J. Scott Russell. Although commercially a failure, the mere construction of so large a ship was in itself a great engineering feat.

Certain disadvantages are attached to the use of iron in ships. The fouling of the bottom, by the attachment of barnacles to the surface below the waterline, seriously reduces the speed. Wooden ships are protected by nailing sheets of copper to the planking; on this metal the sea-growths can obtain no permanent hold. It is not possible to use the same means on iron hulls, as the two metals, when immersed together in sea water, set up a galvanic action which rapidly corrodes the iron.

The composite system of construction is an attempt to combine the advantages of iron and wood. In this system, while the ribs, beams, and certain tie-plates, etc., are of iron, the skin is of wood-planking copper-sheathed. This arrangement was used in some of the fast tea-clippers which could not afford to lose any part of their speed by fouling. Nowadays excessive fouling

is prevented by the regular application of antifouling compositions applied to the bottom plating in dry dock. Some naval vessels have their bottom plating covered with wood-sheathing which is coppered. This is, of course, a heavy and expensive arrangement and has been used only in cases where the ship must remain at sea for long periods without docking.

The Admiralty was somewhat slow to adopt iron for warships. Firing experiments in 1845 had shown that the splintering effect was greater with iron plating than with wood; hence they continued to use wood until the introduction of armour. When they put armour on their new ship, *Warrior*, in 1860, they followed the example of the French, but they went a step further and built the hull entirely of iron.

Steel Ships.—Not long after iron had obtained a footing as a material for shipbuilding steel was proposed. This material, as first manufactured, was harder and more brittle, though stronger than iron. It was also very expensive. An improved 'mild' steel was used in the building of the French warships in 1873, but the Brit. Admiralty considered it unreliable and asked for a better material. Steel makers of this country rose to the occasion and almost immediately succeeded in producing a material which met the exacting requirements of the naval constructors. Mild steel is better described as homogeneous iron, whereas wrought-iron has a fibrous structure, due to the process of its manufacture, and is stronger with the grain than across; mild steel is nearly uniform in quality in every direction. It is also much stronger than iron, so that steel plates are allowed (20 %) thinner. For some time iron continued to be the principal material in merchant shipbuilding owing to the greater cost of steel, but steel is now universally adopted except for certain parts. Iron is less liable to corrosion and is used in places which have been found to suffer badly in this way. A careful system of testing material is employed to ensure that a high standard of strength and ductility is maintained.

Types of Ships.—Experience and the rigour of competition have produced a variety of types of steamers, each type being peculiarly suited to its special work. Many of the modifications have affected the arrangement of decks and erections on deck. At first the arrangement of sailing ships was followed and steamers were flush-decked, *i.e.* the side showed a continuous line fore and aft. For a short distance at the fore end the deck was sometimes set at a higher level, giving a platform called a 'monkey forecastle' or 'anchor deck,' on which the seamen stood when working the anchors. This platform was in later vessels raised sufficiently high to give a space under it for accommodation above the level of the upper deck. Such an erection is termed a 'topgallant forecastle.' Similarly at the stern an 'aftercastle' or 'poop' was developed to protect the steering-gear or raise it higher above the water.

At first the openings on deck over the machinery space were not sufficiently guarded, but later an iron house or casing was erected on deck above which the engine skylight was fitted. As a further protection some vessels have their side-plating extended upwards over a part of the length, shielding the casing and the doors leading down to the engine- and boiler-rooms. This part being covered in by a deck forms a complete erection. It is called a 'bridge,' but is quite distinct from the navigating bridge, which is a light, elevated structure for navigating purposes. A ship having these three erections, viz. poop, bridge, and forecastle, is often referred to as a 'three-island' steamer on account of the isolated appearance of the erections.

If the three separate erections be joined by decking over the intervening spaces and plating the sides, a new type is produced which is simply one 'storey' higher than the flush-deck ship. This latter would have two, an upper and a lower, so that the new class may be called a 'three-deck' ship. The name 'three-decker,' however, was only applied to the strongest of this class, viz. to that type which was designed to carry a heavy cargo and load to a deep draught. There are actually three types—the 'three-deck,' the 'spar-deck,' and the 'awning-deck' ship—which are the same in outward appearance. The spar-decker was at first designed to carry passengers in the space under the spar, or top deck, and this upper part was regarded as a light erection built upon the hull proper. Afterwards it was found desirable to carry cargo in the passenger space, and the upper part of the ship was strengthened to meet the increased stresses due to the heavier burden. In the case of the awning-decker the history of the spar-decker repeated itself, with the result that the three types differ from each other only in the degree of their strengths and the relative weight of cargo which they may carry. The spar-decker is intermediate between the three-deck and awning-deck types, and within these limits the draught to which it may load will depend on the structural strength provided.

The 'shade-deck' type is similar to those above mentioned, but in this class the space between upper- and shade-decks is distinctly a passenger space and correspondingly light in construction, with long openings in the side for ventilation.

A variation of the 'three-island' type is produced by joining two of the erections—for example, the bridge and poop—to form a long continuous erection. The gap between this and the forecastle is called the 'well,' on account of its being often inundated by the sea.

The raised quarter-deck ship resembles the above type in having a forward well, but the part abaft the bridge is not raised quite up to the level of the bridge and remains about 4 ft. lower.

FIG. 1.

By raising the after-deck in this way greater hold space aft is obtained. This is needed because the propeller-shaft, passing through from the engine to the stern, is enclosed in a trunk or tunnel, and the space so occupied is a considerable deduction from the space available for cargo. The volumes of the fore- and after-holds being thus equalised, a proper balance is obtained.

Returning to the three-decker we find that this type in its turn has been modified by the addition of poop, bridge, and forecastle. Again a junction of these three erections has been made, in certain cases, forming a complete fourth deck termed the 'shelter-deck.' Originally intended for the protection of cattle, this upper shelter was at first lightly built, but in later designs it has been strengthened and incorporated in the main structure of the vessel. The shelter-deck being then a continuous strong deck has again received additions in the form of poop, bridge, and forecastle. The original distinctions between the spar-decker and its companion types have tended to disappear as time went on, the chief remaining differences being in the relative draughts or weight of cargo carried, and the corresponding strength which must be provided.

A notable feature of modern large passenger vessels is their high, towering erections. These give promenading space at the sides in which the passengers may have fresh air and exercise, the central portion being occupied by state-rooms, lounge, smoking-rooms, etc. The highest of all is the boat deck, which carries the rows of lifeboats, and leaves an excellent promenade open to the sky.

Patent Ships and Specialised Types.—While decks have been added above, they have been eliminated to some extent below. This has been done to give clear holds for cargo, and has led to changes in construction. Large single-deck cargo vessels have thus been evolved with depths up to about 30 ft. The nature of the cargo carried has influenced the design of certain ships.

This is particularly so with cargoes such as grain, which are liable to shift to one side and give the vessel a dangerous list. Even if the holds were at first quite full the cargo would gradually settle down, leaving a space under the deck, with possibilities of a large flow from side to side. The effect of such movement depends greatly on the width at the surface of the grain, so that if this width be reduced sufficiently the flow is restricted and all danger is removed.

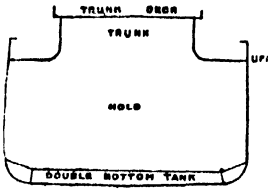


Fig. 2.—Trunk Deck Steamer.

The 'trunk' type is like the ordinary cargo vessel up to the upper deck; along the central portion of this deck runs a deep trunk or casing, extending over the greater part of the ship's length. This trunk forms the upper portion of the hold space, the cargo is filled into it, and in the limited breadth the transverse shift is restricted.

The 'turret' vessel resembles the above type in having the central trunk, but here the upper deck, instead of meeting the ship's side sharply at an angle, curves gently into it with an easy rounded form.

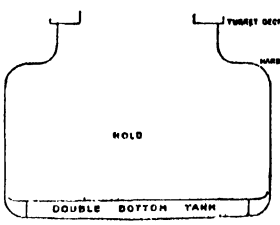

Fig. 3.—Section of Turret Steamer.

Another matter which has greatly affected ship-design is the question of *ballast*. When a ship is compelled to undertake a voyage without cargo, it is necessary to take a certain weight on board in order that her propeller may be sufficiently immersed. Water ballast was first introduced in the steamers carrying coal from Newcastle which had to return light. It supplanted the awkward stone ballast which had formerly been used, and could be quickly run in and pumped out. At first the water was contained in separate tanks in the bottom of the hold, but afterwards an inner bottom was fitted, forming with the outer shell a double-bottom ballast tank. In addition to the double bottom it has been found necessary to provide in some ships a hold compartment for ballast. A vessel which carries all her ballast in the bottom has this disadvantage that when heeled over to an angle her great stability causes her to return to the upright with a sharp and sudden motion. This gives a quick, uncomfortable roll not only disagreeable to those on board, but tending to strain the structure and fittings. To avoid this, several designs have been produced in which the ballast is carried high up in the ship. Thus in the M'Glashan type the inner skin is extended right up to the deck, giving a double side, as well as a double bottom, for carrying water.

In the Harroway-Dixon design, the ballast is contained in triangular spaces—one on either side of the ship under the deck. Each space is divided from the hold by a sloping wall of plating, extending from the ship's side up to the edge of hatchway or deck opening. It will be noticed that the shape of hold in thus narrowing towards the top gives advantages for bulk cargoes similar to those in 'trunk' and 'turret' steamers. Moreover, in filling an ordinary rectangular hold by pouring in through the hatchway, a cargo such as coal will heap itself up in the centre and leave the triangular spaces at the side empty. These spaces would have to be filled or trimmed by hand. In 'self-trimming' designs like that mentioned above, the coal, flowing in, naturally adjusts itself to fill all the available space.

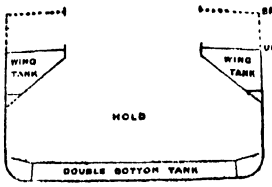

Fig. 4.—Harroway-Dixon Design.

The oil-tank vessel, built to carry petroleum in bulk, has special features. At first the oil was carried in casks or cases, then in separate tanks, then within an inner skin, but now only the shell-plating separates it from the outside water.

A liquid cargo presses on the sides as well as on the bottom of the enclosing tank, and even when the hold is completely full this pressure is increased by the motion of the ship. In oil-tank vessels the hold space is divided into a number of spaces by transverse divisions or 'bulkheads,' which extend, oil-tight, across the ship at intervals of about 28 ft. In addition, each space or tank is bisected by a fore-and-aft bulkhead erected on the centre line. In this way the large mass of oil cargo is divided into a number of smaller units of mass, and when in motion the momentum is correspondingly subdivided, each bulkhead taking its share in checking the lurch of the contained liquid. When a tank is not quite full the forces on the dividing walls are very much increased owing to the blows of the oil which is moving about inside. It is impossible to keep the tank full, as oil contracts and expands greatly with variations of temperature. To meet the difficulty, a casing called the 'expansion trunk' is built, extending fore and aft, along the middle of the ship. In this trunk, which extends to the next deck, the level of the liquid rises and falls with expansion or contraction of the bulk, and within its narrow bounds the oil finds a much restricted surface for its play. Special precautions are also necessary owing to the dangerous nature of the cargo. At the end of each range of oil tanks a space about 4 ft. long is left between two transverse bulkheads, one of which forms the end of the oil tanks. This space is called a 'cofferdam,' and is sometimes filled with water. The engines and boilers are usually placed at the stern with a cofferdam insulating them from the oil. Otherwise two cofferdams are necessary, and the screw shafting would have to be led through an oil space and enclosed in an oil-tight tunnel.

Warships.—Since its first introduction great improvements have been made in warship armour. At first wrought-iron was used, then compound armour composed of hard steel plate welded to a wrought-iron back plate. Afterwards by the Harvey, and still later by the Krupp process, a hard protecting face was produced on iron plate. Thus armour became more effective against projectiles and thinner plate could be used. With improvements in armour, however, there have come corresponding improvements in the destructive power of guns, and now it is possible to send a 14-inch projectile clean through a 12-inch Krupp plate from a distance of 7½ miles. Armour was successfully introduced by the French on their floating batteries during the Crimean War, and they proceeded to add this protection to their ships. The first sea-going armoured warship was the French *Gloire*. The British Admiralty quickly followed with the *Warrior*, which had armour 4½ inches thick.

At first only a part of the side was protected, but afterwards an armour-belt extended along the water-line. As the power of guns increased armour was made thicker and reduced in extent, being concentrated in an enclosed citadel of moderate length. The old *Inflexible* was of this type, with 24 inches of armour. A thick lower deck protected the ends under the water, but above this and outside the citadel was ordinary thin plating which could easily be pierced.

To retain some floating power, however, several of the unprotected side compartments were filled with cork. When it became possible to use lighter armour it was once more extended. It is usually fitted in a belt along the waterline, reaching under the water far enough to protect the side which will emerge as the ship rolls. Towards the ends it is made thinner, and sometimes it is not carried the full length of the ship.

The heaviest guns were mounted in pairs in two revolving armoured turrets which rose above the citadel armour. Turrets gave place to 'barbettes' (fixed turrets), containing the revolving machinery for the guns which point over the edge of the barbette armour. A thick covering shield was added which revolves with the guns. The lighter guns project through holes in the armoured side, or are carried in separate armoured houses called 'casemates.'

Horizontal protection is provided by decks covered with thinner armour, particularly the lower protective deck, which is situated near the waterline. Under shelter of this deck are placed all the magazines and important machinery. Its central portion is above the level of the waterline, but its sides slope down to the lower edge of the side armour. A projectile striking on the waterline must pass not only through the side armour, but also through the sloping protective deck before entering the lower part of the ship. To add to the protection, the ship's coal is stowed at the side both above and below the deck, thus providing a considerable resistance to the shell. The bottom of the ship under the protective deck is open to the attack of torpedo and mine. In view of this danger the hold is subdivided into a large number of watertight compartments. In addition to the inner bottom which, in the battleship class, extends up to the lower protective deck, longitudinal protective bulkheads are fitted, giving watertight spaces between the boilers and the ship's side, while the engines are placed in separate compartments.

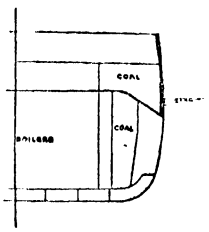

FIG. 5.—HALF-SECTION OF BATTLESHIP.

Warship Types.—The BATTLESHIP is the most heavily armed and armoured type of warship. The latest *Orion* and *King George V.* classes carry ten 13·5-inch guns, mounted in pairs in five barbettes, and sixteen 4-inch guns as secondary armament. Their greatest thickness of armour is 12 inches on waterline belt.

The CRUISER is, in general, inferior to the battleship in offensive and defensive power, but faster. The BATTLE-CRUISER approaches the battleship type, being, in fact, more powerful than the earlier battleships. The *Lion* is 660 feet long, with 28 knots speed, and carries eight 13·5-inch and sixteen 4-inch guns. Its maximum thickness of armour is 9 inches.

The armoured cruiser of pre-Dreadnought times is less powerful. The *Minotaur* (23 knots) has four 9·2-inch and ten 7·5-inch guns, with 6-inch armour on the waterline.

Cruisers, without armour-belt, which have protective decks, are called '*protected* cruisers.' The largest of these, called 'first-class cruisers,' are not now built. The *Bristol* is an example of the 'second-class cruiser.' She is 430 feet long, of 25 knots speed, and carries two 6-inch and ten 4-inch guns. 'Third-class cruisers' are smaller, 360 feet long, and the fast SCOUT class are similar to the third-class cruisers.

TORPEDO BOATS are small, swift boats, carrying torpedoes which they can discharge against battleships, trusting, by their speed and smallness, to escape the fire of the larger ship.

TORPEDO DESTROYERS are larger and faster vessels, armed, and capable of overtaking and overpowering torpedo boats. They also carry torpedoes with which to attack the larger warships.

SUBMARINES are designed to approach their object and discharge a torpedo unnoticed, by travelling for some distance under water. By taking in water the vessel is made to sink until almost submerged, when, being set in motion, she is forced downward by the action of inclined planes or rudder just as a vertical rudder turns the ship to port or starboard.

Structure—Strain.—In considering its strength, the ship is regarded as a great beam supported by the water and loaded with cargo and its own weight. As she rides over long waves the support varies, now concentrating at the middle and leaving the ends mainly unsupported, now lifting the ends and deserting the middle. The actual bending which results from such an uneven distribution of load and support may indeed be small, but even a slight yield makes great demands upon the material. It is impossible to foretell exactly the strains which may come upon a ship in the course of its existence, but a knowledge of the straining action allows us to compare one ship with another as regards the resistance which they are able to offer. A ship which has stood the test of ocean travel offers a standard of comparison for new ships.

In making the calculation of strength, the most trying conditions of load and support are assumed. Suppose the ship is balanced upon a wave of her own length. This will produce a tendency to 'hog' or arch upward in the middle, and as a result of this bending the upper parts must stretch slightly and the lower parts contract. These opposite strains of extension and compression will reach their maxima at the extremities—deck and keel respectively. In the converse condition the ship is supposed to span the hollow of a wave from crest to crest. The support will now be reduced over the middle part and increased at the ends. The result will be a tendency to sag with compression at deck and extension at keel. The distribution of material in the ship must be such as to offer sufficient resistance to the stresses so produced, and the theory of beams suggests a certain concentration of material near the upper and lower extremities. Towards the ends a reduction in thickness is permissible, as the bending stresses are more intense over the middle part.

In addition to the stresses produced by longitudinal bending, provision must be made to resist the collapsing pressures on bottom and sides (which come upon any submerged body), and the tremendous blows of waves striking on the vertical wall of side-plating. This comparatively thin wall must be stiffened by 'ribs' (frames) at short intervals (the deck beams also give rigid support). Across the bottom, where the pressure is greatest, the frames are developed into deep webs which also support concentrated loads of engines, boilers, and cargo.

The earliest iron ships were built like their wooden predecessors, with closely spaced ribs curving upward on either side from a massive keel. Immediately above the keel and extending along the middle line ran a strong girder arrangement called a 'keelson'; the keel and keelson are a sort of backbone. The 'skin' or shell-plating is attached to the frames; it is put on in strips ('strakes') running lengthwise and riveted together at their edges. Each strake is composed of a number of plates, as long as practicable, and well riveted together at their ends.

The decks are supported by cross-beams attached at their end to the frames. In many cases decks are simply wooden floors laid on the beams, but sometimes they are plated.

The above arrangement of frames, etc., is called the 'transverse system' and is still common. Where double bottoms are fitted they are usually arranged on the 'cellular system.' The space between the outer and inner bottoms is subdivided by longitudinal and transverse vertical plate-divisions which intersect, forming rectangular cells. This arrangement gives great stiffness to the surfaces of plating.

In the design of the *Great Eastern* a striking depar-

ture was made. This vessel was without transverse frames. She had an inner skin carried well up the side, and longitudinal girders, extending from inner to outer bottom, took the place of frames in stiffening the shell. A modification of this system is adopted in the larger classes of warships, which have also a set of transverse frames worked in pieces between the longitudinals.

In the well-known ISHERWOOD system the longitudinal arrangement of framing has been applied to merchant ships. In this system the closely spaced frames are disposed longitudinally instead of transversely, and at intervals along the length deep transverse webs support the sides and bottom.

Bulkheads are vertical partitions within the ship. The most important are watertight. They are plated surfaces supported by stiffeners just as the shell is supported by frames.

A transverse vertical bulkhead, called the 'collision bulkhead,' is fitted near the stem to isolate the flooded part in case of collision. In steamers the compartment containing the engines and boilers is enclosed by bulkheads, and one is placed near the stern in case of leakage where the screw shaft enters the ship. The line of shafting is enclosed in a watertight tunnel leading into the engine-room through a watertight door which can be closed from the deck. This is the minimum number of watertight divisions, but additional bulkheads are fitted according to the length of ship. Watertight subdivision and strength of bulkheads were considered by the BULKHEAD COMMITTEE of 1890. The loss of the *Titanic* (q.v.) destroyed faith in bulkheads, and new liners added a double hull.

The flooding of a compartment near the middle will cause the ship to sink deeper in the water until the buoyancy lost at the middle has been regained at the ends. If the flooded space were situated near the forward end, besides the direct bodily sinkage there would be produced a longitudinal inclination which would bring the deck at that end nearer to the water.

Bulkheads should extend up to a watertight deck, so as to prevent the water overflowing from a damaged to an intact compartment. Besides the transverse bulkheads longitudinal ones are sometimes fitted forming side coal-bunkers. These have been made watertight, in some cases giving an inner skin. The extensive subdivision in warships has already been mentioned. In merchant vessels a close spacing of bulkheads interferes with cargo stowage.

Displacement of Stability.—A ship, floating freely in still water, obtains all its support from fluid pressures. If the ship were absent its place (under the water-level) would be occupied by water. The water-volume which she displaces would be identical in its lower shape with the wetted surface of the ship, and its upper boundary would be the water-level. This water-volume is called the 'displacement,' and its weight is obviously equal to the weight of the ship, seeing that it would receive the same support. If, therefore, we know the dimensions and form of the ship exactly we can calculate the volume of this displacement and its weight. In this way, by noting its draught of water, we are able to tell the weight of a ship just as if she were placed in the scale-pan of a huge balance.

In considering the question of a ship's stability, or power of recovering the upright position, we have to deal with two forces—weight and buoyancy. They are equal in magnitude and their lines of action are vertical. It is convenient to consider each as acting at a point, the weight pulling downward at the *centre of gravity*, and the buoyancy thrusting upward at the *centre of buoyancy*. The position of the centre of gravity (C.G.) depends solely on the distribution of weights in the ship. The centre of buoyancy (C.B.) is the C.G. of the displacement, and its position depends on the shape of the under-water form. When this shape changes, the C.B. must alter its position, but we may assume the C.G. to be fixed in the ship.

If the ship be inclined from the upright by the push of the wind on her sails, the C.B. immediately takes up a new position, moving outward towards the low side. The two opposing forces are not now on the same line, and they will operate to turn the ship back to the upright. The amount of this turning effort will depend partly on the magnitude of the forces acting, and partly on the distance between their lines of action. This distance is called the 'righting lever,' and it is a measure of the ship's stability at the angle considered.

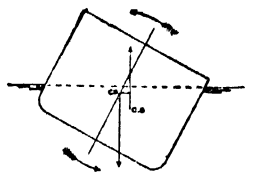

FIG. 6.

An excessive inclination might result in a disposition of forces shown in Fig. 7 which would turn the ship farther from the upright and upset it. The effect on stability of 'freeboard' or high side above water should be noted. Fig. 7 shows water coming in upon the deck. If the side were carried farther up, as shown by the dotted lines, the water would still be excluded from the deck, and the centre of buoyancy would be farther out to the low side, giving increased stability.

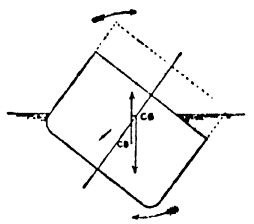

FIG. 7.

Though the centre of buoyancy changes its position as the ship heels over, it is found that for small inclinations the upward force always passes through the same point (nearly). It is called the *metacentre* (M) and the ship is virtually supported at that point.

The advantage of having a fixed point of support is obvious, for once G and M are known, the righting lever can readily be found for any moderate inclination. The distance between G and M is important; the greater it is the greater will be the righting lever. GM is called the 'metacentric height,' and it is usually quoted as indicating the stiffness of the vessel or its resistance to inclination from the upright.

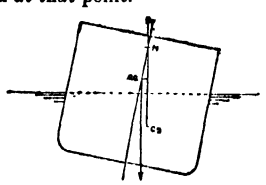

FIG. 8.

Laws relating to Shipping, etc.—The Merchant Shipping Act of 1894 (as amended in 1906, etc.) makes certain provisions for the comfort and safety of seamen and passengers, for the seaworthiness of ships, the measurement of tonnage, and other matters connected with shipping. The Board of Trade is empowered to fix the freeboard, or clear side of ship above the deepest waterline (load-line). This is permanently shown on the ship's side by a line-and-circle mark—the *Plimsoll Mark*—at mid-length. The freeboard is determined so as to leave sufficient reserve buoyancy above the waterline, and to limit the weight of cargo to correspond with the structural strength.

The basis for fixing dock dues is the net tonnage of the ship. The tonnage is intended to be a measure of cargo-carrying or money-earning power of the ship. For this purpose the internal volume is calculated, including the closed-in parts above deck. This, reckoned at 100 cubic ft. to the ton, gives the *gross tonnage*. After deductions have been made for machinery spaces (including an allowance for coal bunkers), and for crew and master's spaces, etc., the remainder is called the *net tonnage*. It is the policy of the owner to keep this as low as possible.

The space to be occupied by seamen must fulfil the requirements of the Act, otherwise a fine is incurred; it will also be added to the net tonnage unless, in addition, proper privy accommodation is provided. It must be protected from the weather and carefully

ceiled from effluvium arising from cargo, etc., in the hold. It must be kept separate from the lamp- and oil-room, and must satisfy certain requirements as to light and ventilation. The space allowed per man is 120 cubic ft., with 15 sq. ft. of floor space (for Lascars, 72 cubic ft. and 12 sq. ft. respectively). No goods may be carried in the space under a penalty.

Seamanship, the actual practice of pilotage in sight of land and astronomical navigation on the high seas, is a term generally used in connection with sailing-ships, the setting of sails, steering, etc. Technical terms relating to seamanship are: *starboard*, right side of a ship when spectator is looking towards bow; *port* (formerly *larboard*), left side; *windward side*, side facing the wind; *lee side*, side away from wind; *to tack*, change ship's course so that wind acts from port side and starboard side alternately, *e.g.* against a N. wind she can sail E.N.E. and then W.N.W.; *to wear*, bringing wind from one side to the other by way of the stern, used only in very bad sea; *heave-to*, placing sails aback sufficiently to deaden the ship's way—in heavy wind a ship is 'hove to' against the wind; *close-hauled*, sailing as closely as sails allow in direction from which wind blows. See NAVIGATION, RIGGING.

SHIPKA PASS (42° 40′ N., 23° 15′ E.), pass, Balkans, Bulgaria; scene of unsuccessful attacks by Turks in Russo-Turkish War, 1877–78.

SHIPLEY (53° 50′ N., 1° 46′ W.), town, on Aire, W. Riding, Yorkshire, England; woollens. Pop. (1911) 27,710.

SHIPLEY, JONATHAN (1714–88), bp. of Llandaff and St. Asaph, 1769.

SHIP-MONEY, Eng. tax for raising fleet, levied by Crown; uncertain whether inland counties might legally be assessed; resistance to general writs, 1628; writs of 1634–35 and 1639 resisted (notably by John Hampden, *q.v.*) because issued in time of peace, although judges decided for Crown; illegal by Act of Parliament, 1641.

SHIPPARD, SIR SIDNEY GODOLPHIN ALEXANDER (1838–1902), Brit. administrator; sent to organise Bechuanaland, 1885; through Rhodes obtained promise from Lobengula not to alienate any part of Matabeleland to other powers.

SHIPTON, MOTHER, URSULA SHIPTON, *née* SOUTHIEL (*c.* 1488–1561), Knaresborough witch; lived near Dropping Well, where her cave is still shown; said to have prophesied Fire of London.

SHIRAZ (29° 30′ N., 52° 40′ E.), town, capital, Fars province, Persia; has some fine mosques and good bazaars; trading centre; manufactures wine; founded about VII. cent. B.C.; was at one time capital of the Empire; in Middle Ages a famous literary centre; contains tombs of poets Sadi and Hafiz. Pop. *c.* 52,000.

SHIRÉ (16° 5′ S., 35° 5′ E.), river, S.E. Africa; issues from Lake Nyassa, joins Zambesi near Shamo.

SHIRLEY, SIR ANTHONY (1565–1635 ?), Eng. soldier; served in wars in Netherlands, France, Africa, Italy, Turkey; went to Russia as representative of Persia and became Span. admiral; wrote *Travels into Persia*, 1613. Bro., SIR THOMAS, typical Elizabethan privateer, was f. of dramatist Henry.

SHIRLEY, JAMES (1596–1666), Eng. dramatist; b. London; a prolific playwriter, but the suppression of the theatre in 1642 broke his fortunes. Among his plays are *The Brothers*, *The Wedding*, *The Traitor*, *The Gamester*, *The Lady of Pleasure*, and *The Cardinal*.

SHIRVAN (37° 20′ N., 58° E.), district, province Khorasan, Persia. Pop. *c.* 13,000. Capital, Shirvan. Pop. *c.* 7500.

SHOA (9° 30′ N., 39° 40′ E.), division (formerly kingdom), Abyssinia; capital of division and of Abyssinian Empire is Addis Abeba.

SHOCK is a condition of depression of vitality due to violent derangement of the nervous system, caused by powerful mental emotions, such as horror or joy, by extreme irritation of the peripheral nerves through injury, or by certain poisons. There is loss of control over the vasomotor nerves (or nerves of the blood vessels), the blood leaving the brain and superficial parts of the body and accumulating in the blood vessels of the internal organs, and the heart's action may also be inhibited. The patient may feel faint or become insensible, pale and cold, perspiration often appearing on the forehead; the pulse is at first slow then rapid and irregular, the breathing at first weak and short and later deeper and gasping, the temperature is subnormal, and the pupils dilated. There are, however, many degrees of the condition, from a slight and transient faintness to sudden death. The treatment is to keep the patient lying horizontally, or with the head lower than the body, with hot blankets and hot bottles to keep him warm. Alcohol, in the form of brandy, and strychnine are given as stimulants, followed by or combined with beef-tea, while in severe cases saline injections, up to two or three pints, are given per rectum or intravenously.

SHODDY, inferior substitute for woollen fabrics, made by teasing out woollen rags and clippings; frequently used as generic term for any inferior fabric.

SHOE, covering for feet, generally made of leather in England and America, but in Holland and France often made of wood, and called *sabot*. In China and Japan sometimes made of paper. S's are combination of sandal and moccasin, and were used among the early Jews. Romans used *calceus*, which covered the whole foot and was tied with a lace. Those used by their soldiers were shod with nails. In Henry I.'s time long, pointed shoes were fashionable; present form of shoe was first used in XVII. cent. Rubber s's or galoshes are sometimes used as an overshoe to keep out wet.

SHOE-BILL or **WHALE-HEADED STORK** (*Balæniceps rex*), a large and rare Wading Bird, with huge, broad, flattened bill; found only in the neighbourhood of the White Nile and its tributaries.

SHOEBURYNESS (51° 31′ N., 0° 46′ E.), headland and small town, on Thames, Essex, England; school of gunnery. Pop. (1911) 5006.

SHOLAPUR (17° 39′ N., 75° 54′ E.), city, capital, Sholabur district, Bombay, Brit. India. Pop. (1911) 61,345; (district) 715,000.

SHOOT, see PLANTS (MORPHOLOGY).

SHOOTING.—The use of the gun in sport is a late development. There is mention of the use of firearms in the middle of the XV. cent. for the purpose of finally killing quarry after it had been brought to bay by the hounds, but it was not till the close of the XVIII. cent. that s. as a pure sport was commonly practised. S. falls into two divisions—game and big game. Roughly, game consists of such wild birds and animals as are edible, *e.g.* grouse and hares; big game consists of such wild animals as are not good for food, *e.g.* lions and elephants. In the game laws for Scotland the following animals are classified as game: hares, pheasants, partridges, grouse, ptarmigan, moor-game, black-game, bustards, woodcock, snipe, quails, landrails, and wild duck. In Britain trespassing with a gun is criminal, and subject to heavy penalties. Trespassing for the purpose of shooting game by night is a much more serious offence, because the trespasser may use the offensive weapon against those seeking to arrest him. Such a trespasser is liable to from three to fourteen years' penal servitude. These trespass laws are framed to secure exclusive rights to the landowners. But a close season is also enforced by law to prevent the extermination of game, during which time it is illegal to kill certain species. Game is usually shot with a gun; big game with a rifle. A game gun normally weighs about 6½ lb. The bore varies for different species of game. For shooting wild fowl double-barrelled guns of 8 and 12 bore or oven of 20 bore are employed. In the sporting rifle, accuracy and penetrative power are required. In shooting dangerous game (*e.g.* lions, tigers, elephants, buffaloes) the small-bore rifle (·303) is both handy and effective, and is now superseding the heavy types of gun formerly used for such game. Rifles used in deer-stalking are

usually ·400 bore. The best bore for rabbit-shooting is ·300.

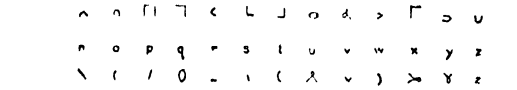
In s. good eyesight is essential. Steady nerves are also an invaluable asset. Correct gauging of the angle and speed is only acquired by practice. The crack shot knows, too, exactly in what position to take the animal.

SHORE, JANE (d. *c.* 1528), mistress of Edward IV.; forced by Richard III. to walk in her kirtle, holding a taper (an incident of Shakespeare's *Richard III.*); ballads tell of her death in a ditch, hence name Shoreditch.

SHOREDITCH, metropolitan borough, London, England. Pop. (1911) 111,463.

SHOREHAM, NEW (50° 50′ N., 0° 16′ W.), seaport, Sussex, England. Pop. (1911) 5731.

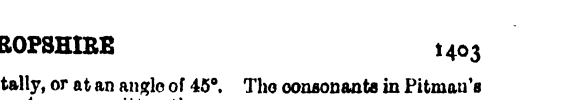
SHORING, the supporting of buildings which have settled in some part, or which require additional support during alterations. Raking shores are the commonest, and consist of timbers with their lower ends resting upon a sole-piece, or plate of timber, to prevent them from sinking into the ground. They slope upwards at a suitable angle, their upper ends resting upon wall-plates attached to the wall. The supporting pressure must be applied only where a floor or roof provides a counterbalancing thrust from inside. The timbers rise fanwise, so as to press against the wall at different points. Raking shores are open to the objection that the feet are liable to be disturbed. Horizontal or flying shores are used during the rebuilding of a house, to support the adjoining walls. They are more effective than raking shores, and also cheaper. There is also vertical shoring, used to support the higher parts of a wall while the lower parts are being altered, or during work at the foundations.



SHORNCLIFFE (51° 4′ N., 1° 8′ E.), military station, near English Channel, Kent, England.

SHORTHAND, a system of writing words by means of signs which can be more rapidly written than ordinary letters, the object being for the writer to keep pace with a speaker. Also known as *tachygraphy* (quick-writing), *brachygraphy* (short-writing), *stenography* (compressed writing), and *phonography* (sound-writing).

S. was used by the Greeks and Romans not only for the sake of brevity, but also to ensure secrecy. Some 200 different systems of s. have been invented since 1588, but many are of little practical value. All knowledge of the art was lost between the X. and XVI. cent's, but in 1587 Dr. Bright published his *Characterie*, and used signs for *words*, a hopeless method for a growing vocabulary.



J abound. ⌊ about. ⌋ accept. ⌊ accuse. ⌋ advance.

In 1590 Peter Bales wrote *The Arte of Brachygraphie*, and he also used separate signs for each word, as did Bright. In 1602 John Willis published *The arte of Stenographie*, and his system was perhaps the first of any practical value. It was fairly popular, and much used until Pitman's system was introduced. In Willis's system signs were used for letters as follows:—

In 1620 Skelton imitated Willis's system, and his method was used by Samuel Pepys (*q.v.*). Jeremiah Rich in 1640 brought out a system which was commended by Locke, and in 1753 Thos. Gurney published his *Brachygraphy*.

The most popular method, and that in general use by all classes of shorthand writers at the present time, was the Phonetic system of Pitman, first brought out in 1837. Its principle is entirely dependent on sound, as the name implies. Words are written as they sound, not as they are spelled; thus *cough* becomes 'cof,' *though*, 'tho.' Straight and curved lines indicate consonants, while vowels are shown by dot and dash. The same line is used to represent a different sound as it is thick or thin, written vertically, horizontally, or at an angle of 45°. The consonants in Pitman's system are written thus:—

Many abbreviations are used, and contractions are often employed in that branch of the system known as the *Reporting style*. An expert writer is able to take down a verbatim report at the rate of about 180 words per minute.

SHOSHONG (23° S., 26° 30′ E.), town, Bechuanaland; former capital of Bamangwato.

SHOTTS (55° 51′ N., 3° 52′ W.), parish, Lanarkshire, Scotland; coal mines; ironworks. Pop. (1911) 18,434.

SHOVEL, SIR CLOUDSLEY (1650–1707), Eng. admiral; fought in battles of *Bantry Bay* (1689), *Vigo* (1702), *Malaga* (1704); his ship, the *Association*, struck a rock near Scilly Isles and all hands were lost.

SHOVELLER, see under DUCK FAMILY.

SHREVEPORT (32° 28′ N., 93° 47′ W.), city, on Red River, Louisiana, U.S.A.; cotton manufactures. Pop. (1910) 28,015.

SHREW FAMILY (*Soricidæ*), a large family of Insectivora, with about 230 species, found in the tropical and temperate regions of the Old World and N. America; small creatures, often mistaken for mice, from which their insectivore teeth, their long sharp snouts, and their close-lying rounded ears distinguish them. A few examples are: the Common Shrew (*Sorex*), the Short-Tailed Shrews (*Blarina*) of America, the Water-Shrew (*Crossopus*), not uncommon in Great Britain but absent from Ireland, and the Old World Musk Shrews (*Crocidura*), with scent glands producing a musky odour.

SHREWSBURY (52° 43′ N., 2° 46′ W.), county town, on Severn, Shropshire, England; there are remains of the old city walls and of a Norman castle; famous school was founded by Edward VI., 1551; many interesting old churches, public buildings, and black and white houses; Parliaments assembled here in 1283 and 1397; and in 1403 Henry IV. defeated Hotspur and Douglas in the neighbourhood. Pop. (1911) 29,389.

SHREWSBURY, CHARLES TALBOT, DUKE OF (1660–1718), succ. his f. as Earl of Shrewsbury, 1668; dismissed by king from lord-lieutenancy of Staffordshire, 1687; signed invitation to Prince of Orange; great figure in politics and society after Revolution; one of lord-justices of realm, 1695–96, 1697, 1714; last Lord High Treasurer, 1714.

SHREWSBURY, ELIZABETH TALBOT, COUNTESS OF (1518–1608), 'Building Bess of Hardwick'; owed epithet partly to construction of Hardwick Hall, partly to systematic improvement of fortune; dau. of John Hardwick, she m. (1) Robert Barley, (2) Sir William Cavendish (becoming an ancestress of Earls and Dukes of Devonshire), (3) Sir William St. Loe, (4) (1568) Lord Shrewsbury.

SHREWSBURY, JOHN TALBOT, EARL OF (1390–1453), Eng. baron; famous in Fr. wars of Henry V. and Henry VI.; said to have won 40 battles; put down Irish revolt, 1414–19.

SHRIKES, LANIIDÆ, small birds with varying characters, but often with compressed, hooked, serrated bills, suitable for seizing and tearing the small birds and animals upon which they often feed. Found all over the world, except in S. America. Of the true Shrikes (*Lanius*), also known as BUTCHER-BIRDS, one breeds in Britain. The PIED- and WOOD-SHRIKES (*Hemipus* and *Tephrodornis*) are Indian representatives.

SHRIMPS (for general relationship, see under MALACOSTRACA), small, translucent, grey Crustacea, common on sandy places on the Brit. coasts, where at ebb-tide they are caught for food by means of a push-net.

SHROPSHIRE (52° 45′ N., 2° 45′ W.), county of

western England, near centre of Welsh border; surrounded by Flint, Cheshire, Stafford, Worcester, Hereford, Radnor, Montgomery, and Denbigh; area, 1342 sq. miles; surface mountainous in S. and W.; crossed by Clee Hills, Caradoc Hills, and other ranges; drained by Severn and a number of its tributaries; capital, Shrewsbury.

County was part of kingdom of Mercia in early times, and suffered from Dan. invasions of IX. and X. cent's.; scene of hostilities in Civil War of XII. cent., Barons' War, and Great Rebellion; has remains of several old castles, some of which date from Norman times, and ruins of many religious houses. Agriculture is principal industry. There are several small detached coal-fields, of which Coalbrookdale is most important; other minerals found include iron, lead, limestone, and small quantities of zinc and barytes; blast furnaces, iron manufactures. Pop. (1911) 246,306.

SHUMLA (43° 17′ N., 26° 58′ E.), fortified town, Bulgaria; manufactures slippers, clothes; occupied by Russians, 1878. Pop. (1910) 22,275.

SHUSHA (39° 48′ N., 46° 44′ E.), town, Yelisavetpol, Russ. Transcaucasia; formerly important fortress. Pop. 26,000.

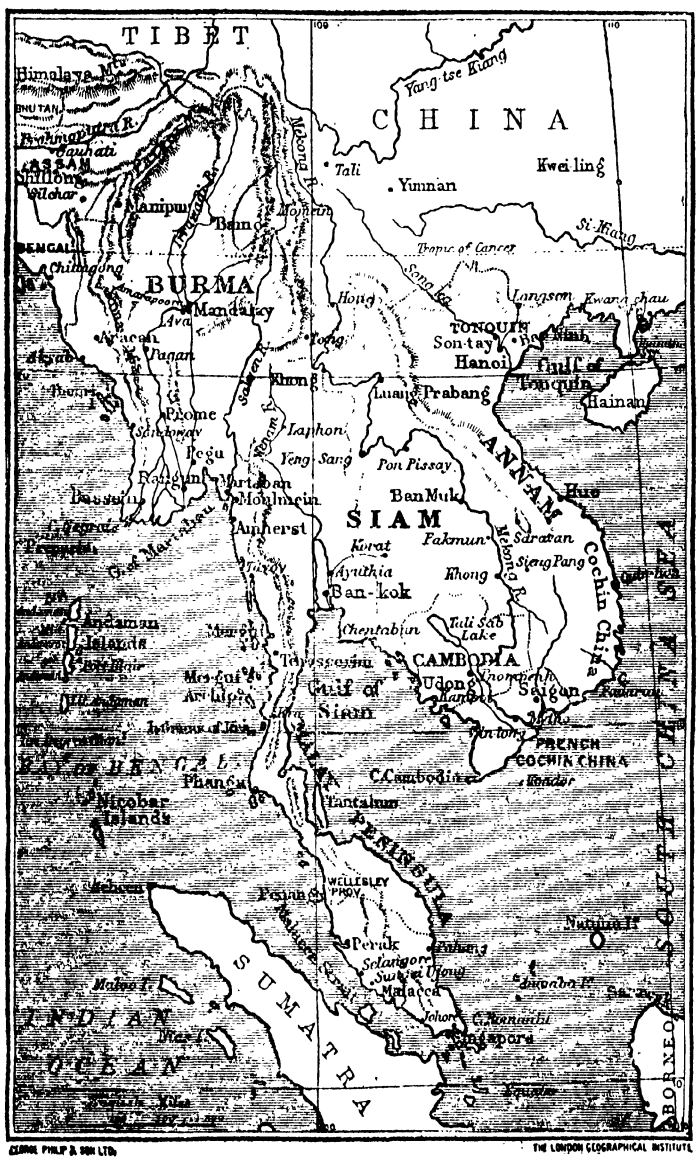
SHUSHTER, SHUSTER (32° 8′ N., 48° 45′ E.), town, on Karun, Shushter district, Arabistan, Persia; manufactures carpets; exports grain. Pop. *c.* 16,000.

SHUTTLE, pointed instrument used from earliest times in weaving to carry weft thread between warp; modern s's are about 12 in. long.

SHUVÁLOV, PETER ANDREIVICH, COUNT, SCHOUVALOFF (1827–89), Russ. general and diplomat; governed Baltic provinces, 1864–66; ambassador to Britain, 1874–79.

SHUYA (57° N., 41° 30′ E.), town, Vladimir, Russia; cotton-manufacturing centre. Pop. 21,000.

SHWEBO (22° 30′ N., 95° 40′ E.), town, capital, Shwebo district, Upper Burma; rice-growing centre. Pop. 10,500; (district) 295,000.



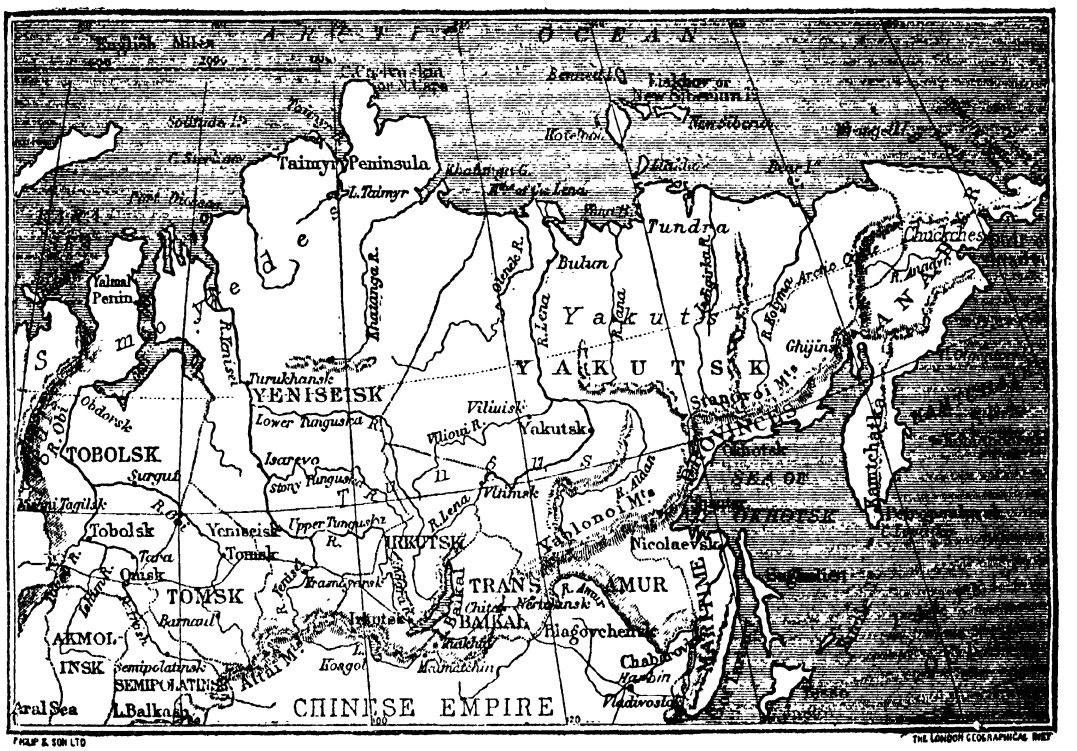
SIALKOT, SEALKOTE (32° 31′ N., 74° 36′ E.), town, cantonment, capital, Sialkot district, Punjab, Brit. India; extensive commerce; manufactures paper and cloth. Pop. 61,000; (district) 1,090,000.

SIALOGOGUES, see PHARMACOLOGY.

SIAM (4° 10′ to 20° 18′ N., 96° 35′ to 106° E.), kingdom, Indo-China; lies mainly in centre of Indo-China Peninsula, with Brit. Burma on the N. and W., and Fr. Indo-China on the N.E., E., and S.E.; it has a long strip running down northern half of Malay Peninsula between Strait of Malacca and Gulf of Siam, with the Brit. Malay possessions to the S. Western half of main portion consists of valley of the Menam and eastern half of Korat plateau which stretches to Mekong basin. Area, 195,000 sq. miles. The N. is mountainous, rising to heights of 6000 to 8000 ft. The S. is an alluvial plain, drained by rivers mentioned and their tributaries, chief of which is the Meping, joining the Menam. Chief towns, Bangkok, Puket.

Climate not unhealthy; mean temperature in lower ground is about 80° F., and average rainfall 54 in.; wet season, May to October.

In early times there existed various independent states in Siam, but by middle of XIV. cent. Siamese had established their power over whole country, making Ayuthia, built *c.* 1350, seat of government. For long time struggle with Cambodia was carried on, and that country was for some time a tributary state. The XV. and XVI. cent's were marked by Burmese invasions, and in 1555 the country temporarily lost its independence, regaining it under Phra Naret not long afterwards. In XVII. cent. Phaulcon, a Cephalonian Greek, became chief minister of Siamese king, whom he persuaded to send an embassy to Fr. court. About 1685, as a result of this, a number of Frenchmen and some Jesuits arrived in Siam, only to be banished from the country some five years later. The XVIII. cent.



GEORGE PHILIP & SON LTD. THE LONDON GEOGRAPHICAL INSTITUTE

was marked by an invasion of Burmese, who destroyed Ayuthia by fire in 1768; they were defeated and expelled by a Chin. general, Phaya Tak, who usurped the throne c. 1768 and removed seat of government from Ayuthia to Bangkok. He was subsequently killed, whereupon the ruling dynasty was established by another general, Tschakri, who became king in 1782. His descendant Chowfa Maha Vajiravudh, succeeded his father, Chulalongkorn, in 1910. Boundary treaties with France were signed in 1893 and 1904, and with Britain in 1891.

Government is absolute monarchy; king is advised by Cabinet of Ministers, and there is a legislative council of 40 members, some of whom are Ministers of State, while remainder are chosen by king. Siam is divided for administrative purposes into 17 districts, 16 of which are under High Commissioners, while Bangkok is directly controlled by Minister of Local Government. Buddhism is principal religion; education chiefly carried out by priests. Military service compulsory.

SIBERIA (c. 42° to 77° 35′ N., 60° E. to 170° W.), Russ. territories in Asia, stretches between Urals and Pacific, and between Arctic Ocean and Chin. empire. Total area is c. 4,786,730 sq. miles. Much of N. consists of waste ground, but there is a sufficiency of good ground to provide for surplus population of European Russia. The S.E. forms a great tableland from 2000 to 3000 ft. high, with mountains rising above it to heights of over 7000 ft., and from this the region slopes northward and westward. Principal mountain ranges are Stanovoi Mountains, between Yakutsk and Maritime Provinces, and in Amur, in the E.; Verkhoyansk Mountains, extending in a north-westerly direction from the Stanovoi; Little Khingan in S.E.; Yablonga, Sayan, and Altai Mountains in S.; Taibagatai and other ranges in extreme S.W.

Principal rivers are Obi (with affluent Irtysh), Yenesei (with affluent Tunguzka), Lena (with affluents Vitim and Aldan), all of which flow across great plain to Arctic coast; and Amur, draining the S.E.; of smaller streams, Kolyma, Indigirka, and Yana, in N.E., may be

PHILIP & SON LTD THE LONDON GEOGRAPHICAL INST

Chief wealth of Siam lies in the rice of the south, teak and other timber trees of the north. Rice to value of nearly £7,000,000 was exported in 1910–11, other exports, including teak, hides, pepper, silk. Chief imports are textiles, machinery, provisions. Mineral resources are hardly known, but gold, coal, petroleum, tin, and iron occur in various places, and rubies and sapphires are found. Railway mileage about 700.

The population, besides Siamese themselves, includes large number of Shans or Laos, Chinese, Malays, and other Eastern races. Pop. estimated at 6,300,000.

A. W. Graham, *Siam* (1912).

SIAMESE TWINS, see under TERATOLOGY.

SIBBALD, SIR ROBERT (1641–1722), Scot. physician; practised med. in Edinburgh, helped to found the botanical garden (1667), and to establish the Royal Coll. of Physicians, of which he became pres. (1684); first prof. of Medicine at Edinburgh University (1685); wrote extensively on antiquarian, as well as on medical, subjects.

mentioned. Siberia has many lakes, of which Lake Baikal, in the S., is largest.

Little known of early history; in XI. cent. Turk. race established a kingdom here, but they were overcome by Jenghiz Khan, Mongol leader, in XIII. cent. Russians first entered S. in XVI. cent. in search of furs; and eventually most of country was annexed to Russia in reign of Ivan the Terrible (1533–84). Further territories were acquired from China in 1858 and 1860.

Siberia is divided for administrative purposes into the five governments of Irkutsk, Tobolsk, Tomsk, Yakutsk, Yeniseisk, and the four provinces of Amur, Sakhalin, Transbaikalia, Maritime. Largest towns are Tomsk (western capital) and Irkutsk (eastern capital), both of which have populations over 80,000; Vladivostok and Krasnoyarsk, both with populations over 62,000. Climate is excessively cold, but there is a warm summer of short duration. Verkhoyansk, in N.E., is coldest place.

Natural resources are great; coal abundant, but of

poor quality; gold, silver, lead, iron, copper, graphite, naphtha also exist, but have not been fully developed. There are enormous forests, stretching from the S. to Arctic tundras, and from N. of Tobolsk and Tomsk to E. Siberia—pine, fir, cedar, poplar, aspen, willow, birch. Grain is chief source of wealth and export, but meat, hides, wool, dairy produce are also exported to considerable value. Fishing and hunting afford remunerative occupation to many of inhabitants.

Fauna includes sables, foxes, bears, reindeer, and many other valuable fur-bearing animals. Siberian Railway, constructed 1892–1903, stretches right across from Ural Mountains to Vladivostok. Gk. Orthodox Church is principal religion, and education is in backward state. Siberia is used as penal settlement for Russ. convicts and political prisoners. Population chiefly Russians, but there are tribes of Turk. and Mongolian stock, representing earlier inhabitants. Pop. (1910) 8,220,100.

Wright, *Asiatic Russia* (1903).

SIBI (29° 30′ N., 67° 59′ E.), town, Sibi district, Brit. Baluchistan; important junction on Sindh-Peshin railway. Pop. 5000; (district) *c.* 78,000.

SIBONGA (10° 5′ N., 123° 40′ E.), coast town, Cebu, Philippine Islands. Pop. 27,000.

SIBPUR (22° 34′ N., 88° 16′ E.), town, Hugli district, Bengal, Brit. India.

SIBSAGAR (26° 59′ N., 94° 38′ E.), town, on Dikhu, capital, Sibsagar district, Assam, Brit. India; tea-planting industry. Pop. 6300; (district) 610,000.

SIBTHORP, JOHN (1758–96), Eng. botanist.

SIBYLLINE ORACLES, body of writings written from II. cent. B.C. to I. cent. A.D.; of partly Jewish and partly Christian origin.

SIBYLS, prophetic women of ancient Rom. legend. The Cumæan S. conducted Æneas to the lower regions, and brought the Sibylline books to Tarquinius.

SICILIAN VESPERS, see VESPERS, SICILIAN.

SICILY (38° N., 14° E.), Ital. island, largest and most fertile in Mediterranean; about 2 miles from S.W. extremity of Ital. mainland, from which it is separated by the deep, narrow Strait of Messina; 80 miles from African coast; area, *c.* 10,000 sq. miles, 180 miles long, 120 wide. S. is triangular in shape, hence old name *Trinacria*; at N.E. corner is Cape Faro (ancient Pelorus), N.W., Cape Bœo (Lilybæum), S.E., Cape Passaro (Pachynus).

S. was divided from Italy in Tertiary period, and was once joined to Africa by tableland. Surface is mountainous; most of island over 500 ft. above sea-level. Steep mountains (attaining height of over 6000 ft.) continue Apennine range along N. coast, which faces Tyrrhenian Sea; highest point, Etna (*q.v.*), *c.* 10,800 ft.; other volcanoes are extinct, dormant, or incipient.

Good harbours are provided by bays and headlands on north but not on south coast. Rivers are unimportant, mostly intermittent. Summer is hot and dry, winter mild and rainy; rainfall, *c.* 30 inches; S. suffers from earthquakes, eruptions, sirocco in summer, and malaria in parts.

The flora is rich; chief crop is wheat; fruit trees and olives, especially on N. and E. coasts, vines mainly in W.; soil fertile, but agricultural methods backward; trees scarce, only 4 % of island forested; principal exports, oranges and citrous fruits, almonds, nuts, wine (Marsala, etc.), preserved vegetables, sulphur (from Girgenti, etc.), salt, silk, tunny, and sardines, sumach (for dyeing).

Thanks to its situation and surroundings, S. figures prominently in mythology, literature, and history. Here are Scylla and Charybdis; here Proserpine was seized and hurried to the underworld; Vulcan plies his forge 'neath Etna; here Acis loved Galatea; here is the fountain of Arethusa; here Odysseus escaped from Polyphemus. Here lived Theocritus, Pindar, Empedocles, Archimedes among others. Here architectural remains of every age and style witness the island's wondrous, chequered career. Here nature has been too kind and anon too cruel; rich soil, beautiful scenery, glorious climate have been counterbalanced by earthquakes, volcanoes, famine, pestilence, oppression, bloodshed.

The earliest recorded inhabitants were Sicani, Siculi, Elymi, Phœnicians; then came Gks., VIII. cent. B.C.; Eubœans founded Naxos (*q.v.*), 735 B.C.; Corinthians, Syracuse (*q.v.*), 734 B.C. Tyrants arose; Phalaris (*q.v.*) made Akragas (Roman Agrigentum, modern Girgenti) supreme in S., *c* 560 B.C.; cities combined to withstand Carthaginian inroads in V. cent. B.C.; Gelon of Gela became ruler of Syracuse, and defeated Carthaginians at *Himera*, 480 B.C.; Syracuse became chief city of S.; great Athenian expedition against Syracuse (415–413 B.C.), defeated with Lacedæmonian aid. Dionysius I. made Syracuse leading European city, 405–367 B.C.; waged long war against Carthaginians, who secured footing in island; Republic restored by Timoleon, and overthrown again by Agathocles, who continued Carthaginian war. S. was battleground of Romans and Carthaginians during First Punic War, 264–241 B.C., and consequently fell into Rom. power; rebellious Syracuse taken by Marcellus, 212 B.C.; slaves' revolt ruthlessly crushed, 135–132 B.C., 102–99 B.C.; under the avaricious Sextus Pompeius Verres (indicted by Cicero) island further declined; pirate régime ended by Octavianus, 36 B.C.

In the V. cent. A.D. S. came under the Vandals and Goths; recovered by Belisarius, 536. With conquest of island by Saracens in IX. cent., N. coast replaced E. as predominant region; Saracens overcome by Normans under the Guiscards, 1060–90; prosperity was restored, all customs, creeds, legal systems, languages being tolerated under Normans. United Sicily thus became great European power; after 1130, Naples (*q.v.*) and S. were subject to same king; Charles of Anjou conquered S. and Naples, 1266; his misrule avenged by *Sicilian Vespers*, March 30, 1282, all French being massacred, and Pedro of Anjou made king. Ferdinand the Catholic (1479–1515) seized Naples (continental Sicily), and became King of the 'Two Sicilies.' Spanish greed and intolerance impoverished S.; Duke of Savoy made King, 1713, but exchanged it to Austria for Sardinia, 1720; Charles III., King of Spain's son, became King of Two Sicilies, 1735; disastrous earthquakes, 1693, 1783. In 1806 French took Naples, but Britain protected S.; Ferdinand I. restored as King of Two Sicilies, 1815; abortive revolutions against Bourbons, 1836, 1848; Neapolitans defeated, and S. finally freed by Garibaldi and united to Italy, 1860. Her ambition realised, S. cannot be said to be peaceful; brigandage and bloodshed (see MAFIA), earthquakes (*e.g.* 1908), eruptions (*e.g.* 1910), still disturb the island.

The population, which is very mixed, is densest on N. coast; inhabitants mostly uneducated, proud, jealous, and intensely passionate. Capital is Palermo (*q.v.*); other towns, Messina, Catania, Syracuse, Girgenti, Marsala, Trapani, etc. Poverty and unsettled conditions have caused great stream of emigration in recent years. Pop. (1911) 3,683,380.

Freeman, *History of Sicily* (1891–94); Jackson, *Sicily* (1894).

SICKINGEN, FRANZ VON (1481–1523), Ger. Ritter; served under Charles V., whose election as emperor he helped to secure; supported Reformation; mortally wounded at Ebernburg.

SICULI, SICELS, ancient tribe of E. Sicily, from which name of island is derived; migrated thither from Italy, probably in XI. cent. B.C.

SICYON (38° N., 22° 45′ E.), ancient city, near Corinthian Gulf, Greece; important seat of Gk. art; ruled by the dynasty of the Orthagoridæ in VII. and VI. cent's B.C.; in time of Aratus (251 B.C.) became one of the chief cities of the Achæan League.

SIDDONS, SARAH (1755–1831), Eng. actress; b. Brecon, Wales; dau. of Roger Kemble. Her private performances attracted the notice of Garrick, but her first London performances were unsuccessful. The rôle best adapted to her powers was that of Lady Macbeth.

SIDE (36° 45′ N., 31° 25′ E.) (modern *Eski Adalia*), ancient town, on Gulf of Pamphylia, Pamphylia, Asia Minor.

SIDEBOARD, table fitted with drawers and shelves, used as receptacle for food; later became decorative; fine specimens extant by Sheraton and Hepplewhite.

SIDERIAL CLOCK, see OBSERVATORY.

SIDERITES, see METEORITE.

SIDEROLITES, see METEORITE.

SIDGWICK, HENRY (1838–1900), Eng. philosopher; b. Skipton, Yorkshire; app. prof. of Moral Philosophy, Cambridge, 1883. Chief works are *Methods of Ethics*, *History of Ethics*, *Principles of Political Economy*.

SIDI-BEL-ABBES (35° 9′ N., 0° 35′ W.), town, on Mekerra, Oran, Algeria; trade in grain; military centre. Pop. (1911) 30,942.

SIDMOUTH (50° 41′ N., 3° 14′ W.), seaport, watering-place, on English Channel, Devonshire, England. Pop. (1911) 5612.

SIDMOUTH, HENRY ADDINGTON, 1ST VISCOUNT (1757–1844), Brit. statesman; b. Reading; ed. Winchester and Oxford. M.P., 1784; friend of Pitt; Speaker of Commons from 1789 to 1801, when he became Prime Minister; pres. of Council and peer, 1805; Home Sec., 1812; retired from public life, 1822.

SIDNEY (40° 17′ N., 84° 10′ W.), city, on Miami, capital, Shelby County, Ohio, U.S.A.; iron foundries. Pop. (1910) 6607.

SIDNEY, ALGERNON, SYDNEY (1622–83), Eng. politician; younger s. of Earl of Leicester; fought (1641) in Ireland, of which his father was Lord-Lieut; one of judges app. to try king; disapproved of assumption of power by Cromwell and went into retirement; returned to Parliament, 1659; went abroad at Restoration; allowed to return, 1677, but never reconciled to monarchy; leader of opposition to Duke of York; joined Russell and the Country Party in agitation for assembling of new Parliament, 1682; accused of part in Rye House Plot; executed. Wrote *Discourses concerning Government*, a learned, passionately republican work.

Life, by Meadley, Ewald (1873).

SIDNEY, SIR HENRY (1529–86), Eng. statesman; in Ireland as vice-treasurer to his bro.-in-law, Lord Sussex, 1556–59; Lord-Deputy, 1565–78; tried hard to establish peace and order in the country under Elizabeth; set up county divisions; pres. of the Welsh Marches after his recall, 1578.

SIDNEY, SIR PHILIP (1554–86), Eng. poet, soldier, and courtier; s. of Sir Henry S., Lord-Lieut. of Ireland; b. Penshurst, Kent; ed. Shrewsbury and Christ's Church Coll., Oxford; in France during massacre of St. Bartholomew; travelled in Germany, Austria, and Italy; engaged in numerous diplomatic missions and won friendship of many famous men abroad and at home, including Spenser; held various posts at court, where he enjoyed high favour; m. Frances, dau. of Walsingham; interested himself in classical metres, Amer. colonisation, repression of Jesuits, thwarting of Spain, and other literary and political questions; app. gov. of Flushing; received mortal wound at *Zutphen* as volunteer against Spaniards; died as he had lived, a gallant, generous gentleman, giving his own cup of water to a common soldier. S.'s works, which enjoyed great popularity, were all pub. after his death, viz. *Arcadia*, a romance written for his sister's diversion; *Apologie for Poetrie*; *Astrophel and Stella* (fine sonnets dedicated to Penelope, dau. of Earl of Essex).

Grosart's edit. (1873); *Life*, by Addleshan (1906), Fox Bourne (1891), Symonds ('E.M.L.,' 1886).

SIDON (33° 33′ N., 35° 22′ E.) (modern *Saida*), ancient city, on Mediterranean, Phœnicia; extensive commerce; famed for its glass; conquered by Artaxerxes, 351 B.C.; destroyed several times during the Crusades.

SIDONIUS APOLLINARIS, see APOLLINARIS SIDONIUS, CAIUS SOLLIUS.

SIEBENGEBIRGE (50° 43′ N., 7° 13′ E.), range of hills, on Rhine, Rhenish Prussia; noted scenery.

SIEBOLD, CARL THEODOR ERNST VON (1804–85), Ger. zoologist, famous entomologist and parasitologist.

SIEBOLD, PHILIPP FRANZ VON (1796–1866), Ger. scientific explorer of Japan; b. Würzburg; medical officer to Dutch East Ind. Army.

SIEDLCE (52° N., 22° 30′ E.), government, Russ. Poland; generally flat; watered by Vistula and Bug. Pop. (1910) 981,900. Capital, **Siedlce**. Pop. 25,000 (mostly Semitic).

SIEGBURG (50° 48′ N., 7° 11′ E.), town, Rhineland, Prussia; manufactures firearms. Pop. (1910) 17,280.

SIEGECRAFT as a science was first developed by the **Greeks**. Before their time, however, there were various methods of attack, of which the earliest was the *escalade* by ladders. When this became impossible owing to height of walls two methods were invented, one being to batter down the walls by means of a ram and the other to undermine the walls. Other developments were the use of engines for throwing heavy stones, and of movable towers, both of which were known to the Babylonians in the VI. cent. B.C. The methods invented by the Greeks were brought to great perfection by the Romans, who successfully carried out a great number of sieges; all Rom. troops could be turned into miners, masons, or carpenters, and the whole army worked at the approaches, earthworks, etc., at the same time as they made attacks on, and defended themselves against, the enemy. In the course of many of their sieges they had to erect enormous works. They made use of various rams, catapults, movable towers, etc.; in Britain many of their sieges were conducted by blockade, as they found that to attack by assault cost too many lives. During the Middle Ages *battering-rams* continued to be employed, and are indeed mentioned as late as the XVI. cent. In late XII. and early XIII. cent's methods of attack were greatly improved, and engineers were employed especially to construct the necessary engines. Wooden towers, which moved on rollers, were much used; and there was a movable platform called the *gate*, which was placed against the foot of the walls and gave cover to the besiegers when they were undermining, filling up the moat, or using the ram. Mines have been employed since the earliest times, and have undergone little change. An engine called a *cat* was used for filling up the moat, and there were wooden towers with drawbridges by which attack was made.

The introduction of gunpowder and of cannon made great changes in system of attack. Cannon were first used to destroy hoardings by throwing stones. Towards middle of XV. cent. great improvements were made by the brothers Bureau, who were first to employ iron instead of stone missiles. These were able to penetrate stonework, and by their use an increase of velocity was attained, as equal weight could be obtained with less volume. Before long the improved artillery was able to destroy gates and walls in very short time. As, however, the besieged were also in possession of effective artillery, the besiegers had to provide themselves with protective trenches, in order to approach the battery positions. Siegecraft, however, was in a chaotic state until systematised by Vauban in such a way that the result of a siege came to be a mere matter of time. His method was still employed until end of XIX. cent., and was used in the Peninsular War. In modern siege, besiegers should number three or four times as many as the besieged; the place is first surrounded and all communications between it and outer world are cut off. The weakest side is then chosen as the point of attack, and the artillery is brought up and placed beyond range of gun-fire from the besieged. Armed batteries are established to subdue the enemy's fire over the space which the besiegers have to cross. This is called the first artillery position. Trenches called parallels are excavated at intervals, the last of which is to contain

the forces who make the final assault through the breaches made by the artillery. Mines are employed wherever possible, and are generally met by countermines laid by the besieged. See also FORTIFICATION.

SIEGEN (50° 53′ N., 8° 1′ E.), town, on Sieg, Westphalia, Prussia; manufactures iron, leather; birthplace of Rubens. Pop. (1910) 27,415.

SIEGFRIED, SIGURD, hero of the old Ger. mythological poem, the *Nibelungenlied*. Wagner has immortalised the name in one of his great music-dramas. See NIBELUNGENLIED.

SIEMENS, ERNST WERNER VON (1816–92), Ger. scientist; b. Lenthe, Hanover; military career till 1848; made electrical discoveries in connection with telegraphy; bro. of Sir Wm. S.

SIEMENS, SIR WILLIAM, KARL WILHELM (1823–83), scientist, inventor, and engineer; b. Lenthe, Hanover; settled in England; naturalised Brit. subject, 1859; knighted, 1883; practised as engineer, especially in applications of heat and electricity; made important improvements in steam engine, furnaces, telegraph, dynamo, electric lighting, locomotion, etc.

SIENA, SIENNA (43° 20′ N., 11° 19′ E.), town, Tuscany, Italy; capital of province S., about 60 miles from Florence. S. has a mediæval appearance, with old walls and gateways, narrow steep streets, splendid churches and palaces, and ranks next to Florence, Rome, and Venice in the history of art. Outstanding features are the magnificent Gothic cathedral of black and white marble (begun XIII. cent.), with pulpit by Niccola Pisano and fine mosaic marble floor; churches of San Giovanni (wonderful font with bas-reliefs by Donatello, Ghiberti, and others) San Domenico, Sant' Agostino (XIII. cent.), Servites (XV. cent.), San Francesco, San Martino, Fontegiusto, etc., all with paintings and sculptures by famous Sienese artists; palaces, Publico (municipal palace, XIII. cent., with fine paintings), Tolmei, Buonsignori (XIV. cent.), Marsilii, Spinnochi, Piccolomini (now containing state archives), Monte de' Paschi, Loggia del Papa, Loggia di Merzanzai (XV. cent.); Opera del Duomo (with famous art collection), once celebrated univ. (XIII. cent.), now only faculties of law and medicine; Institute of Fine Arts (with good collection of Sienese school), Fonte Gaia and Fontebranda (fountains). Chief industries are machinery, furniture, leather, silk, cloth, hats, etc. S. was probably founded by Etruscans; a Rom. colony, *Saena Julia*, under Augustus; one of most important and flourishing cities of Italy in art, lit., and commerce during Middle Ages; continuous strife between S. and Florence during XII. to XIII. cent's, which ended with defeat of Florentines at *Montaperto*, 1260; under Duke of Milan, 1399; Charles V., 1524; passed to Cosimo de Medici, 1557, and annexed to Tuscany; great Sienese school of painting arose in XIII., flourished in XIV., and declined in XV. cent. The well-known Pallio della Contrada (public festivals), dating back XV. to XVI. cent's, take place once a year and consist in horse races, formerly bull-fights and buffalo races. Pop. (1911) 41,659; (prov.) 241,470.

Langton Douglas, *History of Sienna* (1902).

SIENKIEWICZ, HENRYK (1846–), Polish novelist; author of *Quo Vadis*; Nobel prize for literature, 1905.

SIERADZ (51° 35′ N., 19° 55′ E.), town, Kalisz, Russ. Poland; agricultural machinery. Pop. 7300.

SIERO (43° 25′ N., 5° 40′ W.), town, on Nora, Oviedo, Spain; tanneries. Pop. (1910) 25,075.

SIERRA LEONE (8° N., 12° 30′ W.), Brit. colony, W. Africa, with large inland protectorate; area of colony, 515 sq. miles; of protectorate, *c.* 31,110 sq. miles; surface is very variable, some parts being low and swampy, others mountainous, rising over 3000 ft.; watered by Mano, Bum, Jong, Rokelle, Little and Great Scarcies; chief town, Freetown, the most important port of W. Africa. The climate is unhealthy, especially on coast; rainy season from May to October. S. L. was first permanently settled by the British in 1791; at first in hands of a company, and was a settlement for escaped slaves; became a Crown colony in 1807. Protectorate was established in 1896; administered by a governor, assisted by executive and legislative councils. There are about 104 schools belonging to missions, and assisted by the Government, besides 5 Muhammadan schools. The principal products are palm oil and kernels, kola-nuts, rubber, copal, hides, ginger, ground-nuts. A railway runs from Freetown to Baiima, and there are about 300 miles of telegraph line. Pop.: colony (1911), 75,572; protectorate, *c.* 1,320,000.

SIERRA MORENA (38° 15′ N., 4° 30′ W.), mountain range, between valleys of Guadiana and Guadalquivir, S. Spain.

SIERRA NEVADA.—(1) (39° N., 120° W.) mountain range, California, U.S.A.; highest summit, Mount Whitney, 14,500 ft. (2) (37° N., 3° W.) highest mountain range, Spain, between valley of Guadalquivir and Mediterranean Andalusia; highest peak, Mulá-hacen, 11,500 ft.

SIEYÈS, EMMANUEL-JOSEPH (1748–1836), Fr. cleric and statesman, canon, diocesan chancellor, vicar-gen.; Liberal opinions; deputy to States-General from Paris, 1789; urged constitution as National Assembly; Pres., 1790; a great constitution-maker. He retired from Paris under the Robespierre terror; member of Five Hundred, and of Directory, 1799. Consul with Napoleon and Ducos, 1799; elected member of the Academy, 1830.

SIFAKAS (*Propithecus*), a genus of *Lemuroidea* (*q.v.* under PRIMATES); fur generally white, tail long, snout short; confined to Madagascar.

SIGEL, FRANZ (1824–1902), Ger. soldier; rebel leader in Baden, 1848–49; subsequently became Federal general in Amer. Civil War.

SIGER DE BRABANT (fl. XIII. cent.), Fr. philosopher; taught at Sorbonne; passed from kind of Scotism to Thomism.

SIGFRID, see NIBELUNGENLIED.

SIGHTS, see ORDNANCE.

SIGILLARIA, see under PALÆOBOTANY.

SIGIRI (8° N., 81° E.), rocky height, Ceylon, on summit of which Kasyapa the Parricide built palace in V. cent. A.D.

SIGISMUND (1368–1437), Holy Rom. emperor; succ. to margravate of Brandenburg, 1378; acquired Hungary by marriage with Mary, d. of Louis the Great; conducted crusade against Turks, who routed him at Nicopolis, 1396; Rom. king, 1410; instrumental in summoning Council of Constance (*q.v.*), 1414; king of Bohemia, 1419; blamed for death of Huss, which resulted in Hussite War, 1419–36; crowned at Rome, 1433.

SIGISMUND I., THE GREAT (1467–1548), king of Poland; succ., 1506; drove Russians from Lithuania after victory at Orsza, 1508; repelled invasion of Moldavians and Walachians, over whom he established suzerainty, and drove back Tatar hordes; second Russ. invasion defeated with great slaughter, 1514; expelled Teutonic knights from Polish Prussia, which he formed into duchy, 1525; tolerated Lutheranism; mild, just ruler.

SIGISMUND II. (1520–72), king of Poland; grand-duke of Lithuania, 1544; king of Poland, 1548; acquired Livonia, 1561; united Lithuania and Poland as single state by Union of Lublin, 1569; granted religious toleration; d. childless.

SIGISMUND III. (1566–1632), king of Poland and Sweden; s. of John III. of Sweden; chosen king of Poland, 1587; succ. to Swed. throne, 1592; reign marked by frequent revolts among nobles, whom he ultimately subdued at Guzow; deposed in Sweden, 1604; allied himself with emperor at beginning of Thirty Years War; his troops, under Chodkiewicz, gained brilliant victory over Turks at Khotin, 1622.

SIGMARINGEN (48° 4′ N., 9° 12′ E.), town, capital, Hohenzollern, Prussia, on Danube; interesting art collections. Pop. 5450.

SIGNALLING.—Marine sight signals are made chiefly by flags or semaphores, and sound signals

by fog-horns, steam whistles, sirens, or guns. Commands used in the ordinary operations of a squadron are signalled by two alphabetical flags, and words or short sentences by three alphabetical flags. Manœuvring orders are signalled by a combination of alphabetical and numeral flags. Flag s. is of necessity a rather slow process. Semaphore s. is usually done by the movements of a man's arms, a flag generally being held in each hand to facilitate reading. Mechanical semaphores are also used, the signals being visible for several miles. At night signals are made by flashing, by means of the exposure and eclipse of a single light for short or long periods representing the dots and dashes of the code. There are also methods of s. by means of coloured lights. For flashing over long distances the search-light is used. During fogs, signals are transmitted by short or long sounds standing for dots and dashes, or by the intervals between the shots, in the case of signalling by guns. A century ago Napoleon's escape from Elba was signalled by 'telegraph' to Paris, but the so-called telegraph was a system of semaphores. Our navy established a similar 'telegraph' at Torres Vedras in 1810. Nelson's order to his fleet at Trafalgar was conveyed by flag signals. For the interchange of signals between ships of all nations a special international code is employed. Wireless telegraphy is largely used for long distance s., and wireless telephony is employed to some extent.

Military s. is usually done by Morse system with flags (see TELEGRAPH), or by Semaphore s. (*q.v.*) with or without flags. Section commanders convey messages by rifle, *e.g.* rifle held above head horizontally is signal for 'Halt.' Bugle and trumpet calls are used for well-known messages, *e.g.* 'Pioneers,' 'Fall in,' 'Cease fire,' etc.

The heliograph was first used in the Afghan War of 1879–80; the cable line (field telegraph) was first used by the Federals in December 1862. The telephone was first seen on the battlefields in Manchuria, 1904–5.—For railway signalling, see RAILWAYS.

SIGNET, see SEAL.

SIGNIA, SEGNI (41° 45′ N., 13° 5′ E.), ancient town, near Volscian mountains, Latium; founded by Tarquinius Priscus, 495 B.C.

SIGNORELLI, LUCA (*c.* 1442–*c.* 1524), Ital. painter; b. Cortona, where he left many specimens of his art. Pope Julius II. called him to Rome in 1508 to assist in decorating the Vatican. His greatest works are a number of frescoes on the walls of a chapel in Orvieto Cathedral.

SIGONIUS, CAROLUS, CARLO SIGONIO (SIGONE) (*c.* 1524–84), Ital. classical scholar; b. Modena; was engaged in a fierce literary controversy as defender of the Ciceronian authorship of the *Consolatio de Tullia*; wrote some important works on classical antiquities.

SIGOURNEY, LYDIA HUNTLEY (1791–1865), Amer. poet.

SIGURDSSON, JÓN (1811–79), Icelandic writer and politician; largely instrumental in obtaining constitution for Iceland from Christian IX. of Denmark; wrote *Diplomatarium Islandicum* and other works on Icelandic history and lit.

SIKH WARS, Brit. conflicts with Sikhs of India, 1845–46, 1848–49. Death, 1839, of peaceful Runjeet Singh was followed by anarchy; Sikh war party invaded Brit. territory; defeated at *Mudki*, *Aliwal*, and *Sobraon*; Britain annexed district between Sutlej and Beas, 1846.

War of 1848, after indecisive *Chillianwalla* and capture of Multan, resulted in Brit. annexation of Punjab, 1849.

SIKHISM, originated as reforming monotheistic religion in revolt against Brahmin orthodoxy. Founded by Nānak, Hindu preacher (b. 1469 A.D.); principal disciples were Panjabi Jats, who became known as Sikhs (from *siksha* = pupil). Nānak condemned caste, idolatry, asceticism, proclaimed one personal God and spiritual equality of men, and aimed at reconciling Hinduism and Islam; selected successor as *Guru*, or spiritual guide. Nine *gurus* followed Nānak. Under Arjun, 5th guru, sacred code '*Granth*' was compiled, written in Gurmukhi, and based upon *Adi-Granth* or psalms of Nānak, and upon teachings of various Hindu and Muslim reformers. Under Mughal persecution, Sikhs, under 6th guru, Har Govind, became soldiers. Govind Singh, 10th guru, converted them into religious military commonwealth, *Khalsa*, abolished guruship, called them Singhs or lions, and gave them distinctive outward appearance. Every true Sikh must have five things, whose names all begin with *k*: *kes* (hair; Sikhs never cut hair or beard); *kanghi* (comb); *kachh* (breeches reaching to knee); *kard* (knife); *kirpan* (sword). Sacred city, Amritsar.

M'Auliffe, *Granth*.

SIKKIM (27° 30′ N., 88° 25′ E.), feudatory state, Himalayas, India, situated between Tibet and Darjeeling; area, 2818 sq. miles; watered by Tista, affluent of Brahmaputra; capital, Gantok; produces maize, rice, fruit, timber, copper, ivory-carving, silks, gold and silver embroidery. Religion, Lamaism. Brit. protectorate established, 1890. Pop. (1911) 88,169.

SILA (39° 15′ N., 16° 30′ E.), wooded mountain region, Calabria, Italy; highest point, Botte Donato, 6330 ft.

SILAS accompanied St. Paul to Philippi, Thessalonica, etc.; perhaps identical with Silvanus.

SILAY (10° 55′ N., 123° E.), town, W. Negros, Philippine Islands. Pop. 23,000.

SILBURY HILL, see AVEBURY.

SILCHAR (24° 50′ N., 92° 51′ E.), town, on Barak, cantonment, capital of Cachar district, Assam, Brit. India. Pop. 10,000.

SILCHESTER (51° 22′ N., 1° 5′ W.) (ancient *Calleva Atrebatum*), village, Hampshire, England; interesting Roman remains.

SILESIA (49° 50′ N., 18° 10′ E.), small duchy, N. Austria, between Moravia and Pruss. Silesia; area, 1987 sq. miles; has Sudetic Mountains in N., spurs of Carpathians in E.; drained by upper waters of Oder and Vistula; capital, Troppau; has small coal-field, and deposits of lignite, iron, sulphur; manufactures machinery, textiles. Represented in Reichsrath by 15 members. Pop. (1910) 756,949.

SILESIA (51° N., 17° E.), province in extreme S.E. of Prussia, with Austrian Silesia, Bohemia, and Saxony along the south; area, 15,569 sq. miles; hilly in S., where Sudetic Mountains reach extreme height of 5260 ft.; elsewhere surface is flat; drained by Oder; large area wooded; has coal-field in S.E.; produces also zinc, iron, silver-lead; agriculture is carried on, and sugar-beet, cereals, fruits, and oil plants are cultivated; manufactures linens, cottons, woollens, zinc and iron goods, paper, etc. The capital is Breslau. Silesia was independent in the XII. cent.; afterwards came under the dominion of Bohemia, and so of Austria, by whom it was finally transferred to Prussia in 1763. Pop. (1910) 5,225,962.

SILICA, silicon oxide $(SiO_2)_n$; white amorphous powder, also crystallised and vitreous; insoluble in water and all acids except fluoric; soluble in alkalies.

SILICON (Si = 28·3), non-metallic element, related to carbon, especially in atomic configuration; prepared from its oxide, silica, by reduction with magnesium: $SiO_2 + 2Mg = Si + 2MgO$; or by the reaction $K_2SiF_6 + 4K = 6KF + Si$; shows allotropy; amorphous s. is a brown powder, S.G. 2·35, insoluble in acids, but dissolved by molten metals, whence crystalline s. separates, S.G. 2·49; burns to SiO_2.

COMPOUNDS.—SiO_2, silica: H_2SiO_3, H_4SiO_4, and silicates, many and complex; SiH_4, spontaneously inflammable gas; SiF_4, gas: $3SiF_4 + 3H_2O = 2H_2SiF_6 + H_2SiO_3$; $SiHCl_3$, silicichloroform; $SiCl_4$, liquid, B.P., 59·6° C.; $SiCl_4 + 3H_2O = H_2SiO_3 + 4HCl$.

SILIQUARIA, see under GASTEROPODA.

SILISTRIA, SILISTRA (44° 7′ N., 27° 14′ E.) (Rom. *Durostorum*), town, former fortress, on Danube, Bulgaria; abp.'s see; active trade; manufactures

cloth; frequently besieged and taken in Middle Ages; successfully held against Russians, 1854. Pop. (1910) 11,646.

SILIUS ITALICUS, Titus Caius S. I. (*c.* 26–101 A.D.), Rom. poet and orator; birthplace unknown; attained considerable forensic success, although he is said to have bartered his oratorical powers to Nero in exchange for his personal safety. His political caution saved him from the fate of most of his prominent contemporaries; obtained consulship, 68, followed by proconsulship of Asia, after which he retired into private life and devoted himself to literature and patronage of art; idolised Cicero and Vergil.

His extant work, the *Punica*, is an epic of some 14,000 lines, in close imitation of the *Iliad* and *Æneid*; though smooth and at times graceful in style it can claim no originality, and Vergilian touches appear constantly. The plot deals with the Punic War; Hannibal and Scipio are protagonists, but, as the poem seldom frees itself from the trammels of conventional epic, it is of little interest to the ordinary student.

SILK, a very fine and glossy thread spun by the caterpillar of certain moths and manufactured by man into fabric.

History.—There is no doubt that the cultivation of s.-spinning moths was practised in China for many centuries before the Christian era. Native records show that the industry is of very remote antiquity. For instance, the Empress Si Ling (2640 B.C.) 'encouraged the cultivation of the mulberry tree, the rearing of worms, and the reeling of s.' During the reign of Justinian (550 A.D.) two Persian monks brought some eggs, secreted in a hollow cane, to Constantinople from China. Having studied s.-making in the East, they supervised the first s. manufacture in Constantinople and so brought the industry to the West. Aristotle mentions 'a great worm which has horns and so differs from others . . .; from this animal women separate and reel off the cocoons and afterwards spin them.' S. manufacture did not commence in England until the reign of Henry VI.; in 1585 some Flemish weavers came over and settled in the country, and so s.-spinning in England was assured.

The Silk Worm belongs to the family of *Bombycidæ*, of which that group known as *Bombyx mori* are the most common; distinguished by the small size of the proboscis; thick, hairy body, and large, broad wings. The female deposits the eggs on leaves, and in s. cultivation they are artificially hatched in rooms heated to about 80° F. In about eight or ten days from the laying, the young caterpillars make their appearance, being black in colour and about ¼ in. in length. They thrive best on the leaves of the white mulberry. In six or eight weeks the worms are fully developed, and during this period they cast their skins four times. Ten days after the final moult the worm is ready to spin its cocoon; it is then about 3 in. long, and of a greenish-white colour; its body is divided into twelve segments with six anterior fore-legs and ten pro-legs. The s. with which the cocoon is spun is a glutinous secretion contained in two tubular glands, one on each side of the body. The threads issue from spinnerets, and harden on coming into contact with the air. Three to five days are occupied in spinning, and if the cocoon were left, the perfect insect or *imago* would emerge in about three weeks. However, the cocoons are not left thus, for in its exit the moth would eat through all the s. threads and destroy their continuity. The worms are therefore killed, after the cocoons have been sorted into sizes and qualities. They are placed in a heated chamber and slightly roasted, then dipped into basins of warm water to loosen the gummy substance which binds the threads together, and the ends of several are brought together and wound or twisted into *raw silk*. The average length of thread from a single cocoon is 300 yards, while 12 lb. of cocoons are needed to furnish 1 lb. of raw s.

Diseases of eggs and larvæ are many, the commonest being *muscardine*, due to a development of fungus in the body of the caterpillar, both contagious and infectious; *pebriné*, a disease first noticed in France; while *grasserié* appears just before or after the first moult and is a form of dropsy.

Silk Spinning.—S. is spun from the raw material, and complex machinery is used in large establishments. The raw s. is first cleaned, twisted, doubled, and wound on bobbins for the weaver. Before winding, flossy s. is removed from the cocoons, and, until the XIX. cent., it was regarded as waste and used by engineers for cleaning purposes. Mr. Lister of Bradford (Lord Masham, 1891), in 1857, discovered a method of spinning from this waste.

About 40 % of the whole supply of raw s. comes from China, and 30 % from Italy. France is the greatest s.-spinning country, although the industry is extensively carried on in the Midlands of England. Leek (Staffs.) is famous for the dyeing of s.

SILK-WORM MOTH, see under Lepidoptera.

SILL, intrusive masses of igneous rocks, common in stratified or sedimentary rocks, also occurring in different forms of lava; a characteristic s. is whin-s., which runs from Kirkby Stephen to Bamborough, England; the river Tees crosses it at High Force; it is formed of dark green diabase. S's have close connection with dykes (*q.v.*), but former are horizontal, the latter vertical.

SILLOTH (54° 52′ N., 3° 23′ W.), town, Cumberland, England; watering-place; port for summer sailings to Isle of Man and Dublin.

SILO, see Ensilage.

SILURIAN, name proposed by Murchison in 1835 for the lowest sedimentary strata of the Palæozoic or Primary period. These strata consist of grits, slates, shales, sandstones, flagstones, and conglomerates, and lie on the Cambrian Rocks, and under the Old Red Sandstones and Devonians.

They are divided into

Upper S. { Ludlow Group. / Wenlock Group. / Upper Llandovery Group.

Lower S. { Lower Llandovery Group. / Bala or Caradoc. / Llandeilo Group. / Lingula Beds.

Deposits are *c.* 20,000 ft. in thickness, and are found in Wales, Westmoreland, Cumberland, Scot. Highlands, Ireland, Europe, and other places.

SILUROIDS, see Cat-Fishes.

SILVA, ANTONIO JOSÉ DA (1705–39), Portug. dramatist; b. Rio de Janeiro. A Jew by birth, he suffered violent persecution, culminating in his execution. His best comedies are *Alecrim e Mangerona* and *Don Quixote*.

SILVER (Ag = 107·88), metallic element, allied to copper and gold; known to the ancients; associated by alchemists with Luna ☽. Occurs native, as s. glance Ag_2S, horn s. AgCl, in galena (PbS), etc.

Extraction.—(1) Alloyed with lead, which is removed by oxidation; (2) amalgamated with mercury, and mercury distilled (Mexico); (3) extracted in wet way after preliminary treatment of ore.

Properties.—Pure white; takes high polish; best-known conductor of heat and electricity; tough; malleable; forms, by reduction of salt solutions, bright deposit on glass, which transmits blue light; dull grey when precipitated in bulk; may become colloidal; S.G. 10·49, M.P. 960·5° C.; molten metal occludes oxygen, which it evolves by 'spitting' on solidification; vapour bright blue, monatomic. Dissolved by dilute nitric acid, unattacked by fused caustic alkali, tarnished by hydrogen sulphide. Silver coinage contains 92·5 % silver, 7·5 % copper.

Compounds.—Oxide Ag_2O, precipitated from salt solutions by alkali, chocolate colour, faintly alkaline, gives silver and oxygen when heated;—halides AgF,

soluble in water; AgCl, AgBr, AgI, practically insoluble in water, but show progressive insolubility in water and ammonia, and deepening of colour from white to yellow; sensitive to, and darkened by, light; AgCl and AgBr used in photography, soluble in potassium cyanide and sodium thiosulphate ('hypo') solutions (fixing);—sulphide Ag_2S, black precipitate;—sulphate Ag_2SO_4, sparingly soluble in water;—nitrate $AgNO_3$, Lunar caustic, crystallises in rhombic plates, fusible, poisonous, blackens organic matter, hence used for marking-ink, in chemical analyses, surgery, and photography;—cyanide AgCN, white, curdy precipitate, soluble in KCN, forming $KAg(CN)_2$ solution, used in electroplating. Silver is detected by the precipitate its salts give with solution of chloride, and estimated by weighing as chloride, or titrating with standard chloride or thiocyanate solution.

SILVER FISH (*Lepisma saccharina*), a minute bristle-tailed or *Thysanurous* insect, found in damp corners, amongst old papers and books. It feeds on starchy or sugary substances—hence the specific name—and is recognised by silvery scales.

SILVER GLANCE, see ARGENTITE.

SILVER KING, see under HERRING FAMILY.

SILVERIUS, pope, 536–37, when deposed.

SILVES (37° 10′ N., 8° 28′ W.), town, on Silves, Algarve, Portugal; cathedral; Moorish relics; manufactures corks. Pop. 10,500.

SILVESTER I., pope, 314–35; traditionally (but falsely) said to have baptized Constantine the Great.

SILVESTER II., pope, 999–1003; his personal name was Gerbert; was introduced to the emperor and studied at Reims, and soon became famous as a scholar; abbot of Bobbio, *c.* 981, then abp. of Reims; for a time tutor to Emperor Otto III. After his election to papacy he continued to be active as an ecclesiastic and a politician; a letter which may not be genuine seems to anticipate the position of Hildebrand. He was a very learned man, and in science in advance of his age; wrote theological and mathematical works and numerous letters.

SILVESTRE DE SACY, ANTOINE ISAAC, BARON (1758–1838), Fr. scholar; prof. of Arabic at the School of Eastern Languages, and of Persian at the *Collège de France*; founded *Société Asiatique* with Abel Rémusat, 1822; wrote *Chrestomathie Arabe*, *Exposé de la Religion des Druses*.

SILVESTRINES, small religious order, with rule of St. Benedict, existing since 1231.

SIMANCAS (41° 37′ N., 4° 51′ W.), town, on Pisuerga, Valladolid, Spain.

SIMBIRSK (54° 15′ N., 47° E.), government, Russia; consists in general of an extensive and fertile plain; drained by Volga and tributaries; has deposits of sulphur, salt, and asphalt; exports grain and fish; trade in timber. Pop. (1910) 1,931,700. Capital, **Simbirsk** (54° 17′ N., 48° 26′ E.), river port, on Volga; trade in grain; annual fair. Pop. (1910) 52,240.

SIMEON, Israelite tribe; according to Genesis S. was one of sons of Jacob and Leah; placed, according to Chronicles, in N., according to Joshua, in S. Palestine. According to some, the events in Genesis reflect an early stage of conquest about 1400 B.C., before the entry of the remaining tribes.

SIMEON, CHARLES (1759–1836), Anglican clergyman, of strong Evangelical sympathies.

SIMFEROPOL (44° 56′ N., 34° 5′ E.), town, on Salghur, capital, Taurida government, Russia; cathedral; exports fruit. Pop. (1910) 70,420.

SIMIA, see ORANG.

SIMIIDÆ, a family of PRIMATES (*q.v.*).

SIMLA (31° 6′ N., 77° 11′ E.), town, sanatorium, on spur of the Himalayas, capital, Simla district, Punjab, Brit. India; seat of government during hot season. Pop. (winter) 16,000; (summer) 45,000; (district, resident) 45,000.

SIMMS, WILLIAM GILMORE (1806–70), Amer. poet, novelist, and historian.

SIMNEL, LAMBERT (fl. 1477–1534), Eng. pretender; a youth trained to impersonate the young Earl of Warwick, Yorkist claimant to the throne against Henry VII.; captured and made a scullion in the royal kitchen.

SIMON MAGUS, a curious character mentioned in *Acts* 8. He seems to have been a sorcerer, converted or partially converted by Philip, and then trying to buy the gift of the conferring the Holy Spirit from the Apostles. In the post-apostolic lit. he appears as a false Messiah, and, according to Justin Martyr, was born in Samaria and lived at Rome under Claudius. Irenæus includes in his work against the heretics (*Centra heresios*) a Gnostic fragment in which Simon is described as a divine power, and even as God Himself, and emanating from him Helena (a woman with whom he had become traditionally associated); through her the world is created.

He appears again in Celsus, Origen, the pseudo-Clementine literature, now as a sorcerer, now as a sort of embodiment of the Samaritan religion, now as the upholder of Marcionite theology. Sometimes the references to him have been interpreted as a veiled attack on St. Paul, but this view is now generally abandoned. Sometimes he has been thought to be the beast of Revelation, and there have been several other guesses. The original idea that he was a sorcerer is probably true, and he proclaimed himself to be divine, thus forming a basis for Gnostic speculations. Finally he was identified with the sun-god, and Helena becomes the moon-goddess, his partner. His cult continued some time after his death; Simonists are mentioned by Origen, but seem soon after to have disappeared in the East, but lasted longer in the West. Different Gnostic theologies called after him developed in Alexandria and Syria.

Hort, *Notes Introductory to Clementine Recognitions*.

SIMON OF ST. QUENTIN, Fr. dominican; went with Pope Innocent IV.'s unsuccessful embassy to Baigre, the Mongol ruler of Armenia.

SIMON, SIR JOHN (1816–1904), Eng. surgeon and public health reformer; surgeon and lecturer on Pathology at St. Thomas's Hospital, London (1847), medical officer of health to City of London (1848), and later to the Government; pres., Royal College of Surgeons (1878); had a very great share in the development of sanitary science.

SIMON, JULES FRANÇOIS (1814–96), Fr. politician and philosopher; b. Lorient; lectured on philosophy at Sorbonne, Paris, 1839–51; entered National Assembly, 1848; member of Legislative Assembly, 1863; Minister of Education, 1870; Academician, 1875; Prime Minister, 1876–77; wrote *Le Devoir*, *Le Travail*, and other works.

SIMON, RICHARD (1635–1712), R.C. scholar and divine; studied at College of the Oratory in Paris, becoming interested in Oriental languages; involved in controversy with ecclesiastics of Port Royal, which lasted most of his life; his real work was on the text of the Old and New Testament, and S. was for his day a radical critic; pub. works, some of which are still valuable.

SIMONIDES OF CEOS (*c.* 556–469 B.C.), Gk. lyric poet who celebrated the events of the Persian War. In 489 he conquered Æschylus in the contest for an elegy on those who fell at Marathon.

SIMON'S TOWN (34° 11′ S., 18° 26′ E.), fortified seaport, naval station, on False Bay, Cape of Good Hope, S. Africa. Pop. 4800.

SIMONY, the buying and selling of spiritual offices was from early times regarded as a grievous sin in the Church: It is so called from Simon Magus (*q.v.*), who, according to *Acts* 8, wished to buy spiritual power from St. Peter. Sometimes to accept money at all for the performance of spiritual functions was held to be S.; but it was seen that this was hardly just. More difficult was the buying and selling of patronage, which, though not contrary to canon law, has been to some an offence. S. is now an ecclesiastical but not a criminal offence.

SIMOOM, SIMOON, see under WIND.

SIMPLICIDENTATA, a division of RODENTS (*q.v.*).

SIMPLON PASS (46° 16′ N., 8° 3′ E.), mountain pass (6590 ft.), between Switzerland and N. Italy; the Simplon railway tunnel is 12¼ miles in length.

SIMPSON, MATTHEW (1811–84), Methodist bp. in U.S.A.

SIMPSON, SIR JAMES YOUNG (1811–70), Scot. physician; b. at Bathgate; ed. Edinburgh Univ.; became assistant to prof. of Pathology, 1837, and prof. of Midwifery, 1840; he advocated the use of acupressure to stop bleeding from arteries, and introduced many improvements in obstetrical and gynecological methods; his greatest achievement was his discovery of the anæsthetic power of chloroform, which was applied, through his advocacy, for the relief of pain in obstetrical and surgical practice; author of works on obstetrics, diseases of women, and other medical subjects, and on archæology; baronet, 1866.

E. B. Simpson, *Life* (1896); Gordon, *Sir J. Y. S. and Chloroform* (1897).

SIMPSON, THOMAS (1710–61), Eng. mathematician; b. Market Bosworth; app. prof. of Mathematics, Woolwich Military Academy, 1743; author of numerous treatises on algebra, geometry, trigonometry, etc.

SIMSBURY (41° 53′ N., 72° 50′ W.), town, on Farmington, Hartford County, Connecticut, U.S.A.; manufactures fuses. Pop. (1910) 2537.

SIMSON, MARTIN EDUARD VON (1810–99), Ger. jurist and politician; b. Königsberg; was made a judge, 1846; pres. of Imperial Tribunal, 1879–91.

SIN, that which in man is contrary to the will of God; according to Genesis, man was created sinless, but fell; a school of modern theology tends to minimise or deny the existence of sin.

SINAI.—The Jewish records of the wanderings in the wilderness were undoubtedly written long after the events they relate, and no mountain corresponds exactly to the Biblical Mt. Sinai. It must have been in the peninsula of Sinai—probably the mountain mass now called Jebel-al-Tūr.

Flinders Petrie, *Researches in Sinai.*

SINAIA (45° 17′ N., 25° 33′ E.), town, summer resort, Prahova, Rumania; mineral springs.

SINALOA (26° N., 108° 25′ W.), state, on Gulf of California, Mexico; well watered; mining and agricultural industries. Pop. 323,642. Capital, Culiacán.

SINCLAIR, SAINT CLAIR, Scot. family. Sir William S. (1260–1303) was descendant of long line of Anglo-Norman barons, active in revolt against Edward I. His great-grandson obtained the Earldom of Orkney. William, 3rd earl, became Earl of Caithness; eldest s. slain at Flodden.

SINCLAIR, SIR JOHN, Bart. (1754–1835), Scot. writer; first pres., Board of Agriculture; founder of Brit. Wool. Soc.; wrote *History of Public Revenue of Brit. Empire*, 1784; *Statistical Account of Scotland* 1791–99; *Code of Agriculture*, 1819.

SIND, SINDH, SCINDE (25° 29′ N., 69° E.), province, Bombay, India, bounded on N. by Baluchistan and Punjab, on S. by Indian Ocean, on E. by Rajputana, on W. by Baluchistan. Chief river, the Indus; land near it is fertile and watered by irrigation. Climate very dry and hot. Chief occupation is agriculture and wheat; rice, sugar, tobacco, indigo, hemp, cotton are grown. Chief towns are Karachi (large export trade) and Hyderabad.

Sind was taken by Akbar, 1592, and on break-up of his empire it became a semi-independent state as it had been before. During Brit. Afghan War, 1838, Britain made treaties with Sind; these were repudiated, and Napier defeated Sind army at *Meeanee*, 1843. Annexation followed. Area, 53,116 sq. miles. Pop. (1911) 3,513,435.

SINDBAD THE SAILOR, hero of Arab. romance, whose adventures are akin with incidents of the *Iliad*, *Odyssey*, the book of Sir John Mandeville, etc.

SINECURE, ecclesiastical benefice or living without any 'cure' or care of souls, or secular office yielding revenue without duties or responsibilities attached; formerly very common political gifts; one of few surviving s's is Stewardship of Chiltern Hundreds (*q.v.*).

SINEW, a tendon, or the fibrous tissue attaching a muscle to its insertion on a bone. See CONNECTIVE TISSUES.

SINGAN-FU, SIAN-FU (34° 15′ N., 108° 50′ E.), town, capital, Shen-si province, China; enclosed by walls; of great strategic importance; commercial and trading centre; rich in antiquities. Pop. *c.* 700,000.

SINGAPORE (1° 15′ N., 103° 51′ E.), island, Straits Settlements, S.E. Asia; area, 206 sq. miles; surface is generally rolling and forested; climate hot, but healthy. Has belonged to Great Britain since 1819. Pop., including whites, Eurasians, and Asiatics (1911), 311,985. The town **Singapore**, in S.E., is seat of government and contains governor's palace, Protestant and R.C. cathedrals, and Raffles Museum. Has fortified harbour and is important trading centre. Pop. (1911) 303,321.

SINGER, SIMEON (1846–1906), Jewish divine; minister of Borough Synagogue, 1867, West End Synagogue, 1878; translated and edit. *Daily Prayer Book.*

SINGGORA, SONGKLA (7° 6′ N., 100° 30′ E.), town, port, capital, Singgora district, Siam; exports tin. Pop. 10,500.

SINGHBUM (22° 40′ N., 85° 40′ E.), district, Chota Nagpur, Bihar and Orissa, Brit. India; capital, Chaibasa. Pop. 625,000.

SINGLE-STICK, Eng. sport similar to fencing; ash sticks about a yard long are used; popular from early times to XIX. cent.

SINOPE, SINOB (42° 2′ N., 35° 20′ E.), seaport, on Black Sea, Asia Minor; founded by a colony from Miletus, 630 B.C.; became a centre of Gk. trade on the Euxine; taken by Pharnaces, 183 B.C., and made capital of Pontus; birthplace of Mithridates and of Diogenes. Pop. 8700.

SION (46° 14′ N., 7° 21′ E.) (Rom. *Sedunum*), capital, on Sionne, canton Valais, Switzerland; cathedral; two ruined castles. Pop. (1910) 6519.

SIOUX, see INDIANS, RED.

SIOUX CITY (42° 35′ N., 96° 30′ W.), city, on Missouri, capital, Woodbury County, Iowa, U.S.A.; meat-packing establishments; carriage-works. Pop. (1910) 47,828.

SIOUX FALLS (43° 35′ N., 96° 30′ W.), city, on Big Sioux, capital, Minnehaha County, S. Dakota, U.S.A.; granite quarries. Pop. (1910) 14,094.

SIPHANTO (36° 58′ N., 24° 45′ E.) (ancient *Siphnos*), island of the Cyclades, Greece; mountainous; fertile; noted for its pottery. Pop. 4000.

SIPHONAPTERA, see FLEAS.

SIPHONOPHORA, see under HYDROMEDUSÆ.

SIPPARA, see SEPHARVAIM.

SIPUNCULOIDEA, a class of unsegmented worm-like animals, the relationships of which are uncertain. Sipunculids are stout, cylindrical, soft-bodied 'worms,' with a large body cavity, and a curious retractile organ—the introvert, furnished with a fringe of tentacles—at the end of which the mouth is situated. They live in the sea, burrowing in sand or mud, or hiding in rock crevices or shells, and feeding upon the organic matter contained in the mud they swallow. The sexes are separate, and the larva is very unlike the adult.

SIQUIJOR (9° 10′ N., 123° 40′ E.), town, on island Siquijor, W. Negros, Philippine Islands. Pop. 20,000; (island) 48,000.

SIR (Lat. *senior*, through Fr. *seigneur*), a common term of respectful address, is now used officially only before the Christian name of knights and baronets. Formerly it was commonly used in speaking of or to parish priests in Great Britain; 'sire,' an older form, exclusively reserved for addressing royalty.

SIRACH, see ECCLESIASTICUS.

SIRAJGANG (24° 27′ N., 89° 47′ E.), town,

Pabna district, Bengal, Brit. India; trade in jute. Pop. 26,000.

SIREN, MUD-EEL, genus of eel-like tailed Amphibians found in S.E. United States, where they burrow in the mud of ponds and ditches; distinguished by 3 external gills and 3 gill-openings; and though fore-legs each with 4 fingers are present, hind-legs are absent.

SIRENIA, SEA COWS, an order of aquatic mammals, which differ from Whales in being vegetable feeders, in having no snout, but large, thick, mobile lips furnished with bristles, and broad teeth, sometimes developed as tusks. The teats are on the breast, and the flippers are furnished with claws. The order is divided into two families: TUSKED DUGONGS (*Halicoridæ*), found in herds on the shores of the Indian Ocean, often speared by the native Malays, who value them as food; and the MANATEES (*Manatidæ*), inhabiting the warm shores and great river mouths of S. America and W. Africa. These live chiefly on aquatic plants and algæ, which they graze under water. They are harmless and inoffensive, and have been much reduced in number by native hunters, who spear them easily by means of the harpoon. The supposed fantastic resemblance to the human figure of Manatees half raised out of the water gave origin to the belief in sirens and mermaids. The largest member of the order, STELLER'S SEA COW (*Rhytina*), used to inhabit Bering Island, but was exterminated by hunters within a short period of its discovery.

SIRENS (classical myth.), sea-nymphs, who sat on the shore and sang with a ravishing sweetness which lured the passing sailor to their presence, only to meet with death.

SIRGUJA (23° N., 83° E.), feudatory state, Chota Nagpur, Bihar and Orissa, Brit. India. Pop. 357,000. Capital, Bisrampur.

SIRHIND (31° 20′ N., 76° 25′ E.), district, Punjab, India, between Sutlej and Jumna. Pop. 6000.

SIRICIUS, pope, 384–99.

SIRIUS, see CANIS MAJOR.

SIRMIO (45° 30′ N., 10° 35′ E.), promontory, on S. shore of Lake of Garda (*Lacus Benacus*), Italy.

SIRMUR, NAHAN (30° 25′ N., 77° 10′ E.), native state, Punjab, India. Pop. (1911) 138,564. Chief town, Nahan.

SIROCCO, see WIND.

SIROHI (14° 36′ N., 74° 54′ E.), native state, Rajputana Agency, India. Pop. 155,000. Capital, Sirohi. Pop. 5800.

SIRSA (29° 32′ N., 75° 7′ E.), town, Punjab, Brit. India. Pop. 16,500.

SIS (37° 24′ N., 35° 30′ E.), ancient *Flaviopolis*, town, vilayet Adana, Asiatic Turkey. Pop. 4800.

SISAL HEMP, or HENEQUEN, the fibre obtained from a variety of *Agave rigida*, cultivated for that purpose in Mexico, the Bahamas, and other places.

SISKINS, see under FINCH FAMILY.

SISMONDI, JEAN CHARLES LÉONARD DE (1773–1842), Swiss historian; b. Geneva. His output was tremendous. *Tableau de l'Agriculture Toscane, Traité de la Richesse Commerciale, A History of France* (29 vols.), *Nouveaux Principes d'Economie Politique, Histoire de la Renaissance de la Liberté en Italie*, are some of his famous works.

SISSEK (45° 30′ N., 16° 23′ E.), town, at junction Save and Kulpa, Croatia-Slavonia, Hungary. Pop. 7800.

SISTAN, see SEISTAN.

SISTERHOODS, a prominent feature of Eng. mediæval Catholicism, were swept away by Henry VIII. and only restored in the XIX. cent. But they continue to grow in number and influence, and do good charitable and educational work.

SISTOVA, SVISHTOV (43° 37′ N., 25° 21′ E.), town, on Danube, capital, Sistova department, Bulgaria; trade in grain and wine. Pop. (1910) 13,101.

SISYPHUS (classical myth.) was condemned, for certain indefinite crimes, to roll huge stone from bottom to top of hill; stone always rolled down again, and thus the labour had to be renewed.

SITAPUR (27° 34′ N., 80° 43′ E.), town, Sitapur district, Lucknow division, United Prov., Brit. India; trade in grain. Pop. 24,000; (district) 1,185,000.

SITKA (formerly NEW ARCHANGEL) (57° N., 135° 20′ W.), city, on Baranof Island, Alaska; U.S. naval station; magnetic observatory, industrial training-school and Russo-Greek church; salmon fishing and canning industry; was Russ. capital from 1804–67. Capital of Alaska till 1906. Pop. 1396.

SITTIDÆ, NUTHATCHES (*q.v.*).

SITTINGBOURNE (51° 21′ N., 0° 44′ E.), town, Kent, England. Pop. (1911) 8382.

SIVA, see HINDUISM.

SIVAGANGA (9° 51′ N., 78° 32′ E.), town, Madura district, Madras, Brit. India, capital of small state. Pop. 10,000.

SIVAS (39° 37′ N., 37° 3′ E.) (ancient *Scbasteia*), town, on Kizil-Irmak, capital, Sivas vilayet, Asiatic Turkey; manufactures coarse woollen goods; in Middle Ages belonged to Seljuks and Turks. Pop. c. 63,000; (vilayet) c. 165,000.

SIVRI-HISSAR (38° 15′ N., 26° 50′ E.), town, vilayet Angaro, Asia Minor; trade in opium.

SIWA (29° 5′ N., 25° 30′ E.), oasis, Libyan Desert, Egypt; well watered and fertile, with groves of date-palms; contains ruins of the oracle temple of Zeus Ammon and many other antiquities.

SIWALIK HILLS (30° 10′ N., 77° 50′ E.), mountain range, Dehra Dun district, United Prov. and Punjab, India.

SIX NATIONS, see IROQUOIS.

SIXTUS IV., FRANCESCO DELLA ROVERE, pope, 1471–84; b. 1414; a Franciscan; general of order, 1464; after his election to papacy embarked in expensive wars and wasted vast sums on nepotism, though personally of fine character; patron of lit. and art.

SIXTUS V., FELICE PERETTI, pope, 1585–90; b. 1521; a Franciscan; cardinal, 1570; after his election suppressed brigandage in Papal States; spent much on building, and carried through administrative reforms; formed schemes of foreign conquest; a very able man.

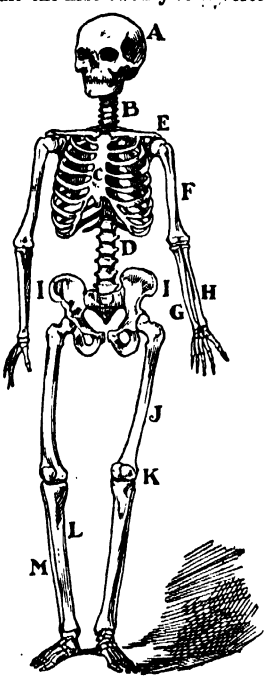
SKAGER-RACK (57° 50′ N., 9° 30′ E.), arm of North Sea, between Jutland and Norway.

SKAGWAY (59° 15′ N., 135° 30′ W.), city, at mouth of Skagway, Alaska; distributing point for Yukon goldfields. Pop. (1910) 872.

SKAT, Ger. card-game, played with cards above seven; suits differently valued, hearts count highest; knaves regarded as trumps. Player may play or 'pass.' *Ramsch* means no trumps except knaves, *matadores*, an unbroken sequence.

SKATE, MONGREL (*i.e.* Mongrel Skate), see ANGEL FISH.

SKATES, see under RAYS.



SKATING, see SPORT, WINTER.

SKEAT, WALTER WILLIAM (1835–1912), Eng. philologist; prof. of Anglo-Saxon, Cambridge, 1878–1912; voluminous writer and editor; issued his *Etymological Dictionary*, 1882, 4th edit. 1910.

SKEGNESS (53° 8′ N., 0° 21′ E.), popular watering-place, Lincolnshire, England. Pop. (1911) 3775.

SKELETON, term applied to the more or less hard and rigid framework of an animal supporting the soft tissues and protecting the internal organs; in invertebrates this structure is usually external to the soft parts, the *exoskeleton*, while in vertebrates it is chiefly internal, the *endoskeleton*, supplemented by external structures, among which must be considered the scales of fishes and the scales and scutes of reptiles, the bony plates of armadillos, the quills of porcupines, the claws and feathers of birds, the claws and nails and even the hair of mammals. The s. of a typical vertebrate, such as man, may be subdivided into the *axial skeleton*, comprising the skull (with the hyoid bone and thyroid cartilage), the spinal column, ribs, and sternum or breast-bone; and the *appendicular skeleton*, including the bones of the limbs along with the bony girdles which support them.

Axial Skeleton.—The skull (*q.v.*) is treated separately elsewhere, so that the spinal column, ribs, and sternum only will be considered here. The SPINAL or VERTEBRAL COLUMN is composed originally of thirty-three vertebræ, but in the adult the first twenty-four vertebræ remain separate, the next five join together to form the sacrum, and the last four fuse more or less completely to form the coccyx. The vertebræ differ in the different regions of the spinal column, but their main characteristics are the same, each possessing a cylindrical body, which is united by cartilage to the bodies immediately above and below, a neural arch, enclosing the nervous structure termed the spinal cord, formed by two pedicles springing from the body and closed behind by the junction of the lamina on each side, while from the arch a spinous process projects backwards, transverse processes on each side, and above and below on each side articular processes project, in articulation with similar processes of the immediately adjacent vertebræ. The first and second vertebræ are, however, peculiar — the first, which is termed the *atlas*, being in the form of a ring, without the usual body, and upon its articular facets the skull rests; the second vertebra, or *axis*, has a vertical prolongation of its body which goes through the ring of the atlas, acting as a pivot for many of the movements of the head. The spinal column is divided into five regions: the *cervical*, with seven vertebræ; the *dorsal*, with twelve, with which the ribs articulate; the *lumbar*, with five; and the fused *sacrum*, which forms part of the bony girdle of the pelvis, and *coccyx*, originally five and four respectively.

A, skull (*q.v.*) made up of 22 bones; *B*, cervical vertebræ; *C*, sternum or breast-bone; *D*, lumbar vertebræ; *E*, clavicle or collar-bone; *F*, humerus; *G*, ulna; *H*, radius; *I*, pelvis; *J*, femur; *K*, patella; *L*, tibia; *M*, fibula.

The RIBS are flat, elastic bones, curved in the form of an arch, and compose a protection for the chest. Numbering twelve on each side, the first seven pairs are connected by bars of cartilage with the sternum, while the lower five pairs are more or less free, the first three of them being attached by cartilage to the ribs above but not to the sternum, while the last two are quite free in front, and termed 'floating.' The articulations with the vertebræ behind freely allow of the movements of respiration, which are not hindered by the rib cartilages or the sternum in front.

The STERNUM, or BREAST-BONE, is flat and points slightly forwards, consisting of three parts—the *manubrium*, the upper, flat, and somewhat square portion, the *gladiolus*, the middle, flat, and rather elongated portion, and the *ensiform process*, which is short, pointed, and cartilaginous. The rib cartilages of the first pair of ribs are joined to the manubrium, and those of the next six pairs to the gladiolus.

Appendicular Skeleton.—The upper limb may be divided into the shoulder, upper arm, forearm, and hand. The bones of the shoulder are the CLAVICLE, which stretches from the scapula to the sternum, with both of which it forms articulations, and is curved, thick and somewhat triangular at the sternal, and flattened at the scapular end, and the SCAPULA, which is triangular and flat, with a prominent spine projecting right across its posterior aspect and ending in a broad process termed the *acromion*, which articulates with the clavicle, while from the border just above the antero-superior angle juts a curved process, the *coracoid*, the articular cup for the humerus, or *glenoid fossa*, lying below and between the two processes.

The HUMERUS is the bone of the upper arm and is a long bone with a rounded shaft, an upper extremity with a convex articular surface and two prominent tuberosities, and a flattened lower extremity with a rounded articular surface at its lowest part, a tuberosity or *condyle* at each side, and a hollow behind into which the olecranon process of the ulna fits, on extension of the arm.

The forearm has two bones, the RADIUS on the outer side, a long bone, with a shaft sharp on the inner side and rounded on the outer, a cup-like articular head or upper extremity below which is a tuberosity, and a broad lower extremity, articulating at its lower surface with the bones of the wrist; while the ULNA, on the inner side, is also a long bone, the shaft having two surfaces with sharp edges; the upper extremity has a deep notch for articulation with the humerus, with one prominent tuberosity above and behind, the *olecranon*, and another below and in front, the *coronoid*, while the lower extremity is round, articulating with the radius and the triangular fibro-cartilage of the wrist, and having a prominent styloid process behind.

The skeleton of the hand includes the bones of the *wrist*, CARPAL BONES, eight in number, arranged in two rows—the *scaphoid*, *semilunar*, *cuneiform*, and *pisiform* above, and the *trapezium*, *trapezoid*, *os magnum*, and *unciform* below; the bones of the palm, or METACARPAL BONES, are five in number, with a shaft compressed in the middle, the extremity nearest the wrist concave, and the farther extremity convex; the bones of the fingers, or PHALANGES, number three in each finger and two in the thumb, resembling the metacarpal in shape, except that the terminal phalanges have no articular surfaces at their farther extremities.

The lower limb may be divided into the haunch, thigh, leg, and foot. The bone of the haunch, or INNOMINATE BONE, forms part of the bony girdle of the pelvis, the innominate bone of each side joining the sacrum behind and articulating with its fellow of the opposite side at the *symphysis pubis* in front. It is an irregular, curved, flat bone, consisting in its earlier stages of development of three bones, the *ilium*, *ischium*, and *pubis*, which only unite completely to form the innominate bone about the twenty-third to twenty-fifth year of life. The three parts join together at the *acetabulum* (also called the *cotyloid cavity*), or socket of the hip-joint.

The thigh has one bone, the FEMUR, which is a long bone, the longest bone, indeed, of the body, with a smooth rounded shaft, the upper extremity consisting of a rounded, convex head, which articulates with the innominate bone, joined to the shaft by a neck, two prominent tuberosities or *trochanters* being situated at the junction, while the lower extremity has, behind, a large tuberosity on each side, the *condyles*, and in front and below is a smooth articular surface, taking part in the formation of the knee-joint.

In front of the lower extremity of the femur is a small triangular flat bone, developed in the tendon of the extensor muscles on the front of the thigh, termed the PATELLA (commonly known as the *knee-cap*), its posterior surface being smooth and forming part of the knee-joint.

There are two bones of the leg, the TIBIA, which has a shaft with three surfaces and sharp borders, a broad, flat, articular upper extremity, having a tuberosity on each side of the external with a small smooth surface to articulate with the fibula, and the lower extremity with a smooth articular surface below, and prolonged

into a prominence, the *internal malleolus*, on its inner side; and the FIBULA, which is a thin, slender, long bone with a ridged shaft, a small smooth surface on the upper extremity to articulate with the tibia, and a process forming the *external malleolus* at the lower extremity.

The foot includes the TARSAL bones, seven in number, arranged in three rows, that nearest to the bones of the leg consisting of the *astragalus*, which has a smooth surface for articulation with the bones of the leg, and the *os calcis*, the middle row consisting of the *scaphoid*, and the farthest including *cuboid*, *external cuneiform*, *middle cuneiform*, and *internal cuneiform*; the *metatarsal bones* and *phalanges* of the toes are the same in number and in their general form as the corresponding metacarpal bones and phalanges in the hand.

See BONE, FOOT, JOINT, LEG, SKULL.

SKELTON AND BROTTON (54° 33′ N., 0° 59′ W.), town, N. Riding, Yorkshire, England; iron-mines. Pop. (1911) 15,202.

SKELTON, JOHN (*c.* 1460–1529), Eng. poet; M.A., Cambridge, 1484; Poet Laureate of Oxford Univ.; took orders, 1498, and became tutor to Henry VIII.; satirised Wolsey in *Why come ye not to Court?* and *Book of Colin Clout*; other poems are *Speak Parrot*, *Book of Philip Sparrow*; famous for his 'Skeltonic Metres'—burlesque, and often doggerel, but a break-away from aureate diction and conventional metres of Chaucerians.

SKIBBEREEN (51° 33′ N., 9° 15′ W.), small market town, on Ilen, County Cork, Ireland.

SKIEN (59° 13′ N., 9° 38′ E.), seaport town, Bratsberg amt, Norway; birthplace of Ibsen. Pop. (1910) 11,870.

SKIERNIEWICE (51° 55′ N., 20° 15′ E.), town, Warsaw, Russ. Poland; has imperial castle; manufactures cloth. Pop. 10,500.

SKI-ING, see SPORT, WINTER.

SKIMMERS, see under GULL FAMILY.

SKIN is the complete covering of the whole body, and consists of two main layers, the *epidermis*, or *scarf-skin*, being the outer, and the *dermis*, or *true skin*, the inner. The epidermis, on microscopical examination, is seen to be composed of five layers, the *first* of horny scale-like cells, the *second*, or *stratum lucidum*, is a thin layer of scale-like cells without horny material, the *third* a thin layer of more swollen cells containing granules, the *fourth*, or *stratum mucosum*, is a deeper layer of polygonal cells connected with one another by minute 'prickles,' and in them is found the pigment of the skin of the coloured races, while the *fifth* consists of one layer of elongated cells.

The dermis is a vascular structure, a network of white fibrous tissue with some elastic fibres, and is composed of two layers, that nearer to the epidermis being raised into projections, or papillæ, which project into corresponding depressions in the under surface of the epidermis. These papillæ contain loops of blood vessels, and many of them also contain a *touch corpuscle*, in which nerve filaments end, and which is one of the special sense-organs of touch. In certain parts of the body, *e.g.* the tips of the fingers, the papillæ are specially prominent, and cause the epidermis to fall into parallel ridges, characteristic of those parts. In the deeper layer of the dermis the structure is looser and there is usually a considerable deposit of fat; there are many blood vessels and nerves present, while the *hair follicles* and the *sebaceous glands*, which pour their secretion into the hair follicles, are situated in this layer. A hair follicle is divided into an inner and an outer sheath, enlarges at the foot to form a bulb into which a loop of blood vessel projects, and is attached to the skin by a band of muscle fibres the *erector muscle* of the hair, which, by contracting, causes a hair to stand on end.

SWEAT GLANDS consist of minute tubes, the lower ends of which form spherical coils in the deeper parts of the dermis, or in the subcutaneous tissue immediately below. The sweat, like the urine, is an excretion of the body, the secreting glands getting rid of substances which have been formed elsewhere in the body, and it contains, in the same relative minute amount, practically the same salts as the urine. About 2 lb. of sweat are excreted by a man in twenty-four hours.

The NAILS are specially modified parts of the epidermis to protect the sensitive ends of the fingers; beginning at the root, which is covered by a fold of skin, a nail lies upon a very sensitive and very vascular part of the dermis, the *nail-bed*, and ends at a free margin.

The FUNCTIONS OF THE SKIN include the sense of *touch* (q.v.); the excretion of sweat; the regulation of the heat of the body, as when more blood passes through the skin the greater is the loss of heat by radiation, conduction, and evaporation; and respiration, carbonic acid gas being exhaled and oxygen inspired, both, however, to a very small extent in man.

Skin Diseases are of many different varieties, the chief of which are treated elsewhere under their separate heads, and may be due to many different causes. These causes include *animal parasites*, e.g. scabies; *vegetable parasites* (fungi), *e.g.* ringworm; *micro-organisms*, e.g. impetigo contagiosa, due to a streptococcus; *general infections*, with local manifestations in the skin, *e.g.* syphilis, scarlet and other fevers; *general toxæmias*, with local manifestations in the skin, *e.g.* gout, sometimes causing urticaria; *nervous affections* (*a*) affecting the vasomotor nerves, *e.g.* herpes; (*b*) affecting the sensory nerves, *e.g.* pruritus; (*c*) with trophic lesions, *e.g.* perforating ulcer. *Diseases of certain organs* may cause skin eruptions, especially the organs connected with digestion; *certain drugs* cause eruptions, *e.g.* copaiba.

SKIPPON, PHILIP (d. 1660), Eng. general; served in Netherlands; Roundhead in Civil War; distinguished at Newbury and Naseby; commander in New Model army.

SKIPTON (53° 58′ N., 2° 1′ W.), town, on Aire, W. Riding, Yorkshire, England; woollen goods. Pop. (1911) 12,981.

SKITTLES, game in which player knocks over pins arranged in group of 9 forming a square.

SKOBELEV, MIKHAIL DIMITRIEVICH (1843–82), Russ. soldier; served with distinction in Central Asia and Caucasus; took Geok Tepe, 1880.

SKOPTSI, Russ. religious sect practising mutilations; known since 1771; frequent efforts have been made to suppress it, and its members have been transported, but without much avail.

SKOWHEGAN (44° 46′ N., 69° 50′ W.), town, on Kennebec, capital, Somerset County, Maine, U.S.A.; paper and pulp-mills. Pop. (1910) 5341.

SKRAM, PEDER (*c.* 1500–81), Dan. admiral; distinguished in war against Sweden, 1518–20; commanded Dan. fleet in Dano-Swedish War, 1562.

SKUAS (*Stercorariidæ*), a family of 7 species of swimming birds closely related to Gulls, with upper mandible of beak longer than under, and strongly hooked at the tip; strong crooked claws and completely webbed toes. They are large, predaceous marine birds, which fed on fish, smaller birds, and carrion. They occur on all the oceans, but are absent from a great part of the Pacific and Indian Oceans.

SKULL.—The bones of the skull of a human being are 22 in number, 8 of them taking part in the formation of the cranium, and 14 in the formation of the skeleton of the face. The bones of the cranium include, in front, the *frontal* bone extending across the forehead, from one side of the skull to the other; the *parietal* bones, one on each side, forming the lateral walls of the cranium; the *temporal* bones, one on each side, the chief parts of each bone being the *squamous* portion, which forms part of the wall of the cranium, and the *petrous* portion, in which the internal ear is situated; the *occipital*, behind and at the base, through a circular opening, the *foramen magnum*, in which the spinal and vertebral arteries pass.

The base of the cranium is composed, in addition to the occipital bone, of the *sphenoid*, the wings of which

are seen at each side coming up to meet the parietal and frontal bones, and the *ethmoid*, a light, spongy bone of somewhat cubical shape with a sharp crest, which rises up in the interior of the cranium.

The bones of the face surround the cavities of the nose and mouth, and take part, with certain bones of the cranium, in the formation of the cavities of the orbits. They include the two *nasal* bones, plate-like little bones at the base of the nose; the two *superior maxillary* bones, which form the upper jaw and bound the nasal cavity and the internal margin of the orbit, their lower border being armed with the teeth of the upper jaw; the two *lachrymal* bones, little bones taking part in the formation of the orbit; the two *malar* bones, which form the outer part of the orbit, and are the prominent bones of the cheek; the two *inferior turbinated* bones, slight, spongy bones of the nasal cavity; the *vomer*, a sharp-edged triangular bone dividing the posterior part of the nasal cavity in two; the two *palate* bones, which form the hard palate; and the *inferior maxillary* bone, a large, hinge-like bone, articulating on each side with the temporal bones, its upper surface armed with the teeth of the lower jaw. The teeth (*q.v.*) themselves, and the ossicles of the ear (*q.v.*), are not included with the bones of the skull. All the bones of the skull, with the exception of the inferior maxillary bone, which forms a diarthrodial joint with the temporals, articulate with one another by *sutures*, many of which become completely ossified in adult life and disappear.

As regards the early development of the skull we find that the brain is, at an early stage of existence, enclosed in a membranous capsule on each side of which arises a cartilaginous bar, along with cartilaginous capsules round the early auditory (hearing), olfactory (smelling), and ocular (seeing) sense-organs. The auditory and olfactory capsules unite with the cartilaginous bars, which join below and at the sides to form the base of the case for the brain. Below this are some seven cartilaginous arches surrounding the mouth and pharynx, which, in water-breathing vertebrates, develop into the supports of the gills.

In man, the first arch develops into the upper and lower jaws, with the palate and malar bones, and the projecting internal pterygoid plate of the sphenoid, the ends of the first and second arches are developed into the tympanic ring and the ossicles of the ear, the second and third arches become the *hyoid bone* and its supports, from the fourth and fifth is developed the *thyroid cartilage*, and the rest disappear. The *hyoid bone* is united by a strong ligament to the styloid process of the temporal bone, and lies in the upper part of the neck beside the root of the tongue, an arched bone with a small body, and a wing at each side; the *thyroid cartilage* consists of two plates of cartilage united at an acute angle in front, forming practically the whole of the front and side walls of the larynx. Thus, we find that the superior maxillary, palate, and malar bones, internal pterygoid plate of the sphenoid, tympanic ring and ear ossicles, with the inferior maxillary and hyoid bones and the thyroid cartilage are all developed from the cartilaginous arches of the so-called visceral skeleton, the basal portions of the cranium and the other bones of the face are developed from cartilage, and the vault of the cranium is developed from a membranous structure. At birth several parts of the vault of the cranium are still uncovered except by membrane, those parts being termed the *fontanelles*, the most important being the space between the parietal and frontal bones, and those fontanelles may not be completely closed by bone until the second year of life. See SKELETON, BRAIN, EAR, LARYNX, and similar articles.

SKUNK, see WEASEL FAMILY.

SKY, the apparent arch or vault of heaven extending from horizon to horizon. Many theories have been framed to account for the blue colour of the s. This is really but a secondary problem, for the fundamental question is, Why is there any light or colour there at all? Clearly, if there were nothing or nothing opaque above us, the s. would show black; that it does not is due evidently to the presence of finely divided matter capable of reflecting light, and if we admit that tiny particles are there we can readily understand that their dispersion of light causes the blue of the s., which becomes deeper at higher altitudes. The presence of these particles is answerable, too, for the phenomena of twilight and everything else which involves reflective and refractive effects in the atmosphere.

SKYE (57° 20′ N., 6° 15′ W.), island, Inner Hebrides, Scotland; area, 535 sq. miles; surface is mountainous, reaching 3000 ft. in Cuillin Hills, of which highest point is Scoor Dearg; chief town, Portree. Has fine pasturage, cattle and sheep being extensively raised; excellent fisheries off coast; exports live stock, fish, wool. Has associations with Young Pretender and Flora Macdonald. Pop. (1911) 13,317.

SKYLARKS, see LARKS.

SLANDER, see LIBEL AND SLANDER.

SLANG, the name given to the use of words not found in a standard dictionary, and not recognised as current verbal coin in the interchange of language between persons of average culture. Almost all professions, trades, and classes use slang terms, inexplicable to the uninitiated; but many of these terms are approved, and become sufficiently familiar to society in general, so that in time they are standardised, finding their way at last into official speech. The Stock Exchange has its own slang, which appears in financial newspapers. Military and naval slang is found in the novels, stories, and poems relating to the services. Sporting slang abounds in the description of racing and athletic contests; the prize ring had a slang of its own. A great deal of gipsy and Yiddish slang is merely the corruption or survival of ancient forms of speech. Amer. slang is so vast and wonderful a thing that it has become practically a new language; many of its expressive phrases are now incorporated in common speech in England. Purity of taste and good manners can alone decide how far the incursions of slang are permissible in letters and in speech.

SLATE, ARGILLITE, a well-known variety of splintery rock, is a form of clay; splits into very thin plates; varies in colour from grey to blue, and is found in all countries where metamorphic rocks occur. The s. quarries of N. Wales are famous for blue s., while Cumberland gives green s., much sought after on account of its colour. Drawing s., sometimes called black chalk, contains about 10 % of carbonaceous matter, and is obtained from Italy and Spain. S. pencils are made of a soft s.

Davies, *Slate and Slate-Quarrying*.

SLATE ISLANDS (56° 12′ N., 5° 40′ W.), group of islands, Argyllshire, Scotland; includes Luing, Shuna, Torsay, Seil, and Easdale.

SLATERS, see WOOD-LICE.

SLATIN, SIR RUDOLF, CARL VON, SLATIN PASHA (1857–), Egyptian administrator; served in Sudan under Gordon; imprisoned eleven years in Omdurman; Inspector-General of Sudan, 1900.

SLAUGHTER-HOUSE, ABATTOIR.—Not until the XIX. cent. was any serious attempt made to establish public s's. Napoleon I., by a decree in 1807, ordered their erection in France, and now both in France and Germany municipal abattoirs have long been the rule. In Germany not only does the municipality erect and maintain the s., but the slaughtering of meat elsewhere is forbidden. In Great Britain municipalities are empowered to provide s's, and the town councils of Edinburgh (in 1851) and of Manchester (in 1872) early took the matter in hand. But there is no compulsion, and the erection of a municipal s. rests entirely on local option.

It is of the greatest importance to the public health that the slaughtering of animals, and the preparation of meat for food, should be under careful inspection. Hence the demand for public s's. In U.S.A. municipal

s's are not customary, but the meat inspection law of 1906 imposes a very stringent and comprehensive official inspection of all meat and meat products for human consumption, and requires the presence of inspectors in all abattoirs. Apart from the urgent need of cleanliness and the guarding against the slaughter of animals, diseased or otherwise unfit for human food, by the authorised inspection and control of all s's, humanitarian feeling prompts the necessity of conducting the slaughter of animals with the minimum amount of suffering to the victims, and urges inspection for the prevention of cruelty.

C. Cash, *Our Slaughter-House System*; H. Heiss, *The German Abattoir.*

SLAVE COAST (6° N., 3° E.), region, W. coast Africa, extending from the Benin to the Volta; divided between Great Britain, Germany, and France.

SLAVE-MAKING or **AMAZON ANT** (*Polyergus rufescens*), a European ant—the most fierce of robber-ants, specialised for fighting, of great size and strength. They attack colonies of other ants and carry off the pupæ, which, hatched in the captors' nest, become their slaves. On these slaves the Amazons altogether depend for existence, even being fed by them.

SLAVERY.—In the Mycenæan age, capture in war was synonymous with loss of personal liberty; prisoners were either employed by their captor in agricultural or domestic duties or were sold; kidnappers were not unknown. In classical Greece additional causes of servitude were sale in infancy and accident of birth; slaves in a State sometimes outnumbered citizens, and, in addition to private service, were employed in minor public offices, *e.g.* the Scythian police of Athens. They were regarded as 'living chattels' (*zoa organa*), but their condition was usually tolerable. The Helots (*q.v.*) of Sparta were in a position of serfdom and were harshly used by the Spartiates.

The Rom. State had its slave system, originating as in Greece, but producing more disastrous effects. Gangs of servile labourers supplanted the Rom. farmer, while the slaves were often treated with cruelty. The town slaves were in a much better position, and were occasionally treated as friends and at times manumitted, though there were legal restrictions to prevent this practice becoming common. Under the Empire, the lot of slaves improved; they were granted the right of appeal to magistrates, while the power of life and death was taken from their masters.

Christianity, while unable to abolish the practice, gained for slaves such concessions as facilities for manumission, validity of marriage, and full citizenship for freedmen. The slave traffic was one of the chief branches of commerce in classical times; Greeks and Asiatics fetched highest prices.

Villeinage.—The hereditary attachment of the lower classes to the land was the natural successor to absolute slavery. A serf (the Anglo-Saxon *ceorl*, or Norman *villein*) was neither slave or freeman; he was bound to the soil and compelled to give his labour in his master's service, but was permitted certain legal rights and privileges, such as exemption from military duties and right of appeal to the king's court against cruelty or oppression, although he could not own land of his own nor choose his master. He could not become a knight or clerk or make his children clerks without his lord's consent. Freedom could be won by residence in a town as a member of a guild for a year and a day unclaimed by his lord. Later the villein gave money payments instead of service, *i.e.* commenced to pay rent. By the middle of XIV. cent. villeins were no longer serfs. The Peasants' Revolt, 1381, demanded abolition of villeinage, and it completely disappeared in Elizabeth's reign. The condition of the villeins in France gradually improved after several rebellions, but up to 1789 the peasants were compelled to perform onerous services (*the corvée*) for their overlords.

In Russia an elaborate system of serfdom was established at the beginning of the XVII. cent., of much the same nature as that of mediæval Europe; Russian serfs were emancipated as late as 1861.

Modern slavery began in 1442, when one of the captains of Prince Henry the Navigator brought back from Africa 10 negroes whom he had purchased. The traffic rapidly developed, largely to supply labour for the Spanish colonies in the New World, and England became one of the chief participants; Sir John Hawkins was the pioneer of British slave-trading. It is calculated that, in 1791, 38,000 negroes were taken as slaves by British traders. Many writers, including Steele and Cowper, inveighed against the traffic, and the Quakers did all in their power to check it. In 1785 Thomas Clarkson wrote his 'Prize-Essay' (on the ethics of slavery) at Cambridge, and in 1788 a Parliamentary Committee was appointed to look into the matter. **Wilberforce** was the slaves' champion, but for long was foiled by public opinion.

In 1807 a Bill was passed prohibiting the slave trade, but the Act was systematically evaded. In 1834 all slaves in British colonies were freed, but were compelled to apprentice themselves to their former masters; £20,000,000 was paid in compensation to slave-owners; in 1838 they were fully emancipated.

Other powers followed Britain's lead—France in 1848, Holland, 1863; Denmark had abolished its slave trade in 1802.

In the United States the number of slaves was steadily increasing, especially in the Southern States. The *Fugitive Slave Laws*, passed by Congress in 1793 and 1850 to provide for the return of escaped slaves, were particularly stringent. The great American thinkers—Franklin, Jefferson, and later Emerson and Longfellow—were strenuously opposed to the system, but it fell to **Abraham Lincoln** to be the moving force in freeing the slaves by the Civil War of 1861. In 1865 slavery was finally abolished in the United States.

Shortly after the middle of the XIX. cent., voluntary labour was imported into Queensland from the South Sea Islands, but this soon degenerated into little better than the old slave trade; it was known as 'Black-birding,' but was stopped after the inquiry of 1884. (The 'Kanakas' have since been deported from Queensland.)

By the efforts of the British, the Arab slave-traders have been almost entirely exterminated, but what is practically slavery still exists in the Congo, although the Belgian Government is taking steps to rectify this.

In connection with the rubber industry in the Putomayo district of S. America several outrages have lately been reported, and a Commission of the House of Commons has been appointed to inquire into the conditions of labour.

Ingram, *History of Slavery and Serfdom* (1895); Thomas, *The American Negro* (1901); Washington, *Up from Slavery* (1902).

SLAVONIA, see CROATIA-SLAVONIA.

SLAVONIC, name given to languages spoken by Slavs. These are of two branches, E. and W.; the first comprehending Russian, Prussian, Polish, Bohemian, Servian, and Bulgarian; the second, Lithuanian, Lettish, and obsolete Old Prussian.

SLAVS, the largest race in Europe, estimated according to extent of Slavonic language at about 140,000,000 persons; have also spread in Siberia, and emigrated to America; chief divisions are the Russians, 100,000,000; the Poles, Kashubes, Wends (Lusatia), Czechs (Bohemia), Moravians, *Slovaks* (Hungary) Polabs (Slavs on the Elbe)—about 20,000,000, all north of the Danube; the *Slovenes* (Carinthia and Styria), Serb-Croats (Servia), Bulgarians, Montenegrins, Macedonians—about 20,000,000 from the Danube to the Adriatic and Ægean Seas.

Originally settled north-east of Carpathian Mountains in basins of Vistula, Pripet, and Upper Dniester, a peaceful race subject in first cent's A.D. to Goths

and Huns, they overran the Balkan Peninsula in VI. cent., and Russia under leadership of Swedes in IX. cent.; converted to Christianity (chiefly) by the great missionary enterprise of SS. Cyril and Methodius in IX. cent. Methodius instituted Slavonic prayer books, was abp. of Moravia, and d. in 885 A.D. Cyril invented a Slavonic alphabet, and with Methodius translated much of the Bible into Slavonic. In addition to the Cyril alphabet, which is used by all Orthodox Slavs, there is a Lat. alphabet used in Dalmatia, Croatia, and generally where the people are Roman Catholic, and a Glagolitic, the oldest form of all, and, like the Cyril, of Gk. foundation.

The Slavonic language really covers a number of kindred languages of the Aryan family, and may be divided as follows: (1) Russian—subdivided again into Malo Russian and White Russian; (2) Bulgarian; (3) Serbo-Croatian; (4) Slovenish; (5) Polish; (6) Bohemian or Czech; (7) Lusatian Wendish or Sorbish. In Russia and Poland and (in XIX. cent.) in Servia and Bulgaria there is a Slavonic lit. both of prose and poetry. Whilst the Slavonic language varies amongst the various Slav nations certain words are found to have a wide existence: *e.g.* the old Slavic *dumn*, house (Gk. *domos*, Latin, *domus*), is *dom* in Russia, Servia, Bulgaria, and Slovenia, and *dum* in Czech and Polish. *Zima*, again, the old Slavonic for 'winter,' is the same word in Russian, Serbian, Bulgarian, Sloven, Polish, and Czech. In Lithuanian it is *zëmd*. 'Widow' is *vidova* in old Slavonic, *vdova* in Russian and Czech, *udova* in Serbian, *vdovica* in Bulgarian (Latin, *vidua*, and Gothic, *widuwō*).

Slavonic music in Russia, notably in the folk-songs, has been largely influenced by the church music. The words are metrical, the melodies are commonly unaccompanied, and are either sung in unison to dance tunes, or in harmony, in a minor key.

There is no 'Slav type,' for too many races are interblended, but generally the Slav is broad headed, short in stature, and of pale white, swarthy, or light brown skin.

The government of the early Slavs was patriarchal, the chiefs being chosen by the assemblies of the tribes. Contact with feudalism on the west, with Mongols and the Imperial throne of Byzantium on the east, changed this, and the free peasants became serfs, and the Slavonic princes despotic. Hereditary nobility became the rule in Slavonic states about XII. cent., and the people fell to the lowest serfdom. No middle class existed, and the nobility were too powerful to allow the rise of any cities of commerce. To-day Russia, Servia, Bulgaria, and Montenegro are the independent Slavonic countries, while Bohemia, Moravia, and Croatia are part of the Austrian Empire, and Poland is distributed between Russia, Germany, and Austria.

The various Slavonic peoples are treated separately.

The Slovaks are a Slavic people dwelling in N.W. Hungary and S. Moravia. They are closely akin to the Czechs, and number about 2,000,000. Like certain of the Croats and Poles, and unlike the great mass of Slavs, they are R.C. and not Orthodox Gk. in religion. The Ruthenians of E. Austria and S. Poland use the Gk. liturgy.

The Slovenes, a South Slavic people, form the great bulk of the population in Carniola (Austria-Hungary), and are found in the neighbouring districts of Carinthia and Styria. Their migration from the home of the race in the Carpathian Mountains took place in VI. cent. For the tendency of S. towards unity, see PANSLAVISM.

W. R. Morfill, *Slavonic Lit.*

SLAVYANSK (48° 52′ N., 37° 45′ E.), town, on Torets, Kharkov, Russia; soap- and tallow-works. Pop. 17,000.

SLEAFORD (53° N., 0° 24′ W.), town, Lincolnshire, England. Pop. (1911) 6428.

SLEDGING, see SPORT, WINTER.

SLEEP, a normal condition of more or less complete unconsciousness, occurring periodically, and usually lasting each night for from six to eight hours, although children sleep normally for a much greater period. It is a period of rest and repair for all the tissues of the body, and especially for the brain, spinal cord, and nervous system generally. The onset of s. is gradual, the eyelids feel heavy, yawning is common, the head droops, there is a feeling of fatigue and a desire for s., while the intelligence and the senses are less alert.

Activity becomes lessened first in the highest centres, that is to say, the motor centres, of the brain, and this lessening of activity progresses until the lower centres in the medulla oblongata and spinal cord are involved. S. is most profound an hour after its onset, the intensity increasing rapidly up to this point, and then decreasing during the next three hours, after which period it decreases more slowly, or may even become for a time more profound until waking.

The cause of s. is not exactly known, various theories having been advanced, such as that the condition is due to asphyxia of the brain through deficiency of oxygen, but without sufficient proof of their truth. Various drugs cause s., but their effects are dangerous, and they should only be used under the supervision of a medical practitioner.

SLEEPING-SICKNESS, disease characterised in its early stages by fever and a tired feeling, tremors of the tongue and limbs, and a shuffling gait, and later by profound lethargy and wasting. It occurs in tropical Africa, and is due to a minute, worm-like parasite, *Trypanosoma gambiense*, found in the blood and cerebro-spinal fluid of affected persons, and transmitted to man by the tse-tse fly. The condition is treated with some success by injections of the arsenical compound atoxyl (or soamin, which is said to be a purer form of the same compound), best given in combination with another drug, such as mercury. See under TRYPANOSOMES.

SLEEVE VALVE, see ENGINE.

SLESWICK, SCHLESWIG (*q.v.*).

SLIDE RULE, see CALCULATING MACHINES.

SLIGO (54° 16′ N., 8° 28′ W.), county, Connaught, Ireland, bordering on Atlantic; surface is diversified, the well-wooded hills being interspersed with lakes, bogs, and fertile tracts of level land; occupations chiefly pastoral. Pop. (1911) 78,850. Capital, **Sligo** (54° 16′ N., 8° 28′ W.), on Sligo Bay; has a R.C. cathedral; ruined XV.-cent. abbey; exports cattle and agricultural produce. Pop. (1911) 11,163.

SLING, weapon for throwing missiles; fastened to the end of a short pole, it could discharge a bolt 500 yards; favourite weapon of experts in Rom. army, and later with semi-savage races. Inhabitants of Balearic Islands were famous as slingers, and were extensively employed in mediæval warfare.

SLIVEN, SLIVNO, SELIMNIA (Turk. ISLINIYE), (42° 40′ N., 26° 38′ E.), town, Bulgaria; manufactures cloth, military clothing. Pop. (1910) 25,142.

SLOANE, SIR HANS, Bart. (1660–1753), Irish physician and naturalist; studied med. at London and on the Continent, commencing practice in London, where he eventually had great success; went to Jamaica as physician to the Duke of Albemarle, 1687, making a large collection of the flora of the island, on which he wrote a valuable work; pres., Coll. of Physicians, 1719–35; pres., Royal Soc., 1727–40; first physician to the king, 1727; on his death his large library and varied collection were sold to the nation by the terms of his will, this forming the beginning of the Brit. Museum.

SLOE, BLACKTHORN (*Prunus spinosa*), plant of order Rosaceæ; flowers resemble hawthorn; fruit is black and bitter.

SLONIM (53° 4′ N., 25° 23′ E.), town, on Shchara, Grodno, Russia. Pop. 26,000.

SLOTHS, see under EDENTATES.

SLOUGH (51° 31′ N., 0° 35′ W.), town, Buckinghamshire, England. Pop. (1911) 14,985.

SLOUGHING, see REPTILES.

SLOVAKS, see SLAVS.

SLOVENES, see SLAVS.

SLOW LEMURS, see LORIS, POTTOS.

SLOW WORMS, see under LIZARDS.

SLOYD, Finnish system of manual training; much practised in Sweden, whence it came to Britain; its influence is seen in modern technical education, especially 'Woodwork' in schools.

SLUGS, see GASTEROPODA.

SLUYS, BATTLE OF, naval battle, June 24, 1330, when English under Edward III. defeated Fr. fleet commanded by Quiéret and Béhuchet.

SMALL HOLDINGS, term given to portions of land possessed by peasants, separate from their own dwellings, and cultivated to increase their incomes. It has long been recognised that the agricultural labourer could expect not only payment in money, but certain privileges on the land. In the Middle Ages this was obtained by the curious 'open field' system. In the XIV. cent., after the Black Death, there were many enclosures, but most was still unenclosed till the XVIII. cent., when great enclosures were made, so that by the middle of the XIX. cent. there was little common land left. This was on the whole a good thing, but the villagers were often hard hit, as it was not they but the landlord who was compensated.

Various acts were passed from 1806 onwards to encourage the granting of allotments, but they were not really successful, being taken advantage of in very few places. The most important were the Allotments Act, 1887, the Small Holdings Act, 1892, and the Small Holdings and Allotments Act of 1907. Meanwhile, in several places more has been achieved by private enterprise than by legislation, the experiments of the Marquess of Lincolnshire on his Sleaford estate having been particularly successful. There are many more small holdings in France, Germany, Belgium, and Denmark than in England.

SMALL ISLES (57° N., 6° 25′ W.), Hebridean parish, Inverness-shire, Scotland, comprising islands of Canna, Sanday, Rum, Eigg, Muck. Pop. (1911) 396.

SMALL-POX, VARIOLA, acute contagious disease, caused by a micro-organism not yet discovered, characterised by fever and the appearance on the body of an eruption, which passes through the stages of papule, vesicle, pustule, and scab. The early history of the disease is obscure, but it has been known in Asia from a very early period, and seems to have spread throughout Europe at the time of the Crusades, was known in England before XIII. cent., and was introduced into America by the early Span. explorers.

The incubation period is about twelve days, the first symptoms being sudden onset of fever, with headache, often vomiting, and severe pain in the back. Although a prodromal rash may appear in the stage of primary fever, the eruption proper appears about the third day after the symptoms of the disease have become evident, as papules which are hard to the touch, first appearing on the face, and spreading over the trunk and extremities, the lower part of the body being least affected. The papules become vesicular in a day or two, and in a week the vesicles are pustular. A few days later the pustules commence to dry up into scales, which eventually fall off, sometimes leaving pitted scars. Several varieties of the disease are described, varying with the extent and character of the eruption, *mild, discrete, confluent, hæmorrhagic,* and *malignant,* death usually resulting in the last at an early stage.

The case mortality in s. of persons who have been vaccinated is about 5 %, while of the unvaccinated it is 37 %; and the disease is no longer a disease of childhood, as it was before vaccination was introduced, but a disease of adult life. These facts are sufficient to show the benefit of vaccination, and this is also borne out by the statistics of cases of s. in those countries where the population is well vaccinated, compared with those where vaccination is incompletely carried out. Vaccination modifies the severity of the disease even after the person has been exposed to infection, so that it should be performed in all persons who have been exposed to infection when a case occurs.

The treatment of a case of s. is simply the administration of salines, light and nourishing food, *e.g.* milk and soups, antiseptic gargles for sore throat, and to watch for and treat complications as they arise. Compresses, soaked in cold water, with a few drops of carbolic acid, are sometimes applied to the face to prevent pitting.

The preventive treatment includes isolation of cases, thorough disinfection of rooms, and anything with which affected individuals have come in contact, and vaccination of all persons exposed to infection.

SMALRIDGE, GEORGE (1663–1719), bp. of Bristol, 1714.

SMART, CHRISTOPHER (1722–71), Eng. poet; his mind gave way, 1751, and in an asylum he wrote his only notable poem, *A Song to David.*

SMELL, the sensory apparatus, stimulation of which occasions olfactory sensations; consists of end-organs in the olfactory epithelium, which occupies part (in man a small part) of the mucous membrane of the nose. The stimulus consists of vaporised particles which pass from odoriferous substances to the nose. Total *anosmia* (inability to smell) is not very uncommon; partial anosmia is frequent, *e.g.* when due to catarrh or smoking. Congenital inability to smell certain odours only has been recorded, and prolonged stimulation by any odour fatigues the nose for that odour. No satisfactory classification of odours has been made; Zwaardemaker suggested the following: (1) Ethereal, (2) Aromatic, (3) Balsamic, (4) Amber-musk, (5) Allyl-cacodyl (*e.g.* asafœtida), (6) Burning, (7) Caprylic (*e.g.* cheese), (8) Repulsive, (9) Nauseating.

SMELT, see under SALMON FAMILY.

SMELTING, see METAL (METALLURGY).

SMERDIS, s. of Cyrus, assassinated by brother Cambyses (*c.* 525). Gaumata, a priest, personating him, usurped throne, 522 B.C., but was killed next year.

SMETANA, FRIEDRICH (1824–84), Bohemian pianist and composer; wrote several notable operas and symphonic poems.

SMETHWICK (59° 29′ N., 1° 58′ W.), town, Staffordshire, England; glass and chemical works. Pop. (1911) 70,681.

SMILES, SAMUEL (1812–1904), Brit. author; first practised medicine; later took to journalism, and became known for a series of books, of which *Self-Help* had the most notable success.

SMITH, ADAM (1723–90), Brit. economist; b. Kirkcaldy, Scotland; ed. Glasgow Univ. and Balliol Coll., Oxford; prof. of Logic at Glasgow, 1751, and of Moral Philosophy, 1752; pub. his *Moral Sentiments,* 1759; travelling tutor to Duke of Buccleuch, 1763–66, visiting chief cities of France. S. began his great work, *The Wealth of Nations,* at Toulouse, and saw it published, 1776. He was commissioner of customs at Edinburgh, 1778–90. S. held that 'moral sentiments' were founded on fellow-feeling rather than on self-interest.

The *Wealth of Nations* stands as one of the world's greatest economic works. S. defines political economy as 'an inquiry into the nature and causes of the wealth of nations.' Human commodities, necessaries, and conveniences are seen to be the 'nature' of the wealth, and labour to be the 'cause.' In spite of the 'moral sentiments' the great argument of the *Wealth of Nations* is the freedom of the individual to sell his labour and his goods where he will, 'and to bring both his industry and capital into competition with those of any other man.' The influence of the book was not immediate, but when once its economic teaching had been grasped by public men it was enormous. The Free Trade and *laissez-faire* doctrines expounded by Bright and Cobden, and put into operation by Huskisson, Peel, and Gladstone, had Adam Smith for their founder. The *Wealth of Nations* has been translated into every important language.

Life, by Rae, Haldane, Hirst, Macpherson.

SMITH, FREDERICK EDWIN (1872–), Eng. politician (Unionist) and lawyer; P.C., 1911;

authority on international law; brilliant speaker; M.P. since 1906; rose rapidly in party politics, becoming one of most uncompromising leaders in House of Lords and Home Rule controversies.

SMITH, GEORGE (1840–76), Brit. Assyriologist; engaged first at the Brit. Museum; went later to Nineveh on a mission of discovery, with important results; author of several authoritative works.

SMITH, GEORGE ADAM (1856–), Presbyterian Biblical scholar; principal of Aberdeen Univ. since 1909.

SMITH, GERRIT (1797–1874), Amer. philanthropist, who gave away 200,000 acres, in holdings of 50 acres, to poor men; strong supporter of emancipation; member of Congress, 1852.

SMITH, GOLDWIN (1824–1910), Brit. historian; sec. to Oxford Commission, 1854; Education Commissioner, 1858; held chair of Modern History, Oxford, 1858–66; prof. of Eng. History at Cornell, New York, 1868; Senator, Toronto Univ., 1871; wrote political histories of Great Britain and U.S.A.; suggested annexation of Canada by U.S.A.

SMITH, HENRY BOYNTON (1815–77), Congregationalist minister; prof. at Union Theological Seminary, New York, U.S.A.

SMITH, HENRY JOHN STEPHEN (1826–83), Brit. mathematician; b. Dublin; ed. Rugby and Oxford; Savilian prof. of Geometry, 1861; F.R.S., 1861; author of important works on theory of numbers, elliptic functions, and geometry.

SMITH, JAMES, and **HORACE** (1775–1839, and 1779–1849), brothers; b. London, noted for *Rejected Addresses*, a parody of certain distinguished writers, suggested by an advertisement of the management of the new Drury Lane Theatre, inviting an address for the opening of that house in 1812.

SMITH, JOHN (1579–1631), Virginian colonist; b. Willoughby, Lincolnshire, of humble parents; led life of marvellous adventures, described by himself in his *Generall Historie*, about which an Eng. gentleman of the time wrote: 'The author hathe not spared to appropriate many deserts to himself which he never performed, and has stuffed his relacyons with many falsetics and malycyous detractyons.' As leader in Virginian expedition, 1606, S. showed himself valiant and capable, but again embellished history in *True Relation of such Occurrences and Accidents of Note as hath passed in Virginia since the first planting of that Colony*, 1608; explored Chesapeake, made maps of bay, etc.; befriended by Indian maiden Pocohontas; app. pres. of colony, 1608; arrival of fleet of new colonists led to his resignation, 1609; made map of New England coast, 1614; app. Admiral of New England, 1617, for expedition which never came off; author of numerous tracts to be found in Arber's reprints; romantic, attractive character.

Bradley, *Life* (1905).

SMITH, JOSEPH, see MORMONS.

SMITH, SIR HENRY GEORGE WAKELYN, Bart. (1787–1860), Brit. general; served in Peninsular and Amer. Wars; distinguished in Kaffir War, 1834–36, and Sikh War, 1845–46; won brilliant victory at Aliwal, 1846; High Commissioner of S. Africa, 1847; conducted second Kaffir War, 1851–52. Harrismith (*q.v.*) and Ladysmith (*q.v.*) perpetuate his name and his wife's.

SMITH, SIR WILLIAM SIDNEY (1764–1840), Brit. sailor; served in Fr. wars; imprisoned in Paris, 1796–98; successfully conducted defence of St. Jean d'Acre when besieged by Napoleon, 1799; admiral, 1841.

SMITH, SYDNEY (1771–1845), Eng. scholar, divine, and wit.; ed. at Winchester and New College, Oxford, where he became a fellow; went to Edinburgh and studied philosophy; started *Edinburgh Review*, 1802; app. incumbent of Foston-le-Clay in Yorkshire, 1806, where he settled, 1808, doing much good work; prebend. of Bristol, 1828; rector of Combe-Florey (Somerset), 1829; canon of St. Paul's, 1831. S. was a vigorous upholder of Catholic emancipation, which he advocated in famous *Peter Plymley's Letters* (1807–8); *Three Letters to Archdeacon Singleton on the Ecclesiastical Commission* appeared (1837–39). But for his outspokenness he might have become a bp. He originated the story of Mrs. Partington and her broom, and was noted for his brilliant, audacious wit.

Reid, *Life and Times* (1884); Russell, *Life* (1905).

SMITH, THOMAS SOUTHWOOD (1788–1861), Eng. physician; practised med. at Yeovil and afterwards in London, where he became physician to London Fever Hospital; author of a standard work on *Fever*; an authority on fever epidemics and sanitary affairs.

SMITH, WILLIAM (1769–1839), Eng. geologist; known as 'the father of Eng. geology'; started as farmer; took up surveying and land draining; engineer for Somerset Coal Canal, 1794; prepared valuable geological maps of England; awarded Wollaston medal by Geological Society, London, 1831.

SMITH, WILLIAM FARRAR (1824–1903), Amer. soldier; Federalist; distinguished at *Antietam*; commanded division at *Fredericksburg*; major-general, 1864.

SMITH, WILLIAM ROBERTSON (1846–94), Scot. philologist and Biblical critic, etc.; b. Keig, Aberdeenshire. In 1870 he became prof. of Oriental Languages and Old Testament at the Free Church Coll., Aberdeen, but certain articles of his on the higher Biblical criticism so offended the Church authorities that he lost his chair. In 1882 he became editor of the *Encyclopædia Britannica*; app. prof. of Arabic at Cambridge, 1883.

SMITH'S FALLS (44° 57′ N., 76° 20′ W.), town, Lanark County, Ontario, Canada; lumber. Pop. 6700.

SMITHSONIAN INSTITUTION was created at Washington by Act of Congress, 1846, in accordance with the will of JAMES SMITHSON (1765–1829), a wealthy Englishman and Fellow of the Royal Society, who bequeathed $515,000 to the U.S.A. to the 'increase and diffusion of knowledge among men.' The trust was not accepted for ten years, but in 1847 the plan was adopted for 'increasing knowledge' by an institute for scientific research. A National Museum, Research Library, Bureau of American Ethnology, Zoological Park, and Astrophysical Observatory are now attached to the Institution. See Goode's *The Smithsonian Institution* (1897).

SMOKE, visible vapour which rises from a burning substance; gaseous exhalations charged with minute particles of carbonaceous matter or soot. S. is the product of imperfect combustion of such substances as wood or coal. The s. nuisance in large manufacturing towns charges the atmosphere with soot and dirt particles which penetrate everywhere.

Brit. Acts of Parliament (Public Health (London) Act, 1891, etc.) prohibit the discharge of s. from factory chimneys, but this is not enforced although several methods of s. combustion have been invented. These chiefly deal with introducing oxygen to the particles of carbon so as to make them burn. In warm weather the s. of towns gets away and is unnoticed in the atmosphere, but in winter or cold weather, when the atmosphere is charged with moisture, the s. is kept down and, mixing with the moist atmosphere, causes the black or brown fogs so common in our large towns. The s. of coal is black and of an oily and tarry nature, peat s. is azure blue, while burning wood gives off an almost invisible smoke, mainly composed of carbonic acid.

Smoke Abatement, by Graham, and by Nicholson (1906); *Smoke Prevention*, by Kershaw (1904), Nicholson (1902), Popplewell (1901), and Bar.

SMOKELESS POWDER, see GUN-COTTON, CORDITE, EXPLOSIVES.

SMOLENSK (55° N., 33° E.), government, Russia; hilly or undulating; forest-clad; principal river is the Dnieper; chief occupation, agriculture. Pop. (1910) 1,949,600. **Capital, Smolensk** (54° 49′ N., 32° 3′ E.), on Dnieper; has an old citadel, cathedral,

and numerous churches; scene of a victory by French under Napoleon in 1812. Pop. (1910) 59,000.

SMOLLETT, TOBIAS GEORGE (1721–71), Scot. novelist and man of letters; b. Dalquhurn, Dumbartonshire; of good family and education; studied med. but early aspired to literary fame; went to London at eighteen to make fortune with tragedy *The Regicide*, but naturally failed; sailed as surgeon's mate on warship to West Indies, 1746; failing as physician, took to novel-writing and hack-work with marked success, although financially S. never flourished; cynical, but warm-hearted. His three best-known works are *Roderick Random* (1748), *Peregrine Pickle* (1751), and his masterpiece, *Humphrey Clinker* (1771). All are 'picaresque' romances, with no plot worth mentioning, full of personal experiences, humour, and observation. S. had great narrative faculty; *Random* is written in first person, *Pickle* in usual biographical fashion, and *Clinker* in form of letters. All are tainted with coarseness. S. also wrote a *History of England*, *Count Fathom*, *Sir Launcelot Greaves*, *The Adventures of an Atom* (political lampoon), *Travels through France and Italy*, trans. of *Don Quixote*, etc.

Works, edit. by Henley and Seccombe (1899–1902); *Life*, by Smeaton (1897).

SMOLT, see under SALMON FAMILY.

SMUGGLING is the secret importation into any country of goods liable to Customs duty, for the purpose of escaping the Customs. It is an offence punishable by fine or imprisonment. Formerly s.—chiefly of spirits, tea, and tobacco—was carried on by organised and armed bands, and was a serious business, requiring the maintenance of an extensive Preventive Service (king's cutters and land officers). It has been often described in fiction (notably in *Guy Mannering*).

SMUT, see FUNGI.

SMYRNA (38° 26′ N., 27° 7′ E.), chief port of Asia Minor, situated at head of Gulf of S., on arm of Ægean Sea; built on amphitheatre of hills rising from head of gulf; partly Turkish and partly European; seat of R.C., Gk., and Armenian archbishoprics; headquarters of Turk. provincial gov.; important depôt for Turkey carpets. S. was founded by Gk. colonists, and was a flourishing commercial centre in VII. cent. B.C.; pillaged by Lydians in 630 B.C.; subsequently belonged to Romans and Byzantines; taken by Turks, 1424. Pop. *c.* 250,000.

SMYTH, CHARLES PIAZZI (1819–1900), Brit. astronomer; b. Naples; app. assistant at Cape Observatory (S.A.), 1835; Astronomer-Royal, Scotland, 1845; ascended Peak of Teneriffe, 1856.

SMYTH, JOHN (1570–1612), Eng. Nonconformist theologian; first Anglican, then went to Amsterdam and became Mennonite; next became Baptist, rejecting infant baptism; baptized himself, hence called *Se-Baptist*; wrote several works; a man of fine character.

SMYTH, WILLIAM (1460–1514), bp. of Coventry and Lichfield (1493), of Lincoln (1496).

SNAILS, see GASTEROPODA.

SNAKE BIRDS, or DARTERS (*Plotidæ*), a family of Cormorant-like birds, with long, slim necks and small heads (hence their second name). They occur near rivers, lakes, and sea lochs in tropical and subtropical regions, where they prosecute their fishing during twilight and at night.

SNAKE-FLIES, CAMEL-FLIES (*Raphidiidæ*), a family of Neuropterous insects, named on account of a neck-like prolongation of head and thorax. The larvæ live in rotting wood, where they feed upon insects; found in Europe, Asia, and N. America.

SNAKE RIVER, LEWIS FORK (42° 30′ N., 114° W.), longest tributary of Columbia (*q.v.*), N. America; length, *c.* 1000 miles; rises in Shoshone Lake; flows through deep cañons.

SNAKES AND SERPENTS, constituting the order Ophidia, while absent from many islands, including Ireland, Iceland, and New Zealand, are distributed all over the world, but are most abundant in the tropics. They are well known by their elongated, limbless form, adapted for their creeping mode of life. Except in Pythons, Boas, and a few others where external spurs representing hind-legs are present, there is no trace of any exterior structures or appendages. The skin, shed periodically, is covered with scales, which in the head portion are so developed as to form protecting plates. The vertebræ are very numerous, amounting in some Pythons to over 400. The teeth are fused to the jaw; no external ear and no eyelids are present, the latter feature distinguishing the snake-like and limbless Lizards from true Snakes. The bifurcated tongue is specially sensitive both to touch and air vibrations. Within the mouth there is sometimes present a poison gland, associated, in the forward part of the upper jaw, with fangs attached to a movable bone, the whole serving as successful weapon of defence and instrument for killing prey.

VENOMOUS SNAKE'S HEAD. *F*, poison fang; *L*, lower jaw; *M*, upper jaw; *S*, sheath of fang; *T*, tongue.

One of the most striking characteristics of the snake is its ability, by means of the movable bones of the skull and elasticity of skin, to swallow animals much larger than the normal size of its mouth and throat.

The great majority of snakes lay limy-shelled eggs, but in a few, such as the British Adder, the young are born alive; yet some normally egg-laying species have been known to become viviparous in confinement.

Snakes move with great agility and grace by means of the broad, flattened scales which lie along their under-surface. By moving these forwards and backwards with a lever-like motion, they are enabled to glide over rough and smooth ground, while many are expert climbers, and pass most of their time on trees, feeding on birds' eggs and young birds. Some species (*Typhlopidæ*), with eyes hidden under scales, have adopted a burrowing habit, while in the Indian Ocean and tropical Pacific exceedingly poisonous SEA-SNAKES or SEA-SERPENTS (*Hydrophiinæ*) are found, which, with their flattened tails, paddle on the surface in crowds numbering several dozens.

Snakes may be roughly grouped according to their prey and mode of capturing it. There are the simple insectivorous burrowers, such as *Typhlops*, which feed only upon termites and insect larvæ. There are the great Constrictors, the largest of snakes; one, the RETICULATED PYTHON (*Python reticulatus*), reaching a length of 30 ft. The Constrictors, which include Boas and Pythons, are mostly arboreal; some, however, are quite small, and a few have taken to burrowing habits. These creatures live almost entirely on birds or mammals, some of the large forms having been known to swallow small antelopes. They have no poison fangs, and all kill their prey by squeezing it to death. A well-known type of Python is the CARPET SNAKE (*Python spilotes*) of New Guinea and Australia.

Apart from the Constrictors, there are other non-venomous snakes which live upon small mammals swallowed directly. To this group belong the BRITISH GRASS-SNAKE (*Tropidonotus natrix*) and the SMOOTH SNAKE (*Coronella*). Lastly, there may be mentioned the venomous snakes, which poison their prey before swallowing. Many are brilliantly coloured, and they include such forms as the English ADDER or VIPER, the only British poisonous snake, the Indian COBRA, and the N. American RATTLESNAKE, distinguished by a series of loose horny rings at the tip of its tail.

It has been recently proved also that S. African BOOMSLANG or TREE SNAKE (*Dispholidus typus*), long considered an almost harmless species, possesses highly active venom, and can inflict dangerous wounds.

'SNAKE-STONES,' fossil Cephalopoda (*q.v.*).

SNAPDRAGON (*Antirrhinum*), genus of plants, order Scrophulariaceæ (*q.v.*); name derived from corolla closing with a snap on pressure.

SNEEK (53° 2′ N., 5° 39′ E.), town, Friesland, Netherlands; butter and cheese mart. Pop. 13,010.

SNIATYN (48° 27′ N., 25° 32′ E.), town, on Pruth, Galicia, Austria; horse market. Pop. 12,500.

SNIDER, see RIFLES.

SNIPE, see under PLOVER FAMILY.

SNORRI STURLASON (1179–1241), Icelandic historian; undertook to secure submission of Iceland to Haakon of Norway; afterwards lost royal favour; killed, 1241; wrote *Heimskringla*, history of Norwegian kings, and prose *Edda* (q.v.).

SNOW, frozen water-vapour which crystallises round nuclei of dust, assuming hexagonal shape.

SNOW LEOPARD, see under CAT FAMILY.

SNOWDON (53° 5′ N., 4° 4′ W.), loftiest mountain (3560 ft.) of Wales; in Carnarvonshire.

SNOWDROP (*Galanthus*), genus of plants, order Amaryllideæ; Common s. (*G. nivalis*) flowers in Feb. or March.

SNUFF, see TOBACCO.

SOAPS are metallic salts of stearic, palmitic, and oleic acids. Only the alkali s's are soluble in water. S's are made by decomposing natural fats by caustic alkali solution. These are the glyceryl $(C_3H_5)'''$ salts or esters (glycerides) of the above fatty acids; and their *saponification* yields glycerol (glycerine) as a by-product; thus, *e.g.* :—

$$(C_{17}H_{35}COO)_3C_3H_5 + 3HONa = 3C_{17}H_{35}COONa + C_3H_5(OH)_3$$

Glyceryl stearate (=stearine). Sodium stearate (=soap). Glycerol.

The fats employed are tallow, bone grease, house grease, palm oil, cocoa-nut oil, linseed oil, cotton-seed oil, etc.; and usually they are heated with caustic soda solution till saponification is complete; then common salt is added to separate the s., which is insoluble in brine (salting out), and the glycerine may be recovered from the liquor. *Soft* s. is produced when potash is substituted for soda, and the glycerine and water remain. S. is also made by neutralising with alkali carbonate the fatty acids obtained from fats by decomposition with lime or sulphuric acid, or, more recently, by enzyme fermentation.

Hurst, *Soaps*; Gadd, *Soap Manufacture*; Watt, *Soap-Making*.

SOAP-STONE, see TALC.

SOAPWORT (*Saponaria*), genus of plants, order Caryophyllaceæ; Common S. (*S. officinalis*) contains Saponin (*q.v.*).

SOBAT (8° 36′ N., 33° 35′ E.), river, N.E. Africa; rises in Abyssinian highlands, flows W.N.W.; joins White Nile.

SOBIESKI, JOHN, see JOHN III.

SOCIAL WASPS, see WASPS.

SOCIALISM, an economic theory for regulating the production and distribution of goods by getting rid of competition and making the community the sole proprietors of the land, the machinery, and all mechanical instruments of wealth production. ROBERT OWEN in England, 1835, and LEROUX, ST. SIMON, and FOURIER in France, 1838, were the first to use the term. The S. of these men is called *Utopian*, because it was preached as a new order of society that would come into operation by the goodwill of men, and only waited for that goodwill. The modern S., which dates from KARL MARX and ENGELS, is called *scientific*, because it is alleged by its founders and their followers that S. will be brought about, as an inevitable process of human evolution, by the working class, who, perceiving they are deprived of the greater part of the wealth they create, will unite to obtain that political power which will place them in command of the forces of government and thereby enable them to displace the capitalists and landowners.

A still more recent school of Socialists, called *Revisionists* on the Continent, and represented in England by the LABOUR PARTY, are content to extend gradually the scope of government activity, and to legislate in Parliament for the protection of the working class and the raising of the labourers' standard of comfort. The *Fabian Society* (founded 1883) co-operates with the Independent Labour Party, preaches intellectual S., and deprecates revolutionary methods approved by the Brit. Socialist Party (formed 1911). A sort of aristocratic S. was expounded by Ruskin; and other great Eng. thinkers have supported the Socialist movement by their writings. In France the *Commune* (*q.v.*) was a Socialist insurrection. The Socialists under Jaurès are influential in the Fr. Parliament, supporting Radicals and 'Radical-Socialists' on many questions. In Germany the Social Democratic Party has since Lassalle's time (d. 1864) been making rapid strides; in 1912 they gained 110 seats (as against 53 in 1907) and polled 4¼ million votes. Socialism is also strong in Belgium, Russia, Austria, Denmark, Italy, and other parts of Europe; and Socialistic legislation is promoted by Labour governments in Brit. Australasia.

The essence of S. is the abolition of poverty, by securing an even distribution of the total amount of wealth produced, and by making it impossible for one or more persons to make profit out of the employment of others. The obvious ills of the industrial system of the XIX. cent., and the doctrine of *Laissez-Faire*, brought the theory of S. into existence and won popularity for it. The claim of the Socialists is that the establishment of their teaching would end not only poverty, but all unemployment and all disputes between labour and capital, and secure for all a worthy livelihood.

Apart from the State Socialists who look to government regulation, there are Christian Socialists who seek to apply the principle of association by voluntary co-operation.

Ramsay Macdonald, *Socialism*; Flint, *Socialism* (1908); Kirkup, *An Inquiry into Socialism* (1907) and *History of Socialism* (1906); Ellis Barker, *British Socialism* (1908); Snowden, *Socialism* (1913).

SOCIETIES, LEARNED, are associations for the promotion and propagation of lit., science, and art, through the converse of learned men and from purely disinterested motives. Soc's originated with the schools of Greece and notably the *Academy*.

The first or 'old' Academy (347–270 B.C.), mainly Pythagorean in doctrine, was said to embrace all culture and learning. Its leaders were Spensippus, Xenocrates, Polemon, Cantor, and Crates. The second or 'middle' Academy dates from 316–241 B.C., and was founded by Arcesilaus. It emphasised probability rather than reality, and this tendency ultimately produced the extreme scepticism of the third or 'new' Academy (214–129 B.C.), under Carneades. The Museum of Alexandria, founded at the beginning of the III. cent. B.C. by the first of the Ptolemies, became the meeting-place of the votaries of all the arts and sciences. At Constantinople in the early IX. cent. A.D. Cæsar Bardas founded a State institute for the promotion of science, in rivalry probably of the Western centres of learning at Granada, Corduba, etc. In 782 Charlemagne founded his *Palatine Academy*, with Alcuin at the head; it was instituted to foster the studies of math's, history, and letters. The Academy founded by Alfred the Great at Oxford is now an exploded myth.

More modern in organisation were the soc's of the Troubadours in the early XIV. cent., of which the *Académie des Jeux Floraux* is a direct descendant. In Italy of the Renaissance we see the nearest approach to the modern learned soc. The most celebrated association was the *Academia Platonica*, founded 1442, by Cosimo de' Medici. In 1582 the *Academia della Crusca* was founded at Florence with the specific aim of purifying the Ital. language. Most celebrated of all Academies is the famous *Institut de France*.

In Germany the most famous associations are the *Collegium Curiosum* (1672) and the *Akademie der Wissenschaften*.

The chief Brit. learned soc's are the *Royal Society of London*, founded by the followers of Bacon (1660), the

Dublin Philosophical (or Royal Dublin) (1684), the Royal Physical, of Edinburgh (1771), Highland and Agricultural (1784), the Linnæan (for the promotion of Bot. and Zool.) (1788), Royal Medical and Chirurgical (1805), Royal Geographical (1830), Brit. Association (1831), the Brit. Association for the Advancement of Sciences (1831), Brit. Medical Association (1832), Royal Botanical (1834), Royal Soc. of Arts (1847).

Amer. societies are: Amer. Philosophical (1743), Connecticut Academy of Arts and Sciences (1799), New York Academy of Sciences (1817), Boston Soc. of Natural History (1830), Smithsonian Institution (1846), Amer. Association for Advancement of Science (1847), Amer. Geographical (1852), National Academy of Sciences (1863), Social Science Association (1865), Amer. Chemical (1876), Amer. Folklore (1888).

Since the XVIII. cent. the tendency has been towards specialisation. See ACADEMY.

SOCIETY ISLANDS (17° 39′ S., 149° 30′ W.), archipelago, in Polynesia, S. Pacific, belonging to France; volcanic and fertile. Total area, c. 800 sq. miles. Pop. (estimated) 20,000. Chief island, Tahiti; exports copra. Capital, Papeete.

SOCINUS, two Ital. Prot. theologians, called SOZZINI.—**Lælius** (1525–62), threatened by the Inquisition, settled at Zürich and became leader of Swiss and Ger. reformers. Though not openly denying the doctrine of the Trinity, he was suspected of unorthodoxy, and found it prudent to keep quiet; the Inquisition seized the family property on his f.'s death, and he lived latterly under the protection of King Sigismund II. of Poland.—His nephew, **Faustus** (1539–1604), studied law, living at Lyons and Zürich, then at Medician court in Florence, then in Transylvania and Poland, becoming leader of new Unitarian or anti-Trinitarian movement called after him *Socinian*. Like Anabaptists, Socinians objected to government authority, whether civil or military. After S.'s death his movement continued in Poland, where it was finally crushed out, and in Transylvania, where it still exists.

Gordon, *Faustus and Lælius Socinus* (Heroes of Reformation Series).

SOCIOLOGY (Lat. *socius*, companion, and Gk. *logos*, science), term introduced by Comte (1839) for comprehensive study of fundamental laws of social phenomena; the science of man in society: not identical with political science, as Sidgwick supposes, since the social consciousness is wider than the political, nor merely the sum of the separate social sciences, but a common basis for all these, investigating the first principles taken by them as their postulates.

The beginnings of a scientific observation of social facts are found in Plato's *Republic* and Aristotle's *Politics*; both philosophers interpret the society organised in the city state as the best means to the most perfect life, a political view of the science influencing even recent theories. In the Middle Ages fragmentary studies of social phenomena are found, economic, legal, political, ecclesiastical, the *De Regimine Principum* of Aquinas enjoying a reputation almost as great as Aristotle's *Politics*, but the work was left incomplete. Montesquieu and the physiocrats developed an objective explanation through race, heredity, historical conditions; Grotius, Hobbes, Locke, Hume, Bentham, and Kant attempted a subjective, through human nature, utility, and ideals. Comte, however, first viewed society as indivisible and organic, and social science as positive in method, based on wide observation, and freed from metaphysical and supernatural elements. Since Comte, s. has developed on evolutionary lines, making use of the writings of Darwin, Huxley, Wallace, and Spencer; it interprets human society as bound by the laws of natural causation, refusing to regard humanity as a law unto itself. For Spencer, society, like the living organism, passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, these changes making for equilibration of energy between the organism and its surroundings. Perfect equilibrium is never reached, and society is a 'moving equilibrium.' Spencer attempts to trace the religious and political sanctions to fear respectively of the dead and of the living, and to show that militarism and industrialism create diverse types of national character, employing extensively anthropological and ethnological data to establish these propositions.

More recently, inquirers tend to form different schools, according to the method pursued. The Biological school (Schäffle, Réné-Worms) regards society as an organism, and social reform as needing a social pathology based on a sound knowledge of the anatomy of society. The anthropologists, Letourneau, Gumplowicz, M'Lennan, Bachofen, Tylor, Frazer, and Karl Pearson, have investigated primitive forms of society, the evolution of the family, clan, tribe, and nation. Galton, Pearson, and Levasseur have adopted a statistical method to examine the distribution of races, nationalities, crime, pauperism, and religion. Much emphasis has been placed on psychological analysis, to discern the fundamental fact on which social phenomena depend. This distinctive fact is taken by Novicow to consist of a progressive modification of struggle by alliance; by De Greef, of contract; by Tarde, of imitation, preceding all mutual aid and division of labour; by Durkheim, of coercion of individual minds by external modes of thought and action; by Giddings, of 'consciousness of kind.'

The problems of S. include those of aggregation, of association and mutual aid, of the social character of the population, of the mental activity of individuals and of masses, of the evolution of society, and of the development of the interaction between conscious motives and physical forces.

Giddings, *Principles of Sociology* (1896); Herbert Spencer, *Study of Sociology*; Granger, *Historical Sociology* (1911); Ferri, *Criminal Sociology* (1895).

SOCOTRA, see SOKOTRA.

SOCRATES (c. 470–399 B.C.), Gk. philosopher; b. Athens; s. of a mason-sculptor. S. did not long follow his f.'s trade, but managed, though poor, to live frugally without a regular trade. He took little part in public affairs, though both in battle and in the Assembly he performed necessary civic duties with courage; but spent his time among friends and acquaintances talking, discussing, searching after knowledge. Though popularly reckoned a Sophist, he neither wrote nor professed to teach, or even to possess, knowledge, but only to be a learner conscious of his ignorance, yet able by a mental 'midwifery' through question and answer to bring forth, from his friends' minds, truths lying there unknown to them. Whilst his dialectical subtlety and power of repartee were unusual, his friends were still more impressed, firstly, by his self-control and force of character, and, secondly, by his belief that a divine voice within him checked him from acting wrongly. In 399 B.C. he was accused (1) of corrupting young men—a charge doubtless due to the oligarchic activities of some of his friends; and (2) of not recognising the city's divinities and introducing others. Found guilty by a small majority, he was condemned to death, though he might have avoided the penalty had he not appeared to flout the court, or had he subsequently taken an opportunity of escaping from prison.

The exact nature of his philosophical position is disputed. Though he was acquainted with the 'physical' speculations of Anaxagoras and others, he early ceased to take much interest in them, his chief concern being man and human conduct. The usual view is that, as against contemporary scepticism, he maintained the possibility of finding a firm basis for morality in knowledge, going so far as to say that no one who knows what is right will act wrongly; and therefore he was led to a search for definitions, especially of the virtues, by means of question and answer, and of inductive arguments from experience. On this view he indicated a method rather than formulated

a systematic doctrine. It has recently been contended, however, that he was greatly influenced by the Pythagoreans, and that many doctrines usually called Platonic should be ascribed to Socrates, whom Plato himself represents as voicing them, *e.g.* the 'ascetic' morality of the *Phædo*, the doctrine of Recollection, the theory of Ideas as presented in the *Phædo* and the *Republic*, and perhaps even much of the political theory of the latter dialogue. See PLATO.

Benn, *The Greek Philosophers*, vol. i.; Gomperz, *The Greek Thinkers*, vol. ii.; Grote, *History of Greece*, ch. 68; A. E. Taylor, *Varia Socratica*; Zeller, *Socrates and the Socratic Schools*.

SOCRATES (b. *c.* 380 A.D.), ecclesiastical historian. Little is known of his life, for which his own *Church History* is the sole authority; latterly he lived in Paphlagonia and Cyprus. His *Church History* deals with the IV. and early V. cent's, and he occupies himself mostly with controversies, theological and political; largely uses Rufinus, Eusebius, Athanasius, and other sources; generally copies, but sometimes criticises; neither a great scholar nor a great thinker; valuable as a source, though to be used with caution.

Gwatkin, *Studies of Arianism*.

SODEN, SODEN AM TAUNUS (50° 10′ N., 8° 30′ E.), watering-place, Hesse-Nassau, Prussia; saline springs.

SODEN, HERMANN, FREIHERR VON (1852–), Ger. divine; prof. at Berlin; author of several works on New Testament criticism. His most important work is in textual criticism: S. developed a fresh theory of three recensions.

SÖDERHAMN (61° 17′ N., 17° 5′ E.), seaport, on Gulf of Bothnia, Gefleborg, Sweden; exports timber and iron. Pop. (1911) 11,439.

SÖDERTELGE (59° 14′ N., 17° 42′ E.), town, summer resort, on Lake Malar, Sweden. Pop. (1911) 11,271.

SODIUM (Na=23·0); metallic element of the alkali group; occurs in rock salt and sea water, Chili saltpetre ($NaNO_3$), in silicates, etc.; metal first obtained by Davy (1807) by electrolysis of NaOH, prepared later by reducing the carbonate (Na_2CO_3) or hydroxide (NaOH) with carbon, now again by electrolysis of NaOH. *Properties:* silvery white, soft, crystallisable, S.G. 0·971, M.P. 95·6°, B.P. 742°, colours bunsen flame bright yellow, spectrum a double line (D), tarnishes in moist air, decomposes water rapidly, burns to mon- and di-oxide; used for manufacture of cyanide and peroxide, magnesium, indigo, etc., and in form of amalgam as a reducing agent; monovalent. Important compounds: chloride, common salt (NaCl); hydroxide, caustic soda (NaOH), peroxide (Na_2O_2); carbonate, washing soda ($Na_2CO_3+10H_2O$), bicarbonate ($NaHCO_3$); sulphate, Glauber's salt ($Na_2SO_4+10H_2O$); phosphate ($Na_2HPO_4+12H_2O$).

SODOM AND GOMORRAH, two 'cities of the plain' destroyed by God for wickedness; site supposed to be near Dead Sea.

SODOMA, IL (1477–1549), Ital. painter of religious and historical pictures, who worked chiefly at Sienna. Some frescoes in the Villa Farnesina at Rome are regarded as his crowning achievement.

SODOR AND MAN, name of the Anglican diocese of the Isle of Man; in mediæval times included the Scot. Hebrides.

SOEST (51° 35′ N., 8° 7′ E.), town, Westphalia, Prussia; contains several interesting old churches; manufactures iron; was an important Hanse town. Pop. (1910) 18,466.

SOFALA (26° 10′ S., 34° 29′ E.), decayed seaport, at mouth of Sofala, Portug. E. Africa; taken by Portuguese, 1505.

SOFIA (42° 32′ N., 23° 23′ E.) (ancient *Serdica*), town, capital of Bulgaria; seat of R.C. abp.; Gk. bp.; also of a university (1888); has cathedral and several mosques; taken by Bulgarians, 809; by Turks, 1382. Pop. (1910) 102,812.

SOFT CHANCRE is a local infection of the genital organs without the accompaniment of constitutional symptoms, due to a micro-organism, *Ducrey's bacillus*. A papule forms twenty-four hours after infection, becoming vesicular in two or three days, and a sharply outlined ulcer in four or five days. The lymphatic glands in the neighbourhood become enlarged and suppuration may take place (*bubo*). The treatment is either to destroy the organisms and make the ulcers healthy by touching them with pure carbolic acid, or to dress them with the mercurial preparation 'black wash,' healing taking place in a week or two. The prepuce may require to be slit open to ensure adequate treatment of the ulcers.

SOGDIANA (39° 30′ N., 68° E.), ancient region, between the Oxus and Jaxartes, Central Asia; corresponds to modern Bokhara and Samarkand.

SOGNE FJORD (61° 6′ N., 6° E.), longest fjord in Norway; on W. coast.

SOHAM (52° 21′ N., 0° 20′ E.), town, Cambridgeshire, England.

SOIGNIES (50° 34′ N., 4° 3′ E.), town, Hainault, Belgium; granite quarries. Pop. 11,500.

SOIL constitutes the major portion of the most superficial layer of the earth's crust, and its importance lies in the fact that it is the reservoir of water and mineral food for the whole of the vegetation of the globe. All primary s's, that is, s's unmodified by vegetable growths, are produced by the disintegration of rocks by various natural agencies, and may be grouped under two heads: (*a*) SEDENTARY s's, derived from the rock they overlie, and having essentially the same characters; (*b*) TRANSPORTED s's which have been removed from the place in which they were formed (*e.g.* boulder clay). Between the s. proper and the underlying rock mass there is usually a layer of intermediate character termed the *subsoil*. The chief agents in the weathering or disintegration of rocks to form s. are air, water, and dissolved gases, temperature variations, frost, burrowing animals, and subterranean plant organs.

As s's are derived from different rocks they will naturally differ both in chemical composition and in physical and physiological properties, and these will be found to have a large influence in determining the type of vegetation. Once a carpet of vegetation is produced, the original character of the s. is, to a certain extent, modified, by the accumulation of partially decayed and disintegrated plant remains, or *humus*. The gradual breaking-up of plant matter is accomplished by various fungi, its final restoration to the s. as reavailable raw material being the work of certain definite groups of nitrifying bacteria, viz. Nitrosomonas, Nitrococcus, and Nitrobacter. S. ultimately consists of minute particles of matter, each surrounded by an aqueous film, and between which there is usually air, except in water-logged s's. It is part of this water which is utilisable by plants, since it tends to distribute itself equally through the s. layers, although each particle also retains a certain amount. S's may be briefly classified as follows: (1) *Loam*, in which the chief constituent is clay, variously mixed and forming sandy loam, calcareous loam, gravelly loam, etc.; (2) *Sand*, other constituents below 10 %; (3) *Marls*, calcareous and otherwise; (4) *Humus* s's (*e.g.* peat).

A. D. Hall, *The Soil*.

SOISSONS (49° 23′ N., 3° 20′ E.), town, Aisne, France; episcopal see; has cathedral dating from XII. cent., and remains of several religious houses, including Abbey of St. Jean des Vignes, which has associations with Thomas à Becket. S. came in I. cent. B.C. to possession of Romans, under whom it was an important town and fortress; gave name to countship from X. cent. onwards; has been frequently besieged. Pop. 14,000.

SOKE, a manor or lordship with jurisdiction over free tenants, or *soc men*; often originating in royal grant.

SOKOTO (10° N., 10° E.), an inland district of 35,000 sq. miles in Niger basin, formerly administered by the Royal Niger Company, but included

in 1903 in Brit. protectorate of N. Nigeria; controlled by resident officials app. by Colonial Office; centre of administration, Zungeru; the native (Fula) rulers are still allowed to govern, subject to Brit. control. Palm oil and kernels are exported. Pop. c. 520,000.

SOKOTRA, Socotra (12° 30′ N., 53° 45′ E.), island belonging to Britain in Ind. Ocean, off E. extremity of N. Africa; area, 1382 sq. miles: surface mountainous, reaching height of over 4500 ft.; climate healthy; soil fertile. Inhabitants are a mixed race, of two principal types, one dark, one light in colour; those in interior are a pastoral people, raising large numbers of cattle, sheep, and goats; and those on the coasts engage in fishing. S. came under British protection in 1876, and was formally annexed to Britain by treaty with Sultan in 1886. The island is famous for aloes, and produces also dragon's blood, dates, and various gums; and butter is made and exported. Pop. c. 12,000.

SOLAN GOOSE, see under Gannets.

SOLANACEÆ, sympetalous dicotyledons, usually herbaceous or shrubby, which show, in many genera, a complex branch system derivable from a dichasial cyme; flowers pentamerous and bicarpellary, and fruit a berry, or capsule. Most important genera are: *Solanum tuberosum* (Potato), *Lycopersicum esculentum* (Tomato), *Nicotiana* (Tobacco), and *Atropa belladonna* (Deadly Nightshade).

SOLAR SYSTEM, number of planets (of which earth is one), comets, and meteors revolving round the sun. It is supposed the solar system developed from a single large nebula.

SOLDERING, see Brazing and Soldering.

SOLE (*Solea*), genus of Flat-Fishes (*q.v.*); main supply comes from North Sea.

SOLEN, Razor-Shell, see under Lamellibranchiata.

SOLENT, THE (50° 45′ N., 1° 25′ W.), strait, separating Isle of Wight from Hampshire, and extending between the Needles and W. Cowes.

SOLESMES (47° 52′ N., 0° 20′ W.), village on Sarthe, Sarthe, France; Benedictine XI.-cent. abbey.

SOLETO (40° 15′ N., 18° 10′ E.), town, Lecce, Italy. Pop. 3500.

SOLEURE, Solothurn (47° 20′ N., 7° 35′ E.), canton, Switzerland; belongs to basin of Rhine; traversed by the Jura Mountains; fertile, containing rich pastures; manufactures include watches, shoes. Pop. (1910) 117,040. Capital, **Soleure,** Solothurn (47° 12′ N., 7° 32′ E.), on Aar; has a cathedral (XVIII. cent.), museum with a rich collection of Jura fossils, and the finest armoury in Switzerland; was admitted to the Swiss Confederacy in 1481. Pop. (1912) 11,900.

SOL-FA, Tonic Sol-fa, a system of musical notation founded by Miss Glover and Rev. John Curwen (*q.v.*); the scale is Doh', Te, Lah, Soh, Fa, Me, Ray, Doh, written thus—d' t l s f m r d; chromatic notes add *a* (if lower), *e* if higher, e.g. *fe*=f, a semitone higher, *ta*=t, a semitone lower. In transcribing *Staff* into *Sol-fa* Doh stands for the keynote in major keys, *e.g.* in an A key A is doh. Time is represented by dots and dashes; a dot indicates a half-beat, a comma a quarter-beat.

SOLFATARA, volcanic crater, ½ mile E. of Pozzuoli, Italy.

SOLFERINO (45° 22′ N., 10° 33′ E.), village, Mantua, Italy; scene of victory of French and Sardinians over Austrians, 1859.

SOLI.—(1) (36° 50′ N., 34° 35′ E.) ancient city, on coast of Cilicia, Asia Minor; destroyed by Tigranes; rebuilt by Pompey and called Pompeiopolis. (2) (35° 10′ N., 33° E.) ancient city, on N. coast of Cyprus.

SOLICITOR, a lawyer of the lower branch of the profession, akin to the Writer to the Signet (W.S.) in Scotland; can only plead in county and police Courts; employs the barrister for the higher courts and prepares the case for him. The Law Society is the authority over the profession. It holds the preliminary and final examination and grants the admission certificate, and can obtain the striking off the roll of solicitors guilty of unprofessional conduct.

SOLIMAN, see Suleiman.

SOLINGEN (51° 11′ N., 7° 4′ E), town, Rhineland, Prussia; cutlery. Pop. (1910) 50,536.

SOLIPSISM, strictly the doctrine that only the self exists, or can be known; but also applied to any theory which denies the independent existence of the external material world.

SOLITARY WASPS, see Wasps.

SOLMONA, see Sulmona.

SOLO, Solo Whist, card game; eldest hand has right of declaration and may elect to play alone (solo) or with another; *misère* is effort to avoid trick-taking.

SOLOGNE (47° 30′ N., 2° E.), ancient district, France, now included in departments of Loiret, Loire-et-Cher, and Cher.

SOLOLA (14° 59′ N., 90° 59′ W.), town, on Lake Atitlan, capital, Solola department, Guatemala; manufactures cloth; ancient capital of the Cakchiquel Indians. Pop. *c.* 22,000.

SOLOMON, Old Testament character, king of Israel; David's successor and son by Bathsheba, the death of whose husband (Uriah, the Hittite) David had contrived. S. was famous for his wisdom and his worldly splendour. His kingdom grew in power and prosperity and he accumulated vast quantities of gold and silver. He built the Temple at Jerusalem. But there are signs that in the Biblical narrative divergent traditions are interwoven. The mere splendid tradition is not the only one, and some modern scholars think the history has been written from a later standpoint which idealised an earlier age. The exact facts are perhaps irrecoverable. **Odes of Solomon.**—Forty-two hymns discovered in 1908, though known earlier by name; probably written I. cent. A.D.; may be Jewish, with Christian interpolations. **Psalms of Solomon.**—Book of Old Testament Apocrypha, corresponding to Psalter; there are eighteen psalms which can hardly all be by one author. They contain references to Pompeius' taking of Jerusalem in 63 B.C. and cannot be much later; Psalm 17 contains a Messianic prophecy.

For **Song of Solomon,** see Canticles; **Wisdom of Solomon,** see Wisdom, Book of.

Conway, *Solomon and Solomonic Literature* (1900).

SOLOMON ISLANDS (6° S., 15° 6′ E.), group of islands, belonging partly to Germany, partly to Great Britain, 500 miles E. of New Guinea in W. Pacific; volcanic; temperature ranges from 75° to 95° Fahr.; heavy rainfall; export copra, ivory, turtle-shell, nuts, sandalwood, pearl-shell. Brit. portion includes Guadalcanar, Malaita, Isabel, Choiseul, and Kansagi; total area, 14,000 sq. miles. Pop. (1911) 150,300. Principal Ger. islands are Bougainville and Buka. Total area, 4200 sq. miles. Pop. *c.* 12,000.

SOLOMON'S SEAL (*Polygonatum multiflorum*), Brit. plant of order Liliaceæ; flowers, white with green tips, hang from long stem.

SOLON (fl. VI. cent. B.C.), Athenian statesman and one of Seven Sages of Greece; of noble family but reduced by poverty to trade; wrote poems; recovered Salamis from Megara; proposed internal reforms and was elected archon *c.* 594 to carry them out. Chief reforms (of which there is no contemporary record) were: repeal of laws by which person of debtor might be sold and his land seized; reconstitution of Athenian society into *Pentacosiomedimni* (whose lands produced 500 measures of corn and oil), *Hippeis* (whose lands produced 300 measures), *Zeugitæ* (200 measures), *Thetæ* (less than 200); archon and treasurer chosen from Pentacosiomedimni, but election and trial of magistrates was given to entire population; establishment of Council of Four Hundred (Boulê), etc.

SOLUNTUM (38° 10′ N., 13° 36′ E.), ancient Phœnician town, Sicily.

SOLUTION, a homogeneous mixture of substances that cannot be separated by mechanical

means. In the wider sense the term includes gases and solids as well as liquids.

Gaseous Solutions.—Gases that do not interact chemically mix in all proportions by agitation or diffusion. The total pressure of a mixture of gases is the sum of the partial pressures of the constituents. Liquids dissolve in gases by evaporation, solids by sublimation.

Liquid Solutions.—Some liquids, *e.g.* alcohol and water, mix in all proportions; otherwise s. in liquids is limited in extent. The liquid receiving a substance into s. is called the *solvent*; the dissolved substance is the *solute*. The amount of solute which will dissolve in a fixed amount of solvent is its *solubility*; the degree of solubility depends partly on physical conditions. A solution is *saturated* when its concentration will remain constant in contact with the solute.

(i.) SOLUTIONS OF GASES IN LIQUIDS.—The solubilities of different gases differ greatly; they vary with different liquids, and diminish with rising temperature, till at the B.P's of liquids they are zero; and the quantity of a gas which will dissolve in a given quantity of a liquid, *e.g.* water, at a given temperature, is proportional to the pressure of the gas; its volume is independent of the pressure. The volume of a gas which will dissolve in unit volume of a liquid at 0° C. is its *absorption coefficient*. The relative quantities of the constituents of a gaseous mixture (*e.g.* air) which will dissolve in water thus depend on their absorption coefficients and their partial pressures.

(ii.) SOLUTIONS OF LIQUIDS IN LIQUIDS.—Most pairs of liquids dissolve in each other to a limited extent. Ether and water, for instance, separate into two layers after being shaken together; the upper layer is a saturated solution of water in ether, the lower of ether in water.

(iii.) SOLUTIONS OF SOLIDS IN LIQUIDS.—Different solids dissolve in liquids to widely different extents. The solubility of a solid in a liquid thus depends on the nature of the solid and of the liquid, as well as upon the latter's temperature. For inorganic salts water is the usual solvent; for many carbon compounds alcohol, ether, benzene, etc., are better. The solubilities of solids are conveniently expressed in grammes per 100 grammes of solvent. Solubility generally increases with temperature; consequently a solution saturated at a given temperature may be made, not only by agitating the solid with the liquid at that temperature, but by heating it with the liquid to a higher temperature, and allowing the s. to cool to the required temperature in contact with the solid.

If a hot saturated s. cools in entire absence of the solid, separation of the latter may not take place, the s. remaining *supersaturated*. If, then, a fragment of solid is added, rapid separation occurs till equilibrium between s. and solid results.

S's of substances may or may not conduct an electric current. Aqueous s's of acids, bases, and salts conduct whilst they undergo electrolysis; they are electrolytes. S's of other substances are non-conductors, and non-electrolytes (see CHEMISTRY).

Solid Solutions are formed (i.) by the simultaneous separation of two or more solids from a liquid s., *e.g.* mixed crystals; (ii.) by the solidification of a liquid s., *e.g.* alloys, glasses, cryohydrates.

SOLWAY FIRTH (54° 50′ N., 3° 30′ W.), inlet of Irish Sea, separating Cumberland from Scotland; length, *c.* 50 miles; fisheries; rapid tides; long frequented by smugglers.

SOLYMAN, see SULEIMAN.

SOMA, a god of Hinduism, equivalent to Bacchus; name *Soma*, or *Homa*, was given to a nectar (the juice of *Asclepias acida*), drunk by gods and men.

SOMALILAND (*c.* 0° to 12° 20′ N., 40° to 51° E.), triangular district of E. Africa, S. of Gulf of Aden and extending along coast of Ind. Ocean. Mountains reaching height of over 7000 ft. run from Cape Guardafui to S.W. of Abyssinia; rest is undulating plateau with a good deal of desert. Largest rivers are Webi Shebeli, which rises in Abyssinian hills and flows across Abyssinian and Ital. Somaliland in a south-easterly direction; and Juba, which forms part of boundary between Italian Somaliland and Brit. E. Africa, and enters sea near equator. Political divisions are Fr., Brit., and Ital. Somaliland along coast, and Abyssinian Somaliland in interior.

French Somaliland or **Somali Coast** (10° to 12° 20′ N., 41° 53′ to 43° 25′ E.), lies between Eritrea and Brit. Somaliland in N.W.; area, 46,320 sq. miles. Chief towns are Jibuti and Obok, latter of which was bought by France *c.* 1855, although not occupied until 1884. France acquired Sagallo and Tajurah in 1884, Ambado in 1885; and limits of Fr. protectorate were defined by Anglo-Fr. treaty in 1888. It is administered by a gov. and Privy Council; produces coffee, ivory, skins. Pop. (1911) 213,396.

Ferrand, *Les Somalis* (1903).

British Somaliland or **Somaliland Protectorate** (*c.* 8° to 11° 30′ N., 42° 40′ to 49° E.), lies between Fr., Abyssinian, and Ital. Somaliland; area, 68,000 sq. miles. Chief towns are Berbera, Zeila, Bulhar. Brit. Protectorate was established here between 1884 and 1886; limits were defined by Anglo-Fr. and Anglo-Ital. treaties in 1888 and 1894 respectively; and by an Anglo-Abyssinian agreement in 1897, when Britain gave up about 15,000 sq. miles to Abyssinia. Administration of Brit. S. was carried out by Indian Office till 1898, Foreign Office, 1898 to 1905, Colonial Office since 1905. Punitive expeditions were undertaken against the 'Mad Mullah' in 1901–5; since 1910, Britain has restricted its administration to the coast. Gums, coffee, ivory, etc., are produced. Pop. (1911) *c.* 300,000, nomadic, except on coast.

Somaliland, by Pease (3 vols., 1902), Peel (1903), Hamilton (1911).

Italian Somaliland (0° to 11° 56′ N., 42° 20′ to 51° E.), lies between Brit. and Abyssinian Somaliland, Brit. E. Africa, and Ind. Ocean; area, 139,430 sq. miles; chief towns, Mogadisho, Marka, Brava; includes Somali sultanates of Obbia and Miguertini, and colony of Benadir. Limits were defined by Anglo-Ital. and Ital.-Abyssinian treaties, 1894 and 1908. Administration is carried out by civil gov. Cattle, sheep, and camels are raised. Pop. *c.* 400,000.

Abyssinian Somaliland has an area of *c.* 130,000 sq. miles.

Somalis are of Hamitic descent, with an admixture of Arab and Negro blood. They are a warlike race, and are generally dark brown in colour, and of good stature. They are Muhammadans.

SOMATERIA, EIDER DUCK; see under DUCK FAMILY.

SOMBRERETE (23° 33′ N., 103° 29′ W.), town, Zacatecas, Mexico; silver mines. Pop. 10,000.

SOMERS ISLANDS, see BERMUDAS.

SOMERS, JOHN SOMERS, BARON (1651–1716), Brit. statesman; b. Claines; called to Bar, 1676; junior counsel for defence in trial of seven bp's, 1688; became successively Solicitor-General, Attorney-General, Lord Chancellor of England; prominent member of Whig party in reigns of William III. and Anne; Declaration of Rights largely attributable to S.

SOMERSET, EARLDOM AND DUKEDOM OF.—JOHN BEAUFORT (d. 1410), 1st earl, was s. of John of Gaunt; family afterwards held dukedom but became extinct, 1471. Dukedom was afterwards held by SEYMOUR family: EDWARD, 1st duke (d. 1552), Protector in Edward VI.'s reign (see below); WILLIAM, 2nd duke (1588–1660), supported Charles I.; CHARLES, 6th duke (1662–1748), held appointments under Anne and George I.; EDWARD, 12th duke (1804–85), held office under William IV. and Victoria.

SOMERSET, EDWARD SEYMOUR, DUKE OF, (*c.* 1506–52), Protector of England; elder bro. of Jane, 3rd queen of Henry VIII.; cr. Earl of Hertford, and led party of New Learning until close of reign; distinguished general; one of Council of Regency app. in king's will;

assumed position of Protector of the Realm, with consent of rest of Council, and was cr. Duke of S., 1547; invaded Scotland, and won victory of *Pinkie Cleugh*, 1547; allowed free hand to Cranmer and Prot. Reformers; sympathised with sufferings of peasantry through enclosure of commons, but forced to send Warwick to put down Kett's rebellion; compelled by Warwick to resign, 1549; executed.

SOMERSET, ROBERT CARR, EARL OF (*c.* 1590–1645), Scots politician, whose great personal attractions won favour of James I.; held various offices of state; married notorious Countess of Essex; both convicted of poisoning Overbury.

SOMERSETSHIRE (51° 10′ N., 2° 50′ W.), coast county, S.W. England; bounded N. by Bristol Channel and Gloucestershire, E. by Wilts, S. by Dorset and Devon, W. by Devon; area, 1640 sq. miles. Surface is varied; crossed by various ranges of hills, including the Mendips, Polden, Quantock, and Brendon Hills; drained by Bristol Avon, Frome, Yeo, Parret, and other streams; county town, Taunton. The county is chiefly of Carboniferous formation; has fine orchards, and is noted for cider and Cheddar cheese; agriculture is carried on and live stock raised; manufactures include silks and woollens, lace, gloves, pottery, beer. There are many traces of Roman occupation; Bath and Ilchester were well-known cities in Roman times; Druidical remains occur in various places, and human bones belonging to the Stone Age have been discovered in caves in the Mendips. S. was scene of Alfred's struggle with the Danes, and in later times of Monmouth's rebellion. Pop. (1911) 407,345.

SOMERSWORTH (43° 15′ N., 71° 1′ W.), city, Strafford County, New Hampshire, U.S.A.; cottons, woollens. Pop. (1910) 6704.

SOMERVILLE.—(1) (42° 25′ N., 71° 5′ W.) city, on Mystic, Middlesex County, Massachusetts, U.S.A.; slaughtering and meat-packing establishments. Pop. (1910) 77,230. (2) (40° 15′ N., 74° 40′ W.) town, on Raritan, capital, Somerset County, New Jersey, U.S.A.; iron foundries. Pop. (1910) 5060.

SOMME (50° N., 2° 10′ E.), department, France; formed from old province of Picardy; traversed by Somme; surface slightly undulating, fertile and well-cultivated, yielding cereals, sugar-beets; textile industries. Pop. (1911) 520,161. Capital, Amiens.

SOMMERFELD (51° 47′ N., 15° E.), town, Brandenburg, Prussia; manufactures cloth. Pop. (1911) 11,880.

SOMNAMBULISM, SLEEP-WALKING, a disorder of sleep in which the motor powers are active, but the controlling centres are dormant. The somnambulist consciousness varies in different individuals; some remember the facts of their sleep-walking, others entirely forget.

SOMNATH (22° 4′ N., 71° 26′ E.), town, on Arabian Sea, Bombay, India; famous for its temple. Pop. 8300.

SONATA, one of the most important of the many forms of musical composition; indeed, it has been described as 'the mainstay of instrumental music.' The term is derived from the Ital. *sonare*, to sound. Thus Prætorius (1614) says: 'Sonata is so called, as it is not sung by human voices, but solely *sounded* by instruments.' The modern s. usually consists of three of four sections, technically termed *movements*; in this respect differing from the earlier forms, some of which had one movement, and many more two movements only. It was EMANUEL BACH (1714–88) who fixed the present form. The first movement is used to determine the general character of the composition; the second is variable as to its musical 'content,' but, as a rule, may be fittingly described by its general designation of the 'slow movement'; the third is either a minuet or a scherzo, something light and lively; while the fourth, called the *Finale*, gathers up, as it were, and develops in a higher degree, the elements enunciated or indicated in the first movement. This is the classical s. —a logical form, an organic whole, pervaded by a general feeling of unity; modern examples are often marked by violent contrasts which disturb the psychological sense.

The s. has always been designed chiefly for a solo instrument. Earlier writers, such as Corelli, favoured the violin for this purpose; later came organ s's, such as those of MENDELSSOHN. The invention and perfection of the pianoforte, with all its variety of resources, led composers more and more to favour it as the instrument *par excellence* of the s.; and from the times of HAYDN, MOZART, and BEETHOVEN (the supreme master of this form) the larger number of s's have been written for pianoforte. A *sonatina* is a smaller and simpler form of s.

Shedlock, *The Pianoforte Sonata* (1895).

SONCINO (45° 22′ N., 9° 55′ E.), town, Cremona, Italy. Pop. 6300.

SONDERBURG (54° 55′ N., 9° 48′ E.), seaport, seaside resort, on island of Alsen, Schleswig-Holstein, Prussia. Pop. (1910) 10,040.

SONDERSHAUSEN (51° 22′ N., 10° 52′ E.), town, capital, Schwarzburg-Sondershausen, Germany; manufactures woollens. Pop. (1910) 7759.

SONDRIO (46° 10′ N., 9° 52′ E.), town, on Adda, capital, Sondrio province, Italy; manufactures silk. Pop. (1911) 9113; (province) 130,073.

SONE, SON (25° N., 84° E.), river, India, joins Ganges above Patna; length, 460 miles.

SONG is a term opening to varying definitions. Thus we speak not only of the musical modulations of the human voice as a song, but also of the 'song' of the blackbird or thrush. Again, the term is applied to a short poem or to its musical setting; and it may further be extended so as to become synonymous with the lyric and the ballad. In common usage, however, it indicates a short poem set to music for rendering by a single voice. For general purposes the form may be conveniently divided into three classes, represented by (1) folk-songs; (2) popular songs chiefly by known writers or composers; (3) art-songs by great composers.

The **Folk-Song**, so called because it has sprung from the people, neither poet nor composer being usually known, is a product of many nations. It may be regarded as the truest expression of national life and sentiment, influenced by geographical and climatic conditions. Thus it has been pointed out that nations inhabiting a mountainous country have folk-songs of a livelier, richer, and more variedly expressive character than the inhabitants of a flat region generally possess. Again, the folk-songs of Northern nations—Russians, Swedes, Danes, and Norwegians, are mostly of a melancholy cast; while Southern nations, like the Spaniards and Italians, and to some extent the Hungarian, Bohemian, and Slavonic races, combine their songs with dancing. The folk-songs of Britain, particularly those of Scotland and Ireland, are justly celebrated; so also are the *Volkslieder* of Germany and Switzerland. The term NATIONAL SONG is sometimes loosely used in this connection: it is more strictly applicable to such airs as *God save the King*, the *Marseillaise*, and *God preserve the Emperor*. Folk-songs have been adapted and utilised by several of the great composers.

As regards **Popular Songs** by known composers, a long list stretches from the days of HENRY PURCELL (1659–95), and earlier, down to the latest vapid composition in the 'drawing-room' style. Before Purcell's time, songs were mostly written to existing and well-known airs. With the development of opera, composers began to write for the stage, and as a fashion had been set for ballad opera, so many songs were composed directly for the theatre. Vauxhall Gardens also gave birth to popular songs. DR. ARNE (1710–78) wrote for this resort, and it was in a stage piece that his *Rule Britannia* first appeared. HENRY CAREY (1685–1743), to whom *God save the King* is doubtfully attributed, also wrote for Vauxhall, and added *Sally in our Alley* to the list of favourites. RICHARD LEVERIDGE (1670–1758), a theatrical bass singer, pub. a large number of

songs, which included settings of Gay's *Black-Eyed Susan, All in the Downs,* and *The Roast Beef of Old England.* WILLIAM SHIELD (1748–1829) was a prolific song writer, whose settings of *The Wolf, The Thorn,* and *The Arethusa* were long popular. CHARLES DIBDIN (1745–88) is said by his biographer to have composed over 1300 songs. He excelled in nautical ballads, and his *Tom Bowling* has taken a permanent place in Brit. minstrelsy. Another voluminous writer was HENRY RUSSELL (1812–1900), who is credited with some 800 songs. He wrote chiefly for his own vocal entertainments, and in his settings largely favoured Longfellow, Eliza Cook, and Charles Mackay. Many of his songs, such as *Cheer, Boys, Cheer, A Life on the Ocean Wave, Woodman, spare that Tree,* and *The Old Arm-Chair,* enjoyed an immense vogue; nor should his setting of Dickens's *Ivy Green* be forgotten. To SIR HENRY R. BISHOP (1786–1855) we owe *Home, Sweet Home*; JOHN BRAHAM'S memory is kept green by *The Death of Nelson,* as is CHARLES HORN'S by *Cherry Ripe.* Other popular songs can only be named—such as *My Pretty Jane, The Village Blacksmith, The Lass of Richmond Hill, Hearts of Oak,* and *Kathleen Mavourneen*: the list is practically endless.

The **Art-Song** so-called differs from the popular song in its more serious musical purport and content. Here the composer aims at the most intimate relation with the poet. He may write so simply as to resemble the folk-song, or so elaborately that the term 'song' seems almost a misnomer. In the latter case the setting is usually a 'composed throughout' setting, each stanza having its own music, and much of the meaning and effect is put into the accompaniment. The class embraces indeed a wide range of styles, though the feeling of 'art' as against 'popularity' is always apparent. SCHUBERT was the first great exponent of the art-song, of which his *Erl King* is a noble example. SCHUMANN, BRAHMS, LOEWE, and HUGO WOLF are other outstanding classics of the form.

S. J. A. Adair-FitzGerald, *Stories of Famous Songs*; Harold Simpson, *A Century of Ballads, 1810–1910.*

SONG THRUSH, see under THRUSH FAMILY.

SONGHOI, SOURHAY, SURHAI, a negro people occupying a large tract of country on both sides of the Middle Niger, below Timbuktu. They number *c.* 2,000,000.

SONNEBERG (50° 22′ N., 11° 10′ E.), town, Saxe-Meiningen, Germany; manufactures toys. Pop. (1910) 15,878.

SONNET, a short poem, consisting of fourteen lines, devoted to a single theme (often amatory). The metre used is iambic pentameter. The s. originated in Italy (some say Provence) and the Ital. or *Petrarchian* s. was divided into an *octave* and a *sestet.* The rhymes followed fixed rules, the octave being always *a b b a, a b b a,* while the sestet might be of two or three rhymes arranged in almost any way, *c d e c d e, c d c d c d,* etc. etc.

The s. was imported into England by the Early Elizabethans; and by Shakespeare and contemporaries hard-and-fast laws regarding division of lines and order of rhymes were discarded; thus Spenser runs octave and sestet into one another, with rhymes—*a b, a b, b c, b c, c d, c d, e e.*

Milton, Wordsworth, and later sonneteers adhered more closely to Ital. models, but retained much freedom. The greatest Fr. sonnet writer is Ronsard.

Sharp, *Sonnets of this Century*; O'Neill, *Pure Gold* (The People's Books).

SONNINO, SIDNEY, BARON (1847–), Ital. politician; Finance Minister, 1893; Treasury Minister, 1894; Prime Minister and Minister of Interior, 1906.

SONORA (30° N., 110° W.), state, Mexico; mountainous in E.; silver-mining and stock-raising industries; some grain, tobacco, and sugar-cane produced; climate very dry. Pop. (1910) 265,383. Capital, Hermosillo.

SONPUR (20° 40′ N., 83° 20′ E.), small native state, Bihar and Orissa, India. Pop. 175,000. Capital, **Sonpur.** Pop. 9500.

SONSONATE (13° 47′ N., 89° 48′ W.), town, capital, Sonsonate department, Salvador; agricultural centre; manufactures cotton cloth. Pop. 18,000.

SONTHALS, SANTALS (*q.v.*).

SOOT, composed mainly of carbon and hydrocarbon particles, is the result of imperfect combustion of coal, etc.; s. of coal or wood contains ammonium sulphate and is used as manure.

SOOTHSAYERS, PRAYING INSECTS (*q.v.*).

SOPHIA, SOFIA (*q.v.*).

SOPHIA (1630–1714), electress of Hanover; dau. of James I.'s dau. Elizabeth, queen of Bohemia. Succession to Eng. throne was settled on her and her heirs, 1701; George I. was her eldest son. See Ward's *Electress Sophia* (1903).

SOPHIA ALEKSYEEVNA (1657–1704), Russ. grand-duchess; usurped royal authority and governed as regent during minority of her bro. Peter, whom she plotted to depose; ultimately compelled by Peter to enter nunnery.

SOPHISTS, THE.—About the middle of V. cent. B.C. there arose in the cities of the Gk. world, and especially in democratic cities such as Athens, a demand for broader, more liberal, and less traditional education, that would fit young men to take part in public affairs and would extend their horizon beyond the bounds of their native cities. This demand was met by men who were popularly known as *Sophists* (*i.e.* wise men), and who, often travelling from city to city, made a livelihood by imparting instruction. They did not form a philosophical school or community, but were simply individual teachers, often widely at variance with one another in their opinions. Yet it may be said of them generally that they were not interested in the physical and metaphysical speculations of the earlier philosophers, and that the tendency of their teaching was increasingly towards scepticism in logic and extreme individualism in morals. That the word *sophistry* has a bad signification to-day is largely due to the unfavourable light in which Plato represents the later Sophists, such as THRASYMACHUS (V. cent. B.C.); but it is to be noted that, though he differs strongly from their opinions, and dislikes their habit of receiving payment for teaching, he makes no personal attacks on the earlier Sophists, such as PROTAGORAS (*c.* 480–411 B.C.) and GORGIAS (*c.* 480–375 B.C.).

Protagoras aimed at producing 'civic excellence' in his hearers, *i.e.* at making cultured and capable citizens, Gorgias more particularly at training orators. The famous Protagorean maxim, 'Man is the measure of all things,' was probably intended first as a protest against uncritical acquiescence in moral and political customs or institutions because referred to divine command: they are of human origin and are justified only by their utility. But it was also open to the interpretation that a common truth is unattainable, and one man's opinions are as true (even though not as advantageous) as another's. Applied to morals, this leads to ethical scepticism, and later Sophists spoke of moral and political duties as conventional, implying that the absence of principles is a more 'natural' condition, and therefore superior. Gorgias's theory of knowledge was frankly sceptical, and the later sophistry of rhetoric degenerated into verbal quibblings.

The importance of the Sophistic movement lay in its humanist tendency: it centred interest upon man and man's institutions. But in it, as in the beginnings of most movements towards freedom of thought, destructive criticism outran the capacity for reconstruction.

Benn, *The Greek Philosophers,* vol. i.; Gomperz, *The Greek Thinkers,* vol. i.; Grote, *History of Greece,* chap. 67; Zeller, *Pre-Socratic Schools.*

SOPHOCLES (495–406 B.C.), Gk. poet; s. of Sophillus; b. Colonus, Attica; at age of fifteen led dance of boys in celebrations after defeat of Persian fleet at Salamis (480); appointed one of the generals (*strategoi*) in Samian campaign (440–439), but the S. mentioned as one of the ten officials created after

collapse of Athenian expedition against Syracuse (413) is probably not the poet.

S. wrote more than a hundred works, mostly dramas, and is said to have vanquished *Æschylus* (*q.v.*) in tragedy competition at the age of twenty-eight, although he carried off the first prize less often than might be expected from the excellence of his work. He lacked the rugged grandeur and inspired prophetic utterance of his older rival, but excelled in his exquisite style and marvellous command of language. His early musical training provided him with that keen sense of rhythm which is characteristic of his choral odes. In all his extant tragedies he quickly introduces his principal character and acquaints his audience with the circumstances of the plot. He rises highest in dramatic force in *Œdipus Rex* (lately produced in Britain by Prof. Max Reinhardt, with Mr. Martin Harvey in the title-rôle); it is the story of a man doomed before his birth to pollution and disgrace, and the contrast between the proud monarch of Thebes and the distraught man who discovers his incest and patricide, and, above all, the magnificent irony of the play, raise this tragedy to the highest place. In *Œdipus Coloneus* the subsequent history of the former king is related, how he wanders, blind and poor, till he finds a resting-place at Colonus. The *Antigone* is the pathetic tale of how a girl is doomed to death for giving her brother burial after it had been forbidden by King Creon; it contains, in addition, much sound political wisdom, and is said to have gained S. the military appointment mentioned above. Other extant tragedies are *Trachiniæ*, *Ajax*, *Electra*, and *Philoctetes* (408). Unlike Euripides (*q.v.*) S. had firm faith in Gk. religion, which inspires some of his finest lines.

SOPHRONIUS, patriarch of Jerusalem, 634; d., 636.

SOPRANO, highest species of female voice; *mezzo-soprano* voice is of lower range.

SOPRON, ODENBURG (47° 41′ N., 16° 36′ E.), town, capital, County Sopron, Hungary; manufactures sugar; trade in cattle. Pop. (1910) 33,932.

SORA (41° 44′ N., 13° 37′ E.), city, Caserta, Italy, on Liris; cathedral; manufactures paper; an ancient Volscian town; taken by the Romans and colonised, 303 B.C. Pop. 6200.

SORACTE (42° 14′ N., 12° 42′ E.) (modern *Monte Sant' Oreste*), mountain, Etruria; sacred to Apollo.

SORANUS (c. A.D. 98–138), Gk. physician; practised med. at Alexandria and later at Romo; his treatises on *Fractures* and *Diseases of Women* and a Latin trans. of his *Acute and Chronic Diseases* are extant, while his biography of *Hippocrates* is the only extant authority for the life of the latter.

SORAU (51° 38′ N., 15° 9′ E.), town, Brandenburg, Prussia; manufactures textiles. Pop. (1910) 18,014.

SORBONNE, educational institution, Paris; founded by ROBERT DE SORBON, chaplain to St. Louis; 1257, as society of clergy for study of, but not instruction in, theology; called *Domus Sorbonnæ*, or commonly *La Sorbonne*; became centre of intellectual activity in France; reconstructed by Richelieu in XVII. cent.; faculty of theology given up at Fr. Revolution; present buildings, *La Nouvelle Sorbonne* —completed 1889—are the quarters of Faculties of Letters and Science of Univ. of Paris; more than 10,000 students.

SORBS, a Slavonic people inhabiting W. Saxony and the neighbouring territory, numbering about 180,000, and maintaining the rights of their language and administration.

SORDINO, SORDONI, SORDUNI, Ital. musical terms used in three distinct significations: (1) devices for muting or damping sound in musical instruments; (2) an obsolete species of wind instrument having a double blow-reed; (3) a species of stringed instrument.

SOREL (46° 1′ N., 73° 1′ W.), town, port of entry, on Richelieu, capital, Richelieu County, Quebec, Canada; manufactures iron; shipbuilding yards. Pop. 8500.

SOREL, AGNES (c. 1422–50), a beautiful French-woman who became the mistress of Charles VII. of France.

SOREL, ALBERT (1842–1906), distinguished Fr. historian; member of *Académie française*; prof. of Diplomatic History at School of Political Sciences, 1872; pub. *L'Europe et la Révolution française* (1885–92).

SOREX, see SHREW FAMILY.

SORGHUM, see MILLET.

SORIA (41° 40′ N., 2° 30′ W.), province, Spain, in Old Castile. Pop. (1910) 156,354. Capital, **Soria** (41° 45′ N., 2° 26′ W.); manufactures flour, leather. Pop. 7200.

SORICIDÆ, see SHREW.

SOROKI (48° 10′ N., 28° 25′ E.), town, on Dniester, Bessarabia, Russia. Pop. 27,000.

SORREL (*Rumex*), genus of plants, order Polygoneæ; Common S. (*R. acetosa*) has arrow-shaped leaves and reddish-green flowers; Wood Sorrel (*Oxalis acetosella*) is of family Oxalideæ and has white flowers.

SORRENTO (40° 38′ N., 14° 23′ E.) (ancient *Sorrentum*), town, watering-place, on Bay of Naples, Naples, Italy; abp.'s see; wood-laying industry; birthplace of Tasso. Pop. 7000.

SOSEN, MORI (1747–1821), Jap. artist; regarded as one of world's greatest animal painters, his especial study being monkeys.

SOTER, Pope, 167–74.

SOTHERN, EDWARD ASKEW (1826–81), Eng. comedian; created part of Lord Dundreary in *Our American Cousin*.

SOTO, FERDINANDO DE (1496 ?–1542), Span. explorer; b. Jeres de Caballeros; accompanied d'Avila on his expedition to Darien, 1529; one of the leaders in the conquest of the Incas. In 1538 he set out on a futile expedition in search of gold in Florida and never returned.

SOU (Lat. *solidus*), Fr. halfpenny (5 centimes); a gold coin in Merovingian times, then silver, finally copper.

SOUDAN, see SUDAN.

SOULT, NICOLAS JEAN DE DIEU, DUKE OF DALMATIA (1769–1851), Fr. soldier; devoted favourite of Napoleon; led decisive charge at *Austerlitz*; as gen. in Span. army conquered Portugal; commander-in-chief in Spain, 1809–13; rallied to Napoleon in Hundred Days, but fell from him after *Waterloo*.

SOUND, ACOUSTICS, the science which deals with the external or objective causes which give rise to the sensation of hearing. On investigation, they are found to consist in every case of a vibratory motion in some piece of matter, which motion is communicated, generally by the air, to the organ of hearing. We therefore require a vibrating body for the production of sound, and a medium for its transmission. The vibrating body acts on the medium by communicating to it a certain number of impulses every second, and these impulses give rise to waves of condensation and rarefaction, which travel through the medium. Nearly all acoustic phenomena may be elucidated by a study of these waves and their mode of progression. Being a periodic phenomenon, a sound-wave in air or other substance is subject to the ordinary kinematical and dynamical laws of harmonic motion, and thus we learn that one sound-wave may differ from another—and therefore one musical note from another—in respect of three essential properties. The first is its *frequency*, i.e. the number of vibrations per second, or what is commonly termed the *pitch* of a note. For instance, the note A^1 in a pianoforte has a pitch of 435 (according to 'standard' pitch)—that is, when this note is struck, the number of sound-waves which reach the ear of a listener is 435 per second. The range of frequency appreciable by the human ear is very considerable, being from about 33 up to about 40,000. The ear can also detect differences in frequency as minute as 1 in 400, but only for those notes which are within the compass of the human voice. Above or below that compass, the acuteness

of perception is much less. In music, 'standard' pitch has fixed 435 as the frequency of the note A^1. But concert pitch is higher, and has been rising for the last 150 years until, at present, the note A^1 is given a frequency of about 460.

The second essential property of a musical sound is its *loudness*, and this depends on the *amplitude* of vibration of the air in the sound-wave, *i.e.* on the extent to which each particle in the line of transmission oscillates to and fro about its mean position of rest. It can be shown that the intensity of a sound is proportional to the square of the amplitude. But loudness, tested subjectively, is difficult to measure, and differs with different persons, and even with the same person from time to time. It may, however, be mentioned that in the least audible sound the extent of motion of the air particles is about one ten-millionth of a centimetre on each side of the mean position. Apart from the vibrating body itself, there are several conditions which affect the intensity or loudness of a sound. The first of these is the obvious fact that loudness diminishes as we recede from a source of sound. Take the case of sound radiating from a point and travelling uninterruptedly in all directions. The first sound-wave spreads out over a spherical surface, whose radius is constantly increasing, and hence the energy per unit surface must diminish as this surface increases; but the surface increases in proportion to the square of the radius. Hence the intensity must diminish in proportion to the square of the distance from the origin of the sound. The loudest sounds known to have travelled through the air were those produced by the explosions accompanying the eruption of Krakatoa in 1883. They were heard at a distance of 2000 miles.

The second factor which tends to diminish loudness is reflection from solid surfaces such as hills, cliffs, buildings, etc.; from the surfaces of large masses of air which may have a distinctly different density from that of the air surrounding them; and, more irregularly, from smaller masses of air which are at different temperatures or are in different hygrometric states. Thirdly, wind has a peculiar action on sound. If, as is borne out by observation, the speed of wind increases as we ascend from the earth's surface, a sound travelling in the same direction as the wind tends to recurve towards the ground, but if travelling against the wind it tends to curve upwards and so be less audible to a listener at ground-level some distance off. Lord Rayleigh has also shown that when the atmosphere is in a steady state of convective equilibrium, when the temperature gradually diminishes as we ascend from ground-level, the path of a ray of sound assumes a form similar to that of a heavy chain suspended between two fixed points in a horizontal line with its middle point lowest. Sound-waves may also suffer diffraction as do light-waves, and this tends to diminish the intensity.

The third essential property of a sound-wave is its *quality*. It is not easy to give this property any numerical or quantitative representation, but its existence can be easily recognised in the differences which are observable in the same musical note when produced by two different instruments, such as a piano and a violin. We may, however, represent the property by a graphical method. Suppose a fine wire or bristle be fastened to the end of one prong of a tuning-fork, and, while the fork vibrates, that a smoked glass plate be drawn along at a uniform speed in contact with the end of the wire and at right angles to its direction of vibration. The vibrations of the tuning-fork will then be traced out on the smoked plate in the form of a wavy curve. If we could imagine the same thing done with a particle of air in a sound-wave, we should find that the curve obtained for the same note sounded by different instruments would differ. One might be a smooth, wavy curve; another might exhibit a series of lines sloped alternately up and down like the teeth of a saw. Indeed, all conceivable varieties of such motion are possible, consistent with the condition that the vibration in one wave is exactly superposable upon that in any other wave.

We have next to consider certain other properties of sound-waves. It is obvious that in passing through any medium which has a finite rigidity, the speed of transmission must be finite, and it can be shown that it is equal to the square root of the ratio of elasticity to density. Now, in the case of a gas, the elasticity is proportional to the pressure; so also is the density. Hence the ratio of elasticity to density cannot involve the pressure, and can only involve the temperature. Therefore the speed of sound in a gas is proportional to the square root of the absolute temperature and is independent of the pressure. In air at 0° C., it has been found to be 331 metres per second. According to theory, sounds of greater intensity should travel at a higher speed; and this has been confirmed experimentally. In liquids, provided the bulk is practically unlimited, we have to deal with the volume elasticity, and in water at 8° C. the speed has been found to be 1437 metres per second. Here again it has been proved that waves of greater intensity travel more quickly. In solids, the speed varies with the elasticity and density in the manner already noted. In cast-iron it is about 3500 metres per second. In such nonisotropic substances as wood it has different velocities along and across the grain or fibre.

Another phenomenon presented by sound-waves is that known as *beats*. When two musical notes whose frequencies are only slightly different are sounded simultaneously, a rising and falling in the intensity of the combined sound may be heard. A full explanation of this phenomenon and the conditions for its production requires the aid of the equations of harmonic motion. But it is perhaps sufficient to say that the rise in intensity is due to the vibration of both sound-waves being in the same direction at one time, so as to produce a wave of increased amplitude (and therefore of increased loudness). The fall in intensity is caused by the vibrations being in opposite directions so that the resultant amplitude, being the difference instead of the sum of the component amplitudes, is diminished. Another peculiarity may be mentioned. When the whistle of a locomotive engine is sounded while the engine is travelling towards an observer, the pitch of the whistle seems to increase as the engine approaches and to diminish as it recedes. The explanation is as follows: suppose the frequency of the whistle is n, the length of each sound wave l, the speed of sound v; that of the engine being V. The first sound-wave from the engine travels a distance (towards the observer) l in a time $\frac{1}{n}$. By the time it has done so, the engine has travelled forward a distance $V \times \frac{1}{n}$, and then gives out a second sound-wave. Hence the interval in length between the two waves will be $l - \frac{V}{n}$. But $l = \frac{v}{n}$, and therefore the interval is $\frac{v}{n} - \frac{V}{n}$, i.e. $(v - V) \div n$. If this interval is divided into the speed of sound, we get $vn \div (v - V)$, or $n \div (1 - \frac{V}{v})$, which is the number of waves which will reach the observer per second, and which is therefore the increased pitch of the whistle. Since the frequency n is divided by a quantity less than unity, the frequency must increase as the engine approaches, and if it approached with the speed of sound, the frequency would be doubled—that is, the pitch would rise by an octave. This change in frequency is known as DOPPLER'S PRINCIPLE, and when applied to light received from stars, it gives their velocity if we know the change in wave-length of the light emitted by them.

All that has been stated above applies only to musical sounds as distinguished from noises. A musical sound depends on a regular and periodic compression and rarefaction of the air, and has a definite frequency and quality. A noise, on the other hand, is produced by an irregular, non-periodic disturbance of the air, and has no definite frequency. There is, however, no absolutely sharp distinction between them. A single blow of a hammer on a heavy mass of iron produces what is undoubtedly a noise. But the sound produced by several hundred riveters at work in a shipbuilding yard might conceivably appear to be musical when heard at a distance.

Catchpool, *Textbook of Sound*; Barton, *Textbook of Sound*; Poynting and Thomson, *Sound*. For the theory of music, consult Sedley Taylor, *Sound and Music*; and Helmholtz, *Sensations of Tone* (trans. by Ellis).

SOUND, THE (Dan. ORESUND) (55° 30′ N., 12° 46′ E.), strait between Sweden and island of Zealand.

SOUNDING, operation of ascertaining depth of water, for navigation, cable-laying, and scientific purposes. For small depths s. is done by lowering a weight attached to a rope marked in fathoms. In deep s's machines are used, wire taking the place of rope. From the reel the wire passes over a wheel which registers the amount run out, an automatic brake stopping the reel when bottom is reached. In hauling in the wire, sudden tensions caused by movements of the ship are relieved by an automatic compensating device. At great depths the weights are not recovered, but are slipped by a contrivance which also brings up a specimen of the bottom. Self-registering thermometers are fixed to the wire at intervals.

SOUSA, LUIZ DE (1555–1652), Portug. author; devoted himself to study and served in Order of Malta; married, but he and his wife took vows, 1614; wrote *Chronicle of St. Dominic, Life of the Archbishop*, etc.

SOUTH AFRICA (15° to 35° S., 13° to 40° E.).—The term South Africa is generally applied to that part of Africa which lies S. of the Zambezi. The 'Subcontinent,' as South Africans often call it, comprises the Union of South Africa (*i.e.* Cape of Good Hope, Transvaal, Natal, and Orange Free State), a Brit. Overseas Dominion; Southern Rhodesia, the Bechuanaland Protectorate; Swaziland, and Basutoland, all under Brit. control; Ger. South-West Africa and the lower half of Portug. East Africa. In Brit. South Africa the whole of Rhodesia is often included, although the northern districts belong rather to Central Africa; Walfisch Bay (*q.v.*), in the centre of Ger. South-West African coast, and the Colonial Islands are also British. The area of Brit. South Africa in its widest sense is *c.* 1,250,000 sq. miles.

The South African coast is regular, and exposed to rough seas. Excluding Madagascar, there are no islands of any size, and not many good harbours; chief ports are Walfisch Bay, Port Nolloth, and Cape Town (Table Bay) on W.; Simon's Town (naval base in False Bay), Mossel Bay, Port Elizabeth (Algoa Bay), and East London on S.; Durban, Lourenço Marques (Delagoa Bay), and Beira on E. Perennial rivers are scarce, and with few exceptions unimportant. The only large rivers are: Orange, flowing W.; Limpopo and Zambezi (both partly navigable), flowing E.; there are numerous shallow *vleis*, and salt pans, but no large lakes. A narrow belt of low-lying coast-land gives place, from 50 to 100 miles inland, to continuous ranges of mountains (Nieuwveld, Drakensberg, etc.), rising to over 6000 ft., and in Basutoland attaining an altitude of over 11,000 ft. On plateaus between successive ranges of mountains in the Cape Province is the Karoo, which rains and irrigation transform from bare wilderness to a fertile garden. A great part of interior of S. A. consists of *veld*, undulating pasture-land with grass and scrub. In Bechuanaland lies the Kalahari Desert, a great sandy waterless waste. The climate, on the whole, warm but healthy; S. A. is essentially a 'white man's country.' In coast districts temperature is more equable than inland, but high altitudes of interior make heat dry and more tolerable; there are practically only two seasons—summer (October to March), winter (April to September). In so vast a country as S. A. the climate of course varies in different parts (see CAPE OF GOOD HOPE, NATAL, TRANSVAAL, etc.).

HISTORY.

Herodotus tells of a Phœnician expedition which circumnavigated Africa *c.* 600 B.C.; but this *Periplus* lacks confirmation, and not till Portug. mariners of XV. cent. sought a sea-route to the East Indies round Africa, does S. A. figure in authentic history. The Zimbabwe (*q.v.*) ruins, however, in Rhodesia, bear witness to ancient civilisation. Cam reached Cape Cross near Walfisch Bay, 1484; Diaz rounded the Cape of Good Hope (*q.v.*) and landed in Algoa Bay, 1486; Da Gama reached and named Natal (*q.v.*), 1497, whence he sailed up the east coast and across the ocean to India. The Portuguese discovered S. A.; the Dutch first colonised it. Van Riebeek founded Cape Town, 1652, and established a half-way house to the East for the Dutch East India Co. Britain occupied Cape Colony, 1795–1803, and permanently, 1806. Raids had already been made on the European settlement by Kaffirs, who supplanted and decimated the earlier native inhabitants—Bushmen and Hottentots. Kaffir wars began in earnest, 1811, and ended in the establishment of the Kei River as boundary between whites and natives.

Discontent with Brit. rule led to the Great Trek (1836–37), which in turn resulted in the colonisation of Natal (annexed by British, 1844) and the foundation by Boers of the South African Republic, 1849 (see TRANSVAAL), and Orange Free State (*q.v.*), 1854. Constant disagreements ensued between the two Republics, between Boers and British, and between the Brit. Colonies and the Home Government. Attempts by Pretorius (1857) to unite the Transvaal and Orange Free State, and by Sir George Grey, Gov. of the Cape, to federate the S. African States (1858), alike proved premature and futile. Brit. Kaffraria, colonised by Eng. and Ger. settlers, was annexed to Cape Colony, 1865. Basutoland (*q.v.*) came under Brit. protection, 1868.

The discovery of diamonds near Kimberley (*c.* 1869), and simultaneous opening up of the Transvaal goldfields, brought about a great influx of immigrants from Britain and Europe, and accentuated the long-standing rivalries of Dutch-speaking and English-speaking S. Africans. In 1872, Lord Carnarvon, Sec. of State, proposed confederation of the S. African States, but again without avail. The Transkei was annexed to Cape Colony, 1878. The first *Boer War* broke out, 1880, and ended 1881 without permanently settling the variances of Boers and British (see TRANSVAAL).

Damaraland was annexed by Germany, 1883; Britain annexed Bechuanaland, 1885, Zululand, 1887; Cape Colony annexed Kaffraria, 1886. In 1888 the first S. African Customs Union Conference was held. In 1889 the Brit. S. Africa Co. received a Charter, and the development of Rhodesia (*q.v.*) began. Railways were now pushed inland from Cape and Natal ports and Delagoa Bay (*q.v.*); and rivalry for Rand carrying trade commenced.

The Jameson Raid, 1895, embittered Boer and Brit. relations. The Dutch found a strong champion of their position in Kruger (*q.v.*), the Brit. side was vigorously urged by Rhodes, Milner, and Chamberlain (*qq.v.*). Finally the Uitlander franchise question led to a Boer ultimatum, and the **South African War** broke out, Oct. 12, 1899. The allied Transvaal and Free State forces, commanded by Joubert (*q.v.*), invaded Natal and Cape territory, and laid siege to Ladysmith, Kimberley, and Mafeking. At first British met with series of reverses. At *Modder River* (Nov. 28) and *Magersfontein* (Dec. 12), Cronje defeated Methuen, who undertook relief of Kimberley (defended by Kekewich); Gatacre

was beaten at *Stormberg* (Dec. 10, 1899); while Buller in attempting to relieve White in Ladysmith suffered disaster at *Colenso* (Dec. 15). In January, 1900, Lord Roberts and Kitchener arrived, and the tide began to turn in Britain's favour. French relieved Kimberley (Feb. 15); Cronje was forced to surrender at *Paardeberg* (Feb. 27); Ladysmith was relieved (Feb. 28). Roberts entered Bloemfontein (March 13), and annexed the Orange Free State (May 24); entered Johannesburg (May 31), Pretoria (June 5), and annexed Transvaal (Sept. 1). Mafeking (defended by Baden-Powell) was relieved, May 17.

By guerilla tactics—constant skirmishes, attacks on communications, etc.—the Boers (under Botha, Beyers, Delarey, De Wet, and others) gallantly held out till Kitchener (in supreme command since Roberts' return) organised 'drives,' block-houses, barbed-wire defences, etc., and Concentration Camps for women, children, and refugees. Finally peace was signed at Vereeniging, May 31, 1902. The Boer forces were estimated at *c.* 100,000; when war closed over 200,000 Brit. troops (including many volunteers and colonial contingents) were in the field.

After a period of Crown Colony Government the Transvaal and Orange River Colony received responsible Government (1906–7). Racial, railway, tariff, and other difficulties pointed the advisability of closer union of the S. African States. A National Convention met Oct. 12, 1908, and drew up a Constitution for the **Union of South Africa**, which found acceptance. Natal favoured federation in preference to unification, but accepted the Constitution by referendum (1909). Imperial Parliament passed the S. A. Act, 1909, and Union came into force, May 31, 1910. Lord Gladstone, first Gov.-Gen., invited Botha to form a ministry, which he did from members of Dutch-speaking parties united to form Nationalist party. Sir Leander Starr Jameson (succeeded, 1912, by Sir Thomas Smartt) became leader of Unionist party. The elimination of Hertzog (*q.v.*) from the Cabinet caused a split (1913) between ministerial moderates and extremists.

The Union of South Africa is a self-governing Brit. Dominion, formed (1910) by the legislative Union of Cape Colony, Transvaal, Natal, and Orange River Colony, now the original Provinces of Cape of Good Hope, Transvaal, Natal, and Orange Free State. The Union has a Gov.-Gen. and Parliament consisting of Senate and House of Assembly. Each province elects 8 senators (for 10 years) and the Gov.-Gen. nominates 8. The Cape has 51 seats in House of Assembly, Transvaal 36, Natal and O.F.S. each 17; representation will change according to growth of population. Maximum duration of each Parliament is five years. Pretoria is Seat of Administration; Cape Town the Seat of Legislature; there is no Union 'capital.' Provincial capitals are Cape Town, Pretoria, Pietermaritzburg, and Bloemfontein. Other important towns are Johannesburg, Durban, Port Elizabeth, Kimberley. For local administration purposes each province has an Administrator (app. for 5 years), and a Provincial Council (elected for 3 years), which can pass 'ordinances' dealing with such matters as roads, bridges, etc., and school education (till 1915). Higher Education and all national questions are reserved for the Union Government and Parliament. Under the Constitution, English and Dutch languages enjoy equal rights. The Univ. of the Cape of Good Hope is an Examining Body; various Colleges in the different provinces prepare students for its degrees. A central teaching Univ. for South Africa is under consideration (1913).

Law.—South African Law is mainly Roman Dutch. Criminal Law resembles that of England. The seat of the Supreme Court is Bloemfontein.

Religion.—There is no State Church. Principal denominations are Dutch Reformed Church, Church of England, Methodists, Presbyterians, and Roman Catholics.

Defence.—In addition to a permanent army the Defence Act, 1912, provides for a Citizen Force, all men between 21 and 25 being liable to military training. The Union makes an annual money contribution to the Brit. Navy. There is a Royal Naval Volunteer Reserve, and at Simon's Town an important Naval Station.

Railways.—The South African Railways (like the principal harbours) are State-owned. The mileage exceeds 7000. They include former Cape Government Railways, Natal Government Railways, and Central South African Railways.

Finance and Trade.—The financial relations between Union and Provinces are not yet (1913) definitely settled. In 1912–13 Revenue totalled £17,314,000; expenditure, £17,196,000. Imports were valued at £37,000,000 (1911); exports over £57,000,000 (1911), £63,262,000 (1912). Chief imports are articles of food and drink, cotton manufactures, clothing and manufactured goods of all kinds. Chief exports are gold, diamonds, wool, ostrich feathers, hides and skins, mohair, maize, coal, copper, tin, etc. Chief industries are agriculture, sheep and ostrich farming; mining (gold, diamonds, coal, copper, etc.); fruit-growing, sugar-planting, etc. There are as yet few manufactures in South Africa.

Inhabitants.—Whites are outnumbered by nearly 4 to 1. About half the white pop. are of Dutch descent. English-speaking inhabitants are chiefly centred in towns. Many colonials are of Fr. Huguenot and of Ger. descent. Inhabitants of non-European descent include over 4,000,000 natives (i.e. pure-blooded Kaffirs, Zulu, etc.), besides coloured people (half-castes), Indians, Malays, etc. The area in sq. miles and pop. of the Union are as follows:—

	Area.	Pop. (1911).
Cape . .	276,995	2,564,965 (583,177 whites)
Transvaal .	119,000	1,686,212 (420,831 whites)
Natal . .	35,371	1,194,043 (98,582 whites)
Orange Free State .	50,000	528,174 (175,435 whites)
Union .	481,366	5,973,394 (1,278,025 whites)

The united pop. of the Colonies now forming the Union was at 1904 census 5,175,824, including 1,116,806 whites. See also CAPE OF GOOD HOPE, TRANSVAAL, NATAL, ORANGE FREE STATE, BASUTOLAND, ZULULAND, SWAZILAND, BECHUANALAND, RHODESIA, TRANSKEIAN TERRITORIES, GERMAN SOUTH-WEST AFRICA, PORTUGUESE EAST AFRICA.

SOUTH AFRICAN REPUBLIC, see TRANSVAAL.

SOUTH AMBOY (40° 30′ N., 74° 18′ W.), city at mouth of Raritan, Middlesex County, New York, U.S.A.; manufactures pottery; port for shipping coal. Pop. (1910) 7007.

SOUTH AMERICA, see AMERICA.

SOUTH AUSTRALIA (26° to 38° S., 129° to 141° E.), central state of Australia; extended right across the continent from N. to S. till 1911, when Northern Territory was ceded to Commonwealth; bounded E. by Queensland, New South Wales, and Victoria; S. by the Ind. Ocean; W. by Western Australia; area, 380,070 sq. miles. The S. coast on the E. has the estuary of Murray River at Encounter Bay, Gulf of St. Vincent (with Kangaroo Is. at its mouth), and Spencer Gulf; the last runs inland for over 200 miles, and from its head northward are the basins of Lake Torrens and Lake Eyre; to W. of Lake Torrens is Lake

Gairdner. Along Northern Territory coast is a flat strip; interior forms part of great central plateau of continent; desert region in W.; crossed by various mountain ranges (Flinders, Stuart, Gawler, Musgrave); S.E. drained by Murray River. There is a considerable variation in temperature and rainfall; mean summer temperature is 73° Fahr., winter mean, 53°; annual rainfall at Adelaide averages about 20 inches; in interior it is as low as 5 inches.

The Northern Territory was discovered by the Portuguese, and S. A. first permanently colonised by the British in 1836; the discovery of copper in 1843 led to increased prosperity, and the colony became an autonomous state in 1856; joined Commonwealth of Australia, 1900; sends 6 Senators and 7 Representatives to Federal Parliament. State administration is carried out by a gov., nominated by Brit. Government and assisted by an executive council; there is a Parliament consisting of a Legislative Council and a House of Assembly (elected by adult suffrage). The capital is Adelaide. Over 2000 miles of railways (State) are in operation; laying of Trans-Continental Railway from Port Augusta to Western Australia (Kalgoorlie) was begun, 1912; N. to S. trans-Australian railway is also projected. Agriculture is principal industry; live stock largely raised; wheat, oats, and barley produced; oranges, olives, and other fruits are grown. Minerals include copper, iron, silver-lead, gold; manufactures wines, olive oil, flour; exports wool, wheat, flour, copper, skins and hides, frozen meat, live stock, gold, wine, dairy produce, fruit. Education is free and obligatory; principal religious denominations, Anglican, R.C., Wesleyan, Presbyterian. Pop. (1911) 408,558.

Ryan, *South Australia* (1911); Searcy, *In Australian Tropics* (1909); Gordon, *Handbook of South Australia* (1908).

SOUTH BEND (41° 36′ N., 86° 14′ W.), city, on St. Joseph, capital, St. Joseph County, Indiana, U.S.A.; carriage and wagon works. Pop. (1910) 53,864.

SOUTH BETHLEHEM (40° 38′ N., 75° 20′ W.), town, on Lehigh, Northampton County, Pennsylvania, U.S.A.; seat of Lehigh University (1865); iron and steel manufactures. Pop. (1910) 19,973.

SOUTH CAROLINA, see CAROLINA.

SOUTH DAKOTA, see DAKOTA, SOUTH.

SOUTH GEORGIA (54° 30′ S., 37° W.), uninhabited Brit. island, S. Atlantic.

SOUTH HADLEY (42° 20′ N., 72° 35′ W.), town, on Connecticut, Hampshire County, Massachusetts, U.S.A.; manufactures paper. Pop. (1910) 4894.

SOUTH HOLLAND (52° N., 4° 30′ E.), province, Netherlands, bordering on North Sea; generally flat; much of it below sea-level; fertile and well cultivated; flourishing manufactures; contains cities of The Hague (capital), Rotterdam, and Leiden. Pop. 1,390,774.

SOUTH MELBOURNE (37° 51′ S., 144° 58′ E.), town, on Yarra-Yarra, Victoria, Australia. Pop. 45,000.

SOUTH MOLTON (51° 1′ N., 3° 49′ W.), town, on Mole, Devonshire, England.

SOUTH NORWALK (41° 7′ N., 73° 25′ W.), city, on Long Island Sound, Fairfield County, Connecticut, U.S.A.; manufactures machinery, hardware. Pop. (1910) 8968.

SOUTH OMAHA (41° 14′ N., 95° 55′ W.), city, Douglas County, Nebraska, U.S.A.; slaughtering and packing industries. Pop. (1910) 26,259.

SOUTH ORANGE (40° 45′ N., 74° 17′ W.), residential town, Essex County, New Jersey, U.S.A.; contains Seton Hall College (R.C.). Pop. (1910) 6014.

SOUTH, ROBERT (1634–1716), Anglican divine; staunch defender of monarchy after Restoration, and engaged in controversy with Walter Sherlock.

SOUTH SEA BUBBLE, Eng. scheme for liquidating national debt. Harley, opposed by Walpole, advocated incorporation of South Sea Company, 1711, which, in return for monopoly of trade to Spanish America, took over floating debt of £10,000,000; and later national debt of over £30,000,000. Only one voyage was made to South Seas, but public, encouraged by government, eagerly took up shares, which rose from £100 to £1000; crash came at close of 1720, when chief shareholders and promoters sold out; widespread ruin followed; members of government found guilty in inquiry that followed; result, Walpole attained chief power, and restored country's credit.

SOUTH SHETLAND ISLANDS (62° S., 60° W.), volcanic archipelago, in Antarctic Ocean.

SOUTH SHIELDS (54° 59′ N., 1° 26′ W.), seaport, at mouth of Tyne, Durham, England; manufactures glass; shipbuilding; exports coal. Pop. (1911) 108,649.

SOUTHALL NORWOOD, market-town, Middlesex, England, 9 miles W. of London; chemical works. Pop. (1911) 26,327.

SOUTHAMPTON.—(1) (50° 54′ N., 1° 23′ W.) seaport, parliamentary and county borough, Hampshire (Southampton is also the census title of county), England; situated between Itchen and Test Rivers; has remains of old fortifications, including the Bar Gate, dating from XI. cent.; public buildings include Domus Dei Hospital and Hartley University College; in neighbourhood are Netley Military Hospital and ruins of Netley Abbey; has splendid harbour, with large docks; most important mail-packet station in England. The Royal Southern and Royal Southampton Yacht Clubs have their headquarters here. Pop. (1911) 119,039. (2) (40° 52′ N., 72° 55′ W.) town, summer resort, on Long Island, Suffolk County, New York, U.S.A. Pop. (1910) 2509.

SOUTHAMPTON, COUNTY OF, see HAMPSHIRE.

SOUTHAMPTON, EARLDOM OF.—The first earl was Eng. admiral, WILLIAM FITZWILLIAM (*c.* 1490–1542). The first earl of second creation, THOMAS WRIOTHESLEY (1505–50), held office under Henry VIII.—**Henry Wriothesley**, 3rd Earl of Southampton (1573–1624), Eng. courtier and patron of Shakespeare and other poets; to him were addressed both *Venus and Adonis* and *Lucrece*, and he is believed by many critics to have been the W. H. to whom the *Sonnets* were dedicated; imprisoned for complicity in Essex's plot against Elizabeth.—THOMAS WRIOTHESLEY, 4th earl (1607–67), Royalist in Civil War.

SOUTHBRIDGE (42° 5′ N., 72° 3′ W.), town, on Quinebaug, Worcester County, Massachusetts, U.S.A.; cotton and optical goods. Pop. (1910) 12,592.

SOUTHCOTT, JOANNA (1750–1814), Eng. religious mystic who became mad, wrote books and had many followers.

SOUTHEND-ON-SEA (51° 32′ N., 0° 43′ E.), seaside resort, at mouth of Thames, Essex, England. Pop. (1911) 62,723.

SOUTHERN CROSS, see under CROSS.

SOUTHEY, ROBERT (1774–1843), Eng. poet and prose-writer; b. Bristol; ed. Westminster and Balliol Coll., Oxford; m. (1) Edith Fricker, Mrs. Coleridge's sister, 1795; (2) Caroline Bowles, the poetess, 1839; a hard worker; unfortunate married life; children died and first wife went mad; S.'s mind also failed before his death; lived at Keswick, and included among 'Lake Poets'; long supported Coleridge's family; app. Poet Laureate, 1813. His poems include—*Joan of Arc* (1795), *Thalaba* (1801), *Madoc* (1805), *Curse of Kehama* (1810), *Roderick the Goth* (1814), *Vision of Judgment* (1821); narrative faculty, rhythmic swing, ballads, and Oriental subjects gave S. certain vogue as poet. His greatest work, however, is in prose—*Life of Nelson* (1813: his masterpiece), *History of Brazil* (1810–19), *History of Peninsular War* (1822–32), *Lives* of Bunyan, Wesley, Cowper, etc., and contributions to *Quarterly*. S. is a master of plain, vigorous, straightforward prose. Dowden, *Life* (1879: E.M.L.).

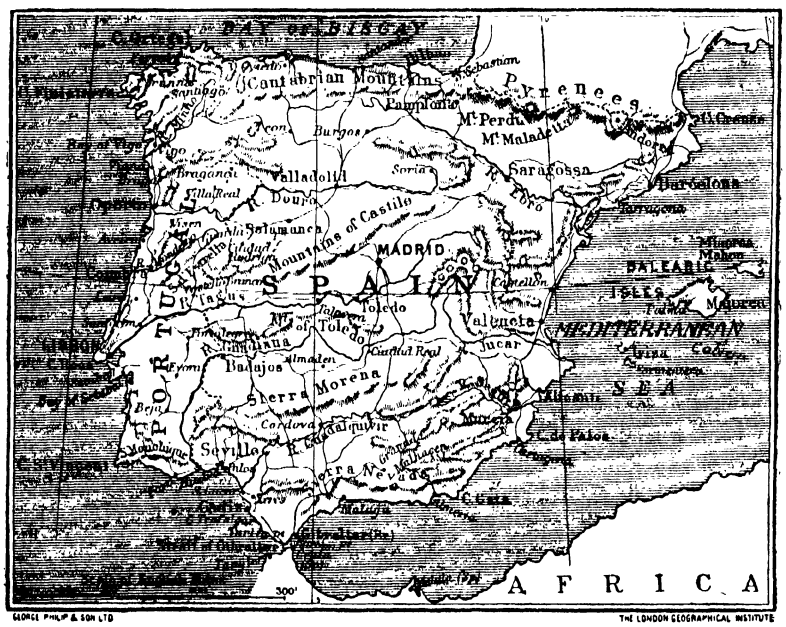
SOUTHGATE, residential town, 8 miles N. of London, Middlesex, England. Pop. (1911) 33,613.

SOUTHINGTON (41° 7′ N., 72° 51′ W.), town, on Quinnipiac, Hartford County, Connecticut, U.S.A.; manufactures cutlery, hardware. Pop. (1910) 3714.

SOUTHOLD (41° 5′ N., 72° 25′ W.), town, summer resort, on Long Island, Suffolk County, New York, U.S.A.

SOUTHPORT (53° 38′ N., 3° 1′ W.), watering-place on Irish Sea, Lancashire, England. Pop. (1911) 51,650.

SOUTHSEA (50° 47′ N., 1° 5′ W.), seaside resort, Hampshire, England, forming part of Portsmouth.



SOUTHWARK, municipal borough, on S. side of Thames, London, England; cathedral. Pop. (1911) 191,951.

SOUTHWELL (53° 4′ N., 0° 58′ W.), city, Nottinghamshire, England; cathedral, founded VII. cent.

SOUTHWELL, ROBERT (*c.* 1561–95), Eng. priest and poet; became R.C. priest of Society of Jesus, 1584, but in 1595, after prolonged imprisonment, he was tried on the charge of treason and hanged at Tyburn. Most of his poems and tracts were written in prison; euphuistic in style.

SOUTHWOLD (52° 20′ N., 1° 41′ E.), seaport, watering-place, on North Sea, Suffolk, England.

SOUZA-BOTELHO, ADELAIDE FILLEUL, COUNTESS DE (1755–1836), Fr. authoress; wrote novels of analysis and observation; best are *Adèle de Sénange, Emile et Adolphe, Eugène de Rothelin.*

GEORGE PHILIP & SON LTD THE LONDON GEOGRAPHICAL INSTITUTE

SOVEREIGN, Brit. gold coin, worth £1 sterling; originally issued by Henry VII., bearing his effigy, hence name; present value fixed, 1817; standard weight, 123·274 grains troy; $\frac{11}{12}$th pure gold.

SOWERBY BRIDGE (53° 53′ N., 1° 55′ W.), town, W. Riding, Yorkshire, England; cotton and woollen mills. Pop. (1911) 11,350.

SOW-THISTLE (*Sonchus*), genus of plants, order Compositæ; Common S. (*S. oleraceus*), 2–3 ft. high, has yellow flowers.

SOYER, ALEXIS BENOÎT (1809–58), Fr. cook; settled in London; sent by Government to control public kitchens during Irish famine (1847); reformed food-supply in Crimean War; wrote books on cookery.

SOZOMEN, Hermeias Sozomenus (*c.* 400–43), advocate and ecclesiastical historian; wrote *Ekklesiastike Historia*, in nine vol's, giving history of Church, 324–439; borrowed largely from Socrates' *Church History.*

SPA (50° 28′ N., 5° 52′ E.), watering-place, Liège, Belgium; mineral springs. Pop. 8500.

SPACE.—Philosophy treats the problem as to whether any objective reality corresponds to the conception of s. The objective method treats s. (like time) as really existing, like things of the world. Modern philosophy, beginning with Berkeley, follows subjective method; existonce only in the mind. Kant affirms s. and time the conditions of experience, referring to phenomena, not noumena, and belonging to mind's own constitution. See Psychology.

SPADIX, see Spathe.

SPAIN, España (36° to 43° N., 9° W. to 3° E.), kingdom in S.W. Europe, forming larger part of Iberian peninsula; bounded on N. by Bay of Biscay and France, W. by Atlantic Ocean and Portugal, S. and E. by Mediterranean; length from N. to S. about 560 miles; breadth, 650 miles; area, 190,050 sq. miles; Spain is separated from African coast by Straits of Gibraltar (minimum width about 90 miles); seaboard, 1400 miles; coast rocky in N. and N.W.; S. and E. coasts generally flat; few indentations (Gulf of Cadiz, Gulf of Valencia); several prominent Capes, *e.g.* Tarifa (most southerly point), Gata, and Palos, S.E.; Nao, Tortosa, and Creux, N.E.; Peñas, N.; Ortegal, N.W.; Finisterre, Roca, W.; São Vicente and Trafalgar, S.W.

Surface generally is mountainous; interior consists mainly of tableland known as the *Meseta* with average elevation of 2000–3000 ft., and divided by several mountain ranges running mostly from E. to W. The Meseta consists chiefly of Archæan and Palæozoic rocks, covered to a large extent with Mesozoic strata. Fold mountains lie to N. (Cantabrian-Pyrenean system) and S. (Andalusian system) of Meseta. Chief Mountain Ranges are Pyrenees in N.W. (forming boundary between France and Spain), with Maladetta, or Pico Nethou (11,165 ft.), Mt. Perdu (10,994 ft.); Cantabrian Mts. in N., a continuation of Pyrenees, with Peñas de Europe (8745 ft.); Sierra de Guadarrama, with Pico de Peñalara (7890 ft.), and Montes de Toledo in central region; Sierra de Gredos, with Plaza Almanzor (8730 ft.) and Sierra de Gata, W.; Sierra Nevada, with lofty Mulahaçen (11,420 ft.), S. Principal Rivers are Douro (*Duero*), Tagus (*Tajo*), Guadiana, and Guadalquivir flowing into Atlantic; Ebro, Guadalaviar, Juçar, Segura, Llobregat, Almanzora, Almeira, Guadalfeo, flow into Mediterranean; Bidassoa, Nalon, and Rivideo in N.; few Lakes—Mar Minor in Murcia, Albufera in Valencia, Laguna de la Janda in Cadiz.

Climate of tableland is dry and hot with frequent hot winds and scanty rainfall (10 to 20 in.); N. and N.W. are mild, with rainfall of 40 to 156 in.; districts are sub-tropical and have the mildest winters in Europe. Flora is varied; N. maritime provinces have central European vegetation; most of the central region contains steppe-like vegetation, chiefly esparto grass; flora of Mediterranean districts is tropical. Fauna belongs to the Mediterranean subregion of the Palæarctic region and includes wolf, bear, lynx, fox, chamois, ibex, genet, Barbary ape on Gibraltar (*q.v.*), porcupine, etc.; numerous reptiles,

amphibians, and beautiful butterflies; many birds —eagles, vultures, falcons, kites, snipe, partridge, flamingo, quails, etc.

HISTORY.

The earliest inhabitants of Spain were IBERIANS. Their language and blood are preserved in the Basque Provinces (*q.v.*). The Basques claim to be the oldest race in Europe. Phœnician traders, passing the Pillars of Hercules (Gibraltar), founded Cadiz, *c.* 1100 B.C., and other towns. Celtic tribes crossed the Pyrenees, *c.* 500 B.C., and mingling with Iberians begot 'Celtiberians.' Gk. settlements on the Mediterranean shores were taken by Carthaginians who invaded Spain, IV. cent. B.C.; Hasdrubal founded Cartagena, 242 B.C. Then came ROMANS, who expelled the Carthaginians *c.* 200 B.C., after the Second Punic War (*q.v.*). Spain became a Rom. province (Numantia resisted gallantly till 133 B.C.); its inhabitants became Latinised and contributed famous names to Rom. history and lit. To-day magnificent Rom. remains (*e.g.* at Segovia) and the Span. language testify the thoroughness and durability of Rome's conquest. In V. cent. A.D. Vandals and Suevi overran Spain. On Rome's invitaton, VISIGOTHS followed, overcame these invaders, adopted the Rom. faith and tongue, and ruled the whole peninsula till VIII. cent., when Moslem inroads began. RODERICK, the 'Last of the Goths,' fell (711) at *Xeres*, fighting Berber hordes under Tarik.

The 'MOORS,' or Saracens, quickly mastered most of Spain, and during eight cent's of possession made an indelible impression on race, language, place-names, customs, commerce, art, architecture, and culture, at the same time themselves becoming Europeanised and absorbed to a large extent. The enervated Goths were powerless to resist. The down-trodden Jews welcomed the Arabs. On the whole the native Spanish accepted the conquest placidly. PELAYO, the Goth, however, maintained Span. independence in Asturias (the cradle of Span. liberty), where he ruled (718–37). In 755 Abd-er-Rahman established the great Ommayad Caliphate of CORDOBA, independent of the Muhammadan Empire across the Mediterranean. Under ALFONSO I. of Asturias (739–57), GALICIA (*q.v.*) was recovered. Charlemagne failed to rescue Saragossa and was defeated at *Roncesvalles*, 778, but Louis I. recovered Barcelona, 801. CATALONIA (*q.v.*) became independent, 874, and NAVARRE (*q.v.*) soon after.

In 924 Asturias was united with Galicia in the kingdom of LEON, which in turn was united with CASTILE under FERDINAND I., 1037. Toledo was recaptured, 1085; *New Castile* was added to Old Castile; and ALFONSO VI. (1072–1109) became 'Emperor of Spain.' The valiant CID took Valencia (1094). Meanwhile the Caliphate of Cordoba had been dismembered, and fresh bands of invaders from Africa overran Spain; Christians were hard pressed, but on the whole held their own. The Almoravides came *c.* 1090, the fanatical Almohades, *c.* 1150, to succour their fellow-Muslims in Spain. The Moors gained several victories, but lost Saragossa (1118), which became capital of kingdom of ARAGON (*q.v.*). In 1139 PORTUGAL (*q.v.*) became a separate kingdom under Alfonso I., whose father, Henry of Burgundy, had received from Castile the Countship of *Portucalia* for services against the Moor. The Almohades were crushed by ALFONSO VIII. at *Las Navas de Tolosa*, 1212. Castile and Leon were firmly united (1230) under FERDINAND III., Saint Fernando, who took Cordova (1235), Murcia (1243), and Seville (1248). Cadiz fell to his son Alfonso X., *the Learned*, 1262, and Jeréz, 1264.

JAIME I. of Aragon, who had extended his rule to Balearic Isles (*c.* 1230), conquered Valencia, 1238, which Moors had recaptured after the Cid's death. Barcelona, which with CATALONIA had been united to Aragon, 1149, became a great Mediterranean port, with a famous code of maritime law (*Consulado del Mar*). Aragon's eyes were generally turned towards the sea and Europe—away from Spain; Sicily came under its House, 1282. Castile, therefore, had the chief part in reclaiming Spain from the infidel. Before the end of XIII. cent. Granada (*q.v.*) alone remained under Moorish domination.

The XIV. and XV. cent's were marked by constitutional struggles in the Span. kingdoms between monarchs, nobles, and people. The rights of Aragonese nobles were embodied in the *Fueros de Sobrarbe*, which empowered them to depose any king who broke its provisions. Alfonso the Learned (1252–84) drew up the *Siete Partidas*, codifying Castilian Law. Towns banded themselves together to protect their privileges, but royal power gradually increased, and by XVI. cent. had gained the day. PEDRO THE CRUEL (1350–69), the Black Prince's ally, was murdered and succeeded by his half-bro., HENRY OF TRASTAMARA, whose descendants ruled Castile badly for 100 years.

ISABELLA of Castile (d. 1504), who had secretly married FERDINAND of Aragon (1469), succeeded her half-bro., Henry IV., in 1474. Ferdinand (d. 1516) became king of Aragon in 1479, and the two great Span. kingdoms were thus firmly united. The reign of these 'Catholic kings' is memorable. They unified Spain; they captured Granada, the Moor's last stronghold (1492); expelled the Moors and Jews, introduced the Inquisition, and under Ximenes' guidance kindled Span. bigotry; they sent out Columbus and inaugurated Spain's conquest of the New World. Naples and Sicily were conquered, 1504 (thanks to Gonsalvo de Cordova), and Navarre annexed, 1515. In Italy Ferdinand was defeated at *Ravenna* (1512) by French. Ferdinand and Isabella had no son; of their daughters, Isabel had married the Prince of Portugal; Catherine had married Henry VIII.; Joanna the Mad had married Philip of Austria, and their son, CARLOS I. (1516–56), inherited all Spain, Burgundy, Netherlands, Two Sicilies, and Sardinia. Carlos was soon elected Emperor CHARLES V. At *Villalar* (1521) was crushed the Communers rising against the Hapsburg king, and despotism was firmly established. Great conquests were made in America—Mexico, Peru, Chile, West Indies, Florida (1520–40). France was humbled and Francis I. captured at *Pavia* (1525); Charles was crowned king of Italy, 1529; Tunis was taken, 1535; Charles abdicated, 1556, and died, 1558.

Under his grandson, PHILIP II. (1556–98), husband of Mary, Queen of England, Spain's glory was further enhanced; Portugal, with its oversea possessions, was incorporated (1580) on failure of the male line of the royal house; the French were defeated at *St. Quentin* (1557) and *Gravelines*, and made peace of Câteau-Cambresis (1559). The Turks were crushed at *Lepanto* by Span. and Venetian fleets, 1571. With Cervantes and Velasquez Span. lit. and art were at their zenith. The fanatical king of Spain was recognised as champion of Catholic Christendom—sworn enemy, therefore, of Prot. England. Signs of approaching downfall, however, were not lacking; under Alva's regency the Netherlands revolted, 1568, and United Provinces were formed, 1581; the Grand Armada was destroyed, 1588, and Cadiz burned by Eng. seadogs, 1596. The southern provinces of Netherlands were made a separate kingdom under Philip's nephew, Archduke of Austria.

Under PHILIP III. (1598–1621), Spain's power waned. The expulsion of Moriscos (*q.v.*), 1609, greatly reduced population in numbers and industry. Under Philip IV. (1621–65) Netherlands renounced allegiance, 1621; independence recognised, 1648. Heavy taxation for Fr. wars and Olivare's attempts to impose Castilian institutions on rest of Spain provoked Civil War; Portugal revolted and set up house of Braganza, 1640; Catalonia also rebelled, 1640; French won victories at *Rocroi* (1643), *Dunkirk* (1658), etc.; by *Treaty of Westphalia* (ending Thirty Years War) Spain recognised independence of Netherlands, 1648; Jamaica was captured by English, 1653. Feeble-minded Carlos II. (1665–1700) continued Fr. wars, and dying without issue bequeathed the War of Spanish Succession (*q.v.*) 1701–14.

The Fr. candidate, PHILIP V. (1700–46), was finally recognised by *Peace of Utrecht* (1713), and Bourbon dynasty succeeded Hapsburg. Britain, which had opposed Philip's claim, retained Gibraltar, taken 1704. The Quadruple Alliance (Britain, France, Austria, Holland) was formed, 1718, to counteract Span. minister Alberoni's schemes. After exhausting wars in Italy, Spain recovered Two Sicilies (1735) from Austrians.

FERDINAND VI. (1746–59) had a more peaceful reign, and CARLOS III. (1759–88) gave illusory promise of a period of revival. Many sadly needed internal reforms were introduced. British captured Manila and Havana, and helped to repel Span. invasion of Portugal, 1762. Gibraltar triumphantly resisted combined Fr. and Span. siege (1779–82), and Rodney defeated Span. fleet off *Cape St. Vincent* (1780). CARLOS IV. (1788–1808) waged war against France (1793–95), then with France and Holland against Britain (1796–1802), sustaining second defeat off *Cape St. Vincent*, 1797. At *Trafalgar*, 1805, Fr. and Span. fleets were destroyed.

Portugal refusing to observe Berlin Decrees, Napoleon, hoodwinking Godoy, entered Spain, forced Charles IV. to resign, set aside his son, Ferdinand V., installed Joseph Bonaparte as king, 1808, and began Peninsular War (*q.v.*), 1808–14. FERDINAND V., on his restoration, 1814, abolished new constitution framed at Cadiz, 1812, and reinstituted the Inquisition. The XIX. cent. saw Spain's Amer. Empire dispersed; Florida was sold to U.S.A., 1819; Peru and Central States revolted, 1821; Bolivar freed Venezuela, New Granada, and Bolivia; Chile became independent, 1822, Mexico in 1825. Meanwhile Civil War shook Spain at home, 1820–23. With Fr. support Ferdinand suppressed revolution and established despotism; and on birth of daughter, Isabella (1830), abolished Salic Law (established 1713). On Ferdinand's death (1833), Civil War broke out between supporters of ISABELLA II. (1833–68) and *Carlists*, who upheld claims of Don Carlos, Ferdinand's brother; Carlists, strong in N., were subdued, 1840. Queen mother, Maria Cristina, acted as regent till 1841, Espartero till 1843, when Isabella came of age. Continual constitutional troubles reached a head, 1868, when Prim and Serrano led revolution which ended in Isabella's flight to France. After a provisional Government, AMADEUS of Savoy, son of Victor Emanuel, was chosen king, 1870, only to abdicate, 1873, owing to Carlist insurrections.

A republic was declared 1873, during second Carlist War (1872–76), on behalf of Don Carlos' son, but in 1875 Bourbons were restored, Isabella's son, ALFONSO XII. (1875–86), becoming king; constitutional monarchy was established, 1876. ALFONSO XIII. (1886–), Alfonso XII.'s posthumous son, came of age 1902, his mother, Maria Cristina, acting as regent meanwhile. Insurrections arose in Cuba, 1895, against Span. misgovernment, and, Spain refusing U.S.A.'s demand for Cuban independence, the SPANISH-AMERICAN WAR (*q.v.*) broke out, 1898, when the last of Spain's great oversea possessions (Cuba and Philippines) were lost. Of late years campaigns in Morocco (*q.v.*), religious, labour, and other troubles have retarded progress, and Portug. Revolution (1910) has encouraged republican hopes in Spain; Carlists anticipate a republic, followed by restoration of monarchy and establishment of Carlist dynasty in person of Don Jaime de Bourbon.

Burke, *History of Spain to Death of Ferdinand the Catholic* (1900); Hume, *Spain, 1479–1788* (1898); *Modern Spain, 1788–1898* (1899).

Language.—The Span. language is a Romance tongue, descended from Latin. Celtic and Germanic invaders adopted it; the Moors failed to obliterate it; from all the conquerors of Spain, it borrowed words and enriched its vocabulary. Various dialects arose owing to political and geographical causes, in Asturias, Galicia, Navarre, Castile, Aragon, Catalonia, etc. CASTILIAN triumphed and became the standard literary language of Spain (XIII. cent.). The CATALAN tongue and LIMOUSIN of the old troubadours are akin to Provençal (*q.v.*), GALICIAN to Portuguese. Spanish, carried to the New World, where millions in S. and Central America speak it, has developed local peculiarities. The vocabulary is very wealthy and the language euphonious. The BASQUE language, quite apart, preserves the tongue of the Iberians, if not even earlier aborigines; some 500,000 people speak it and guard it jealously.

Spanish Literature may be said to begin with Spain's Latinisation (II. cent. B.C.). The Senecas, Lucan, Martial, Quintilian, are among Span. contributors to Latin lit. Between the disruption of the Rom. Empire and the struggle for Span. independence, lit. in Spain was confined to the Moors, who greatly promoted learning by Arabic treatises on philosophy, science, etc., and translations of classics (*e.g.* Averroës' *Aristotle*).

The Cid's exploits against the Saracens at length inspired Span. minstrels, especially the Castilian writer of the epic *Poema del Cid* (c. 1150). The first Span. poet whose name we know was GONZALO DE BERCEO (fl. *c.* 1225). Some early bards used Catalonian, Limousin, and Galician (see **Language**), but ALFONSO X., *the Learned* (d. 1284), who greatly fostered Span. lit., assured Castilian linguistic supremacy. For him were prepared in Castilian the *Siete Partidas* (code of laws), and *Grande y Generale Historia*, which, though comparatively sober, reflects the heroic age, like the chronicles, romances, etc., of this mediæval period. Didactic and satiric verses, songs, hymns, etc., were also composed by such XIV.-cent. poets as DON JUAN MANUEL, JUAN RIZ, LOPEZ DE AYALA. But, above all, Romances, prose and poetic, captivated the Span. imagination—cycles of Troy, Alexander, Arthur, Charlemagne, and particularly Amadis de Gaul; Spain simply revelled in supernatural Romances of Chivalry, whose extravagance affected England and other countries.

Marquis ENRIQUE DE VILLENA, MARQUIS DE SANTILLANA, JUAN DE MENA, PEREZ DE GUZMAN, and other poets adorned the Court of John II. (1406–54). But the dawn of the Golden Age of Span. lit. was heralded by BOSCAN and GARCILASO (d. 1536), the lyric poets who introduced the Ital. Renaissance influence into Spain, and with it more grace, artistry, and variety of form and subject. DIEGO DE MENDOZA (d. 1575) wrote classical poems and history; MONTEMAYOR of Portugal produced in Spanish an elevated pastoral romance—*Diana*, imitated in Cervantes' *Galatea*; FERNANDO DE HERRERA composed classical odes, LUIS DE LEON, lyrics of great dignity and purity; CASTILLEJO (d. 1556) championed the old romantic style.

The absurdities of the heroic romance, however, were soon to be laughed to scorn by CERVANTES (1547–1616), the greatest figure in Span. lit.; while the writer of the famous *Lazarillo de Tormes* (*c.* 1550)—perhaps Diego de Mendoza—established the popularity of the realistic *Picaresque novel* (q.v.), the type afterwards favoured by Lesage, Defoe, Fielding, and others.

Religious representatives (relieved by farcical interludes), pastoral plays, eclogues, and dramatic novels (*e.g.* Fernando de Rojas' *Celestina*, *c.* 1500) had paved the way for real Drama, in which Span. genius found natural expression, for a time surpassing all Europe. Erudite dramatists copied the ancients; others used the stage to enforce morals; national Span. drama came with the XVI. cent., ushered in by TORRES NAHARRO, and popularised by LOPE DE RUEDA, whom Cervantes admired. Cervantes himself wrote plays (at first eschewing the involved and unnatural plots then becoming fashionable); but in fertility was far excelled by LOPE DE VEGA (1562–*c.* 1635), whose inventive, dramatic, poetic gifts were displayed in 2000 plays and in other works. The Span. Comedy as he shaped it has been described as a 'dramatic novel' in principle.

Other famous dramatists and poets of this illustrious period are the 'Span. Horaces,' the brothers ARGENSOLA (b. *c.* 1565); the classical poet, VICENTE ESPINEL

(d. 1634); the fantastical GONGORA (1561–1627), the Span. Marini or Lyly, who introduced the *Estilo Culto*; JUAN DE MARIANA (d. 1623), the historian; QUEVEDO (1580–1645), the great satirist, who mocked the Gongorists' 'New Art'; VILLEGAS (1595–1669), the graceful Span. Anacreon; and CALDERON (1600–81) who, in fine poetry, maintained the glories of Span. drama. ANTONIO DE SOLIS, AUGUSTIN MORETO, FRANCISCO DE ROJAS, TIRSO DE MOLINO, GUILLEN DE CASTRO are among Calderon's many contemporaries, followers, and fellow-dramatists.

After this great national outburst came a period of decadence in the XVIII. cent., when Fr. models were greatly copied. MELENDEZ VALDEZ wrote graceful poetry, MORATIN (1737–80), praiseworthy tragedies, RAMON DE LA CRUZ, estimable comedies.

About the mid-XIX. cent. a Revival began. ESPRONCEDA, SAAVEDRA, and others introduced Romanticism; and a number of recent and living writers have attained European reputation as poets, dramatists, novelists, and scholars. Here mention can only be made of ZORRILLA (1817–93), PEDRO ALARCON (1833–98), DE VALERA (1824–1905), PEREZ GALDOS, RAMON DE CAMPOAMOR, JOSÉ ECHEGARAY, the dramatist, MENANDEZ Y PELAYO, ARMANDO PALACIO VALDES, and EMILIO FERRARI, the poet.

Fitzmaurice-Kelly, *History of Span. Literature* (1898).

Art, see PAINTING, ARCHITECTURE.

Colonies.—Spain's once vast colonies have almost all been lost (see HISTORY). A few possessions in Africa alone remain. The Canary Islands are treated as an integral part of Spain; Ceuta forms a province with Cadiz. In Morocco, Spain also occupies Melilla, Alhucemas, Gomera, Chaferinas Islands, and various 'presidios.' On W. coast of Africa Spain has Rio de Oro and Adrar; Span. Guinea (Muni River Settlements); Fernando Po, Elobey, Annabon, Corisco, and other islands in Gulf of Guinea.

Defence.—Military service is compulsory; before 1912 conscription prevailed. Peace strength of ARMY (1912) was *c.* 116,000 men; war strength *c.* 500,000. NAVY, destroyed in Span.-Amer. War, is being reconstructed. Fleet consisted (1912) of 1 battleship, 3 first-class cruisers, 1 second-class, 2 third-class, 4 destroyers, besides small and obsolete vessels.

Products and Industries.—Agriculture is the main occupation; 60 per cent. of the total area is under cultivation. Principal products are wheat, barley, oats, rice, maize, olives, oil, flax, hemp, esparto grass, raisins, fruits (oranges, grapes, almonds, etc.); important wine industries—famous sherries made in south and red wines in north; manufactures of cotton and woollen goods, silks, machinery, paper, tobacco (a state monopoly), preserves, etc.; fine horses are bred in Andalusia; sheep and swine in Estremadura, cattle in Galicia; extensive fisheries (tunny, sardines, cod, etc.); total value caught annually about £1,500,000; rich in minerals; coal, iron, copper, lead, zinc, cobalt, salt, mercury, sulphur, etc.; numerous mineral springs. Railway mileage (1912) was 9200 (all private companies).

Government is a hereditary constitutional monarchy with Cortes, composed of Senate (360 members) and Congress (406 deputies). Spain comprises the following ancient kingdoms or provinces: Castile (Old and New), Aragon, Basque Provinces, Asturias, Galicia, Leon, Estremadura, Andalusia, Granada, Murcia, Valencia, Catalonia, Navarre. Andorra (*q.v.*) in the Pyrenees is a Republic under joint suzerainty of Spain and France. For local government purposes it is now divided into 49 PROVINCES, viz. (on Span. mainland) Alava, Alicante, Albacete, Almeria, Airla, Badajoz, Barcelona, Burgos, Cáceres, Cadiz and Ceuta, Castellon, Ciudad-Real, Córdoba, Coruña, Cuenca, Granada, Gerona, Guadelajara, Guipúzcoa, Huesca, Huelva, Jaen, Leon, Lèrida, Lugo, Logroño, Madrid, Málaga, Murcia, Navarra, Orense, Oviedo, Palencia, Pontevedra, Santander, Salamanca, Sevilla, Segovia, Soria, Tarragona, Teruel, Toledo, Valencia, Valladolid, Vizcaya, Zamora, Zaragoza, Baleares, Canarias. Each province has a *Diputacion Provincial* (meeting annually); each commune has an *Ayuntiamento* presided over by an *Alcalde*.

Chief Towns are Madrid (capital), Barcelona, Valencia, Seville, Malaga, Murcia, Saragossa.

State RELIGION is Roman Catholic; until 1910 public worship of any other religion was forbidden. Since 1857 primary EDUCATION has been nominally compulsory, and free for most children; public and primary schools are maintained chiefly by local taxation; Spain has 10 univ's (see UNIVERSITIES), besides schools for engineering, agriculture, architecture, arts, music, etc. Pop. (1910) 19,588,688.

Calvert, *Spain* (2 vols., 1911), and other works; Baedeker, *Spain and Portugal* (1908); Murray's *Handbook*; Borrow, *Bible in Spain*.

SPALATIN, GEORGE, GEORGE BURKHARDT (1484–1545), scholar and promoter of Reformation; sec. and adviser to Frederick the Wise, elector of Saxony; greatly influenced by Luther; organised church in Saxony.

SPALATO, SPALATRO (43° 30′ N., 16° 25′ E.), city, seaport, on Adriatic, Dalmatia, Austria; contains ruins of vast palace of Diocletian and other Rom. antiquities; bp.'s see; exports wine and oil. Pop. (1910) 27,494.

SPALAX, MOLE RATS (*q.v.*).

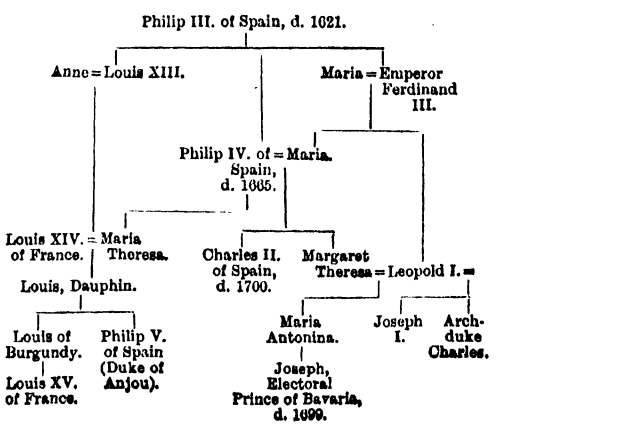
SPALDING (52° 48′ N., 0° 9′ W.), market town, on Welland, Lincolnshire, England; agricultural centre. Pop. (1911) 10,309.

SPALLANZANI, LAZARO (1729–99), Ital. scientist; studied at Bologna; brilliant all-round scholar; made important contributions to meteorology, physiology, etc.; first to explain digestion correctly.

SPAN, distance from tip of thumb to tip of little finger when hand is expanded; reckoned as 9 inches.

SPANDAU (52° 34′ N., 13° 10′ E.), fortified town, at junction of Spree and Havel, Brandenburg, Prussia; manufactures small-arms, artillery. Pop. (1910) 84,855.

SPANGENBERG, AUGUST GOTTLIEB (1704–92), Moravian religious leader; ed. at Jena, where he lectured on theology, but got into trouble for his views; joined Moravians, 1733, and devoted his life to organising Moravian Church, ably assisting founder, Count Zinzendorf; wrote several works and hymns.



SPANIELS, see DOG FAMILY.

SPANISH FLIES, see CANTHARIDEA.

SPANISH GUINEA, see MUNI RIVER SETTLEMENT.

SPANISH REFORMED CHURCH, body of Span. Protestants, since 1871 under episcopal government on Anglican lines. A petition was sent to the Anglican Church to send a bp. to ordain, then to the Irish bp's, who ordained Señor Cabrera, bp. elect, 1894. A Portug. church is affiliated to the Spanish.

SPANISH SUCCESSION, WAR OF THE, 1701–14.

On death of Charles II. of Spain, childless, 1700, succession was doubtful. When Maria Theresa, his elder sister and co-heir, m. Louis XIV., she disclaimed all title to Spain, receiving in return as dower settlement of 500,000 crowns; as dower was never paid, it was questionable whether quitclaim remained in force. Her half-sister, Margaret Theresa, left a dau., Maria Antonia, who also, on marrying elector of Bavaria, disclaimed title to Span. succession for herself and heirs, but, it was said, under compulsion.

Next natural heirs were descendants of Anne and Maria, daughters of Philip III.; of these Anne had quitclaimed right, but Maria had not; Emperor Leopold I., son of Maria, therefore claimed inheritance. Succession, however, was of international interest; re union of Spain and Empire was dangerous to Balance of Power; therefore, in 1668 Louis XIV. arranged with Leopold to partition Span. territories on death of Charles II.; question lapsed till close of cent. when England interfered.

By First Partition Treaty, 1698, Louis XIV. agreed to allow electoral prince of Bavaria to succeed to Spain, Netherlands, and Indies, while the Archduke Charles and the dauphin were to share rest; Charles II. agreed, but electoral prince died, 1699. Second Partition Treaty, 1700, between England, Holland, and France, substituted archduke for electoral prince, but Charles II. on deathbed bequeathed entire dominions to dauphin's younger son Philip, Duke of Anjou, and Louis XIV. accepted bequest; Holland forced to acquiesce in Fr. occupation of Netherlands, 1701; England and Holland alienated by continued restrictions on Span. trade and Fr. recognition of Pretender; Grand Alliance formed, 1701, by England, Holland, Prussia, the Emperor and Grand-Duke of Hesse to wrest Italy and Indies from Bourbons. French under Catinat forced to retreat before Prince Eugene in Italy, 1701; Villeroy defeated and captured, 1702, but Philip V. drove Eugene back beyond Adige. English and Dutch under Marlborough defeated Boufflers in Netherlands, capturing Liège, 1702; Marlborough occupied Köln, 1703, but Dutch refused to besiege Antwerp and hampered Marlborough's movements.

In 1703 Louis XIV. assumed the aggressive; Villars, in conjunction with elector of Bavaria and Hungarians, advanced on Austria; elector turned aside to co-operate with Vendôme against Eugene; he was driven back by Savoyards (Savoy having joined Allies), joined Villars, and captured Augsburg. New attack on Austria, 1704, necessitated arrival of aid from Allies in Netherlands; Marsin superseded Villars, while Villeroy took over command in Netherlands and Tallard was stationed on Rhine; Marlborough determined to escape to Danube unknown to Dutch, who would not have suffered abandonment of United Provinces; he deceived Villeroy by feigned attempt to invade France, joined Eugene on Upper Danube, and cut off Bourbon forces from Austria; Tallard at once joined Marsin and elector and offered battle at Blenheim; annihilation of Fr. army; after this battle England took place of France as chief military power; meanwhile Eng. Mediterranean fleet captured Gibraltar, 1704.

Leopold d. 1705; Austrians gave little further help, and Dutch again hampered Marlborough in Netherlands. In 1706 Marlborough defeated Villeroy at Ramillies and drove French back to frontier, while Eugene, after winning battle of Turin, drove them from Italy. England had made treaty with Portugal, 1703; Allied forces under Schomberg failed in invasion of Spain, 1704, but Peterborough overran Aragon, 1705; Galway occupied Madrid, 1706, and proclaimed Archduke king, but opposition of Spaniards necessitated withdrawal. French under Vendôme advanced victoriously through Flanders, 1708, but were defeated at Oudenarde and cut off from France now open to invasion; Lille fell, Oct. 1708; last Fr. army defeated at Malplaquet, 1709, by Marlborough and Eugene, who then captured Mons.

Allies under Stanhope and Stahremberg again occupied Madrid, 1710, but were again opposed by Spaniards and forced to withdraw by Vendôme; treaty agreed to between England and France, 1711, and signed at Utrecht, 1713. Archduke Charles, who succ. as emperor, 1711, held out until successive defeats of Eugene, 1712–13, after which he made peace at Rastadt and Baden, 1714. Philip V. was confirmed king of Spain and Indies, Bourbons accepting condition that crowns of France and Spain were never to be united; France lost acquisitions on right bank of Rhine and banished Pretender; emperor received Naples, Milanese, Sardinia, and Netherlands, though Dutch garrisoned Fr. frontier; Duke of Savoy had Sicily; Prussia obtained Upper Guelderland; England acquired trading rights with Span. Indies, and sovereignty of Acadia, Newfoundland, Hudson's Bay, S. Kitts, Gibraltar, Minorca. Great naval and colonial advance of England.

SPANISH-AMERICAN WAR, 1898.—Spain retained last relics of her Amer. empire, Porto Rico and Cuba, despite their efforts to obtain independence, long after the rest had split up into republics. Cuban revolt, 1868, was put down, 1878, although Monroe Doctrine (*q.v.*) had become very powerful in U.S.A.; fresh revolt, 1895, was punished by Span. military occupation of the island and measures of excessive severity; Amer. sympathy with rebels perhaps caused mysterious destruction of Amer. warship *Maine* with officers and men in Havana Bay, Feb. 1898; 2 months later U.S.A. and Spain declared war, the former determined to expel Spain from America. U.S.A. confined themselves to naval defence of their coast and aggressive action against Cuba.

Amer. commodore, Dewey, destroyed Span. squadron and captured Cavite at end of April; Spaniards victorious at *Cardenas*, May 11, breaking Amer. blockade of Havana; on May 19 Span. fleet under Cervera arrived at Santiago de Cuba, evading Amer. ships watching for it; Schley, ordered to blockade Santiago, declared it impossible; Sampson sent with reinforcements and closed harbour; attack on land side by troops under General Shafter at close of June; Spaniards stoutly contested hills and hamlets round Santiago; both sides suffered greatly; destruction of Span. fleet and capture of Cervera, July 3; fall of Santiago, July 17.

Rebel Span. subjects proclaimed Philippine Republic and attacked Manila, which was carried by Dewey and Merritt, Aug. 13; U.S.A. annexed Philippines and Porto Rico and occupied Cuba until independent state was set up.

SPARKS, JARED (1789–1866), Amer. educationist; b. Wellington, Connecticut; editor of the *North American Review* (1823–30); prof. of History at Harvard (1839–49). His greatest work was his edition of *The Writings of George Washington*.

SPARLING, see under Salmon Family.

SPARROW, see under Finch Family.

SPARROW HAWK, a member of the Hawk Family (*q.v.*).

SPARTA (37° 5′ N., 22° 25′ E.), city of ancient Greece, capital of Laconia in the Peloponnesus; famous for the warlike prowess of its citizens; the *Laws of Lycurgus* laid the foundations of the city's greatness; inhabitants were distinguished for simplicity of life, terseness of speech, and courage in battle. Weakly children were not allowed to live; boys were trained from the age of 7 under supervision of the State and apart from their mothers; they were taught to endure hardships and suffer pain without complaint; both sexes went through a rigorous course of gymnastics, with the object of producing a physically perfect race.

In early times two kings, who were also priests, were at the head of the State, and exercised absolute authority over the army; but in the V. cent. B.C.

their powers came to be limited by the *ephors*, magistrates elected annually by the people. The State was entirely a military organisation.

S. came into the possession of the Dorians towards close of VII. cent. B.C.; waged war against and subdued Messenia, 668 B.C., and after a long war against Arcadia, gained the upper hand about 600 B.C. At time of the Persian invasion of the V. cent. B.C., S. obtained the chief command in the war, with the consent of all the Greeks. Subsequently S. and Athens fought for supremacy, and after the great struggle of the Peloponnesian War Athens was overthrown and Sparta became the leading state in Greece. In the following cent., however, she was defeated by Thebes (371 B.C.), and henceforth her power declined. With the rest of Greece, S. fell under the domination of Macedon, *c.* 340 B.C., and passed under Rom. rule, 146 B.C. Subsequent history is coincident with that of Greece (*q.v.*) as a whole.

SPARTACUS, leader in Italian slave rising (73–71 B.C.); Thracian captive; escaped with others from gladiatorial training-school; with discontented agricultural population defeated Rom. legions for two years; slain, 71.

SPARTANBURG (34° 55′ N., 81° 49′ W.), city, capital, Spartanburg County, S. Carolina, U.S.A; cotton-growing region; cotton-mills; ironworks. Pop. (1910) 17,517.

SPASMODIC SCHOOL, group of mid-XIX.-cent. Eng. poets who, trying to improve on Tennyson's form, achieved gush and bathos; members were P. J. Bailey, Dobell, Alexander Smith.

SPATHE, a bract enclosing flower or flowers. A **spadix**, spike of flowers so enclosed, is elaborate in Palms.

SPATHIC IRON ORE, see IRON.

SPEAKER, title first given to pres. of House of Commons in 1377; must be a member, and chosen by the House to enforce rules of order. The office is non-political and held during successive and opposing ministries. On retirement a peerage is usually conferred. As representative of House the Speaker is first commoner of England. In U.S.A. the office is highly political. The Speaker's chair in the House of Commons has, since 1905, been occupied by the Rt. Hon. J. W. Lowther.

SPEARWORT, name of certain plants of order Ranunculaceæ growing in moist places.

SPECIFIC DENSITY, see DENSITY, HYDROMETER.

SPECIFIC GRAVITY, see HYDROMECHANICS (HYDROSTATICS), DENSITY.

SPECKLE, DANIEL, see FORTIFICATION.

SPECTACLES, mechanical aids to defective vision worn close to the eye (*q.v.*), consisting of lens; invented *c.* 1280. To correct short-sight, when focus of image lies in front of retina, concave lenses are worn; in cases of long-sight, convex lenses focus image in retina instead of behind it; prismatic glasses used to remedy squinting; darkened spectacles worn by weak-eyed people.

SPECTROHELIOGRAPH, instrument for photographing the sun in calcium, hydrogen, or other chemical light; invented (1892) by Prof. Hale, of Yerkes Observatory; consists of a direct vision spectroscope (*q.v.*) with a slit which may be so adjusted as to exclude all other light but that of desired part of spectrum; appearances invisible to the eye, or by ordinary solar photography, may thus be recorded.

SPECTROSCOPE.—NEWTON (1666) proved the composite nature of sunlight by allowing a beam of sunlight to pass through a circular hole in a shutter of a darkened room, then through a glass prism, and allowing it to fall on a screen. The screen showed a series of coloured images of the circular hole, thus proving that the light had suffered varying amounts of refraction. The *spectrum* thus obtained was not, however, *pure*, for the images due to each kind of light overlapped those next to it. WOLLASTON (1802) improved the arrangement by using a narrow slit instead of a circular hole, and, on examining the spectrum so produced, observed several dark bands or lines crossing it in a direction parallel to the slit. FRAUNHOFER investigated these bands very closely, and from his observations and results there has sprung that branch of optics known as spectroscopy. His first improvement was to pass the beam of light from the slit through a convex lens, so placed with reference to the slit and prism that it formed on the screen a well-marked image of the slit. He also used a telescope in order to examine the spectrum more minutely. In this way he was able to identify several hundreds of lines, and his most important contribution to knowledge at this stage was the fact that each line has a definite place in the spectrum.

A spectroscope thus consists essentially of (1) a narrow slit, (2) an arrangement of lenses termed a *collimator*, (3) a prism which can turn about an axis parallel to the slit, (4) a telescope for examining the rays after passing out of the prism. The beam of light to be examined enters the slit; is converted into parallel rays by the collimator; enters the prism, where it undergoes refraction; and lastly is brought to a focus by the telescope so as to be closely examined. The different parts of the instrument are attached to a pillar resting on a heavy tripod base. One radial arm, supported by the pillar, carries the collimator with the slit at its outer end. The prism rests on a plate at the top of the pillar, and this plate (or the prism on the plate) is generally capable of rotation about an axis parallel to the slit. The prism is generally one of dense glass, fluorite, rock-salt, or quartz. Occasionally a hollow prism filled with carbon bisulphide is used. The telescope is carried on another radial arm which can revolve round the pillar so that different rays may be examined, the position of the telescope being read on a graduated circle.

In the order of historical development after Fraunhofer's discovery of the dark lines, the first advance was the establishment of the connection between the bright line spectrum of a chemical element and the dark lines of the solar spectrum. This can best be explained by an analogy from sound. Suppose that from a certain point there issues steadily a continuous stream of musical sound, including sounds of every variety of pitch within a wide range. Also that between this point and the ear of a listener there be placed a frame of piano wires all tuned to the same particular pitch. The sound-waves from the point pass through the frame and affect the listener's ear. But if any of these waves have a frequency equal to that of the piano wires when these are struck, such waves are stopped by the frame because they are absorbed there, and that particular note will not pass on to be heard by the listener. In other words, a vibrating system can absorb the energy of vibrations of its own proper frequency. Suppose now we have an arrangement as follows: (1) a source of white light at a high temperature, *e.g.* an electric arc-light; (2) a low temperature flame to which, ordinarily colourless, a yellow tinge has been given by allowing some sodium salt to vaporise in it; (3) a spectroscope. Examining (1) by the spectroscope, a continuous spectrum from violet to red, with no dark lines in it, is seen. Examining (2), its spectrum is seen to consist of a single (in reality, multiple) *bright* line in the yellow region. Now pass the light from (1) through (2) and examine its spectrum. It will show a *dark* line occupying exactly the same position as the bright line of (2) when seen alone. KIRCHHOFF explained this 'reversal' (as it is termed), and applied it to the dark lines in the solar spectrum. He supposed the hotter main body of the sun to be giving out light of all kinds, but that the cooler vapours which surround the sun absorb those rays whose frequencies correspond to the chemical elements in these vapours. Hence the existence of a dark line in the solar spectrum indicates the presence in the sun of that particular

element which, when incandescent, gives rise to light of that kind.

This discovery led to the examination of the spectra of the different chemical elements, the determination of the wave-length for each line in each spectrum, and the comparison of the spectra of different celestial bodies with the data so obtained. In order to identify a given line, it is sufficient to know the wave-length of the light to which it corresponds. This is usually expressed in terms of the **Augström unit**, viz. one ten-millionth of a millimetre; *e.g.* one of the lines of yellow sodium light has a wave-length of 5896·62 Augström units.

The spectroscope has been applied in many branches of physics, terrestrial and cosmical, but space forbids any detailed statement of the methods or results. The following may, however, be mentioned: velocity of stars, velocity in different parts of a nebula, rotation of the sun, velocity of solar prominences, detection of chemical elements, Zeeman effect.

Landauer, *Spectrum Analysis*; Baly, *Spectroscopy* (1905).

SPECTRUM, see SPECTROSCOPE.

SPECULAR IRON ORE, see IRON.

SPEEDWELL (*Veronica*), genus of plants, order Scrophulariaceæ; Common S. (*V. officinalis*) and Germander Speedwell (*V. chamædrys*), both azure blue flowers, are common on waysides.

SPEKE, JOHN HANNING (1827–64), Eng. explorer; b. near Ilchester, Somersetshire. In his first expedition he explored Lake Tanganyika; discovered Victoria Nyanza and became certain that it was the source of the Nile. In 1860 he made a second expedition to corroborate his conjecture, and from the lake followed the course of the Nile for a considerable distance. His works are: *Journal of the Discovery of the Source of the Nile* and *What Led to the Discovery of the Source of the Nile.*

SPELL, see INCANTATION.

SPELLO (43° N., 12° 40′ E.) (ancient *Hispellum*), small town, Perugia, Italy. Pop. 5700.

SPELMAN, SIR HENRY (*c.* 1564–1641), Eng. antiquary; for Speed's *Theatre of Great Britain* he wrote an account of Norfolk. His masterpiece was his *Concilia, decreta, leges, constitutiones in re ecclesiarum orbis Britannici*, an examination of the documents relative to Church history.

SPELTER, see ZINC.

SPENCER (42° 15′ N., 72° W.), town, Worcester County, Massachusetts, U.S.A.; boots, wire. Pop. (1910) 6740.

SPENCER, HERBERT (1820–1903), Eng. philosopher; b. Derby; sub-editor of *Economist*, 1848–53; first studies were principally on political and social questions; expounded *Synthetic Philosophy* in voluminous writings from *First Principles* (1862) to *Data of Ethics* (1879); endeavoured to include all sciences in one comprehensive system.

S.'s philosophy is based on evolution; he accepts the associationist psychology, but seeks to explain all types of being and activity by a broader law, of which association is only a special case. All organic development is a change from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; a law not self-evident, but amply verified from experience; applicable to all kinds of phenomena, since these are component parts of one universe. Assumptions are, knowledge limited to relations, behind phenomena an inscrutable absolute, the postulates of space, time, matter, motion, force, all traceable to persistent force. The goal of evolution is equilibrium, the balance of contending forces. See SOCIOLOGY.

Spencer, *Autobiography* (2 vol's, 1904); Duncan, *Life and Letters* (1908).

SPENCER, JOHN CHARLES SPENCER, 3RD EARL (1782–1845), Brit. statesman; M.P. for Northampton, 1806–32; Chancellor of the Exchequer and leader of House of Commons, 1830; took important part in carrying through Reform Bill; brought in Poor Law Amendment Bill, 1834; main support of Melbourne administration, 1834; universally trusted.

SPENCER, JOHN POYNTZ SPENCER, 5TH EARL (1835–1910), Brit. (Liberal) statesman; Lord-Lieut. of Ireland, 1868–74, 1882–85; Pres. of Council, 1880, 1886; First Lord of Admiralty, 1892–95.

SPENER, PHILIPP JAKOB (1635–1705), Ger. Lutheran divine; lecturer at Strassburg; Lutheran pastor at Frankfort-on-Main, Dresden, and Berlin; helped to found Halle Univ.; leader of Pietist movement; a voluminous writer.

SPENNYMOOR (54° 42′ N., 1° 35′ W.), town, Durham, England; collieries, ironworks. Pop. (1911) 17,914.

SPENSER, EDMUND (1552–99), Eng. poet; b. London; ed. Merchant Taylors' School and Pembroke Coll., Cambridge. After distinguishing himself at Cambridge he became known to Sir Philip Sidney, published his *Shepheard's Calendar*, and was at once hailed as the coming poet. In 1580 he received an appointment in Ireland, followed in 1586 by a grant of land near Cork. In that year he published *Astrophel*, an elegy on Sidney, and in 1590, at Raleigh's instance, came to court and issued the first part of his long allegorical poem, the *Faërie Queene* (begun 1580), with a dedication to Queen Elizabeth, followed by a collection containing *The Teares of the Muses* and *The Ruins of Time*. Returning to Ireland, he married Elizabeth Boyle in 1594, in whose honour he wrote the magnificent *Epithalamion*. Once more in England he published in 1596 the second part of the *Faërie Queene*, and the *Prothalamion*, written to celebrate a marriage in the Earl of Worcester's family. In 1598 he was appointed Sheriff of Cork, but after having his castle burnt and one of his children killed by rebels, he returned to London and died there in poverty and disappointment. His poetry is remarkable for grace and melody and a sumptuous imagination, and he has enriched Eng. lit. with a stanza, called after him, the *Spenserian* stanza (eight lines of Iambic Pentameter, followed by an Alexandrine; rhyming *a b a b b c b c c*). For the influence he has exercised upon succeeding poets he has been well named 'The Poet's Poet.'

Grosart's edition of the poems, 10 vol's (1882–84); Globe Edition (1899); Dean Church, *Life* (in the E.M.L. Series, 1879).

SPENSERIAN STANZA, a stately form of Eng. verse, so called from its use in Spenser's *Faërie Queene*. Byron adopted it in *Childe Harold*.

SPERANSKI, COUNT MIKHAIL MIKHAILOVICH (1772–1839), Russ. politician; favourite minister of Tsar Alexander I.; drew up new constitution; charged with treason, 1812, and dismissed for time; afterwards became gov. of Siberia; councillor of state, 1821.

SPERM WHALE, CACHALOT, see WHALES.

SPERMATOZOA, see REPRODUCTION.

SPERMBERG (51° 34′ N., 14° 23′ E.), town, on an island of the Spree, Brandenburg, Prussia; manufactures cloth.

SPESSART (50° N., 9° 28′ E.), wooded region (rising to height of about 2000 ft.), Hesse-Cassel, Prussia.

SPEUSIPPUS (d. 339 B.C.), a nephew of Plato; became on latter's death head of the Academy.

SPEY (57° 40′ N., 3° 7′ W.), swift river, Scotland; rises in Highlands and enters Moray Firth; length, 110 miles; extensive salmon fisheries.

SPEZIA (44° 6′ N., 9° 48′ E.), fortified town, watering-place on Bay of Spezia, Genoa, Italy; chief Italian arsenal and naval station; docks and shipbuilding yards; exports olive oil; near remains of ancient Luna. Pop. (1911) 66,263.

SPHÆROTHERIUM, a genus of Millipedes; see MYRIAPODA.

SPHAGNALES, see under BRYOPHYTA.

SPHEGIDÆ, see WASPS.

SPHENISCIDÆ, PENGUINS (*q.v.*).

SPHENODON, HATTERIA, TUATARA, a scaly, lizard-like animal with comb-like crest, found only in

New Zealand. It is a living fossil, the only modern representative of the great Reptilian order *Rhynchocephala*, which began in Permian times.

SPHENOID BONE, see SKULL.

SPHENOPHYLLALES, see PALÆOBOTANY, PTERIDOPHYTA.

SPHERE, a solid bounded by a single surface, every point of which is the same distance from a fixed point, called the centre of the s. Any plane through the centre cuts the surface in a *great* circle. Volume of s. $=\frac{4}{3}\pi r^3$; surface area $=4\pi r^2$, where r is the radius.

SPHERES, MUSIC OF THE.—The Pythagoreans held that the ten heavenly bodies revolving round the central fire (viz. the counter-earth, earth, moon, sun, five planets, and heaven of the fixed stars) produce musical notes.

SPHERES OF INFLUENCE.—The provisional appropriation of territories by one power is recognised as a sphere of influence by other powers. A boundary of this sphere is agreed upon, and every form of aggrandisement in that region must be abstained from by each power that is a party to the agreement, which is really a reciprocal acknowledgment of abstention from territorial expansion in certain directions. Sometimes the sphere of influence is acknowledged by an agreement that territory shall not be alienated, as in the agreements by China with Britain in 1898, and with France in 1897. The granting of leases of territory by one country to another gives the lessee a sphere of influence over that territory, as does also the right by treaty of protectorate and administration.

SPHERICAL HARMONICS.—A *solid spherical harmonic* of the mth degree may be defined as a homogeneous rational integral algebraic function of x, y, and z, $S_m(x, y, z)$ of the mth degree satisfying the equation $\nabla^2 S_m(x, y, z)=0$; and a *surface spherical harmonic* of the mth degree as such a function divided by $(x^2+y^2+z^2)^{\frac{m}{2}}$, that is by r^m. Here ∇^2 stands for the differential operator $\left(\frac{d^2}{dx^2}+\frac{d^2}{dy^2}+\frac{d^2}{dz^2}\right)$.

The equation $\nabla^2 V=0$ is known as *Laplace's equation*, and when transformed to spherical co-ordinates it takes the form

$$rD_r^2(rV)+\frac{1}{\sin\theta}D_\theta(\sin\theta\,.\,D_\theta V)+\frac{1}{\sin^2\theta}D_\phi^2 V=0 \quad . \quad \text{(i.)}$$

where D_r is put for $\frac{d}{dr}$, etc. Important particular solutions of (i.) are

$$V=r^n\,(A\cos n\phi+B\sin n\phi)\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n} \quad . \quad \text{(ii.)}$$

$$\text{and } V=\frac{1}{r^{m+1}}(A\cos n\phi+B\sin n\phi)\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n} \quad . \quad \text{(iii.)}$$

where m and n are positive integers, and $n<m+1$.

$P_m(x)$ is a *Legendre Coefficient*, or *Surface Zonal Harmonic*, and is a solution of Legendre's equation

$$D_x[(1-x^2)D_x P]+m(m+1)P=0.$$

$$P_m(x)=\frac{(2m-1)(2m-3)\ldots 1}{m!}\left[x^m-\frac{m(m-1)}{2(2m-1)}x^{m-2}+\frac{m(m-1)(m-2)(m-3)}{.4\,.\,(2m-1)(2m-3)}x^{m-4}-\ldots\right].$$

The function of $P_m(\mu)$ occurring in (ii.) and (iii.) $\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}$ is an associated function of the nth order and mth degree, and may be represented by $P_m^n(\mu)$. Cos $n\phi P_m^n(\mu)$ and $\sin n\phi P_m^n(\mu)$ are called *Tesseral Harmonics* of the mth degree and nth order, and satisfy the equation

$$m(m+1)V+D_\mu[(1-\mu^2)D_\mu V]+\frac{1}{1-\mu^2}D_\phi^2 V=0 \quad . \quad \text{(iv.)}$$

There are $2m+1$ Tesseral Harmonics of the mth degree—

$$P_m(\mu),\ \cos\phi\sin\theta\frac{dP_m(\mu)}{d\mu},\ \sin\phi\sin\theta\frac{dP_m(\mu)}{d\mu},$$

$$\cos 2\phi\sin^2\theta\frac{d^2P_m(\mu)}{d\mu^2},\ \sin 2\phi\sin^2\theta\frac{d^2P_m(\mu)}{d\mu^2},$$

$$\ldots\ldots\ldots\ldots\ldots$$

$$\cos m\phi\sin^m\theta\frac{d^mP_m(\mu)}{d\mu^m},\ \sin m\phi\sin^m\theta\frac{d^mP_m(\mu)}{d\mu^m}.$$

If each of these is multiplied by a constant and their sum taken, we get a *Surface Spherical Harmonic* of the mth degree, and this is a solution of equation (iv.). It is represented by $Y_m(\mu, \phi)$, or by $Y_m(\theta, \phi)$. Hence we have

$$Y_m(\mu_1\phi)=\sum_{n=0}^{n=m}\left[A_n\cos n\phi\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}+B_n\sin n\phi\sin^n\theta\frac{d^nP_m(\mu)}{d\mu^n}\right].$$

Any homogeneous rational integral algebraic function $S_m(x, y, z)$ of the mth degree in x, y, and z, which is a value of V satisfying $\nabla^2V=0$, contains $2m+1$ arbitrary constant coefficients. In general it has $\frac{1}{2}(m+1)(m+2)$ coefficients; but $\nabla^2S_m(x, y, z)=0$ gives rise to $\frac{1}{2}m(m-1)$ equations of condition between these coefficients, leaving $2m+1$ coefficients undetermined. We can therefore choose the coefficients in $r^mY_m(\mu_1\theta)$, so that it will transform into any given $S_m(x, y, z)$. Hence the definition given at first.

In finding the Potential Function in problems in electrostatics or gravitation, if we have the value given as a function of θ and ϕ for some given value of r (*i.e.* on surface of some sphere with centre at origin), and if we can express it in terms of spherical harmonics of θ and ϕ, we have only to multiply each term by the proper power of r to get the solution of the problem; for we then have a value of V satisfying Laplace's equation, and reducing to the given function of θ and ϕ on the surface of the given sphere; *e.g.* suppose we require to find the value at an external point of the potential function due to the attraction of a solid sphere, whose density at any point is proportional to the product of any power of the radius vector by a Surface Spherical Harmonic.

Let $\rho=Cr_1^kY^m(\mu_1, \phi_1)$; then we have

$$V=\int_0^a dr_1\int_0^{2\pi}d\phi_1\int_{-1}^{1}\frac{Cr_1^kY^m(\mu_1, \phi_1)r_1^2d\mu_1}{\sqrt{r^2-2rr_1\cos\gamma+r_1^2}}$$

which reduces finally to $\frac{4\pi C}{2m+1}\cdot\frac{a^{m+k+3}}{n+k+3}\cdot\frac{Y_m(\mu, \phi)}{r^{m+1}}$.

Another problem is the following: A conducting sphere, radius a, earth-connected by a wire, is placed in the field of an electrified point charged with m units; find the potential function due to the induced charge. The solution is easy in terms of Zonal Harmonics, and shows the effect of the induced charge is the same at an external point as if the sphere were replaced by ma/b units of electricity at the point $r=a^2/b, \theta=0$, where b is the distance of the centre of the sphere from the point charge.

Ferrers, *Spherical Harmonics*; Todhunter, *Laplace's, Lamé's, and Bessel's Functions*; Byerly, *Fourier's Series and Spherical Harmonics*; Thomson and Tait, *Natural Philosophy*.

SPHERULITES, small rounded bodies, a mixture of quartz and acid-feldspar, found in vitreous igneous rocks, common in acid glassy rocks, and also in basic rocks such as tachylyte; visible in obsidian as tiny rounded bodies of different colour from obsidian.

SPHINX (classical myth.), she-monster of Bœotia who propounded the riddle: 'What animal has four feet, two feet, three feet, and one voice; when it has most feet it is weakest?' Œdipus answered: 'Man; he crawls on all fours when a child, and in age uses a third foot—a staff.' On hearing the answer she

slew herself. The Sphinx in Egypt is a huge figure with lion's body and paws, woman's face and breast.

SPHYGMOGRAPH, see FLIGHT.

SPHYRNA, see under SHARKS AND DOG-FISHES.

SPIDERS (Order *Araneæ*, *Araneida*, or *Araneina* in Class ARACHNIDA).—Spiders are easily to be distinguished from their Arachnid relatives by their narrow 'waist' and by the presence at the hinder end of the body of a cluster of spinnerets, usually six or eight in number. Apart from these their most striking characters are a pair of grasping two-jointed cheliceræ above the mouth, the last joint of which is sharp and bears the opening of a poison gland; the presence for respiration of tracheæ and of two or four 'lung-books'—leaf-like plates within which blood circulates while an air current washes them; and in the male the modification of pedipalps as depositors of spermatozoa. Most spiders have eight eyes. In some cases the males are smaller than the females, which occasionally punish an undesirable suitor by devouring him.

S's have exceedingly small mouths and can consume only liquid food, sucked from their prey. This consists mostly of insects, caught in the familiar webs, or by lurking and stealth as in the giant MYGALE, which has been seen to catch small birds, or by active pursuit, as in the WOLF SPIDERS (*Lycosidæ*), which include the TARANTULAS, and JUMPING SPIDERS (*Salticidæ* or *Attidæ*).

S's are perhaps best known, however, on account of their spinning, silken threads being woven into galleries, as in the nest of the TRAP-DOOR SPIDERS (e.g. *Atypus* and *Cteniza*), into rough protections for the eggs, or simple platforms before the nest, as in the HOUSE SPIDER (*Tegenaria domestica*), into beautiful orb-webs built in Brit. gardens, generally by the COMMON GARDEN SPIDER (*Epeira diademata*), or into air-storing, thimble-shaped huts in which the WATER SPIDER (*Agyroneta aquatica*) lives beneath the surface of ponds. Young spiders often use a silken thread as a balloon, the threads being wafted by the wind and forming the well-known 'gossamer' of autumn.

The eggs of spiders are protected in cocoons, and the young moult about eight times before adult life is reached.

SPIKENARD, perfume used in unguents by Oriental races; made from nard (*Nardostachys jatamansi*); contained balm and myrrh; popular in Rome; for Biblical reference see *John* 12^{3-5}.

SPILLIKINS, ancient game played with small sticks flung in a heap; object to draw out one stick without disturbing the rest.

SPINACH (*Spinacia*), genus of plants, order Chenopodiaceæ; Common S. (*S. oleracea*), the vegetable, is cultivated for its tender leaves, which are cooked.

SPINAL ACCESSORY, see NERVOUS SYSTEM.

SPINAL CORD is the term applied to that part of the central nervous system within the spinal or vertebral canal. It is from 16 to 18 inches in length, extending from the opening in the base of the skull, where it becomes continuous with the medulla oblongata, to the upper border of the second lumbar vertebra, below which point it is represented by a thread-like structure, not of nervous tissue, termed the *filum terminale*. Like the brain it is enclosed in three membranes: the *pia mater*, closely applied to the cord; the *arachnoid mater*, a delicate middle membrane; and the *dura mater*, less closely applied, however, to the vertebral column than that of the brain is to the skull.

The s. c. is a somewhat flattened cylinder, thicker in the cervical region where the nerves forming the brachial plexus leave it, and in the lumbar region where the nerves forming the lumbar and sacral plexuses have their origin from it. It is divided into halves by the anterior median fissure in front and the posterior median septum behind, which are best observed in a transverse section of the cord, the anterior median fissure being wider but much less deep than the posterior median septum.

Like the brain, the s. c. consists of *grey* and *white matter*, the grey matter being arranged, as is seen on transverse section of the cord, in a crescentic form in the centre of each lateral half of the cord, the two being joined by a bar in the middle, so that the whole has roughly the shape of the letter H. In the centre of the middle bar, or *grey commissure*, is the central canal, which extends throughout the length of the cord and is continuous above with the fourth ventricle of the brain. The anterior limbs of the H-shaped grey matter are termed the *anterior horns*, and are larger and broader than the posterior limbs, or *posterior horns*. With the anterior horns the anterior nerve roots, containing motor nerve fibres taking origin from the nerve cells of the anterior horn, are connected, while with the posterior horns the posterior nerve roots are connected, containing sensory nerve fibres taking origin from the nerve cells in the ganglia outside the cord and linking up with the nerve cells of the posterior horn.

The white matter of the cord surrounds the grey, passing in front of the grey commissure to join the white matter of the other side and forming the *white commissure*. It is composed of nerve fibres and of neuroglia and is arranged in definite longitudinal tracts which have been mapped out by various experimental methods, but which are not visible in a transverse section of the cord on examination by the naked eye or by the microscope. The posterior column, between the posterior nerve roots and the posterior median septum, is composed of the *tract of Goll*, next to the septum, and the *tract of Burdach*, next to the posterior nerve roots, while in the middle of the latter tract is the *comma tract of Schultze*. The lateral column, on the external aspect of the cord between the posterior and the anterior nerve roots, is composed (from behind forwards) of, first, the *tract of Lissauer*, on the surface beside the tip of the posterior horn; then, externally, the *direct cerebellar tract*; internally, the *crossed pyramidal tract*; farther forward, externally, the *tract of Gowers*; and, internally, the *antero-lateral ground bundle*, which includes part of the column on the internal side of the anterior nerve roots. On the side of the anterior fissure is the *direct pyramidal tract*. The direct and the crossed pyramidal tracts contain the motor fibres from the cortex of the brain running to the anterior horn of grey matter, forming the upper segment of the path of motor impulses, while the other tracts conduct sensory nervous impulses upwards to the brain, or contain fibres which form connections for nerve cells at different levels in the cord.

The **nervous system** is built up of an aggregation of *neurons*, a neuron consisting of a nerve cell which gives off a number of branching processes and also one branch which is a nerve fibre, termed the *axon*, or *axis cylinder*; by means of the processes nervous impulses are conducted to the cell, and are then transmitted by the axis cylinder away from the cell, either so as to come into relation with the collecting processes of another cell or to the termination of the axis cylinder in a sense-organ. The path of motor impulses from the brain is in two segments, each composed of a neuron, the axis cylinder of the upper extending from a nerve cell in the motor area of the cortex of the brain to the anterior horn of grey matter in the spinal cord; the axis cylinders conducting the impulses compose the direct pyramidal tract, which is on the side of the anterior fissure, and the crossed pyramidal tract, which is situated internally in the lateral column of the spinal cord. The lower segment of the motor path is composed of a neuron which has an axis cylinder extending from a nerve cell in the anterior horn of grey matter of the spinal cord, the processes of which come into relation with the axis cylinder of the upper neuron, to the termination in a muscle.

The path of sensory impulses is in three segments, the lowest being a neuron, with its nerve cell (from which a process goes to the muscles, skin, or mucous membranes), in the ganglion of the posterior root of a spinal nerve, and the axis cylinder going into the

spinal cord, where it takes part in the composition of one of the tracts of white matter, ending eventually in the medulla oblongata. In the medulla oblongata it comes into relation with the processes of the nerve cell of the neuron of the second segment of the path, and the impulse is transmitted by the axis cylinder of this nerve cell to the brain, where it ends in one of the internal nuclei of grey matter. The upper segment of the path consists of a neuron composed of a nerve cell in the nucleus of grey matter, the processes of which come into relation with the termination of the axis cylinder of the second neuron, which sends an axis cylinder to come into relation with the processes of one of the motor nerve cells of the motor area of the brain cortex.

REFLEX ACTION, as, for instance, when the foot is moved automatically in response to tickling the sole, is brought about by the nervous impulse travelling by the afferent sensory fibres to the nerve cells in the ganglion of the posterior root of the spinal nerve, and being then short-circuited by a branch from this nerve cell to the nerve cell of the lower segment of the motor path in the anterior horn of grey matter of the spinal cord, and being then transmitted by the efferent motor fibres to the muscles.

Diseases of Spinal Cord.—The s. c. may be affected by *meningitis* (*q.v.*), or inflammation of the membranes which enclose it, designated as external or internal, according as it commences outside or inside the dura mater, while it may take an acute or a chronic form. *Myelitis*, or inflammation of the substance of the cord, may follow exposure, may be due to the toxins of measles, enteric fever, and other infections, or may be an extension of disease of the vertebral column or of the spinal membranes. There is loss of feeling and weakness and eventually paralysis of the muscles below the level of the part of the cord affected, further symptoms depending upon the extent of the lesion. The treatment is rest and application of fomentations, with tonics, massage, and electricity in the later stages if the condition becomes more chronic.

Acute anterior poliomyelitis is a condition of inflammation of the anterior horn of grey matter of the cord, usually occurring in childhood, due to cold, injury, or the toxins of infectious diseases. There is usually pain, fever, and paralysis of one or more limbs, the muscles of which become flabby and wasted. With rest, fomentations, and, after the acute stage, plenty of fresh air, tonics, and massage, there is generally great improvement, but complete recovery is unusual. *Syringomyelia* is a condition in which a cavity is formed in the s. c., usually from dilatation of the central canal, with increase of neuroglia. The condition is incurable, but the person affected may live for many years; the general health should be kept up, and tonics, especially strychnine, given. See BRAIN, NERVOUS SYSTEM, MUSCLE (for connection of nervous system with muscular contraction), LOCOMOTOR ATAXIA, SCIATICA.

SPINAL NERVES, see NERVOUS SYSTEM.

SPINAZZOLA (40° 58′ N., 16° 4′ E.), town, Bari, Italy; fruit and oil. Pop. *c.* 11,900.

SPINEL, group of minerals, and variety of corundum occurring in regular crystals; composed of alumina, magnesia, silica, and protoxide of iron; colours—red, black, blue, yellow, and green; used for ornamental stones as jewellery; found in river beds of Ceylon and Siam, and embedded in carbonate of lime in N. America. See RUBY.

SPINET, predecessor of pianoforte (*q.v.*); small keyboard, single string to each note; used in XVII. cent. *Virginal* (or 'pair of Virginals'), small spinet without legs.

SPINIFEX, PORCUPINE GRASS (*Triodia irritans*), coarse Australian grass growing in tufts 2–4 ft. high.

SPINNING, the twisting of fibres of cotton, flax, silk, wool, etc., into threads of uniform size ready for weaving. S. was formerly accomplished by means of a distaff round which the fibres were coiled; a spindle was turned by the operator, whose left hand guided the fibres while the finger and thumb of the right fashioned them into a thread; later the spindle was placed in a frame and revolved from a large wheel, worked by a treadle. Such apparatus only produced a single thread at a time; the inventions of Arkwright (*q.v.*), Crompton (*q.v.*), and Hargreaves (*q.v.*) revolutionised spinning.

SPINOLA, AMBROSE, MARQUIS DE LOS BALBASES (1569–1630), Span. soldier; b. Genoa; served in Low Countries; successfully besieged Ostend, 1604, and other towns; relieved Ghent, 1605; supported Emperor Ferdinand II. in Palatinate in beginning of Thirty Years War; returned to Netherlands, 1621; took Jülich, 1622, Breda, 1624.

SPINOZA, BARUCH, or BENEDICT (1632–77), philosopher; b. Amsterdam, of Jewish parents; ed. in Hebrew faith, but expelled as a heretic; supported himself by polishing lenses, while occupying leisure in philosophical studies; principal works, *Principles of the Philosophy of Descartes* (1663), *Tractatus Theologico-Politicus* (1670), *De Intellectus Emendatione, Ethica* (posthumous).

S. retains the dualism of mind and matter, but as an opposition of attributes, not of substances, as with Descartes (*q.v.*). This method is mathematical, following a hint given by Descartes. From definitions of Substance, Attribute, Mode, he deduces a system of parts logically connected, claiming for it the certainty of geometrical deductions. Substance is the great reality underlying phenomena (*substans*); eternal, infinite, cause of itself and of all things, identical with God. God is the ultimate principle from which all things proceed; His essence is expressed by the 'Attributes,' mind and matter, thought and extension, through which substance is revealed to the human mind; independent of each other, and needing in the case of man a 'law of parallelism' to explain their apparent interaction. Modes, which with attributes explain things as we find them, are modifications of the attributes; of thought,—idea, wish, feeling; of extension,—every visible thing.

S.'s aim is practical; the way to perfection is intellectual, through a mind cleared of all illusions, and wholly absorbed in the divine substance. God is denied personality; freedom is replaced by absolute necessity; we are free only as sharing the nature of God, who everywhere acts necessarily, by the laws of His own nature.

Caird, *Spinoza* (1888); Pollock, *Spinoza, Life and Philosophy* (1880).

SPION KOP (28° 30′ S., 29° 40′ E.), hill, near the Tugela, Natal, S. Africa; scene of a British repulse in Transvaal War, Jan. 1900.

SPIRÆA, genus of plants, order Rosaceæ; includes Meadow Sweet or Queen of the Meadows (*S. ulmaria*), famous for its scent, and many cultivated flowers.

SPIRE (O.E. *spir*, a blade of grass), a tapering pointed roof, crowning a tower of church or other building; favourite feature of Gothic architecture; great variety of forms; common type, octagonal s. on square tower; *broach* s. has no parapet at base; many s's are exceedingly high, and some (*e.g.* St. Stephen's, Vienna) ornamented with elaborate tracery. The highest s's are Ulm, 532 ft.; Cologne, 512; Rouen, 483. Other famous s's are St. Nicholas, Hamburg (480), Strassburg (464), St. Peter's, Rome (440), Salisbury Cathedral (404), Chartres, and St. Mary's, Oxford.

SPIRES, SPEYER (49° 18′ N., 8° 26′ E.) (ancient *Augusta Nemetum* or *Noviogamus*), town, on Rhine, Bavaria, capital of the Palatinate; bp.'s see; cathedral (1030); the Reformers first were called Protestants at the famous Diet of 1529. Pop. (1910) 23,045.

SPIRIGERA, a group of INFUSORIA (*q.v.*).

SPIRITS are distilled alcoholic liquids. The alcohol is produced by fermentation of fruit juices, cane sugar, molasses, beet sugar, and starchy products (grain, potatoes).

Brandy, when genuine, is distilled from fermented grape juice (wine). The best Fr. brandy is made in and around *Cognac* (whence name) from a small, white grape. Inferior brandy comes from Spain, Portugal, and Italy. The colourless, distilled s. is diluted and matured in oaken casks, whence it derives a pale colour; a deeper colour is sometimes imparted by caramel. The characteristic aroma and flavour of brandy depend on the wine from which it is distilled, but are developed by maturing, through the slow formation of esters (*q.v.*). Besides alcohol and water, the chief constituents of brandy are acetic acid, ethyl acetate, ethyl œnanthate, volatile oil, colouring matter, and tannin derived from the storage cask. Average brandy contains 45 to 55 % alcohol by weight, and 80 to 100 milligrammes esters to 100 c.c. alcohol. Special brandies, *e.g.* plum brandy, cherry brandy, are distilled from fruit. Much brandy is factitious, being made by adding the necessary esters, colouring matter, etc., to *silent spirit*, *i.e.* pure diluted alcohol.

Whisky, which contains about 55 % alcohol, is the s. distilled in a pot still from the fermented wort of malted barley or other grain. Scotch w. has a special flavour derived from the peat used in drying the malt. Freshly distilled w. contains fusel oil (*q.v.*), which disappears on storage in casks. Factitious w. is made from silent spirit, suitably diluted, coloured and flavoured.—**Gin**, which contains about 40 % alcohol, is a grain s., uncoloured, but flavoured by distillation with juniper berries, or other aromatic substances.—**Rum**, containing 50 to 60 % alcohol, is distilled from fermented molasses (see SUGAR). Its characteristic flavour is due to ethyl acetate and butyrate. Factitious rum is made by adding these flavourings to diluted grain s.—**Liqueurs and Cordials**, which contain 20 to 60 % alcohol, are mixtures of alcohol, water, flavouring essences, and sugar.—**Absinthe** is grain s. flavoured with wormwood.—**Arrack** is the spirit obtained from rice and the cocoanut palm.

Alcohol to be employed for making factitious spirits, or for various industrial purposes, is obtained from the starch of barley, rice, corn, rye, or potatoes, or from molasses. The starch extracted from the grain is converted into maltose at about 63° C.; and the wort is fermented at 20°–25° C. during three days The turbid product, or mash, containing 10 to 13 % alcohol, is submitted to continuous distillation, generally in Coffey's still. In this process the alcohol is removed as vapour from the mash by means of steam, from which it is separated by dephlegmation, *i.e.* fractional condensation. The product is rectified spirit. By repeated rectification the alcohol in the distillate may reach 95 %. To prepare absolute alcohol a drying agent is necessary.

Proof Spirit contains 49 % alcohol by weight; at 51° F. 13 volumes weigh the same as 12 volumes water. The strength of s. was originally 'proved' by gunpowder; s. *under proof* failed to ignite the powder when it burnt out. Spirit 30 degrees under proof contains 70 volumes of proof spirit and 30 volumes of water; 100 volumes of spirit 50 degrees over proof diluted with water to 150 volumes would give proof spirit.—**Rectified Spirit** (Brit. Pharmacopœia) contains 85·65 % alcohol by weight.—**Methylated Spirit**, sold duty free, contains 90 % ethyl alcohol with 10 % crude wood s. (methyl alcohol).

Duty-free alcohol is now sold under special permit for purposes of scientific teaching and research in recognised institutions. Alcohol is used for making tinctures, perfumes, transparent soap, varnishes, dyes, ether, chloroform, fine chemicals, celluloid, collodion, and artificial silk; also for preserving anatomical specimens, and as a means of heat, light, and motive power.

SPIRITUALISM, name given to a movement, in existence since 1848, which might be called religious, philosophical, or scientific, and which believes in the communication with 'another world' and the existence of phenomena which cannot be explained by ordinary physical laws. The reality and validity of s. has been hotly discussed, and whatever opinion be held it cannot be denied that, although there has been much both of unconscious self-deception and of conscious fraud, there are admittedly phenomena for which no adequate explanation has been given outside the spiritualistic assumptions. *Séances* with *mediums* are often very unsatisfactory, and a medium is admittedly not quite reliable and may give false information or no information at all. The physical phenomena of s., such as table-turning, which involve not communication with the departed but the existence of forces in nature otherwise unknown, are disputable. It cannot be denied that here, as with communication though mediums, there has been much deception. Much good work in exposing fraud and sifting evidence has been done by Society for Psychical Research (1882), in which the late F. W. Myers was prominent.

Myers' *Human Personality and its Survival of Bodily Death.*

SPITALFIELDS, district, Stepney, London, England, 1 mile N.E. of St. Paul's; seat of silk-weaving industry.

SPITHEAD (50° 44′ N., 1° 4′ W.), roadstead, English Channel, between Portsmouth and Isle of Wight.

SPITI (32° N., 78° E.), district, Kangra division, Punjab, India; traversed by river Spiti. Pop. 3500.

SPITZBERGEN (76° to 80° 48′ N., 10° to 30° E.), archipelago of five large islands and several smaller ones, situated in Arctic Ocean about 400 miles N. of Norway; largest are West Spitzbergen, North-East Land, and Edge Island; total area *c.* 22,000 sq. miles; surface is generally mountainous, reaching an extreme height of over 5500 ft. in island of Prince Charles Foreland. The summits are covered with perpetual snow, and there are many glaciers. There is little vegetation, chiefly mosses and sedges. Animals include reindeer and polar bears. During the short summer the islands are visited by Norweg. and Russ. walrus-hunters; seals and whales were formerly numerous, but are now fast disappearing. The islands have no permanent population, and have not been taken possession of by any country; first discovered by a Dutch explorer, 1596.

SPLEEN, a solid vascular organ, situated deeply in the upper part of the abdomen at the left side, behind the stomach, with which a large part of its interior surface is in contact. It has no duct, and does not produce any secretion, communicating with the rest of the body by its blood-vessels, nerves, and lymphatics. It is covered with a strong capsule; and internally is of a soft, pulpy consistence, with little white patches, composed of lymphoid tissue investing the blood-vessels, scattered through it. The arteries open into the loose tissue which composes the pulp, and the blood flows through it before entering the veins. The functions of the spleen are, probably, the destruction of worn-out red blood corpuscles, certainly the formation of new corpuscles, white and red, chiefly the former variety, while it acts as a blood filter, and has a controlling influence upon the blood stream. It has been shown that the spleen is not essential to life, and that, when it has been excised, its functions have been assumed to some extent by the lymphatic glands and bone-marrow. In certain diseases, particularly in blood diseases, *e.g.* splenic leucocythæmia, and in fevers, the spleen may become enlarged, sometimes to an enormous extent, and to reduce its size the application of the X-rays has been employed with success. See DUCTLESS GLANDS.

SPLÜGEN PASS (46° 30′ N., 9° 20′ E.), Alpine pass (6946 ft.), between canton Grisons, Switzerland, and Lombardy, Italy.

SPODUMENE, a mineral belonging to pyroxene group; colours—lilac, green, grey; used as gem stones; occurs in granite and crystalline schists.

SPOHR, LUDWIG (1784–1859), Ger. composer and brilliant violinist; b. Brunswick; composed and appeared in public from earliest childhood; app. director of Theater an der Wien, Vienna, 1813; visited London, 1820; composed *Faust*, *Jessonda* (operas), *Die letzten Dinge* (oratorio), nine grand Symphonies, violin concertos, etc.; wrote a complete and invaluable *violinschule*; an original composer and master of form, but utterly lacking in critical faculty.

SPOIL-FIVE, Irish card game; five cards dealt; suit followed with certain exceptions; ace of hearts always trump; game of three tricks.

SPOKANE (47° 45′ N., 117° 25′ W.), city, on Falls of Spokane, capital, Spokane County, Washington, U.S.A.; seat of Gonzaga College and other collegiate institutions; extensive trade in lumber; flour- and saw-mills. Pop. (1910) 104,402.

SPOLETO (42° 44′ N., 12° 44′ E.), town, Umbria, Italy; archiepiscopal see; has XI.-cent. cathedral containing frescoes by Filippo Lippi, and fine church dedicated to St. Agostino. Rom. remains include ruined theatre and triumphal arch; was seat of government of dukes of S. in early times; passed into possession of popes, XIII. cent. Pop. 25,500.

SPONDEE, see PROSODY.

SPONDYLUS, see under LAMELLIBRANCHIATA.

SPONGES, PORIFERA (Lat. *porus*, 'a passage'; *fero*, 'I bear').—On account of their use in the economy of mankind, sponges have been known from earliest times. There were many early guesses at their nature, but now it is agreed that sponges are sedentary, plantlike animals of low organisation, the habits of which have impressed upon them a vegetative form. They stand apart from all other groups of animals—the simplest type of many-celled creatures (*Metazoa*).

TOILET SPONGE (after Lydekker), with Flagellated Chambers.

From other groups of animals they may be distinguished by their simplicity. Many of them possess a porous, 'spongy' texture, but apart from this they have only lack of character to characterise them. They have no definite external organs. They vary in shape from encrusting masses, such as the BREADCRUMB SPONGE (*Halichondria*) of British coasts, to giant cups 4 ft. high, as NEPTUNE'S CUP (*Poterion*) of Pacific seas. Their colour varies from pale yellow and brown to rich browns and reds. Many are tough and fleshy like the BATH SPONGE (*Euspongia*), others are hard and stony, or leathery, or net-like, or resembling spun glass, but in each case the essential structure is the same.

The sponge body consists of a mass of cells of various kinds, forming a delicate tissue, and this is supported on a skeleton formed of minute rods, or spicules, of calcite (carbonate of lime), of silica (oxide of silicon), or of a horny organic substance—spongin.

In spite of the fact that neither muscular nor nervous systems are present, the sponge body still exhibits an indefinite sensibility, for changes in the surrounding water cause openings and contractions of pores and of the 'mouth' opening, or osculum. Only in connection with its nourishment does the sponge show activity, and even then in a restricted sense. Exceedingly active, whip-like flagella, by their lashings to and fro, cause an inflow of water from the exterior through the pores to internal chambers, and out again by the larger openings, or oscula, visible on the sponge surface. The constant stream of water furnishes the chief means of aeration and respiration, and from it also the food-supply—diatoms and Protozoa—is obtained. It has recently been asserted that the sponge can also utilise as food the organic compounds dissolved in the water. The flagellate cells act, besides, as excretory organs, the rejectamenta being borne away by the exhalant currents.

Three methods are utilised by sponges in propagating their kind. The simplest method, found in all lowly types of animals and in plants, is that of budding. A bud arises on the parent sponge like it in all essential characters; it grows, and finally, becoming detached, starts life as a new individual. The second, a less common method, is also asexual, and occurs in, for example, the Freshwater Sponges common in canals in Britain. In the autumn the sponge tissue becomes crowded with minute shot-like yellow grains, and when in early winter the sponge itself dies down and decays, the grains or gemmules are set free, and in the succeeding spring burst into life and give origin to new growths of sponge. Most general, however, is sexual reproduction. The majority of sponges are unisexual, but some types are hermaphrodite. As the result of fertilisation the egg develops, by complete and regular segmentation, within the body of the parent into a larva which escapes, and after a short free life settles down and gives rise to a fixed sponge. It is only during the ciliated larval stages that the sponge has an independent power of movement.

All sponges are aquatic, some preferring the quiet slow-moving fresh waters of lochs and canals, but the vast majority live in the sea, distributed therein in every part of the globe. In favourable localities, generally where the normal temperature is high, as on coral reefs, they grow in great abundance. Most are to be found firmly attached to stones, corals, or shells; others simply anchor themselves in the mud by means of long glassy 'root' threads, as the GLASS-ROPE SPONGE (*Hyalonema*); while still others, like the British SEA-FIGS (*Subarites*), lie rolling upon the sea-bottom. Other animals are sometimes found in friendly and constant association with sponges. Around the stalk of the Glass-Rope Sponge grows a colonial Sea Anemone, *Palythoa*; small shrimps and sea-slaters often inhabit the cavity of VENUS'S FLOWER-BASKET, imprisoned, as it were, in a cage of spun glass, and feeding on the organisms borne to them by the water current created by the sponge; and Hermit Crabs dwell in the cavities of the British Fig Sponge and others.

Sponges are amongst the oldest animals known, their fossil remains having been found in rocks of Cambrian age. From time immemorial they have been used by man. Commercial sponges (*Euspongia officinalis*) are found in the Mediterranean, where the finest varieties occur, and in the West Indies. They are obtained by pronged forks with long handles, by divers, or in deeper water by a drag-net. The sponges, once procured, are left for a few days in the open air to decay, then sunk in the ocean in an open crate for a week; thereafter they are beaten and squeezed clean from fleshy matter and hung in the sun so that the fibrous skeleton may dry.

Sponges fall into three main groups, distinguished by the nature of the spicules composing their skeletons.

Class I. CALCAREA, with calcareous spicules, includes the familiar PURSE SPONGE (*Sycon compressum*) of Brit. coasts.

Class II. HEXACTINELLIDA, or TRIAXONIA, with sex-radiate siliceous spicules, includes the beautiful deep-sea Glass Sponges—Venus's Flower-Basket (*Euplectella*) and the Glass-Rope Sponge (*Hyalonema*).

Class III. DEMOSPONGIÆ, with either siliceous spicules (never sex-radiate), or spongin fibres, or both together, or neither, includes the majority of well-known forms, such as the Sea-Fig (*Subarites*), the encrusting CRUMB-OF-BREAD SPONGE (*Halichondria panicea*), the MERMAID'S GLOVE (*Isodictya palmata*), of Brit. Seas, FRESH-WATER SPONGES (*Spongilla*), and the BATH SPONGE of commerce (*Euspongia*).

SPONGILLA, see under SPONGES.

SPONSOR, person taking responsibility for another's obligation, in especial, godfather or godmother

in baptism (also in confirmation in R.C. Church), who makes the vows in infant's name.

SPONTANEOUS GENERATION, see ABIOGENESIS.

SPONTINI, GASPARO LUIGI PACIFICO (1774–1851), Ital. composer, obtained much contemporary fame for his operas, especially for his masterpiece, *La Vestale*, produced in 1807. His compositions, forgotten now, influenced such diverse natures as Wagner and Meyerbeer.

SPOONBILL, or SHOVELLER; see under DUCK FAMILY.

SPOONBILLS (*Platalcidæ*), a family of stork-like wading birds, with very wide and flat bills; found near shallow fresh waters all over the world, except in Northern Europe, Asia, and America. The White S. (*Platalea leucorodia*) is an occasional visitor to Britain.

SPORADES (37° N., 27° E.), islands of the Gk. Archipelago, consisting of two groups surrounding Cyclades, the northern group belonging to Greece, the southern to Turkey. Pop. *c.* 25,000.

SPORADOPORA, see under HYDROMEDUSÆ.

SPORANGIA, see under MYCETOZOA.

SPORES, see PLANTS (PHYSIOLOGY).

SPOROZOA, a class of Protozoa, the members of which have of recent years assumed great importance to man on account of their agency in malarial fever and in several cattle diseases. Some of their number cause destructive epidemics among fishes, and to one was due the silkworm disease, the ravages of which cost France almost £40,000,000.

All Sporozoa live as parasites in the bodies of other animals, but their tastes in parasitism differ; for while such as the *Gregarines* occur in the food canal and body cavity of Invertebrate animals, the *Coccidians* have both Invertebrate and Vertebrate hosts, and others, for example the *Hæmosporidia*, *Myxosporidia*, and *Sarcosporidia*, are in the main confined to Vertebrate animals.

Besides their inveterate parasitism, Sporozoa are characterised by the definite rind which surrounds the body; by their sluggishness, for, although young stages may be mobile, the adults are generally without locomotor appendages such as the pseudopodia, flagella, or cilia of other Protozoa; and by the fact that they are propagated by means of spores, protected during periods of danger in a cyst or capsule. To this characteristic mode of reproduction is due the name Sporozoa.

But although the typical reproduction is by spore formation, which is preceded by a union of two (male and female) individuals, alternation of this with an asexual generation or series of generations is common, the individuals breaking up into numerous daughter individuals (*merozoites*). The spore-forming mode is known as sporogony, the individuals which increase thus are sporonts; the asexual dividing is schizogony, the partakers in such division schizonts.

Many of the Sporozoa are exceedingly minute, but some attain a large size for Protozoa, the cysts of *Sarcocystis tenella* reaching a length of 16 or even 50 millimetres in the muscles of Sheep or Roedeer.

The Class Sporozoa is divided into two sub-classes: Sub-Class I., ECTOSPOREA or TELOSPORIDIA. In these the minute individuals which germinate from the spore are elongated, rod- or sickle-shaped; flagellate male individuals (*sperms*) are often present; the individuals have only one nucleus and become full-grown before spore formation begins; and spore formation develops by a splitting off from margin of parental individual.

Amongst the Ectosporea are the GREGARINES (*Gregarinoidea*), a group of parasites which live in the gut of Invertebrates, their chief hosts being Insects, Worms, Echinoderms, and Molluscs. At first they live within a cell of the host, but soon protrude outwards, almost or altogether lying free in the gut or body cavity. In the former case they are attached by means of an anchor-like head (*epimerite*). Gregarines are apparently harmless parasites compared with the majority of their relatives. *Monocystis* occurs in the seminal vesicles of Earthworms, and *Gregarina* in the Earwig and Cockroach.

Other Ectosporea are the COCCIDIANS (*Coccidia*, *q.v.*) and the Hæmosporidia, the former of which spend the growing part of their existence within a cell of an Invertebrate or Vertebrate animal. They are much more dangerous than Gregarines, causing the disease coccidiosis, which occurs in Rabbits, Cattle, and even man, sometimes resulting in the death of the host. The HÆMOSPORIDIA (*q.v.*) live in the red blood corpuscles and fluid of many Vertebrates (Monkeys, Bats, Squirrels, Birds, Reptiles, Fishes, etc.), and include the parasites (*Plasmodium*) of tertian, quartan, and tropical malaria. These parasites, by disrupting the blood corpuscles, cause serious and sometimes fatal fevers, and while they swarm in the blood may be ingested by a mosquito (*Anopheles*). Within this new host a sexual reproduction takes place, finally rendering the mosquito capable of carrying infection at about its fourth feed after it has first sucked the germ-laden blood. *Piroplasma* and its relatives give rise to 'red-water,' Texas fever in cattle, and similar diseases in many kinds of domesticated animals, and perhaps even in man.

Sub-Class II., ENDOSPOREA or NEOSPORIDIA: in the Sporozoa the minute individuals which germinate from the spore are amœba-like; flagellate individuals are never present; the individuals have more than one nucleus, the commencement of spore formation is noticeable in young individuals, and the spores develop by an internal dividing up of the parent individual. Some Endosporea possess curious ejaculatory cells (*polar capsules*) similar to the stinging cells of Cœlenterates.

Many members of the group are of great interest. Amongst the MYXOSPORIDIA, which generally occur in the tissues of cold-blooded Vertebrates, some cause severe and fatal epidemics in Fishes, *Lentospora* being responsible for a kind of 'staggers' in members of the Trout family. MICROSPORIDIA cause harmful epidemics among Invertebrates; *Nosema apis* is the cause of the 'Isle of Wight' hive-bee disease, and *N. bombycis* of silkworm disease; while *Thelohania* is responsible for the death of many fresh-water Crayfishes. Of the SARCOSPORIDIA, *Sarcocystis* occurs in the muscles of many Vertebrates, and *S. tenella* has recently been discovered to be the cause of the itching disease 'scrapey' in sheep. Harmful HAPLOSPORIDIA are represented by *Ichthyosporidium*, which gives rise to rapidly spreading and highly fatal epidemics amongst various Fishes.

SPORT, WINTER, term to include popular winter pastimes, generally with special reference to organised games in Norway and Switzerland, especially at Davos and St. Moritz.

Skating was long employed in Holland and the Fens as mode of progression; metal blades supplanted bones tied under feet; for speed-skating blade of skate, *c.* $\frac{1}{16}$ inch thick, is slightly convex, blades for figure-skating are broader and much more convex. Premier club in Britain is Edinburgh Skating Club (1642).

Ski-ing is the national sport of Norway; ski is a long, narrow board, pointed and curved in front, with socket for boot; used for military purposes in Scandinavia and France. *Tobogganing* and *sledging* are popular in all cold countries; tobogganing is applied to coasting down long inclines, sledging to short runs. The vehicle used is the *sled*, a wooden platform equipped with steel runners; *sledge* or *sleigh* is larger and drawn by animal traction; toboggan is flat without runners. *Curling* (*q.v.*) has been introduced into Switzerland by British travellers.

SPORTS, see under EVOLUTION.

SPOTTED FEVER, cerebro-spinal Meningitis (*q.v.*).

SPOTTISWOODE, JOHN (1565–1639), Scot. historian; abp. of St. Andrews (1615); assisted

James I. in introducing Anglican Church settlement into Scotland.

SPOTTISWOODE, WILLIAM (1825–83), Eng. mathematician and physicist; pres. Mathematical Soc. (1871), Brit. Association (1878), Royal Soc. (1879); wrote on polarisation of light, geographical and astronomical subjects.

SPOTTSYLVANIA (38° 9′ N., 75° 35′ W.), county, Virginia, U.S.A.; scene of several battles in Civil War. Pop. (1910) 9035. Capital, **Spotsylvania Court House.**

SPRAIN, STRAIN, laceration of ligaments round a joint (*q.v.*), with effusion of blood; s. of ankle or wrist is treated by holding in cold water, bandaging, and elevation of the limb; massage prevents stiffness.

SPRAT, see under HERRING FAMILY.

SPRAT, THOMAS (1635–1713), dean of Westminster, 1683; bp. of Rochester, 1684.

SPREE (52° 23′ N., 14° E.) (ancient *Sprea*), river, Germany, rises in E. Saxony; joins Havel at Spandau; length, 230 miles.

SPREEWALD (52° N., 14° E.), wooded and marshy region, Brandenburg, Prussia; traversed by Spree.

SPRENGTPORTEN, GÖRAN MAGNUS, COUNT (1740–1819), Swed. soldier and politician; served in Seven Years War; subsequently entered service of Catherine of Russia.

SPRING, see WATER.

SPRING EQUINOX, see ARIES.

SPRING VALLEY (41° 20′ N., 89° 18′ W.) city, on Illinois, Bureau County, Illinois, U.S.A.; coal-mining industries. Pop. (1910) 7035.

SPRING-BALANCE, see WEIGHING-MACHINES.

SPRINGBOK (*Gazella euchore*), S. African antelope of great beauty; it can leap to height of 12 ft.

SPRINGFIELD.—(1) (42° 5′ N., 72° 35′ W.) town, on Connecticut River, Massachusetts; fine public buildings, including town library, Federal Government building, Art and Science Museums; has government arsenal for manufacture of rifles; railway centre; manufactures iron goods, cars, machinery, textiles, paper, needles, organs, etc. Fine system of parks, of which Forest Park is largest; several philanthropic establishments. Pop. (1910) 88,926. (2) (39° 47′ N., 89° 35′ W.) city, on Sangamon, capital of Illinois, U.S.A., and of Sangamon County; railway repair-shops; flour and coal-mining industries; manufactures watches; burial-place of Abraham Lincoln. Pop. (1910) 51,678. (3) (39° 53′ N., 83° 45′ W.) city, at junction of Lagonda Creek and Mad River, capital, Clark County, Ohio, U.S.A.; manufactures agricultural machinery. Pop. (1910) 46,921. (4) (37° 17′ N., 93° 22′ W.) city, capital, Greene County, Missouri, U.S.A.; manufactures flour, wagons. Pop. (1910) 35,201.

SPRING-GUN, firearm with trigger attached to wire, which, on being touched, fires the gun; illegal since 1827, but still allowed indoors against burglars.

SPRUCE, see FIR.

SPRUE, tropical disease, characterised by inflammation of mucous membrane of the mouth, anæmia, diarrhœa, extreme debility, and loss of flesh; cause is obscure and it is treated by rest and a light milk diet.

SPUR, instrument fastened to horseman's heel to goad horse; in Middle Ages s's were emblem of knighthood, hence phrase 'winning his spurs'; knights wore gold, squires silver, s's.

SPURGE (*Euphorbia*), genus of plants, order Euphorbiaceæ (*q.v.*); Wood S. (*E. amygdaloides*), a yellow flower, becomes red-leaved in autumn.

SPURGEON, CHARLES HADDON (1834–92), Eng. Baptist divine; converted 1851, and began as popular preacher, drawing enormous crowds; minister at the Tabernacle (London) from 1861; intensely religious, with narrow Calvinistic theology. See *Autobiography* and *Life*, by Ray (1903).

SPURN HEAD (53° 34′ N., 0° 7′ E.), headland, at mouth of Humber, Yorkshire, England.

SPURREY (*Spergula*), genus of plants, order doubtful; Common S., or Yarr (*S. arvensis*), a white flower, is a common weed in pasture and corn.

SPURS, BATTLE OF, see COURTRAI.

SPURZHEIM, JOHANN CHRISTOPH (1776–1832), Ger. phrenologist, at first assisted Gall (*q.v.*) and later lectured on phrenology in Europe and America.

SPY.—Employment of spies by belligerents is recognised by international law, but if captured the spy is liable to capital punishment by martial law.

SPY (50° 58′ N., 4° 42′ E.), village, near Namur, Belgium; two prehistoric human skeletons (male and female) were discovered here, 1886.

SQUADRON.—(1) military term; 120 to 200 mounted troops; four s. to division. (2) naval term; part of division, or ships on special duty.

SQUALL.—A gust is a single increase of the wind's velocity which comes suddenly and unexpectedly, whereas a squall is a series of such gusts lasting for at least several minutes. 'Line squalls' are those which visit a number of places situated in a straight or slightly curved line extending across the country. Such a squall was that known as the Eurydice (March 24, 1878), because it capsized H.M.S. *Eurydice*. The highest record of wind force is 106·5 miles per hour. Gale force is an average velocity of 38 miles per hour, while a s. may be sudden gusts of 40 to 100 miles per hour.

SQUARE ROOT, see INVOLUTION.

SQUARING THE CIRCLE, see QUADRATURE.

SQUID, a cuttlefish. See under CEPHALOPODA.

SQUILL, drug consisting of inner part of the bulb of *Urginea scilla*, a plant of natural order Liliaceæ, growing on the Mediterranean coast, cut into slices and dried; it is pink in colour, odourless, and bitter, the chief constituent being a glucoside, scillitoxin; employed medicinally as an expectorant in chronic bronchitis, and, usually combined with digitalis (*q.v.*), as a heat stimulant and diuretic.

SQUIRRELS (*Sciurus*), a genus of Rodents, with climbing feet and long, bushy tails, most common and most highly coloured in tropical regions, but occurring also in temperate parts. They are arboreal and vegetarian. The Common Brit. S. (*S. vulgaris*) hibernates in winter and is destructive to young trees.

SRINAGAR (34° 6′ N., 74° 55′ E.), town, capital, Kashmir state, India; manufactures carpets. Pop. (1911) 126,344.

SRIRANGAM, SERINGHAM (10° 52′ N., 78° 44′ E.), town, Trichinopoly district, Madras, India; noted temple of Vishnu. Pop. 24,000.

SRYETENSK, STRYETENSK (53° N., 116° E.), town, on Amur, Transbaikalia, Russia. Pop. 9000.

STAAL DELAUNAY, BARONNE DE, MARGUERITE JEANNE CORDIER (1684–1750), Fr. writer; attendant of Duchesse du Maine; pub. *Mémoires* in witty style, picturing society of regency and recalling that of La Bruyère; married Baron de Staal, 1735.

STABIÆ (40° 40′ N., 14° 30′ E.), modern *Castellamare*, ancient seaport, Campania, Italy; destroyed along with Pompeii and Herculaneum by Vesuvius, 79 A.D.

STABILITY, see EQUILIBRIUM.

STACHYS, genus of plants, order Labiatæ (*q.v.*); Hedge Nettle (*S. sylvatica*) has purple flowers and disagreeable smell; Woundwort (*S. palustris*) is the tallest of Brit. species.

STADE (53° 36′ N., 9° 27′ E.), town, on Schwinge, Hanover, Prussia; manufactures iron. Pop. (1910) 11,081.

STADE, BERNHARD (1848–1906), Old Testament scholar; prof. at Giessen, 1875.

STADIUM, Gk. standard of length, about 606 Eng. feet; length of foot-race course at Olympia, hence localisation of word.

STADTHOLDER, viceroy of a province or group of provinces in Holland; most important was s. of Holland, Zealand, and Utrecht. See HOLLAND (HISTORY).

STAËL, MADAME DE, Anne Louise Germaine, Baronne de Staël-Holstein (1766–1817), Fr. novelist; dau. of financier, Necker (*q.v.*); b. Paris. Her wit and rare qualities were developed in her mother's distinguished salon. At twenty she married Baron de Staël-Holstein, Swed. ambassador to France, but not finding happiness gave herself up wholly to lit.; encouraged classicists and also new school of J. J. Rousseau, and welcomed dawn of Fr. Revolution; soon disappointed and left Paris; returned under *Directoire*; mixed in politics; was exiled under the Consulate and went first to Switzerland, afterwards to Italy. She had already published, in 1800, a notable work on literature in connection with the moral and political state of nations; her novels, *Delphine* (1802) and *Corinne* (1807), are supposed to be autobiographical. In *Corinne* there are fine descriptions of Ital. monuments and scenery. In Germany she wrote *De l'Allemagne* (1810), which, by praise of Ger. lit., arts, etc. (then, for political reasons, little appreciated in France), prepared Romantic movement in France.

On Napoleon's fall she returned to France and died after publishing *Considérations sur la Révolution Française* (1817), in which she reiterated faith in democratic institutions; after Châteaubriand, the greatest promoter of *Romantisme*.

Duffy, *Madame de Staël*.

STAFF.—Staff officers of an army are distinguished from other combatant officers in that they can exercise no 'command' over troops in action. The s. is divided into two great branches, viz. the general s. and the administrative s. The former in peace attend to training, and in war to the operations against the enemy; the latter, both in peace and war, is concerned with the supply of food and quarters, with discipline, equipment, etc. S. officers are distributed throughout the army by being attached to brigades and divisions and to areas such as coast defences and 'districts.' The administrative s. is classed as adjutant-general's or quartermaster-general's s., according to their duties: the former dealing with personnel, and the latter with the material of the army. The general s. assists the generals by interpreting their wishes, and subordinate commanders by explaining what is required of them. In the Brit. army the duties of the s. in peace are detailed in *The King's Regulations*; war duties are detailed in *Field Service Regulations*.

STAFFA (56° 27′ N., 6° 24′ W.), small island, Inner Hebrides, Scotland; remarkable for its natural caverns, of which the largest is *Fingal's Cave*.

STAFFORD (52° 49′ N., 2° 7′ W.), county town, on Sow, Staffordshire, England; manufactures boots and shoes; birthplace of Izaak Walton; in vicinity is Stafford Castle.

STAFFORD, noble English family of Norman descent. Ralph, 1st earl of S. (d. 1372), and Hugh, 2nd earl (d. 1385), were distinguished in Fr. wars; Humphrey, 6th earl (1402–60), became Duke of Buckingham; his successors, Henry, 2nd duke, and Edward, 3rd duke, were attainted in 1483 and 1523, respectively. Latter's son Henry became Baron S.; this title subsequently came to Howard family through an heiress.

STAFFORDSHIRE (52° 20′ N., 2° 5′ W.), midland county, W. England, with chief town Stafford (*q.v.*); bounded by Cheshire, Derbyshire, Leicestershire, Warwickshire, Worcestershire, and Salop; area, 1170 sq. miles. Surface is generally level in centre, with hills in N. and S.; drained by Trent and its affluents, of which most important is the Dove. There are large deposits of coal in N. and S., the former area being almost entirely covered with towns engaged in manufacture of pottery; in S., which is called the 'Black Country,' there are large manufactures of iron and iron goods; agriculture is carried on, oats being the chief crop; and beer is largely manufactured at Burton. There are many Rom. and early Brit. antiquities, and several ruined religious houses. The county as a whole supported Parliament in the Great Rebellion of Charles I.'s reign. Pop. (1911) 739,105.

STAGE, technically, platform in theatre whereon the play is performed. 'The Stage' is equivalent to 'the Theatrical Profession,' hence 'going on the stage' is usual phrase for 'becoming an actor (or actress).'

Acting, branch of the fine arts dependent on human speech and gesture; one of the oldest, possibly because it requires no appliances, using only the human body as a means of expression. It is doubtful whether pageantry, which has its own place, is a useful accessory of acting. A great imaginative actor can create the illusion of scenery; Greek, mediæval, and Shakespearean drama were played with merely conventional scenery. In quite recent times, however, a movement has started by which dumb show is to replace acting; immense effect was obtained by *Sumurûn*, in which a wordless tragedy is carried out among carefully planned scenery. Extension of symbolism in scenery is advocated by Gordon Craig in *Art of the Theatre*. Ital. marionettes are an illustration of the dumb-show school. The old tradition is predominance of the actor; what actors to-day call a 'good stage presence' has always been important, but it has sometimes been notably absent, as in the case of Garrick, and the chief quality of acting is interpretative imagination, and personality on the stage more than person. The actor's face—pale, mobile, with prominent bones and restless, expressive eyes—is well seen in Edmund Kean. Miss Ellen Terry in her memoirs subtly remarks, when mentioning Irving's marvellous personal effects, that her own face was never any good to her. A more important modern case than that of the marionette *versus* the actor, has been that of the natural actor *versus* the rhetorician. Exaggeration to some extent, in acting as in make-up, is a necessary law of the stage. It is the equivalent of the painter's emphasis of a salient trait in his subject. But the best modern school aims at representing, with normal emotion, life as it is. Fr. acting is naturally light, and the severe naturalistic school may be found in Paris at the Renaissance Theatre. In England the companies of Granville Barker and Miss Horniman have led the way in this direction. The only danger is that fear of melodrama ('curtain') may bring in too rigid realism. Actors can generally be divided into tragedians and comedians. Coquelin aspired to absolutely plastic temperament, but it is questionable how far this is possible or desirable. The pliable temperament of actors led Plato to condemn them *a priori* as immoral. Actresses rested under the repute of Alexandrian Thaïs until quite recently. The large remuneration obtained has served in modern times to give social standing to acting as a profession. See also Drama, Music Halls.

STAGE-COACH, see Coaching.

STAGGERS, see Tapeworm.

STAGIRITE, see Aristotle.

STAHL, GEORG ERNST (1660–1734), Ger. physician and chemist; court physician to Duke of Weimar (1687); prof. of Med. at Halle (1694); physician to king of Prussia (1716); propounded the phlogiston theory, and other theories in chem. and med.

STAINER, SIR JOHN (1840–1901), Eng. musician; knighted, 1888; prof. of Music, Oxford Univ., 1889; oratorios, *Gideon* and *Crucifixion* are his best works.

STAINES (51° 26′ N., 0° 29′ W.), market town, at junction of Colne and Thames, Middlesex, England; breweries. Pop. (1911) 6756.

STAIR, Viscounty and Earldom of, Scot. honours. James Dalrymple of Stair in Kyle (1619–95), judge, an ardent royalist; cr. baronet, 1664; as anti-catholic, lost favour in closing years of Charles II.; retired, and wrote *Institutions of the Law of Scotland*, etc.; cr. viscount by William III., 1690. His wife, known as 'Witch of Endor,' was supposed to have put evil eye on their children, Janet ('Lucy Ashton' in *Bride of Lammermoor*) and John, who, as Master of Stair,

carried out Glencoe Massacre, 1692, winning lifelong infamy; great outcry arose when John was cr. earl, 1703. JOHN, 2nd earl (1707–47), killed his elder bro. by accident; rose to be general in war of Span. Succession; field-marshal, 1742; his beautiful wife was heroine of 'My Aunt Margaret's Mirror,' in *Chronicles of the Canongate.*

Murray Graham, *Stair Annals* (1875).

STAIRCASE.—S's are of ancient origin, being found in Egyptian and Gk. temples, but it was not until the Middle Ages that they became a prominent architectural feature. They were then generally of stone, built about a circular newel, for church towers, etc. In modern staircases the rise and width of tread of the steps are carefully proportioned. There are various forms, the simplest being the straight flight, having from 4 to 12 steps. If more are necessary they are arranged in two flights with a landing between. Winding steps are frequently dangerous. A handrail should be provided, and the whole staircase should be well lighted, the minimum head room being 7 ft. In Great Britain wooden house staircases are usually made in the workshop and fitted into position. Concrete resists fire better than stone, and it is often strengthened by steel or iron, which may be embedded in it. Concrete steps are frequently encased with marble or tiles. A modern innovation is the **Moving Staircase**, an inclined endless platform kept in continual motion, usually by an electric motor. On stepping on to the bottom of the staircase a person is carried upwards without the inconvenient waiting which is inevitable with the ordinary lift.

STALACTITES, masses of calcareous matter hanging in caves, formed by the filtration of water, containing particles of carbonate of lime, through holes or pores in the roof. The evaporation of the water leaves behind it a deposit of lime, which continues to increase in size so long as the water drops. S. may also be seen under bridges and arches and in form of icicles. —**Stalagmites** are of similar formation, but grow upward from cave floors, generally below stalactites, where drops of water, charged with carbonate of lime, fall, and, evaporating, leave lime deposit. In course of time the stalagmites may rise and join the stalactites, thus forming columns.

STALYBRIDGE (53° 29′ N., 2° 3′ W.), town, Cheshire, England; cotton-manufacturing centre. Pop. (1911) 26,514.

STAMBHAS, see ARCHITECTURE, INDIAN.

STAMBOL, see CONSTANTINOPLE.

STAMBOLOV, STEFAN (1854–95), Bulgarian politician; Pres. of Sobranye, 1884; regent after abdication of Alexander, and after election of Frederick of Coburg became Premier, holding office until 1894, when he had to resign; assassinated, 1895.

STAMENS, see FLOWER.

STAMFORD.—(1) (52° 40′ N., 0° 29′ W.) town, on Welland, Lincolnshire, England; contains ruins of a Benedictine abbey, founded VII. cent.; iron foundries. Pop. (1911) 9646. (2) (40° 3′ N., 73° 31′ W.) city, Long Island Sound, Fairfield County, Connecticut, U.S.A.; manufactures hardware. Pop. (1910) 25,138.

STAMFORD, HENRY GREY, 1ST EARL OF (*c.* 1599–1673), Eng. parliamentary general, Civil War. THOMAS, 2nd earl (d. 1720), held office under William III.

STAMMERING, STUTTERING, a spasmodic affection of the organs of speech, mainly due to the patient's difficulty in harmonising the oral and laryngeal actions—thus a consonantal sound may be freely produced, but a spasm intervenes before the production of the following vowel-sound. The sufferer should be taught phonetically, and the habit should be cultivated of taking a deep breath before speaking, and speaking slowly.

STAMP DUTY, see NEWSPAPERS.

STAMPS, see PHILATELY.

STANDARD, see FLAG.

STANDARDS DEPARTMENT of Brit. Board of Trade, cr. 1866, when responsibility for imperial standards of weights and measures was transferred from the exchequer.

STANDERTON (26° 56′ S., 29° 15′ E.), town, on Vaal, Transvaal. Pop. 5000.

STANDING STONES, from time immemorial raised by man in commemoration of some person or event. Solitary standing stones, pillars, or monoliths, called *menhirs*, were often erected to mark a boundary or a battle site, and are found particularly in Scotland, Wales, Ireland, and Brittany. Sometimes the stones are placed in lines (called alignments), as at Carnac in Brittany, where there are no fewer than eleven lines of stones ranging from 4 ft. to 13 ft. high. When the stones form a circle or some sort of enclosure, it is generally called a *cromlech*; three or more stones with a capstone on the top (as at Kit's Coty House, in Kent) is known as a *dolmen*. But the two terms cromlech and dolmen are used very interchangeably in Great Britain. The old notion that these stone monuments were of Celtic origin, built by Druids, and that the monoliths were altars, has of late been given up in favour of the belief that they were tombs of far greater antiquity belonging to the Stone Age. The finer surface of the capstone is always on the underside, which is against the altar theory. No chronological evidence as yet exists to allow dates to be assigned to such prehistoric monuments as Stonehenge, the great group of stones on Salisbury Plain, the remarkable Avebury circles, Kit's Coty House, Stennis (Orkney) and other circles in Scotland, the alignments at Carnac, and similar remains in Brittany and elsewhere.

Fergusson, *Rude Stone Monuments.*

STANFIELD, WILLIAM CLARKSON (1794–1867), Brit. painter; began life in the navy. From theatrical scene-painting he went on to easel work, dealing mostly with marine subjects.

STANFORD, SIR CHARLES VILLIERS (1852–), Brit. composer and conductor; b. Dublin; has written operas and oratorios, and much orchestral and chamber music.

STANHOPE, EARLDOM OF.—James, 1st earl (1674–1721), Eng. statesman and soldier; commander-in-chief in Spain, 1708; Foreign Secretary, 1715; cr. viscount, 1717, earl, 1718. Charles, 3rd earl (1753–1816), scientist, improved printing-press, invented a microscopic lens, and was an able politician; Philip Henry, 5th earl (1805–75), historian, wrote *Life of Pitt, History of Wars of Succession in Spain*, etc.

STANHOPE, LADY HESTER LUCY (1776–1839), exercised great influence over her uncle, the younger Pitt; adopted Muhammadan life in East, 1810; *Memoirs.*

STANIMAKA (42° N., 24° 48′ E.), town, E. Rumelia, Bulgaria; trade in wine. Pop. (1910) 12,936.

STANISLAU (48° 55′ N., 24° 40′ E.), town, Austria; railway workshops; tanneries. Pop. (1910) 33,328.

STANISLAUS I. (1677–1766), king of Poland; election secured by Charles XII., after whose defeat at *Poltava* S. lost his throne; made an unsuccessful attempt to recover it, 1733.

STANISLAUS II., AUGUSTUS (1732–98), last king of Poland; election secured by Catherine II. of Russia, whose favourite he was; during his reign occurred first and second partitions of Poland; forced to abdicate, 1795; d. in captivity in St. Petersburg; brilliantly accomplished, but of weak character.

STANLEY, Eng. family, one branch of which has held earldom of Derby since 1485. Sir Edward, son of 1st earl, distinguished himself at *Flodden*; became Lord Mounteagle, 1514. Another family of Stanleys has held barony of Stanley of Alderley since 1839.

STANLEY, ARTHUR PENRHYN (1815–81), Anglican divine; tutor of Balliol College, Oxford, 1840–50; canon of Canterbury, 1850; prof. of Ecclesiastical History at Oxford, 1856; dean of Westminster, 1863. S. was very liberal in theol. and aimed at a comprehensive Church; a great preacher, he

became interested in philanthropic, social, and other work; greatly respected; wrote numerous works—*Memorials of Westminster Abbey, Jewish Church, Eastern Church, Sinai and Palestine, Christian Institutions*, etc.

Prothero, *Life and Letters*.

STANLEY, EDWARD (1779–1849), bp. of Norwich, 1837.

STANLEY, SIR HENRY MORTON (1840–1904), Brit. explorer of Africa; s. of Denbigh farmer; real name, John Rowlands (Rollant); on f.'s death sent, at age of seven, to workhouse; after some years of hardship, adopted by Amer. merchant, whose name he assumed; enlisted after adopted parent's death; captured in Amer. Civil War; returned to Wales, where his mother refused to receive him. S. sought consolation in adventures by land and sea, and wrote articles to Amer. papers. Given the task of finding Livingstone, 1869, S. left Zanzibar for interior, March 1871, and found Livingstone at Ujiji in Nov.; returned, 1872; pub. *How I found Livingstone*; obtained funds for second expedition, 1874-77, in which he discovered source of Congo, etc.; sent by Leopold II. of Belgium, 1879, and established Congo Free State; undertook Brit. expedition to east equatorial region, 1887; recounted terrible sufferings in *In Darkest Africa*, 1890; knighted, 1899; entered Parliament, 1895. See *Autobiography* (1909), edit. by wife.

STANLEY, SIR WILLIAM (1548–1630), Brit. soldier; served in Ireland; afterwards plotted with Spain for invasion of England.

STANLEY, THOMAS (1625–78), Brit. poet and philosopher; pub. translations from Gk., Lat., Fr., Span., and Ital. poets, but is distinguished by his translation of Æschylus, and his *History of Philosophy*.

STANNARIES, term specially associated in England with tin mines of Devon and Cornwall; by Act of Edward II., Prince of Wales (as Duke of Cornwall) holds title of Lord Warden of the S.

STANS (46° 57′ N., 8° 22′ E.), town, capital, canton Unterwalden, Switzerland. Pop. 3000.

STANTON, EDWIN M'MASTERS (1814–69), Amer. politician; Attorney-General, 1860; War Minister, 1862; resigned, 1868; became judge, 1869.

STANTON, ELIZABETH CADY (1815–1902), Amer. social reformer; b. Johnstown, New York, U.S.A.; secured the passing of a Bill at New York granting married women property rights. From 1865 to 1890 she was president of the National Woman Suffrage Association.

STANYHURST, RICHARD (1547–1618), Irish writer; translated the *Æneid*; championed 'quantity' theory of Eng. prosody.

STAPLEDON, WALTER DE (1261–1326), bp. of Exeter, 1307; treasurer of England, 1320.

STAR CHAMBER, COURT OF, Eng. judicial body (XV.–XVII. cent's); formed by statute 3 Hen. VII. from king's council; named from meeting-place, a chamber decorated with gilt stars in Westminster Palace; members were chancellor, treasurer, keeper of privy seal, chief justices, one ecclesiastical and one lay lord; famed at first for pure justice, but became instrument of king's arbitrary will; abused by Charles I.; abolished, 1641.

STAR OF BETHLEHEM (*Ornithogalum*), genus of plants, order Liliaceæ; Common S. of B. (*O. umbellatum*) has white fragrant flowers in corymbs.

STAR OF INDIA, ORDER OF THE, see KNIGHTHOOD.

STARA ZAGORA, ESKI-ZAGRA, Rom. *Augusta Traiana* (42° 27′ N., 25° 41′ E.), town, on S. slope of Balkans, Bulgaria; mineral springs; manufactures cloth. Pop. (1910) 22,003.

STARAYA-RUSSA (57° 58′ N., 31° E.), town, health-resort, on Polista, Novgorod, Russia; saline springs. Pop. 16,000.

STARBOARD AND LARBOARD, see SHIP (SEAMANSHIP).

STARCH ($C_6H_{10}O_5)_n$, a carbohydrate stored in plants; obtained chiefly from rice, wheat, maize, and other cereals, and from potatoes by crushing, macerating with water, sieving, and drying; white powder consisting of striated, microscopic granules, characteristic of source; insoluble in cold, soluble in boiling water because of rupture of starch cellulose envelope; deep blue colour with iodine. S. is of value as a food, for dressing linen, and in various manufactures.

STARFISHES, see ECHINODERMATA.

STARGARD (53° 21′ N., 15° 1′ E.), town, Pomerania, Prussia; tobacco factories. Pop. 27,540.

STARLINGS (*Sturnidæ*), an Old World family of passerine birds containing the familiar European Starling (*Sturnus vulgaris*), with dark plumage shot with purple, green, and blue specks, an inhabitant of and a constant migrant to Britain; and the rare British visitor from Europe and Asia, the Rose-Coloured Pastor.

STARNBERG (48° N., 11° 20′ E.), village, health-resort, on Starnberger See. See GERMANY.

STAR-NOSED MOLE, see MOLE FAMILY.

STARODUB (52° 33′ N., 32° 44′ E.), town, Chernigov, Russia; manufactures leather. Pop. 26,000.

STARS, see ASTRONOMY.

STARS AND STRIPES, see under FLAG.

STARVATION, see FASTING.

STARWORT, STITCHWORT (*Stellaria*), genus of plants, order Caryophyllaceæ; 5 sepals, 5 deeply cleft petals, 10 stamens, 3 styles; Greater S. (*S. holostea*), Lesser S. (*S. graminea*), and Chickweed (*S. media*), are common white flowers.

STAS, JEAN SERVAIS (1813–91), Belg. chemist; studied under Dumas, in Paris; prof., Royal Military School, Brussels; held post in Royal Mint; best known for his determination of atomic weights of many elements, and for his method, afterwards modified by Otto, of detecting alkaloidal poisons (Stas-Otto process).

STASSFURT (51° 53′ N., 11° 35′ E.), town, on Bode, Pruss. Saxony; salt mines; chemical works. Pop. (1910) 16,785.

STATE.—According to Hobbes the S. is 'one person for whose acts a great multitude by mutual covenants, one with another, have made themselves every one the author, to the end he may use the strength and means of them all as he shall think expedient for their peace and common defence.' This definition happily emphasises the arbitrary power of all governments, but the theory of original 'social contract' is not now accepted; primitive man is never found without some sort of government. Fixed territory and entire international independence are not necessarily characteristics of a State; an army under certain conditions is recognised as a State, and States may be either sovereign or vassal. When a number of States are joined in a political Confederation (*e.g.* U.S.A., Australian Commonwealth), each State reserves to itself certain **State Rights** with which the federal or central government cannot interfere; the question of State Rights was one of principal points on which Amer. Civil War was fought, and to guard or increase their powers a constant tug-of-war between Federal and State authorities goes on in America, Australia, and other lands where Federation has been adopted in preference to Unification.

STATEN ISLAND (40° 35′ N., 74° 10′ W.), island, forming Richmond County, New York, U.S.A.; separated by the narrows from Long Island; surface undulating, rising to over 300 ft. in the N.; length, 13 miles. Pop. (1910) 85,969.

STATES-GENERAL, ÉTATS GÉNÉRAUX, parliament of monarchical France; representative government of France dates back to time of Philippe le Bel (1268–1314), contemporary of Edward I. of England, with whose Model Parliament of 1295 Philip's Assembly of 1302 may be compared. It is both stated and denied that preceding Fr. court of peers or great council was merely consultative, and that Assembly of 1302 was also deliberative, but a great change in 1302 was the introduction of the Third Estate; large towns were always summoned henceforth to make election of

representatives, *procureurs*; country districts divided into *baillages* for purposes of representation; the peers and prelates might also appear by *procureurs*. The States-General controlled taxation in XIV. cent., but chief sources of revenue were appropriated to Crown in XV. cent.; attempt of Estates to regain control, 1484, came to nothing; not summoned again till 1560; dissolved, 1614, and not summoned again till year 1789; transformed into National Constituent Assembly; never possessed statutory powers.

STATES OF THE CHURCH, dominions in Italy, varying in extent from time to time, which for nearly 1000 years were directly under rule of pope; greater part was added to kingdom of Italy in 1859; Rome was retained for pope by the French till 1870.

STATICS, see MECHANICS, DYNAMICS.

STATIONS OF THE CROSS, pictures in church depicting stages of Christ's Passion.

STATISTICS are particulars of social phenomena expressed in figures for the purposes of study. The first point is the collecting of these figures, and the second the use made of the figures. Statistics supply the facts relating to people—the number of births, deaths, and marriages, of criminals, lunatics, unemployed persons, etc., and to the affairs of people—wages, prices of commodities, amount of trade, etc. The accuracy of these figures depends on the capacity and honesty of the statistician, and generally to-day the collecting of statistics has become an important branch of government work. Given accurate statistics, the use of the figures depends again on the honesty and capacity of the individual in possession. Accurate tabulation and analysis are essential if the figures are to be used wisely. The statistics of crime, for instance, without the figures of increase or decrease of population, may give an utterly wrong impression. The statistics of lunacy and of disease require the additional knowledge of the increase of official regulations concerning these social phenomena. Statistics of wages require to be supplemented by statistics as to the cost of living. Statistics of the birth-rate are wisely compared with statistics of the death-rate. Hence the presentation of great bodies of facts concerning human life requires the scientific mind for their arrangement and for their interpretation.

R. Mayo-Smith, *Science of Statistics* (1895); A. L. Bowley, *Elements of Statistics* (1901); Elderton, *Primer of Statistics* (1910); Webb, *New Dictionary of Statistics* (1911).

Vital Statistics cover the returns of births, deaths, and marriages in those regions of the civilised world where these events are officially recorded. From them may be learnt whether a nation is increasing in population, or falling back, and they supply the data for comparisons between nations. The *Registrar-General* for Births, Deaths, and Marriages is the statistical authority for the U.K. in these matters, but before his figures are considered the Census Returns for 1871 and 1911 may be given for our knowledge of the total population.

	1871.	Increase per cent.	1911.	Increase per cent.
England .	21,495,131	13·4	34,043,076	10·5
Wales .	1,217,135	9·5	2,032,193	18·1
Scotland .	3,360,018	9·7	4,759,445	6·4
		Decrease per cent.		Decrease per cent.
Ireland . .	5,412,377	1·7	4,381,951	1·7
Total, U.K. .	31,845,379		45,365,599	

The number of inhabitants per square mile is 619. In England and Scotland there is a marked decline in the birth-rate, that is, the increase of population is not at so rapid a rate as formerly. In Wales the increase is faster, while in Ireland the population is still declining. Various reasons are offered in explanation of these figures. In the case of Ireland emigration continues to draw off the young, and therefore the marriageable proportion of the population is diminished. In Great Britain, as elsewhere, when the standard of living is raised, men and women are often reluctant to marry, unless they have the means to bring up their children to the expected social standard. In certain cases—viz. want of accommodation in rural parts, and the refusal to employ married persons with children—economic reasons explain the falling off. It is also generally true that education and high intellectual interests do not make for large families.

That our birth-rate is still in excess of the death-rate may be seen from the following table for 1910:—

	Births.	Illegitimate, per cent.	Deaths.	Marriages.
England and Wales	897,100	4·1	483,321	267,416
Scotland . .	124,000	6·85	72,245	30,866
Ireland . .	101,963	2·8	74,894	22,112

A comparison of the birth- and death-rates over a period of years, gives the following figures:—

BIRTH-RATE PER 1000.

	1861-70.	1900-5.	Decline per cent. 1861-1904.
England and Wales.	36·0	29·0	19·4
Scotland . .	34·8	29·7	14·7
Ireland . . .	26·1	23·2	11·1
Germany . .	37·2	35·5	4·6
France . . .	26·3	21·7	21·7

DEATH-RATE PER 1000.

	1861-70.	1900-5.	Decline per cent. 1861-1904.
England and Wales.	24·0	17·2	28·3
Scotland . .	21·8	17·3	20·6
Ireland . . .	16·6	18·0	+8·4
Germany . .	16·9	20·8	22·6
France . . .	23·6	20·4	13·5

Taking all Europe, the rate per thousand stands as follows:—

	Births.	Deaths.	Increase.
1801-1850 .	38·6	31·2	7·1
1850-1900 .	38·0	29·4	8·2

the general fall in the death-rate making a real increase of population.

Vital statistics for 1910 of some of the chief cities of the world:—

	Population.	Birth-rate per 1000.	Death-rate per 1000.
London . . .	4,872,702	23·6	12·7
Edinburgh . .	391,167	27·8	18·6
Dublin . . .	402,928	28·3	19·9
Belfast . . .	391,167	27·8	18·6
Birmingham . .	570,113	26·3	13·7
Glasgow . .	884,520	25·1	15·1
Leeds . . .	490,985	22·2	13·7
Liverpool . .	767,606	30·1	17·7
Manchester . .	716,534	27·1	16·1
Sheffield . .	478,763	26·5	13·4
Amsterdam . .	570,057	23·6	12·2
Berlin . . .	2,053,040	21·5	14·7
Brussels . .	720,030	16·8	13·6
New York . .	4,803,264	26·0	16·0
Paris . . .	2,722,731	18·0	10·7
Rome . . .	590,113	23·6	18·5
St. Petersburg .	1,577,892	27·8	24·1
Sydney (N.S.W.) .	613,500	26·4	10·4
Vienna . . .	2,107,981	19·9	15·8

See Registrar-General's Returns. Newsholme, *Elements of Vital Statistics*.

STATIUS, PUBLIUS PAPINIUS (*c.* 45–96 A.D.), Rom. poet of post-Augustan age; b. Naples; early displayed power of extemporising; gained olive-wreath thrice at Alban games and won patronage of Domitian. Works include *The Thebäis*, a conventional epic devoted to story of Thebes, loose in construction and often strained, but redeemed by exquisite passages; one book and a fragment of the *Achillëis*—tedious because subject is too cramped and stereotyped; the *Silvæ*, thirty-two poems full of beauty, his masterpiece; marred in parts by fulsome flattery of the emperor.

STATUTES, written laws which, with customary law, make common law. Concurrence of the three estates of the realm was made necessary by statute 15 Edw. II., but *Statutory Orders* may be issued by departments of government, which have 'statutory powers' from Parliament. S. are known as Acts of Parliament; enrolled on special statute roll, 1278–1485, afterwards entered in Chancery; printed sessionally XVI. cent. onwards; Record Commission commenced publication of s. 1235–1713 in 1810; laws in force,

1886, are listed in *Revised Statutes*, printed by Statute Law Revision Committee, and duly authorised by Interpretation Act, 1889. Short Titles Act, 1896, provides for naming s.; previously known by place at which Parliament was held, or first words of preamble. Preamble is not law. S. are abrogated only by repeal, express or implied in subsequent Act.

STAUNTON (38° 7′ N., 78° 59′ W.), independent city, formerly capital of Augusta County, Virginia, U.S.A.; manufactures flour, iron. Pop. (1910) 10,604.

STAVANGER (59° N., 5° 39′ E.), seaport, capital, Stavanger amt, Norway; bp.'s see; manufactures preserved goods. Pop. (1910) 37,261.

STAVELEY (53° 16′ N., 1° 21′ W.), town, Derbyshire, England; collieries, ironworks. Pop. 11,500.

STAVELOT (50° 20′ N., 5° 55′ E.), town, on Amblève, Liège, Belgium. Pop. 5200.

STAVROPOL (45° N., 44° E.), government, Russ. Caucasia; largely occupied by arid steppes; numerous salt lakes and marshes; watered by Kuma; agricultural and live-stock breeding industries; exports grain. Pop. (1910) 1,231,100. Capital, **Stavropol** (45° 2′ N., 41° 58′ E.); bp.'s see; flour-mills. Pop. (1910) 55,300.

STAWELL (37° S., 142° 45′ E.), town, Victoria, Australia; gold-mines. Pop. 6000.

STAWELL, SIR WILLIAM FOSTER (1815–89), Brit. Australian politician; Attorney-General, Victoria, 1851; helped to draw up constitution of Victoria; Chief Justice, 1857.

STEAD, WILLIAM THOMAS (1849–1912), Eng. journalist; succ. Morley as editor of *Pall Mall Gazette*, 1883; initiated the 'new journalism' in sensational exposure of Naval weakness and of the white slave traffic; founder and editor of *Review of Reviews*, 1890; devoted to psychic research; in journalism he introduced the 'interview' and pictorial illustration; went down with the *Titanic*.

STEALING, see THEFT.

STEAM, the vapour of water when heated to boiling-point (212° F.), dry, invisible, and transparent; when superheated becomes moist and opaque.

STEAM ENGINE, see ENGINE.

STEAM NAVIGATION.—Probably the first method of assisting a vessel by steam-engine power was that invented by Jonathan Hulls, in 1736. He used a single paddle wheel, placed at the stern of the ship, and coupled direct with the engine crank. In 1786 Rumsey and Fitch, two Americans, made several steam-driven vessels; while in 1788 a boat 25 ft. long and 7 ft. broad was made at Edinburgh, under the supervision of Symmington. It had two paddles, and attained a maximum speed of 5 miles per hour. The following year a still larger vessel was built on the Forth, with increased engine power.

The first steam-driven vessel in Great Britain to carry passengers was the *Comet*, built at Glasgow in 1812. It was 42 ft. long and 11 ft. broad. In 1818 the *Rob Roy* commenced to ply regularly between Greenock and Belfast, while a service between Liverpool and Glasgow was also run about this time. In 1819 the *Talbot* sailed regularly between Holyhead and Dublin, and in this same year the *Savannah*, a sailing vessel assisted by steam, accomplished a voyage to America in twenty-six days. 1826 saw the *United Kingdom*, 'a leviathan steamship,' as she was called, running regularly between London and Edinburgh.

No doubt the first steamship company was the City of Dublin Steam Packet Company, founded 1823, while in the following year three companies were floated, viz. the General Steam Navigation Company, the St. George Steam Navigation Company, and the British and Irish Steam Packet Company. The Great Western Steamship Company built and launched on July 19, 1837, the *Great Western*, whilst on Oct. 4 of same year the Atlantic Steamship Company launched the *Liverpool*, and in May 1838 the British and American Steam Navigation Company launched the *British Queen*. It was not until 1838 that any regular steamship service across the Atlantic was run, although isolated voyages were made at odd times. Of these, that of the *Sirius*, from London to New York in 17 days, is worthy of mention. The *Great Western* sailed from Bristol to New York (a few months after sailing of *Sirius* in 1838) in 15 days.

All these steamboats were fitted with paddles, but in 1839 the *Archimedes* was built on the Thames, and this is the first boat to be fitted with a propeller. In 1840 the Cunard Line came into being, and was greatly assisted by the fact that Mr. Samuel Cunard, the founder, secured the Government contract for carrying the mails from Liverpool to Halifax (N.S.) and to Boston. The Cunard Line then built four ships identical in every respect, and commenced a regular steamship service from England to America. This regularity soon outdid the smaller companies with their irregular and erratic sailings, and many companies failed in consequence. The *Liverpool* was sold to the 'P. & O.' Company, and the *Great Western* to the West Indian Royal Mail Company. Late in the 'fifties the *Great Eastern*, a ship fitted with both paddle and screw, was built, and in 1861 the *Scotia*, a Cunarder, sailed from Liverpool to New York in 9 days. She was 366 ft. long and 47 ft. broad, and her cylinder capacity was 100 in., with a 12-ft. stroke.

After the 'fifties the development of steamship service advanced with rapid strides, and almost every year added to its efficiency; more and more attention was paid to the safety, comfort, and luxuries of passengers. The most notable steps, however, were:—

1850. Screw propellers and iron hulls introduced.
1860. Invention of compound steam-engine.
1870. Better passenger equipment; state rooms, etc.
1880. Twin screw and steel hulls introduced.
1890. Boat trains, Liverpool and Southampton.
1900. Turbine engines, wireless telegraphy.
1910. Oil engines and motor liners.

Among leading **steamship lines** are:—

ALLAN LINE: began regular service England to Canada, 1815; now ply U.K. ports to Canada, U.S.A., and South America.

AUSTRIAN LLOYD: first sailed Trieste to Levant, 1837; now serves Levant, India, S. America.

BOOTH LINE: founded 1866, when ran to Brazil; now ply to Brazil and New York, also to Portugal.

CASTLE LINE: founded 1872, when carried mails to Cape in 37 days; amalgamated with UNION LINE, 1900. UNION-CASTLE LINE now sails to all ports in South Africa. Carried troops and stores to South Africa during war in 1899–1902.

CITY OF DUBLIN STEAM PACKET COMPANY: commenced sailings in 1824 to Dublin from Liverpool. Commenced carrying mails Holyhead to Dublin, 1859.

COMPAGNIE GÉNÉRALE TRANSATLANTIQUE: founded 1855 for European and N. African sailings from Rouen; now sails to New York, West Indies, Mexico.

CUNARD LINE: first Cunarder *Britannia* sailed July 4, 1840, with 63 passengers and mails, from Liverpool to Boston, in 14 days; now sails Liverpool to New York.

ELDER, DEMPSTER, & COMPANY: carried mails, 1852, to West African ports; developed banana trade by importing from Canary Islands.

GENERAL STEAM NAVIGATION COMPANY: the oldest existing line, established 1824, and sails to Continent.

HAMBURG-AMERICAN LINE: founded 1847; first sailed Hamburg to New York, 1848; now serves Far East, N., Central, and S. America.

MESSAGERIES MARITIMES: equipped Fr. mail service, 1851; fresh mail contracts, Bordeaux to Brazil, India, and China, 1857–61; since included Japan and Australia.

NORDDEUTSCHER LLOYD: formed from four pre-existing companies, 1857; since absorbed other companies; sails Bremen and Hamburg to Far East, and N. and S. America.

PACIFIC STEAM NAVIGATION COMPANY: founded 1840, with sailings to South America.

PENINSULAR AND ORIENTAL: carried mails, 1829, to Mediterranean ports, Egypt, India, and Far East.

ROYAL MAIL STEAM PACKET COMPANY: founded 1839, with sailings to West Indies; now ply between Southampton and West Indies, Brazil and Far East.

WHITE STAR LINE, taken over by Ismay, 1867; Liverpool, Southampton, and Mediterranean ports to New York, Boston, Canada, Australia, and New Zealand.

WILSON LINE: founded 1835; sails between Hull and Continent (Gothenburg) and Norway.

STEAMING, see COOKERY.

STEARIC ACID ($C_{17}H_{35}COOH$); M.P. 69°; occurs, combined with glycerine, in tallow, etc.

STEATITE, see TALC.

STEATOPYGIA, term applied to an accumulation of fat in the region of the buttocks and thighs, a characteristic of the Bushmen, Pygmies, and Hottentots of Central and S. Africa.

STEATORNIS, GUACHARO (*q.v.*).

STEEL, see IRON.

STEEL CONSTRUCTION is now very largely used as a substitute for wood in the erection of large buildings. There are two main types, 'skeleton' and 'cage.' The former has a skeleton framework not intended to carry the required weight alone, but with the support of the walls; the cage structure is made strong enough to carry every part of the building. Among the advantages of cage construction are speed in erection, small amount of materials, and less weight on the foundations, while the masonry may be begun anywhere. Safety depends upon the strength and rigidity of the cage framework. The parts of the frame are fixed together with hot rivets of iron or soft steel, the columns are of steel rather than cast iron, and the column bases are bolted to the foundations or grouted with cement. The surface of the steel must be rustless, and two coats of paint are applied to it, first red lead and then oxide paint. A preliminary coat of boiled linseed oil is sometimes used. In structures of this kind the wind-pressure has to be carefully calculated. Steel and iron alone are not fire-proof, and are therefore given a protective coating, which generally consists of one of the many patent fire-resisting materials.

STEELE (51° 25′ N., 7° 30′ E.), town, Rhineland, Prussia; collieries; ironworks. Pop. 13,400.

STEELE, SIR RICHARD (1672–1729), Brit. essayist, dramatist, and man of letters; b. Dublin; ed. Charterhouse and Oxford, where met lifelong friend, Addison (*q.v.*); joined army without taking degree, but resigned, 1706, to follow lit.; already had written a devotional work, *The Christian Hero*, and several comedies; app. Gazetteer, 1707; ardent Whig M.P.; knighted by George I.; warm-hearted, improvident nature. S.'s greatest title to fame is as founder of Queen Anne Essay; he established *Tatler* (1709), followed later by *Spectator*, *Guardian*, etc.; contributed bright essays on social, literary, and political subjects; graceful in style and elevating in tone; comedies (*Conscious Lovers*, etc.) amusing, but inclined to sentimentality and moralising.

Editions, with Memoirs, by Dobson, and Aitken (1898).

STEELTON (40° 15′ N., 76° 52′ W.), town, on Susquehanna, Dauphin County, Pennsylvania, U.S.A.; steel-works. Pop. (1910) 14,246.

STEELYARD, see WEIGHING-MACHINES.

STEEN, JAN (1626–79), Dutch painter, began life as a brewer at Delft. His genre pictures, in the style of Rembrandt, were drawn from all phases of life.

STEENKIRK, STEENKERKE (50° 38′ N., 4° 4′ E.), village, on Senne, Hainaut, Belgium; scene of defeat of William III. by Duke of Luxembourg, 1692.

STEEPLECHASE, see RACING.

STEERING, see SHIP (SEAMANSHIP), NAVIGATION.

STEEVENS, GEORGE (1736–1800), Brit. Shakespearean commentator; collaborated with Johnson in an edition of Shakespeare (1773), but attained celebrity by his own monumental edition.

STEFANIE, BASSO-EBOR (4° 50′ N., 36° E.), lake, E. Africa; has no outlet; elevation, 1900 ft.; length, 37 miles.

STEFFANI, AGOSTINO (1653–1728), R.C. priest and musician; supported by the Elector Maximilian, then entered the Elector of Hanover's service; in 1692 carried through important diplomatic work; composed *Servio Tullio* (opera), chamber and church music.

STEFFENS, HENRIK (1773–1845), Ger. philosopher; prof. of Nat. Science, Halle, Breslau, Berlin; assented finally to philosophy of Schleiermacher (*q.v.*).

STEIN, HEINRICH FRIEDRICH KARL, BARON VON (1757–1831), Prussian statesman; one of builders of modern Germany; head of department of taxation, etc., 1804; formed general plan for union of Germany under hegemony of Prussia, but directed chief attention to military, administrative, and financial reform at home. Humiliated by Treaty of Tilsit, Frederick William III. gave S. an absolutely free hand to carry out his Liberal ideas. S. resolutely carried through Edict of Emancipation of Serfs (1807), which came into force, 1810; also various agrarian and military reforms, for which Schön and Scharnhorst had long been agitating; incurring Napoleon's wrath, fled, 1809; returned, 1812, but never regained influence.

Seeley, *Life and Times* (1878, 3 vols.).

STEINER, JAKOB (1796–1863), Swiss mathematician; prof. of Geometry, Berlin, 1834, till death; founder of modern synthetic geometry.

STEINMETZ, KARL FRIEDRICH VON (1796–1877), Pruss. general; distinguished in war with Denmark, 1848; commanded an army against Austria, 1866, winning brilliant victories at *Nachod*, *Skalitz*, and *Schweinschädel*; commanded one of Prussian armies in 1870; was defeated at *Gravelotte* and recalled; became gov.-gen. of Silesia and Posen; resigned in 1871; field-marshal, 1871.

STELLARIA, see STARWORT.

STELLENBOSCH (33° 54′ S., 18° 48′ E.), town, Cape Province, S. Africa; has a college, theological seminary, schools of agriculture and mining; wine- and fruit-growing centre. Pop. (1911) 6155.

STEM, typically the aerial, ascending axis of a plant, the principal functions of which are: (1) to carry the leaves in such a manner that they are advantageously placed for the performance of their functions (respiration, transpiration, carbon assimilation); (2) to transmit to the leaves nutritive material absorbed by the roots from the soil; and (3) to conduct the elaborated food formed by the leaves to the storage areas. In a monocotyledon the s. is normally unbranched, and the conducting strands are distributed throughout the ground tissue, whilst in dicotyledons branching is the rule, and the bundles are arranged in a ring, the separate members being eventually united, in perennials, by cambial activity, so that a solid mass is formed, as in trees. In addition to erect s's there are climbing and twining forms (vine, convolvulus), prostrate (creeping Jenny), or underground, when they are often modified for food storage as in the iris rhizome, crocus corm, tulip bulb, and potato tuber, and bear an adventitious root system.

STENCILLING, painting by means of thin plate of metal, paper, etc., having design cut out.

STENDAL (52° 36′ N., 11° 51′ E.), town, Pruss. Saxony; cathedral; railway-workshops. Pop. 27,250.

STENO, NICOLAUS (1638–86), Swed. divine and physiologist; authority on geology and crystallography.

STENOGRAPHY, see SHORTHAND.

STENTOR, see under INFUSORIA.

STEPHAN, HEINRICH VON (1831–97), Ger. politician; carried out postal reforms in Schleswig-Holstein, 1864; became Postmaster-General of Ger. Empire, 1871; Sec. of State for post department, 1878; chief share in founding International Postal Union.

STEPHEN, whose death by stoning is related in *Acts* 7, was the first martyr of the Christian Church.

STEPHEN (c. 1097–1154), **king of England**; s. of Adela, William I.'s dau., and Count of Blois; successfully claimed throne in opposition to Matilda, Henry I.'s dau., 1135; waged war against Matilda for several years; taken prisoner, 1141; on release, successfully besieged Oxford, 1142; Matilda gave up struggle, 1147; her s. Henry acknowledged as Stephen's heir, 1153.

STEPHEN I., ST. (STEPHEN) (977–1038), king of

Hungary; introduced Christianity into Hungary; defeated emperor, Conrad II., 1030.

STEPHEN I. (*c.* 258), pope, opposed Cyprian concerning baptism of heretics; **Stephen III.** (*c.* 752) was aided against Aistulf by Frankish king, Pippin; **Stephen X.** (*c.* 1057) aimed at papal independence.

STEPHEN, SIR JAMES FITZJAMES, Bart. (1829–94), Eng. jurist; s. of historian, Sir James Stephen; member of Apostles' society at Cambridge, and great friend of Sir Henry Maine; pub. *General View of the Criminal Law of England*, 1863; succ. Maine (*q.v.*) as legal adviser of council in India, 1869, and continued his work of codification; pub. *Liberty, Equality, and Fraternity*, 1873–74, *History of the Criminal Law of England*, 1883; judge of Queen's Bench, 1879–91; contributor for many years to *Saturday Review*, *Pall Mall Gazette*, etc.; reputation that of just judge and diligent, conscientious legal student, eminent but not brilliant. See *Life*, by Sir Leslie Stephen.

STEPHEN, SIR LESLIE (1832–1904), Eng. biographer and critic; ed. Cambridge, and his life as a fellow is recounted in his *Sketches from Cambridge: By a Don*; contributed regularly to the best periodicals of his day. His enthusiasm for Alpine climbing found expression in his *Playground of Europe*; edit. of the *Cornhill* (1871); edit. of the *Dictionary of National Biography* (1882), to which he contributed some of the finest articles. His works include *The History of English Thought in the Eighteenth Century*, *The Science of Ethics*, *The Agnostic's Apology*, and *The English Utilitarians*.

STEPHEN BATHORI (1533–86), prince of Transylvania, 1571; king of Poland, 1575; put down all internal insurrection; warred against Ivan of Muscovy, acquiring Livonia and other territory.

STEPHENS, ALEXANDER HAMILTON (1812–83), Amer. politician; entered Congress, 1843; on secession of his native state, Georgia, from Union, he became vice-pres. of Confederate states; afterwards gov. of Georgia, 1882.

STEPHENSON, GEORGE (1781–1848), Brit. engineer; inventor of the locomotive; b. Wylam, near Newcastle. When an engineer in Killingworth colliery he built his first locomotive. In 1815 he invented a safety mine-lamp. He was chief engineer for construction of Stockton and Darlington Railway; constructed Liverpool and Manchester Railway, where his *Rocket* proved fastest locomotive.

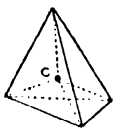
STEPHENSON, ROBERT (1803–59), Eng. engineer; s. of George Stephenson, the inventor of the locomotive. He was chief railway engineer of England, and built the famous bridges at Newcastle, Montreal, and Menai Strait.

STEPNEY, metropolitan borough, London, England, 2 miles E. of St. Paul's. Pop. (1911), 280,024.

STEPNEY, GEORGE (1663–1707), Eng. poet and diplomatist; b. Westminster; acted for many years as ambassador for William III. in Germany. Dr. Johnson includes Stepney in his *Lives of the Poets*.

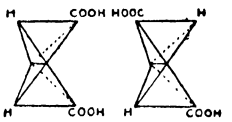
STEPNIAK, SERGIUS (1852–95), pseudonym of Sergius Michaelovitch Kravchinski, Russ. author and revolutionary; wrote *Underground Russia*.

STEPPES, pastoral plains in S. Russia and W. Siberia.



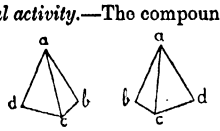
STEPPES, THE (48° N., 60° E.), gen. government, Russ. Central Asia, comprising provinces of Akmolinsk, Semipalatinsk, Turgai, and Uralsk (*qq.v.*); capital, Omsk.

STERCORARIIDÆ, Skuas (*q.v.*).



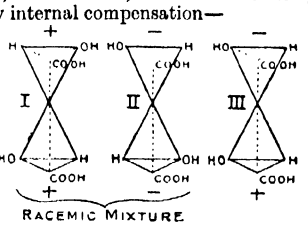
STERCULIACEÆ, natural order of trees and herbs; Baobab (*q.v.*) is a species of suborder Bombaceæ; all are tropical.

STEREOISOMERISM is that kind of isomerism (*q.v.*) which depends on the different relationships of the atoms or radicles of chemical compounds to each other in space. It is shown by differences of physical properties, and frequently by optical activity, *i.e.* rotation of the plane of polarised light.



S. occurs chiefly among carbon compounds, and is then accounted for by the theory of the carbon tetrahedron, in which the carbon atom is supposed situated within a tetrahedron, towards the angles of which its four valencies (*q.v.*) extend thus—

S. without optical activity is shown by maleic and fumaric acids, whose stereochemical formulæ are respectively—



S. with optical activity.—The compounds—

have no plane of symmetry, but are related to one another as object to image, or right to left hand. Such isomerism of molecules is accompanied by optical activity; and a carbon atom to which are attached four dissimilar atoms or groups is called an asymmetric carbon atom.

There are two tartaric acids, each containing two asymmetric carbon atoms; I. is dextro-, II. is lævo-rotatory. Racemic acid, an equimolecular mixture of I. and II., is inactive; mesotartaric acid, III., is inactive by internal compensation—

Salts of the two former acids form asymmetric crystals, related as object and image; they are enantiomorphous. Many vital products are optically active, but artificial compounds are racemic, *i.e.* equimolecular mixtures of oppositely active molecules.

Recently, optically active compounds of nitrogen, sulphur, selenium, silicon, tin, phosphorus, chromium, iron, and cobalt have been prepared.

STEREOSCOPE.—When we look at any solid object, such as a cubical box, an image of the object is formed in each eye, and these two images are slightly different. The reason for this is that the image formed in one eye is produced by a system of rays which proceed from a set of points which are different from those which give rise to the image in the other eye. The combination of the two produces the sense of solidity in the object, and enables us to appreciate those parts of an object which stand out in relief from the rest. In a photograph of the object, this idea of solidity is not conveyed, because the photograph is taken with a single lens—that is, it is not the binocular vision of two eyes. If, however, two photographs are taken by two lenses placed close together (an arrangement known as a *stereoscopic camera*), and converging in the same way as the visual directions of a pair of eyes, then the pair of photographs will differ in the same way as the two images in the eye differ. But if this pair of photographs be viewed by a pair of lenses which combine the rays from both photographs into an image which appears to come from one photograph, we obtain a picture which gives the same impression of solidity or depth that

we obtain in direct vision of the object itself. This arrangement of lenses is termed a *stereoscope*. The lenses are generally half-lenses with their thinner edges turned inwards towards each other. They are mounted on a frame to which is attached a holder for the stereoscopic photographs.

STERILITY, barrenness in reproduction; may be due to altered environment, *e.g.* many cultivated flowers never seed; some animals do not breed in captivity; in human beings s. is caused by disease, age, defective development of reproductive orders, etc. See HYBRIDS, REPRODUCTION, MENDELISM, GYNECOLOGY, IMPOTENCE.

STERLING (41° 47′ N., 89° 45′ W.), city, on Rock River, Whiteside County, Illinois, U.S.A.; iron foundries. Pop. (1910) 7467.

STERLING, legal coin of standard weight and purity. Some derive word from *Easterling* money of Hanse merchants in demand in Richard I.'s time. Sterling silver contains ·075 copper.

STERLING, JOHN (1806–44), Brit. writer; b. Kames Castle, Bute; s. of Edward Sterling of the *Times* staff; pub. *Poems* and *Strafford* (a tragedy). His *Essays and Tales* were collected, 1848. Carlyle wrote a life of Sterling, which chiefly preserves his memory.

STERN, DANIEL, see AGOULT, MARIE CATHERINE.

STERNA, a genus of Terns; see under GULL FAMILY.

STERNBERG (49° 44′ N., 17° 18′ E.), town, Austria; centre of textile industry. Pop. 14,580.

STERNE, LAURENCE (1713–68), Brit. novelist; b. Clonmel, Ireland; ed. Halifax School and Cambridge; took orders and obtained livings of Sutton and Stillington; from obscurity S. suddenly rose to fame by publication in 1760 of first vol. of *Tristram Shandy*. Other eight vol's of the same whimsical novel followed at intervals until his death; and in addition S. issued collection of *Sermons* and *A Sentimental Journey* (1768). S.'s character was far from admirable, but he ranks high in the history of Eng. fiction. He mingled genuine humour with clownish eccentricities, originality with plagiarism, delicacy with gross indecency; his Uncle Toby, Corporal Trim, and Widow Wadman are immortal characters of fiction.

Cross, *Life and Times* (1909); Sichel, *Life* (1910).

STERNE, RICHARD (1596–1683), bp. of Carlisle, 1660; abp. of York, 1664.

STESICHORUS (*c.* 630–555 B.C.), the 'lyric Homer'; Dorian poet of Sicily; struck blind for libelling Helen.

STETHOSCOPE, instrument employed in med. for the purpose of listening to the sounds produced in the body (auscultation); may be *single*, consisting of a wooden tube flattened at one end, for the ear, and cup-shaped at the other, or *binaural*, with two rubber tubes leading from the cup, for the ears.

STETTIN (53° 27′ N., 14° 33′ E.), town, on Oder, capital of Pomerania, Prussia; important shipping and commerce; churches of St. Peter and St. Paul (XII. cent.), St. James (XIV. cent.), royal palace, Königsthor, Berlinerthor, etc.; taken by French, 1806–13; became Prussian, 1814; shipbuilding, machinery, chemicals, oil-refining, sugar, paper. Pop. (1910) 237,419.

STEUBENVILLE (40° 23′ N., 80° 41′ W.), city, on Ohio, capital, Jefferson County, Ohio, U.S.A.; manufactures iron, glass. Pop. (1910) 22,391.

STEVENAGE (51° 55′ N., 0° 13′ W.), town, Hertfordshire, England; straw-plaiting. Pop. (1911) 4856.

STEVENS, ALFRED (1818–75), Brit. sculptor and decorative artist; trained in Italy, partly under Thorwaldsen. His greatest work is the monument of Wellington in St. Paul's Cathedral.

STEVENS, ALFRED (1828–1906), famous Belgian painter.

STEVENS POINT (44° 30′ N., 89° 28′ W.), city, on Wisconsin, capital, Portage County, Wisconsin, U.S.A.; lumber industries. Pop. (1910) 8692.

STEVENS, THADDEUS (1792–1868), Amer. politician and barrister; entered Congress as Whig, 1849; advocated abolition of slavery; led Republican party in Congress, 1859–68; chairman of Reconstruction Committee, 1865.

STEVENSON, ROBERT (1772–1850), civil engineer; b. Glasgow; of Scot. parents; authority on lighthouse construction; built several, including the Bell Rock Lighthouse; improved systems of lighting.

STEVENSON, ROBERT LOUIS BALFOUR, 'R.L.S.' (1850–94), Brit. novelist, essay writer, and poet; b. and ed. Edinburgh; grandson of Robert S., lighthouse engineer; travelled extensively, seeking health and experience; settled finally at Samoa, where he died of consumption. Among his works are *An Inland Voyage* (1878), *Travels with a Donkey* (1879), *Virginibusque Puerisque* (1881), *Familiar Studies of Men and Books* (1881), *New Arabian Nights* (1882), *Treasure Island* (1883), *A Child's Garden of Verse* (1885), *Prince Otto* (1885), *Dr. Jekyll and Mr. Hyde* (1886), *Kidnapped* (1887), *Underwoods* (1887), *Black Arrow* (1888), *Ballads* (1889), *Master of Ballantrae* (1889), *Catriona* (1893); left unfinished *St. Ives* and *Weir of Hermiston*, which promised to be his masterpiece. S., among last and greatest XIX.-cent. novelists, combined finished style with powerful imagination and remarkable narrative faculty. See *Life*, by Graham Balfour (1901).

STEVENSTON (55° 39′ N., 4° 45′ W.), town, Ayrshire, Scotland; collieries; ironworks; manufactures explosives. Pop. (1911) 10,773.

STEVINUS, SIMON (1548–1620), Dutch mathematician; b. Bruges; complete edition of works pub. at Leiden, 1608 and 1634; they include optics, geography, astron., etc.; advocated use of decimal systems for coinage, weights and measures (1586).

STEWART, STUART, or STEUART, Scot. (and Eng.) royal family.—David I. (1124–53) granted the stewardship (*senescallia*) of Scotland to Walter (d. 1177), an Anglo-Norman. His descendants were hereditary *stewards*. Walter the third, who married Marjory Bruce, was father of King Robert II. (1371–90). Various families of Stewart sprang from illegitimate children of this line. From Robert II. descended dynasty which ended with Mary, Queen of Scots, whose son, James VI., became king of England. The last Stewart ruler of Britain was Queen Anne, dau. of James II. The Pretender's line died out, 1807, but there are still descendants of James I. and Charles I.

Thornton, *Stuart Dynasty* (1891).

STEWART, BALFOUR (1828–87), Scot. physicist; app. director of Kew Observatory, 1859; prof. of Physics, Owens Coll., Manchester, 1870; one of founders of spectrum analysis; authority on terrestrial magnetism; wrote treatises on Heat, Physics, Conservation of Energy.

STEWART, DUGALD (1753–1828), Scot. philosopher; b. Edinburgh; prof. at Edinburgh; classifies intellectual powers of man; recognises 'association' more clearly than Reid (*q.v.*), and resolves belief in extension of coloured visible things into 'inseparable association.' Generally follows Reid in metaphysics; approaches Hume in his doctrine of causation.

STEWART, ROBERT, see LONDONDERRY, ROBERT STEWART, 2ND MARQUESS OF.

STEWARTON (55° 42′ N., 4° 30′ W.), town, on Annick, Ayrshire, Scotland; exports dairy produce.

STEWING, see COOKERY.

STEYN, MARTINUS THEUNIS (1857–), S. African statesman; pres., Orange Free State (1896–1900); joined Transvaal in Boer War; member of National Convention, which unified S. Africa (1910); potent force in politics, although retired; a leader of Dutch-speaking population.

STEYNING (50° 33′ N., 0° 20′ W.), small town, Sussex, England.

STEYR, STEIER (48° 2′ N., 14° 25′ E.), town, at junction of Enns and Steyr, Upper Austria; manufactures iron and steel. Pop. 18,000.

STICHOMETRY, the method adopted by the Greeks and Romans for measuring the lines of a literary work. In prose, as the writing of the copyists varied, a standard line was fixed, which consisted of 36 letters.

STICK INSECTS, see under LEAF INSECTS.

STICKLEBACKS (*Gasterosteidæ*), small, scaleless fishes, with three or four sharp dorsal spines, and bodies often covered with bony plates. The males build a nest for the protection of the eggs, which they guard until hatched. Found in fresh water or in the sea only in the N. hemisphere.

STIGAND, bp. of Elmham, 1043; Worcester, 1047; abp. of Canterbury, 1052–70; d. 1072.

STIGMA, see FLOWER.

STIGMATISATION, the impression of the 'stigmata' or marks resembling the wounds of Christ, in feet, and hands, and side, and those caused by the crown of thorns and scourging. St. Francis of Assisi was the first upon whom the stigmata were seen (if we except a disputed passage in St. Paul's epistles), and there have been many cases of s. since his death. More than 100 were reported in the XIX. cent. By certain schools of medicine, hypnotic suggestion is held to produce the phenomenon. Many Catholics hold it to be generally miraculous and preternatural.

STILES, EZRA (1727–95), Amer. divine; preached at Yale, Newport, etc.; prof. at Yale, 1778; student of astron., meteorology, electricity, etc.

STILICHO, FLAVIUS (d. 408), Barbarian general of Rom. Empire; ruled empire during youth of Honorius; by military genius kept back Goths and Vandals, defeating Alaric and Radagaisus.

STILL, JOHN (*c.* 1543–1608), Anglican divine; master of St. John's and Trinity Coll., Cambridge; bp. of Bath and Wells, 1593; *Gammer Gurton's Needle* (1575), early Eng. comedy, is sometimes attributed to him.

STILLINGFLEET, EDWARD (1635–99), Anglican divine; dean of St. Paul's, 1678; bp. of Worcester, 1689; wrote *Irenicum* and other works; an able controversialist.

STILL'S DISEASE, see RHEUMATOID ARTHRITIS.

STILLWATER (45° N., 92° 47′ W.), city, on St. Croix, capital, Washington County, Minnesota, U.S.A.; seat of lumber trade. Pop. (1910) 10,198.

STILTS, see under PLOVER FAMILY.

STILUS, see PALÆOGRAPHY.

STINK FLIES, see LACEWING FLIES.

STIPA, see FEATHER GRASS.

STIPENDIARY MAGISTRATE, see MAGISTRATE.

STIRLING (56° 7′ N., 3° 56′ W.), royal burgh, on Forth, Stirlingshire, Scotland; birthplace and residence of early Stewart kings; fine old fortified castle, with Heading Hill; parish church (XV. cent.), Guildhall, Smith Institute (with picture-gallery and museum), old four-arch bridge (*c.* XIV. cent.), Cambuskenneth Abbey (founded 1147), Wallace Monument on neighbouring Abbey Craig. S. is surrounded by battlefields (*Bannockburn*, etc.); Wallace defeated English at *Stirling Bridge*, 1297; besieged by English under Edward I., 1304; taken by Monk, 1651; unsuccessful siege of Jacobites, 1746. Chief industries are carpets, tartans, tweeds, rubber goods, agricultural implements. Pop. (1911) 21,200.

STIRLING, JAMES (1692–1770), Scot. mathematician; b. Garden, Stirling; chief work, *Methodus differentialis, sive tractatus de summatione et interpolatione serierum, infinitarum*, 1730.

STIRLING, JAMES HUTCHISON (1820–1909), Scot. philosopher; introduced Hegelianism into England; *Secret of Hegel* (1865), *Textbook of Kant* (1881); attempts to show intimate connection of Kant and Hegel.

STIRLING, WILLIAM ALEXANDER, EARL OF (*c.* 1567–1640), Scot. statesman, dramatist, and poet; favourite at James I.'s court; friend of Drummond of Hawthornden; received vast grants of land in America—Nova Scotia; King's Sec. for Scotland, Master of Requests, and judge of the Court of Session; author of various tragedies, poems, and an *Encouragement to Colonies*. Nova Scotia, after being a heavy drain on S., was ceded to France, 1632.

STIRLINGSHIRE (56° 3′ N., 4° 15′ W.), midland county, Scotland; area, 450 sq. miles; surface is hilly in N.W. and centre, while in E. are wide fertile plains called Carses of Stirling and Falkirk; drained by Forth; large deposits of coal and iron; has ironworks and manufactures of textiles and chemicals. County town, Stirling. Has Rom. remains and associations with Wallace, Bruce, and the Young Pretender. Pop. (1911) 161,003.

STITCHWORT, see STARWORT.

STOAT, see WEASEL FAMILY.

STOCK, see GILLYFLOWER.

STOCK DOVE, see under PIGEON FAMILY.

STOCK EXCHANGE.—Stock is the capital of a company, divided into shares, of a given amount, which are transferable. Stock is always fully paid up, shares need not be, but the latter cannot be divided into parts. S. E. means (*a*) the place where merchants and bankers assemble to buy or sell stock and shares, and more usually (*b*) persons composing the assembly. The London S. E. is the largest in the world, and those of Manchester, Liverpool, Leeds, Sheffield, Newcastle, Birmingham, Bristol, Aberdeen, Edinburgh, Glasgow, and Dublin put together do not equal the 'House' (as it is called) in membership or amount of business transacted. In XVIII. cent. London dealers in public securities met in 'Change Alley and Sweetings Alley, and the public were not excluded. There were 500 subscribers in 1802, the year of its formal beginning.

A dealer ('jobber') may not sell to the outside public except through a broker, and a broker must not sell unless he has purchased from a jobber. *Settlement* takes place fortnightly. On the 1st day of settlement —*Contango* or *Making-up Day*—payment and delivery of stock may be postponed until the next fortnightly account by the seller ('backwardation') on buyer paying interest. On the 2nd day of settlement—*Ticket Day*—the broker hands to the jobber a ticket bearing the security amount, and the names of seller, buyer, and broker. Tickets pass from jobber to jobber and often bear many names. On the last day of settlement—*Settling Day*—the buyer hands over the purchase money. The S. E. is, in fact, a strictly regulated club, to which visitors are never admitted. It has committees for house management and settlement of disputes. It can expel members who offend against the rules. A member joining the S. E. requires three members of four years' standing as sponsors, and pays £500. See BEAR, BULL, OPTION.

Poley, *History, Law, and Practice of the Stock Exchange* (1911).

STOCKBRIDGE (42° 17′ N., 73° 20′ W.), town, summer resort, on Housatonic, Berkshire County, Massachusetts, U.S.A.; associated with Jonathan Edwards.

STOCKHOLM (59° 20′ N., 18° 3′ E.), capital of Sweden; beautifully situated on rocky islands and mainland at outlet of Lake Mälar to Baltic; busy port and large industrial centre. Staden (old town) has narrow steep streets, quaint gabled houses, royal palace (with collection of armour and costumes), Storkyrka (great church, founded XIII. cent.), Tyskakyrka, Riddarhus (XVII. cent.), Riddarholms-kyrka (with royal tombs, including that of Gustavus Adolphus); Norrmalm, residential quarter, has fine broad streets, large squares, parks, univ., Royal Opera-House, national museum (valuable Swed. antiquities and art collection), national library, statues of Gustavus Adolphus and Charles XII., Northern Museum, Skansen (open-air museum). S. was founded, 1255; taken by Danes, 1389, 1520; frequent fires, XVII.–XIX. cent. Chief industries are shipbuilding, iron foundries, machinery, cotton, linen, leather, sugar, breweries, etc. Pop. (1911) 346,599.

STOCKINGS, see HOSIERY.

STOCKPORT (53° 25′ N., 2° 10′ W.), town, at junction of Tame and Mersey, Cheshire, England; cotton and hat-making industries. Pop. (1911) 108,693.

STOCKS, obsolete wooden apparatus of punishment; board pierced to receive wrists and ankles of

prisoner; used in Britain from Anglo-Saxon period to XIX. cent.

STOCKTON (37° 56′ N., 121° 13′ W.), city, capital, San Joaquin County, California, U.S.A.; commercial centre; manufactures agricultural implements, flour. Pop. (1910) 22,253.

STOCKTON-ON-TEES (54° 33′ N., 1° 19′ W.), seaport, on Tees, Durham, England; iron and steel manufactures. Pop. (1911) 52,158.

STODDARD, RICHARD HENRY (1825–1903), Amer. poet; wrote *Songs of Summer* (1857), *The Book of the East* (1867), *Recollections* (1903).

STOICHIOMETRY, term applied by B. Richter to all processes for determining ultimate composition of substances; embraces all methods for determining atomic and molecular weights. The atomic weights of elementary gases are derived from their densities observed under regulated conditions. Analysis yields accurate values for equivalent weights of all elements (except argon, etc.), and the laws of specific heat and isomorphism, with the periodic law, furnish other necessary evidence for fixing atomic weights. Otherwise the least weight of an element within molecular weight of any compound is atomic weight. Molecular weights are derived from vapour densities, and physical properties of liquids and solutions.

STOICS, THE, a philosophical school founded by ZENO of Citium, a philosopher possibly not of Gk. descent, who *c.* 300 B.C. began to teach in a *Stoa* or colonnade at Athens. On his death about 265 B.C. the leadership of the school passed to the poet CLEANTHES, and then to CHRYSIPPUS of Soli (d. *c.* 206 B.C.), who consolidated its doctrines. In II. cent. B.C. Panætius of Rhodes won for Stoicism much attention in Rome, where many men of importance became its adherents; and during I.–II. cent's A.D., though it lost in speculative value as expounded by EPICTETUS, SENECA, MARCUS AURELIUS, and others, it was, as a system of popular Puritan morals, the most restraining force amid the vagaries of pseudo-religious exuberance and moral decadence of that period.

In its earlier shape, however, as formulated by Chrysippus, Stoicism was more than a system of morals, though its interest was predominantly ethical. The Stoic metaphysic has been described as a 'materialistic pantheism,' and it certainly tried to combine two views, commonly held apart, that whatever is real is corporeal, and that the world and everything in it is informed by reason and expressive of the world-soul, or God. Thus the Stoics regarded the universe as a rational, though material, whole, and were opposed to the crude atomism of the Epicureans.

The difficulty of such a pantheism is its apparent implication that everything, just as it is observed, is equally rational, an implication which brings forward the problem of evil in a very aggravated form, and seems inconsistent with those moral principles on which the Stoics laid much stress. Of physical evil they made light, as being no real evil to the wise man; but their attempt to account for moral evil as necessary to the goodness of the whole was not very successful.

Their ethical ideal seems at first sight to be in out spoken opposition to Epicureanism. Whilst the latter exalts Feeling, the Stoics bid us follow Reason alone. The life of reason is the life of wisdom and virtue and spiritual health, and the wise man alone is free, having liberated himself from care about external conditions and the vicissitudes of fortune, and especially from the passions, which he wholly extirpates. Nothing seems vile to him but that which is within his own control—an evil will; and in its early uncompromising form the Stoic view was that there are no degrees of virtue, but a man is either perfectly wise or utterly depraved. Since the perfect Sage is not to be found, it follows that we are all equally 'sick fools,' utterly mad and bad, but it came to be allowed that the man who strives after good is good in his degree.

Despite their opposition, however, there is this resemblance between the Stoics and the Epicurean ethics, that both found the ideal in a wise unruffled calm, and both represent that tendency of the individual to find a refuge from the world within his own breast, which arose upon the downfall of the free city-state. The Stoic statement of the ideal offered a possibility of greater dignity, but also a risk of ungracious rigorism and self-righteousness. This risk, however, was somewhat lessened by the Stoic's doctrine of the unity of all men as reasonable beings; and their consequent insistence on the duty of philanthropy saved the best of them from a too stony-hearted heroism.

Epictetus, *Discourses*, trans. by Long; Marcus Aurelius, *Meditations* (Long's or other trans.); Caird, *The Evolution of Theology in the Greek Philosophers*; Capes, *Stoicism*; Dill, *Roman Society from Nero to Marcus Aurelius*; R. D. Hicks, *Stoic and Epicurean*; Zeller, *Stoics, Epicureans, and Sceptics*.

STOKE NEWINGTON, metropolitan borough, London, 3 miles N.E. of St. Paul's. Pop. (1911) 50,683.

STOKE POGES (51° 33′ N., 0° 37′ W.), village, Buckinghamshire, England; burial-place of Thomas Gray.

STOKE-ON-TRENT (53° 1′ N., 2° 10′ W.), town, on Trent, Staffordshire, England; centre of pottery and porcelain manufacture; includes (since 1910) Tunstall, Burslem, Hanley, Longton, Fenton, Stoke. Pop. (1911) 234,553.

STOKES, SIR GEORGE GABRIEL (1819–1903), Brit. mathematician; b. Sligo; ed. Bristol and Cambridge; senior wrangler and first Smith's prizeman (1841); app. Lucasian prof. of Math's, Cambridge, (1849); F.R.S. (1851); pres. of Brit. Association, 1869, and of Royal Soc., 1885 to 1888; cr. baronet, 1889; received Rumford medal for investigations on light; contributed many important papers to various societies. The correspondence between S. and his intimate friend Kelvin brought out many new scientific ideas.

STOKESLEY, JOHN (1475–1539), bp. of London, 1530.

STOLBERG (50° 45′ N., 6° 16′ E.), town, on Vichtbach, Rhineland, Prussia; manufactures brass, iron. Pop. 15,470.

STOLBERG, FRIEDRICH LEOPOLD, GRAF ZU (1750–1819), Ger. poet; b. Bramstedt (Holstein); wrote *Leben Alfred des Grossen*, besides ballads, odes, translations, etc.

STOLE, a narrow strip of stuff; liturgical vestment, worn by bp's, priests, and deacons, the latter wearing it over left shoulder and fastened under right side; priests at mass wear it crossed on the breast; sometimes confused with the scarf, a band of silk (specially Anglican).

STOLE, GROOM OF THE, see BEDCHAMBER, OFFICIALS OF THE.

STOLP, STOLPE (54° 29′ N., 17° 1′ E.), town, on Stolp, Pomerania, Prussia; manufactures machinery. Pop. (1910) 33,762.

STOMACH, a dilated sac-like part of the digestive tract, situated in man in the upper part of the abdomen on the left side, in which the early stage of digestion takes place. (See DIGESTION, DYSPEPSIA, GASTRIC ULCER.) Cancer of the s. is a comparatively common disease, the most usual situation being at the outlet or pylorus, when the symptoms generally include discomfort an hour or two after food, distension of the stomach, vomiting, loss of flesh, and a hard lump may be felt at the pylorus. The treatment is radical operation as soon as diagnosed, while a palliative operation may give great relief for a considerable time when the growth is too advanced for removal.

STOMATA, see LEAF.

STONE, a hard, compact mass of earth, as limestone, sandstone, etc.; generally obtained by quarrying rock. The principal components of s. are silex, aluminia, zirconia, glucinia, lime, and magnesia. When oxides such as iron and copper enter into its composition they generally give it a colour. S. varies in hardness

and weight. Some s's (*e.g.* granites) are extremely hard; others are so soft (*e.g.* sandstones) as to be acted upon by rain and wind. Coarse-grained s's, where the particles exceed the size of a pea, are generally known as *conglomerates*. Some s's are exceedingly brittle; and others are fusible; none are malleable, ductile, or soluble.

Artificial s's generally consist of burnt clay, which is formed into firebricks, and bricks for building purposes. Portland cement is mixed with sand and s's, and when set forms an artificial s. much used for piers, breakwaters, and other marine works. For *precious* s's, see GEMS. See also SLATE.

Merrill, *Stones for Building and Decoration.*

STONE (52° 55′ N., 2° 9′ W.), town, on Trent, Staffordshire, England. Pop. (1911) 5690.

STONE AGE, see ANCIENT HISTORY.

STONE CIRCLES, see STANDING STONES.

STONE, EDWARD JAMES (1831–97), Brit. astronomer; b. London; made accurate redeterminations of many astronomical constants, also two great star catalogues: *Cape Catalogue*, 1880, *Radcliffe Catalogue*, 1890.

STONE, GEORGE (1708–64), Irish ecclesiastic; dean of Ferns, 1733; bp. of Ferns, 1740, Kildare, 1743, Derry, 1743; abp. of Armagh, 1747. His work was more political than religious, upholding Eng. interest in Ireland, though tolerant to Roman Catholics; an able, but worldly man.

STONE MONUMENTS, PREHISTORIC, see STANDING STONES.

STONECHAT, see under THRUSH FAMILY.

STONEHAM (42° 29′ N., 71° 15′ W.), town, Middlesex County, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 7090.

STONEHAVEN (56° 58′ N., 2° 13′ W.), county town, watering-place, on North Sea, Kincardineshire, Scotland; herring-fishing centre; tanneries. Pop. (1911) 4266.

STONEHENGE (51° 11′ N., 1° 49′ W.), remarkable group of huge stones in Salisbury Plain, in Wilts, England, 7 miles N. of Salisbury. When entire it consisted of two circles of stones, many of which now lie on the ground; those remaining show that the general arrangement was in groups of three, two upright stones being joined by a third, which they supported. Largest stone is 22 ft. high, 7½ broad, and 4 thick. Their erection is generally attributed to the late Stone or the Bronze Age, and their use was probably both monumental and sacrificial.

STONES, PRECIOUS, see GEMS.

STONES, STANDING, see STANDING STONES.

STONINGTON (41° 20′ N., 71° 57′ W.), town, seaport, New London County, Connecticut, U.S.A.; manufactures foundry products. Pop. (1910) 9154.

STONY POINT (41° 15′ N., 73° 58′ W.), town, on Hudson River, Rockland County, New York, U.S.A.; taken by British, recaptured by Gen. Wayne, and subsequently reoccupied by British, 1779.

STOOL, portable seat without back; much used in Middle Ages, when chairs were cumbrous; three- or four-legged, sometimes folding like modern camp-stool; often skilfully carved; ducking-stool was contrivance for immersing shrews.

STORACE, STEPHEN (1763–96), Brit. musical composer; b. and died in London; wrote 18 musical dramas and some harpsichord pieces.

STORKS (*Ciconiidæ*), a family of long-necked, long-legged wading birds, found everywhere except in Northern Europe, Asia, and America. The WHITE and BLACK STORKS (*Ciconia*) occasionally visit Britain; the large ADJUTANTS, or MARABOUS, occur in Eastern Asia and Africa.

STORM, see METEOROLOGY, WIND.

STORNOWAY (58° 11′ N., 6° 22′ W.), town, seaport, island of Lewis, Hebrides, Scotland; centre of Outer Hebrides fishery district. Pop. (1911, resident) 3806.

STORRS, RICHARD SALTER (1821–1900), Congregationalist minister in U.S.A.

STORY, JOHN (1510–71), R.C. martyr.

STORY, JOSEPH (1779–1845), Amer. lawyer and statesman; Justice of Supreme Court of U.S.A., 1811–45; decisions important in case law; son was well-known artist and author, WILLIAM WETMORE STORY.

STORY, ROBERT HERBERT (1835–1907), Presbyterian minister, principal of Glasgow University, 1898.

STORY, WILLIAM WETMORE (1819–95), Amer. sculptor and poet; spent his professional life in Italy; produced many fine works in sculpture and several volumes of verse.

STOTHARD, THOMAS (1755–1834), Brit. designer and painter; b. and died in London; became famous as an illustrator of books, some 3000 of his designs having been engraved. His best-known painting is *The Canterbury Pilgrims.*

STOUGHTON, JOHN (1807–97), Congregationalist minister; wrote several books.

STOUR.—(1) (51° 15′ N., 1° E.) river, Kent, England; enters North Sea by two arms at Isle of Thanet. (2) (51° 57′ N., 1° 12′ E.) river, between Essex and Suffolk, England; enters North Sea. (3) (50° 47′ N., 2° 2′ W.) river, Dorsetshire and Hampshire, England; joins Avon at Christchurch. (4) (52° 30′ N., 2° 15′ W.) river, Staffordshire and Worcestershire, England; joins Severn at Stourport.

STOURBRIDGE (52° 28′ N., 2° 9′ W.), town, on Stour, Worcestershire, England; ironworks. Pop. (1911) 17,316.

STOURPORT (52° 21′ N., 2° 25′ W.), town, at junction of Stour and Severn, Worcestershire, England. Pop. (1911) 4432.

STOUT, see BREWING.

STOW, JOHN (*c.* 1525–1605), Eng. chronicler; followed trade of tailor till age of forty; *Summary of English Chronicles* first pub., 1561; *Annals of England*, 1580; chief work, *Survey of London*, 1598; collector and copier of MSS.; writings noted for local colour; died destitute.

STOWE, HARRIET E. BEECHER, see under BEECHER, LYMAN.

STOWELL, WILLIAM SCOTT, BARON (1745–1836), Eng. lawyer; eldest bro. of Lord Eldon; judge in Consistory Court, 1788, and in Court of Admiralty, 1798; the real creator of present admiralty law in England; twenty years M.P. for Oxford.

STOWMARKET (52° 12′ N., 1° E.), market town, Suffolk, England; chemical works. Pop. (1911) 4230.

STRABANE (54° 49′ N., 7° 27′ W.), town, at junction of Mourne and Finn, County Tyrone, Ireland; linen and shirt-making industries. Pop. 5100.

STRABO (*b. c.* 63 B.C.), Gk. geographer; b. Amasia, Pontus; ed. Nysa by Aristodemus and Tyrannion; at Rome, *c.* 29 B.C.; travelled in Arabia, Asia Minor, and Armenia, 24 B.C., returned to Rome, 20 B.C.; compiled a *Geography* in 17 books, dealing with Europe, Asia, and Africa, and a *History* in 43 books—a supplement to Polybius; only fragments of this work remain.

STRACHAN, JOHN (1778–1867), Canadian-Anglican divine; emigrated to Canada, 1799; joined Episcopal Church; ordained, 1803; rendered much help to Brit. government during war of 1812; became interested in education, which he endeavoured to keep under Church control; bp. of Toronto, 1840.

STRACHEY, SIR JOHN (1823–1907), Brit. Indian administrator; b. London; rose to be gov.-gen. of India on the assassination of Lord Mayo. He wrote *India: Its Administration and Progress.*

STRACHEY, SIR RICHARD (1817–1908), Eng. soldier; held various government posts in India; joint-author of work on Ind. finance.

STRADELLA, ALESSANDRO (*c.* 1645–82), Ital. musical composer; b. Naples; murdered, through jealousy, at Genoa. The murder and the incidents leading up to it are the subjects of Flotow's opera *Stradella*, and of a novel by Marion Crawford. His compositions include oratorios, operas, cantatas, and other works.

STRADIVARI, ANTONIO (1644–1737), Ital. violin-maker; b. Cremona; pupil of Amati; violins most perfect in world. See VIOLIN. *Life*, by Petherick (1900), Hill (ed. 1909).

STRAFFORD, EARL OF, THOMAS WENTWORTH (1593–1641), Brit. statesman; e. s. of Sir William Wentworth, Bart.; early alienated Savile through various rivalries, 1617 onwards; opposed Buckingham and sneered at Puritans; imprisoned for refusing forced loan, 1627, and became leader of constitutional party, again and again declaring that his opposition was to ministers, not king; cr. viscount, 1628, and pres. of Council of north; P.C. 1629.

Lord-Deputy (subsequently Lord-Lieut.) of Ireland, 1632, S. declared that his motto would be '*Thorough*.' He restored order, 1633, but being ardent Prot., roused bitter resistance; established Crown claim to Connaught, 1635; not wilfully unjust, but regarded Irish as obstacles to orderly government. Returning to England, 1639, he became king's chief adviser. Bitter jealousy was aroused by his acquisition of barony of Raby and earldom, 1640. When he put Irish army at disposal of Crown, he received title of Black Tom Tyrant; attainted as traitor to the State; Charles I. broke his word and gave deepest stain to his reputation by assenting to his execution.

Traill, *Life of Strafford* (1889).

STRAIN, see ELASTICITY.

STRAITS SETTLEMENTS (5° N., 100° E.), Brit. colony in Malay Peninsula, comprising Singapore, Malacca, Penang, Dindings, and Province Wellesley, with the dependencies of Cocos, or Keeling, Islands, Christmas Island, and several native states. Pop. (1911) 714,060; white, 7368. Capital, Singapore.

STRALSUND (54° 20′ N., 13° 5′ E.), seaport, on Strelasund, Pomerania, Prussia; chief architectural features are four Gothic churches and a XIV.-cent. town hall; exports grain; manufactures machinery; was an important Hanse town; unsuccessfully besieged by Wallenstein in the Thirty Years War (1628); passed to Prussia, 1815. Pop. (1910) 33,988.

STRAMONIUM, drug obtained from seeds and leaves of the thorn-apple, *Datura stramonium*, the chief constituent being an alkaloid daturine or hyoscyamine; medicinally the leaves are smoked and the drug given internally to relieve the bronchial spasm in asthma.

STRANGE, SIR ROBERT (1721–92), line engraver; b. Kirkwall, Orkney; fought at Culloden, and engraved Charles Edward's banknotes. Settling in London, he attained front rank in his profession.

STRANGFORD, VISCOUNTY, Irish title. PERCY SMYTHE, 6th viscount (1780–1855), Brit. ambassador to Portugal, Sweden, Turkey, Russia. PERCY, 8th viscount (1826–69), was noted for his linguistic acquirements; wrote on philology, politics, etc.

STRANGLES, disease of young horses; symptoms —cough, nasal discharge, swelling of lymph glands in throat; treatment—fomentations and tonics; infectious.

STRANGULATION, see under HERNIA.

STRANRAER (54° 54′ N., 5° 2′ W.), seaport, watering-place, on Loch Ryan, Wigtownshire, Scotland; has a ruined castle (XV. cent.); manufactures dairy utensils; exports agricultural produce. Pop. (1911) 6432.

STRASSBURG, STRASBURG (48° 35′ N., 7° 46′ E.), capital of Alsace-Lorraine, Germany, on Ill; first-class fortress of high strategical importance; R.C. bp.'s see; famous cathedral (1015 onwards) with remarkable astronomical clock, Church of St. Thomas (Romanesque and Gothic arch.), library, episcopal palace (now museum and art gallery), imperial palace, univ. (founded, 1567); housetops frequented by storks. S. took prominent part in mediæval history; annexed by France, 1681; severely bombarded, 1870; ceded to Germany, 1871. Chief products are machinery, printing, jewellery, hardware, tanning, tobacco, *pâté de foie gras*, breweries, etc. Pop. (1910) 178,891.

STRATA-FLORIDA (52° 17′ N., 3° 53′ W.), parish, Cardiganshire, Wales; remains of a Cistercian abbey (1194).

STRATEGUS (Gk. *strategos*, 'general'), in Athens designated the highest magistrate of the state. There were normally ten strategi in Athens. The strategi summoned the assembly and laid the propositions before the people. To them were entrusted foreign administration and finance, and they also commanded the home forces. Their authority in regard to military jurisdiction was supreme. Till the year 325 B.C. these functions were performed collectively by the college of strategi; after that year their various spheres of action were assigned on election.

STRATEGY.—The term strategy is derived from Gk. *strategia* (i.e. office of commander, generalship), and denotes that department of war which is concerned with the planning and directing of great military operations. S. is often confounded with *tactics* (q.v.). Now tactics means the actual conduct of the battle which it has been the object of the strategist to bring about or to avoid under certain conditions. S. may, and, indeed, in these days when the growth of naval armaments goes on apace and Europe is an armed camp, *must* be exercised even in times of peace. Thus s. dictated the withdrawal of Brit. warships from outlying stations and their concentration in home waters. As *The Times* remarked (June 1912): 'The North Sea is now the centre of our naval s., because it has witnessed within the last ten years a development of foreign naval strength which touches imperial security to the roots. No victories in other seas could retrieve a failure there, and victory there would leave us with an easy mastery in other European seas.' The purpose of s., then, is so to dispose one's available fighting material that a war or a battle, if undesired, may be avoided, or if it does take place, may be fought under the most advantageous circumstances. Tactics, therefore, is the method of combat; s., according to Clausewitz's definition, is the use or employment of combat.

As Lieut.-Col. James points out in *Modern Strategy* (1903), the ties between s. and tactics are practically indissoluble. S. deals with the military considerations which determine the choice of the offensive or defensive, the selection of the country in which to fight, the objects against which the armies or navies should be directed, and embraces the plan of campaign or general idea dominating the conduct of operations. 'Broadly speaking, s. is concerned with the movement of troops before they come into actual collision, while tactics deal with the leading of troops in battle or when battle is imminent.' S. seeks to win more than the battle: it aims at drawing the greatest advantage from battle.

S. has developed with the art and science of war, and the modern strategist has to take into account not only the physical features of the theatre of war, but the progress of civilisation and all the latest inventions of man. Battles are now fought on sea and land with long distances between the combatants. Means of communication are now very much better than they were, say, in Napoleon's time. News circulates far more quickly in these days of telegraphy and alert newspaper correspondents. Conscription has revolutionised the armies of Europe. The size and composition of navies change continually. Submarines, aeroplanes, new weapons, defensive and offensive, make war ever more and more formidable and alter the strategist's calculations. International alliances, arbitration treaties, and all the ins and outs of the world's politics have an important bearing on s. More and more great wars call for master-strategists to draw up a definite plan of campaign, select suitable bases and lines of operations, lines of defence and lines of retreat, pick out strategical points and safeguard the lines of communications—in a word, to ensure that their country's armies and navies go into battle under the most favourable auspices. In these days of mighty fleets, colonial expansion, and international commercial

rivalries, the strategist's outlook must cover the whole wide world, for the theatre of war is the province of s., as the field of battle is that of tactics (*q.v.*).

STRATFORD (43° 21′ N., 81° 7′ W.), city, on Avon, port of entry, capital, Perth County, Ontario, Canada; railway repair-shops; saw- and flour-mills. Pop. 12,946.

STRATFORD, JOHN DE (d. 1348), Eng. Churchman; bp. of Winchester, 1323; helped to depose Edward II.; Chancellor, 1330; abp. of Canterbury, 1333; quarrelled with Edward III., but reconciled.

STRATFORD-DE-REDCLIFFE, VISCOUNT, STRATFORD CANNING (1786–1880), Brit. diplomatist; cousin of George Canning (*q.v.*), who appointed him ambassador extraordinary to Turkey, 1825, to press cause of Greece; afterwards frequently minister at Constantinople and won remarkable influence over Turk. mind; inspired Turk. resistance to demands of Tsar Nicholas, and by representations at home was largely responsible for Brit. aid to Turkey in Crimean War.

STRATFORD-ON-AVON (52° 12′ N., 1° 43′ W.), town, on Avon, Warwickshire, England; birthplace of Shakespeare; contains church of the Holy Trinity, with the tomb of Shakespeare and a celebrated bust of the poet; the house in which he was born (now Shakespearean museum); the grammar school where he was educated; the New Place, the site of the house where he spent his latter years and died; the old Guild Hall and some modern memorial buildings; about one mile W. of Stratford is Shottery, with Anne Hathaway's cottage. Pop. (1911) 8532.

STRATHAVEN (55° 41′ N., 4° 3′ W.), town, Lanarkshire, Scotland; silk and cotton goods.

STRATHCLYDE, ancient Celtic kingdom, extending from Clyde to Solway; capital, Alclyde (Dumbarton); annexed to Scotland, 1124; at a later period known as Cambria.

STRATHCONA AND MOUNT ROYAL, BARON, DONALD ALEXANDER SMITH (1820–), Canadian politician; became clerk in Hudson's Bay Co., 1838; rose in company's service, and became chief commissioner and gov. at Montreal, 1868–69; completion of Canadian Pacific Railway largely attributable to him; high commissioner for Canada, 1896; cr. baron, 1897; raised cavalry regiment for British in S. African War, 1900.

STRATHNAIRN, 1ST BARON, HUGH HENRY ROSE (1801–85), Brit. soldier; distinguished himself in Syria against Mehemet Ali of Egypt, 1840; consul-general of Syria, 1841; served in Crimean War; during Mutiny won many victories as commander of Central India army; chief Indian command, 1860; commander-in-chief in Ireland during Fenian unrest; cr. baron, 1866.

STRATHPEFFER (57° 36′ N., 4° 30′ W.), village, health-resort, Ross and Cromarty, Scotland; mineral springs.

STRATUM, see GEOLOGY.

STRAUBING (48° 53′ N., 12° 34′ E.), town, on Danube, Bavaria, Germany. Pop. (1910) 22,021.

STRAUSS, DAVID FRIEDRICH (1808–74), Ger. scholar and theologian; ed. Tübingen, where he lectured; pub. *Life of Jesus*, 1835; *Life of Jesus for the German People* appeared 1864; an able critic, but rationalist and devoid of spiritual sympathy.

STRAUSS, JOHANN (1804–49), Austrian composer; the 'Waltz King'; conducted famous Strauss Orchestra. His son, JOHANN (1825–99), conducted orchestra, 1849–63; composed operettas, e.g. *Fledermaus* (1874), and waltzes (e.g. *Blue Danube*).

STRAUSS, RICHARD (1864–), Ger. composer; b. Munich; a prodigy from babyhood; Hofkapellmeister, Berlin, since 1899. Earlier works show classical tendencies; then (e.g. *Tod und Verklärung* and *Guntram*) influence of Liszt and Wagner prevailed; later works (e.g. *Salome, Elektra*) bristle with eccentricities and strange and violent effects; a master of orchestration and composer of some beautiful songs. *Life*, by Newman (1908).

STRAW, stalks of wheat, oats, etc.; used for thatching and plaited work, especially for hats; Tuscany is largest centre of straw-plaiting industry; best material grown there; Luton is centre of Brit. straw industry.

STRAWBERRY (*Fragaria vesca*), a member of the Rosaceæ, cultivated varieties of which are often grown for their fruit; plant possesses tripartite, compound leaf with well-marked stipules, and reproduces vegetatively by means of runners; flower bends downwards on fertilisation and develops into so-called s. fruit. This is really the fleshy, succulent head of the flower stalk, and bears the actual fruits (*achenes*) studded over its surface.

STREATHAM, residential district, Wandsworth, London, England.

STREATOR (41° 1′ N., 88° 57′ W.), city, on Vermilion, Lasalle County, Illinois, U.S.A.; brick- and tile-works; coal mines. Pop. (1910) 14,253.

STREET, GEORGE EDMUND (1824–81), Eng. architect; designed and restored many churches, but is chiefly remembered for the new Law Courts in London.

STRENGTH OF MATERIALS, the science that deals with the nature and size of the stresses in engineering structures and machines, so as to determine the proportions of members. The subject includes a mathematical investigation of the nature and effect of stresses.

Stress can be explained as a mutual action between two bodies, each one exerting force upon the other. Stresses upon any surface may be normal, tangential, or oblique, and may be divided under the following headings: (1) compressive or 'push' forces; (2) tensile or 'pull' forces; (3) shear sliding forces tending to slide one layer of a body upon another; (4) bending forces; (5) twisting or torsional forces.

Any number of forces acting upon a body may be resolved into simple compressive or tensile stresses, acting upon 3 distinct planes of reference at right angles to each other. These forces are called principal stresses, and the planes on which they act are called axes of greatest and least principal stress. Stress is always considered as tons or pounds per square inch. In the design of structures, assumptions as to the safe stress carried by materials—steel, cast-iron, wrought-iron, wood, concrete, etc.—are based upon practical experimental tests. When a material suffers deformation under the action of a given stress it is said to suffer strain. Elasticity is the property of a material by which it tends to regain its original formation when the stress has been removed. When a material is strained it retains its elasticity up to a certain limit called the elastic limit or yield point; if the operation be continued the material loses its elasticity, becomes more or less ductile, and finally breaks. In the case of a pull or tension metals contract at the point of fracture, in compression they expand, while when 'sheared' the layers are slid one over another.

The relation that within the elastic limit stress is proportional to strain is known as **Hooke's Law.** In tension, then, if l represent strain, L the original length of a member, and P the stress or load, then $\frac{l}{L} = \frac{P}{E}$ where E is Young's Modulus of Elasticity, the value of which varies with materials.

Tension.—Tensile stress is of the nature of a 'pull.' The calculation of a suitable section for a member is easy. The product of the cross-sectional area of a member and of the safe stress used, must equal the load; or taking initial letters of symbols, $A \times S = L$. The safe stress to be used is derived by dividing the stress at yield point or elastic limit of a given material by a factor 1, 2, 3, 4, or even 7. The choice of this factor is a matter of experience, and varies with the purpose for which the member is to be used.

Compression.—Compressive stress is a 'push' force. It is obvious that compressive stresses, acting at the ends of a bar, tend to bend it. Experiments and

research by Wohler, Euler, Rankine, and Gordon have produced definite formulæ that the buckling stress of a member varies according to the equation.

$$\text{Buckling stress per sq. inch} = \frac{F}{1 + \frac{1}{N}\left(\frac{l}{r}\right)^2} \quad \text{where}$$

F and N are constants varying with the material used, and $\frac{l}{r}$ is the only variable quantity.

Shear Force tends to slide one layer of a body upon another. The best example of shear is to slide one-half of a pack of cards over the other half, one-half of the pack being sheared off the other.

Bending and Twisting stresses are easy to conceive, and require no illustration. The theories connected with them are, however, too wide to admit of discussion here.

Reinforced Concrete.—The theory of bending has, however, laid the foundations for a practice which has now become general, that of reinforcing concrete with metal bars. Considering a beam in equilibrium under the action a force, if the beam rest upon two supports, the upper fibres of the beam are being compressed, while the lower fibres are in tension. Many structures are in states of tension and compression. Now concrete has high compressive resistance but little or no resistance to tension. The object of using metal reinforcements in concrete structures is to increase the tensile resistance of a structure. In the case of the beam mentioned the reinforcements would be about the lower force.

Strengths of Various Materials:—

Material.	Ultimate Strength in tons per sq. inch.			Working Stress in tons per sq. inch.		
	Tension.	Compression.	Shearing.	Tension.	Compression.	Shearing.
Steel	45	70	30	9	9	5
Cast-iron	7½	48	14	1½	9	3
Wrought-iron	25	17	20	5	3½	4
Oak	6½	3½	1	1	½	⅛
Teak	6½	5	—	1	1	—
Brick in cement	¼	½ to ⅞	—	50 to 180 lb.		
Concrete (1 part sand to 1 cement).	8478 lb.					

STREPSILA, Turnstones; see under Plover Family.

STREPTOCOCCUS, see Parasitic Diseases.

STRESA (45° 50′ N., 8° 34′ E.), village, on Lago Maggiore, N. Italy.

STRICTURE, contraction of a tube, *e.g.* urethra, intestine, gullet; usually result of former ulceration; may be due to a growth in the passage wall.

STRIEGAU (50° 58′ N., 16° 22′ E.), town, Silesia, Prussia; cigar factories. Pop. (1910) 14,574.

STRIGIDÆ, Barn Owls; see under Owls.

STRIKES AND LOCK-OUTS, see Labour (Labour Disputes).

STRINDBERG, AUGUST (1849–1912), Swed. author; b. Stockholm. His *Röda rummet* ('The Red Room'), an exposure of the hardships of journalistic life, roused a torrent of indignation. *Giftas* ('Married'—1884) was the commencement of a prolonged attack on the feminist movement.

STRINGED INSTRUMENTS, a large number of instruments producing sound from stretched strings of gut, wire, etc., in various ways, such as: (1) striking with hammers, *e.g.* piano, dulcimer; (2) plucking with fingers or plectrum, *e.g.* harp, mandoline, guitar; (3) friction of bow, *e.g.* violin, viola, 'cello, double-bass; (4) by current of air, *e.g.* Æolian harp. The term stringed instruments or 'strings' is often restricted to those under (3).

STRINGOPS, Owl Parrot; see under Parrot Tribe.

STRODE, WILLIAM (1598–1645), Eng. politician; M.P. from 1624 onwards; conspicuous member of opposition in struggle between king and Parliament; one of five impeached members, 1642.

STROMATOPOROIDS, see under Hydromedusæ.

STROMBOLI, see Volcanoes.

STROMBUS, a mollusc; see under Gasteropoda.

STROMNESS (58° 57′ N., 3° 17′ W.), seaport, W. coast of Pomona, Orkney Islands, Scotland.

STRONGBOW, see Pembroke, Earldom of.

STRONTIUM (Sr=87·63), alkaline earth metal occurring in strontianite ($SrCO_3$) and celestine ($SrSO_4$); crystalline, silvery, tarnishes, decomposes water; divalent. Compounds: SrO, $Sr(OH)_2$ (strong base), $SrCl_2$, SrS (phosphorescent), $SrSO_4$ (insoluble), $SrCO_3$, $Sr(NO_3)_2$ used for red fire.

STROPHANTHUS, genus of plants, of natural order *Apocynaceæ*, growing chiefly in equatorial Africa and in Farther India. The dried seed of a species, *S. kombé*, is employed as a drug. The chief constituent of the seed is a glucoside, strophanthine. An extract and tincture of the seeds are used medicinally to stimulate and regulate the heart, especially in mitral disease.

STROSSMAYER, JOSEPH GEORGE (1815–1905), Croatian prelate; bp. of Djakovo, 1849; leader of Slavonic national movement against Hungarian influence.

STROUD (51° 15′ N., 2° 13′ W.), town, Gloucestershire, England; cloth manufacturing centre. Pop. (1911) 8772.

STRUCTURES.—Without attempting a scientific discussion this article will touch lightly upon the general principles of structural engineering and the more important discoveries of the day. During the last 50 years the use of concrete with and without reinforcements and the development of steel for bridge work and roofs have rendered possible schemes that were previously impossible. Concrete has almost superseded masonry work in the construction of large works, docks, breakwaters, large buildings, arches, etc. Its advantages include economy, rapidity and ease of construction, and strength. Steel bridges and girders are now in constant use throughout the world, combining strength, economy, good appearance, and lightness. The large ironworks and bridge-building firms standardise their productions, rendering the bridging of obstacles a mere matter of specification. The scientific investigation of the phenomena connected with earth and water press has evolved a complete scheme for the foundations of buildings, bridges, etc.

Theory of Structures.—There are two general types of structures: (1) framed structures the members of which are subject to tension and compression only; (2) structures the members of which are subject to bending stresses as well. The various parts which go to form a structure are called pieces or members; such are the stones of an arch or the girders of a bridge.

Design of Structures.—The first consideration in the design of a structure is the loads that the structure has to carry. These are standardised in any engineering text-book. Loads, speaking generally, are of two kinds—dead loads and what are known as live loads. Dead loads are those which are constantly imposed on a structure, such as its weight. Live loads are the traffic which a structure is designed to carry, or wind-pressure. Proceeding, then, the type of the structure must then be determined, the selection varying with the nature of the work, loads, site, economy, and other details. Having assumed, then, the type of structure and the loading, the stresses in the members are obtained by Graphic Statics combined with mathematical calculation. The stresses are of two kinds—stresses due to dead load and those due to live load. With regard to the stresses due to live load it is usual to allow for impact, or sudden application of a load,

such as the rolling of a train upon a bridge or gusts of wind upon a roof.

Impact or sudden loading increases the stresses produced in any member, and as the result of experiment and experience well-established coefficients or factors are used to determine the stress due to sudden loading from the stresses due to live load. This factor, called an 'impact' factor, varies in value from ½ to 1. The product of it with the ordinary stress due to live load represents the increment of stress due to sudden loading. The sum of this increment and the stress due to dead and live load give the total stress for which the member must be designed.

Concrete and Reinforced Concrete.—All masonry and concrete structures are capable of withstanding great compressive stresses, but have a low tensile resistance. The object of reinforcing concrete with steel or iron bars is to increase the tensile strength of structures. Without the use of reinforced concrete the giant buildings and sky-scrapers of America would have been impossible. The usual method adopted is the formation of a steel frame composed of girders and columns. These are encased in concrete, thereby combining preservation of the steel with strength, economy, and lightness. Upon this frame the walls are built. The whole building, in comparison with its size, is wonderfully light. See also STRENGTH OF MATERIALS.

Rankine, *Manual of Civil Engineering*; Warren, *Engineering Construction*; Goodman, *Applied Mechanics*; Husband and Harby, *Structural Engineering*; Andrew, *Design of Structures*; Rivington, *Building Construction*.

STRUENSEE, JOHAN FREDERICK, COUNT (1737-72), Dan. economist, philosopher, and statesman; b. Halle, Saxony; app. private physician to King Christian VII. of Denmark, and gained great authority at court. By an intrigue with the queen he had the king removed from active rule and became Prime Minister. The crown prince and the dowager queen headed an opposition party. In 1772 this party secured from the king a warrant for the arrest of the queen and her minister; S. was executed.

STRUTHIO, OSTRICH; see under RUNNING BIRDS.

STRUTT, JEDEDIAH (1726–97), Brit. inventor; b. S. Normanton, Derbyshire; invented Strutt's Derby ribbing machine (for the manufacture of stockings); helped Arkwright in his invention and became a partner in the first cotton-mill; invented a species of calico made entirely from cotton.

STRUVE, FRIEDRICH GEORG WILHELM (1793–1864), Ger. astronomer; director of Dorpat observatory, 1817; of observatory at Pulkova, near St. Petersburg, 1839, where he continued his work on nebulæ and double stars.

STRYCHNINE ($C_{21}H_{22}N_2O_2$), an alkaloid obtained from dried seeds of nux vomica and other species of *strychnos*, in colourless, odourless, extremely bitter, minute prisms; employed medicinally in very small doses ($\frac{1}{30}$ to $\frac{1}{15}$ gr.), as a stomachic and tonic, and as a stimulant for the heart. In poisonous doses it causes violent convulsions, asphyxia, and death.

STRYPE, JOHN (1643–1737), Eng. Church historian; rector of Low Leyton, Essex; studied history of Reformation, and produced many monuments of learning, *Ecclesiastical Memorials* being chief.

STUART, JAMES EWELL BROWN (1833–64), Amer. general; confederate in Civil War; distinguished in Shenandoah Valley, Maryland, and Gettysburg campaigns; present at *Bull Run* (first and second), *Fredericksburg*, *Chancellorsville*, *Brandy Station*; defeated and killed at *Yellow Tavern*.

STUART, LADY ARABELLA (1575–1615), dau. of Lord Lennox and cousin of James I. of England; was imprisoned by king in 1610 for marrying William Seymour without royal consent; afterwards escaped, but was recaptured and imprisoned for life in Tower.

STUART, SIR JOHN, COUNT OF MAIDA (1759–1815), Eng. general; served in America, Low Countries, France, Portugal; defeated French at *Maida*, 1806.

STUBBS, WILLIAM (1825–1901), Eng. bp. and historian; b. Knaresborough; ed. Christchurch, Oxford; librarian to abp. of Canterbury at Lambeth, 1862; regius prof. of Modern History, Oxford, 1866–84; bp. of Chester, 1884, of Oxford, 1889; wrote standard *Constitutional History of England*, etc.

STUCCO, mixture of plaster of paris and size; used for decorating walls.

STUCK, FRANZ (1863–), Ger. painter; one of the leaders of the Secessionist school.

STUCLEY, THOMAS, STUKELY (*c.* 1525–78), Eng. privateer; 3rd s. of Sir Hugh S. of Devonshire; imprisoned in Tower, 1553; turned privateer, 1563–65; employed in Ireland, but ultimately fled to Spain; commanded three vessels at *Lepanto*, 1571, and was killed fighting for Sebastian of Portugal at *Alcazar* in Morocco; hero of many ballads and plays.

STUPAS, see ARCHITECTURE, INDIAN.

STURDZA, ALEXANDER, STURZA (1791–1854), Russ. diplomat and writer.—DIMITRIE (1833–), Rumanian politician; opposed Cuza; premier four times.—JOHN (d. 1828), prince of Moldavia; reformed education.—MIKHAIL (1795–1884), prince of Moldavia; carried out industrial and educational reforms.

STURE, STEN (d. 1503), regent of Sweden, 1470–97, 1501–3; defeated Danes under Christian I. at *Brunkeberg*, 1471. STEN (*c.* 1492–1520), regent of Sweden, 1512–20; defeated Danes at *Vedla* and *Brenkyrka*; d. from wounds received at *Bogesund*. SVANTE (*c.* 1452–1512), regent of Sweden; warred against Danes.

STURGEONS (*Acipenseridæ*), a family of Chondrosteous Fishes, with rows of bony scutes, and a rounded, toothless mouth. About twenty species are found in the seas and freshwaters of sub-Arctic and temperate portions of the N. hemisphere. The roes or ovaries form caviare, and the inner layer of the swim-bladder is used as isinglass. The COMMON S. (*Acipenser sturio*) is occasionally found in Brit. seas and rivers.

STURM UND DRANG, see GERMAN EMPIRE (LITERATURE).

STURNIDÆ, STARLINGS (*q.v.*).

STUTTGART (48° 46′ N., 9° 10′ E.), capital of kingdom of Württemberg (*q.v.*), Germany; has some old churches (Stiftskirche, Hospitalkirche, Marienkirche, etc.), and many fine modern buildings in Renaissance style; Königsbau, theatre, palace, museums, library, town hall, art academy, conservatoire of music, etc.; great publishing centre; also woollens, pianos, chemicals, furniture, artists' colours, etc. Pop. (1910) 286,218.

STUYVESANT, PETER (1592–1672), Dutch soldier; administrator of Dutch N. Amer. colonies, 1646; greatly furthered prosperity of New Amsterdam (now New York), which he had to surrender to British, 1664.

STYE, see EYE.

STYLASTER, see under HYDROMEDUSÆ.

STYLASTERINA, see under HYDROMEDUSÆ.

STYLE, OLD and NEW, see CALENDAR.

STYLITES, ST. SIMEON (V. cent.), Syrian monk who lived for 30 years on the 4 ft. square top of a 70 ft. pillar from which he preached.

STYRIA, STEIERMARK (47° N., 15° 20′ E.), duchy and crownland, Austria, divided into northern or Upper Styria and southern or Lower Styria; belongs to the Eastern Alps; traversed by Mur, Drave, and Enns; rich mineral deposits (iron, coal, copper); extensive forests; fertile mountain valleys; contains numerous mineral springs; manufactures iron and steel; population mostly German-speaking and R.C.; capital, Graz; became a duchy about 1180; united with Austria, 1192; passed to the Hapsburgs, 1282. Pop. (1910) 1,444,157.

STYROLENE, phenylethylene ($C_6H_5.CH:CH_2$), colourless liquid, B.P. 145° C.; distils when cinnamic acid is heated with lime: $C_6H_5.CH:CH.COOH = C_6H_5.CH:CH_2 + CO_2$. Resembles ethylene chemically.

STYX (classical myth.), river in lower world over which Charon ferried the souls of dead (*manes*); frequently used in poetry for Hades.

SUAKIM, Sawakin (19° 6′ N., 37° 23′ E.), seaport, on Red Sea, Egyptian Sudan; exports cotton, ivory. Pop. 11,000.

SUAREZ, FRANCISCO (1548–1617), Span. Jesuit theologian; upheld Scholasticism; wrote *Tractatus de legibus ac deo legislatore*, dealing with government, and *Defence of the Catholic Faith* against Anglicanism.

SUBARITES, see under Sponges.

SUBIACO (41° 56′ N., 13° 6′ E.) (ancient *Sublaqueum*), town, on Traverone, Rome, Italy; has an XI.-cent. castle and remains of one of Nero's villas; ironworks; in vicinity are two Benedictine abbeys, founded VI. cent. Pop. 7200.

SUBJECTIVE, adjective applied to introspective thoughts; opposed to **objective,** which refers to external things. Subjectivism limits the mind to consciousness of its own phenomena.

SUBLIMINAL SELF, a term used since the work of the late F. W. Myers. According to him, the conscious portion of our personality is only the smaller part of the whole. He would explain most so-called 'psychic' phenomena—telepathy, automatic writing, etc., as manifestations of the *subconscious* portion of the personality, that below the threshold (Lat. *limen*) of consciousness. Our ordinary consciousness was only able very imperfectly to express the greater whole; the 'spurts' of genius are uprushes of that which is submerged, and so are other abnormalities. Myers' theories are not by any means yet entirely accepted.

Myers' *Human Personality and its Survival of Bodily Death.*

SUBMARINE MINES, see Mines.

SUBMARINES, see under Ship.

SUCCESSION.—The power or right to an estate inherited from ancestors. In all cases the law of the descent of real property is governed by the Inheritance Act, 1833. Male issue is admitted before the female. Where two or more of the male issue are in equal degree of consanguinity to the person owning the estate, the eldest only shall inherit, but the females all together. A kinsman of half blood is capable of being heir, and such kinsman shall inherit next after a kinsman in the same degree of the whole blood, and after the issue of such kinsman, when the common ancestor is a male, and next after the common ancestor when such ancestor is a female. On a total failure of heirs, the estate shall descend (and descent must be traced) to the heir of the person last entitled to the land, as if he had been its purchaser (Law of Property Amendment Act, 1859). Succession to the crown of England is governed by similar laws of inheritance. But no Salic Law prevents female succession on the failure of male issue. Profession of the R.C. faith or marriage with a Rom. Catholic exclude from succession to the throne.

Succession Duty varies in amount from 1 % in case of a child succeeding to a parent, to 10 % in case of succession to a stranger in blood, upon real or personal property to which any person succeeds on death of another. Calculated on capitalised value for the life of the successor.

SUCCESSION, for Wars of Succession see under countries.

SUCCINIC ACID ($C_2H_4(COOH)_2$), crystals with an unpleasant taste; M.P. 185°, occurs in amber, lignite; produced by fermentation and in oxidation of fat.

SUCHET, LOUIS GABRIEL, Duc d'Albufera da Valencia (1770–1826), Fr. soldier; won chief fame in Spain, conquering Valencia, 1812; cr. peer by Louis XVIII., but rallied to Napoleon later; wrote *Mémoires.*

SU-CHOW, Soochow (31° 26′ N., 120° 31′ E.), city, Kiang-su, China; extensive silk manufactures. Pop. *c.* 475,000.

SUCKLING, SIR JOHN (1609–42), Eng. poet; b. Whitton, Middlesex; a great favourite in court circles, beloved for his wit and prodigality, but his attempt to enlist Fr. and Irish troops for a far-reaching plot in 1642 ruined his career. His fame now rests entirely on his ballads, such as the *Ballad upon a Wedding,* and his lyrics, such as *Why so pale and wan, fond lover?*

SUCRE, Chuquisaca (19° 3′ S., 64° 25′ W.), city, capital of Bolivia (since 1826), and of department Chuquisaca; contains cathedral (1553), university (1624), president's palace; founded in 1529. Pop. *c.* 25,000.

SUCROSE, see Sugar.

SUCTORIA, a sub-class of Infusoria (*q.v.*).

SUCZAWA (47° 40′ N., 26° 14′ E.), town, on Suczawa, Bukowina, Austria; manufactures leather. Pop. 11,550.

SUDAN, vast region in Africa with no strictly defined limits, but roughly extending S. from Egypt and Sahara, and from Atlantic in W. to Red Sea and Abyssinia on E.; includes Upper Senegal and Niger Colony (formerly embraced in Fr. Sudan), N. Nigeria, Bagirmi, Kanem, Wadai, and Anglo-Egyptian Sudan. There is a great diversity of physical features, but Sudan is chiefly an elevated region, mountainous in parts, with grassy, steppe-like plains and considerable forest-land; region is watered by several great rivers, including Senegal, Niger, and Nile; in centre is Lake Chad; climate is hot and in many parts very unhealthy.

Anglo-Egyptian Sudan, situated in Upper Nile valley, is bounded on N. by Egypt, on E. by Red Sea, Eritrea, and Abyssinia, on S. by Uganda Protectorate and Belgian Congo, and on W. by Fr. Congo; area, *c.*950,000 sq. miles; district is divided into Darfur and provinces of Halfa, Red Sea, Dongola, Berber, Khartum, Blue Nile, White Nile, Kassala, Sennar, Kordofan, Bahr-el-Ghazal, Upper Nile, and Mongalla; chief towns are Khartum (capital), on junction of White and Blue Niles; Omdurman, situated opposite capital; Halfa, Merowi, Berber, El Obeid, Suakin, Port Sudan, Kassala, and Damir. The coast along Red Sea has few good harbours and no deep indentations; beyond the sandy stretch lying along shores is mt. range running parallel to Red Sea and joining highlands of Abyssinia in S.; chief summits are Jebel Erba and Jebel Soturba; another elevated part is Darfur; in N. between the Red Sea and Nile is Nubian Desert, a bare, desolate tract with little vegetation; in the neighbourhood of Nile and its tributaries the soil is rich and fertile, and in some places thickly wooded; western section of Sudan consists chiefly of grassy plains, and the S. is a swampy, unhealthy district. Besides the Nile and its tributaries the most important rivers are Gash and Baraka. Among many wild animals are the lion, leopard, elephant, hippopotamus, giraffe, and antelope; snakes and birds of brilliant plumage are numerous; forests yield rubber, gum, and much valuable timber; iron, gold, copper, and lignite are produced. Inhabitants are mainly Egyptians, Arabs, and negro tribes, with a few Europeans. Pop. *c.* 2,750,000.

The Egyptian Conquest of Sudan began in Nubia, *c.* 1820, and gradually spread over surrounding districts; in 1874 Darfur was taken; some years later, revolts were crushed in Darfur and Kordofan by General Gordon, and in Bahr-el-Ghazal by Gessi; the Mahdi revolted *c.* 1882, and rapidly overpowered the Egyptian army, their first important victory being over Hicks Pasha's forces in 1885; Gordon was isolated in Khartum, and before assistance arrived he was killed, and the town captured (1885); the Mahdi died in same year, and was succeeded by the Kalifa, who ruled till 1898, when he was completely defeated at *Omdurman* by Anglo-Egyptian army under Kitchener. Sudan contains remains of many pyramids, temples, churches, monasteries, towns, and fortresses. By agreement signed in 1899 Anglo-Egyptian Sudan is under joint-management of Great Britain and Egypt; Gov.-Gen. is appointed by Egypt with assent of Britain; each province has a governor of its own; Darfur is controlled by its Sultan, but pays tribute; the Lado enclave was included in 1910. Anglo-Egyptian Sudan has over 1000 miles of railway; a line to El Obeid was opened in 1912.

Chief occupations are ostrich-farming, sheep-, goat-,

and camel-rearing, cultivation of cotton, durra, barley, wheat, and dates; exports include cotton, gum, rubber, ivory, ostrich feathers, and dates.

SUDBURY.—(1) (52° 2′ N., 0° 43′ E.) town, on Stour, Suffolk, England; manufactures matting. Pop. (1911) 7141. (2) (46° 30′ N., 80° 50′ W.) town, Nipissing district, Ontario, Canada; manufactures explosives. Pop. 4700.

SUDBURY, SIMON OF, bp. of London, 1361; abp. of Canterbury, 1375; Chancellor of England, 1380.

SUDD, SADD, mass of river weed obstructing navigation on White Nile; some are 20 ft. thick; removed by cutting; utilised as fuel.

SUDERMANN, HERMANN (1857–), Ger. dramatist and novelist; b. Matziken, E. Prussia; began life as journalist; among works are novels, *Frau Sorge* (1888), *Der Katzensteg* (1889), *Das Hohe Lied* (1908), and dramas *Die Ehre* (1890), *Sodoms Ende* (1891), *Heimat* (1892). Several of S.'s works have been trans. into English.

SUDORIFICS, DIAPHORETICS (*q.v.*).

SŪDRAS, see CASTE.

SUE, JOSEPH MARIE (EUGÈNE) (1804–57), famous Fr. writer; author of *Mysteries of Paris*, etc.

SUEBI, SUEVI, people who occupied large part of Germany in Rom. times. They lived E. of the Ubii and Sugambri, and W. of the Cherusci.

SUECA (39° 7′ N., 0° 15′ W.), town, on Jucar, Valencia, Spain. Pop. 15,000.

SUESSULA (41° N., 14° 20′ E.), ancient town, Samnium, Italy.

SUET, solid fat about kidneys of sheep and ox; pure s. is used in preparation of ointments.

SUETONIUS TRANQUILLUS, GAIUS, Rom. historian (fl. *c.* 75–160 A.D.); chief sec. of Hadrian, friend of younger Pliny; author of *Lives of the Cæsars*.

SUEZ (29° 56′ N., 32° 35′ E.) (ancient *Kolzum*), seaport, on Gulf of Suez, at S. terminus of Suez Canal, Egypt. Pop. 20,000.

Suez Canal.—Mediterranean and Red Sea have been linked by canal since very early times; Egyptians made canal from Nile *c.* 600 B.C.; Darius and Ptolemy followed. In modern times, Venetians in XVI. cent. and Napoleon projected canals; canal from Port Said to Suez eventually constructed by Ferdinand de Lesseps (*q.v.*) & Company, 1859–69; original cost, £20,000,000; enlargements since cost several millions more.

Canal is *c.* 100 miles long; cuts Isthmus of Suez; runs through Lakes Menzaleh, Ballah, Timsah, and Bitter Lakes; depth *c.* 31 ft., bed width *c.* 121 ft.; lit by electric light; time of passage, 16–24 hrs.; controlled by Council of 32 Administrators (ten British); British Government bought Khedive's shares for £4,000,000 (value since increased nearly tenfold); canal neutralised and blockade prohibited by international agreement, 1887–88; concession expires, 1968; 4533 vessels passed through in 1910, 63 % British, receipts being £5,348,000. Canal reopened ancient highway to East (blocked by Turk. capture of Constantinople, 1453); London to Bombay, *via* Suez, is half the distance *via* Cape of Good Hope.

SUFFOCATION, see CHOKING, ASPHYXIA.

SUFFOLK (52° 12′ N., 1° 3′ E.), coast county, E. England; bounded N. by Norfolk, E. by North Sea, S. by Essex, W. by Cambridgeshire; area, 1531 sq. miles; surface generally level or slightly undulating, with low ridge of hills in N.W.; drained by Stour, which forms S. boundary, Little Ouse and Waveney in N., Blythe, Alde, Orwell, and other streams; county town, Ipswich. County is chiefly of chalk formation; principal industry is agriculture; there are important fisheries on coast; malting is carried on; manufactures include railway plant, gun-cotton, bricks and tiles, chemical manures, agricultural implements. Suffolk has various traces of Roman occupation; suffered from invasions of Danes in early times. The county is divided for administrative purpose into E. and W. Suffolk. Pop. (1911) 320,141.

SUFFOLK, EARLDOM AND DUKEDOM OF.—Earldom held by Ufford family, XIV. cent., Pole family, XIV.–XVI. cent's, Howards, from 1603 onwards. Dukedom held by Poles, XV. cent., Brandons and Greys, XVI. cent.

SUFFOLK, 1ST DUKE OF, CHARLES BRANDON (*c.* 1484–1545), s. of William Brandon, standard-bearer of Earl of Richmond at Flodden; personal friend of Henry VIII.; cr. Viscount Lisle, 1513; handsome, accomplished soldier; risked king's wrath by marrying his sister, dowager queen of France, 1515; ardently supported Henry VIII. in matter of divorce.

SUFFOLK, 1ST EARL OF, THOMAS HOWARD (1561–1626), fought against Span. Armada; admiral, 1599; cr. Lord Howard de Walden, 1597; Lord Chamberlain, 1603–14, Lord Treasurer, 1614–18; embezzlements discovered brought about fall; dau. Frances m. Robert Carr, Earl of Somerset; s. Edward cr. Lord Howard of Escrick, 1628.

SUFFOLK, WILLIAM DE LA POLE, DUKE OF (1396–1450), distinguished in Fr. wars: captured by Joan of Arc, 1429; deputy of Henry VI. for marriage with Margaret of Anjou; cr. marquess, 1444; unpopular in country as promoter of Fr. alliance, accused in later times of *liaison* with queen; enemies secured his banishment, 1450; murdered on way to France.

SUFFREN SAINT TROPEZ, PIERRE ANDRÉ DE (1729–88), Fr. admiral, of noble Provençal family; distinguished as naval officer in Seven Years War, and did good service against Moors as knight of Malta, becoming commander of order; sailed under Estaing to aid of Amer. colonies, 1778; sent as commander to Cape, 1781; defeated Eng. force sent to attack it; won great fame by capture of Trincomalee, 1782, and various brilliant attacks on Sir Edward Hughes' fleet, 1782–83.

SUFIISM, Arab. term for Muhammadan mysticism, appeared in VIII. cent. A.D., but there was a quietistic or mystical element in Islam from the beginning. With its insistence on material conquest and its bare, rigid dogmatism, the personal and devotional side of religion fell into abeyance. The effort to restore it was due to Christian influences from Syrian monasteries, to Buddhism, and to later Gk. Neoplatonic thought from Alexandria. S., systematised in IX. cent., still exists. Sufis somewhat resemble Christian monks; from them the Dervishes developed.

SUGAR is the general name given in chemistry to a class of crystallisable, optically active carbohydrates, occurring in solution in plant juices and animal secretions. The chief s's are classified as *monoses* ($C_6H_{12}O_6$) and *bioses* ($C_{12}H_{22}O_{11}$).

MONOSES are open-chain poly-hydroxyaldehydes—(*aldoses*) or ketones (*ketoses*), *e.g.*—

$CH_2OH.CHOH.CHOH.CHOH.CHOH.CH:O$
Aldose (=*dextrose*).

$CH_2OH.CHOH.CHOH.CHOH.CO.CH_2OH$
Ketose (=*levulose*).

Glucose, dextrose, or grape s. ($CH_2OH.(CHOH)_4.CH:O$) crystallises with 1 molecule of water, M.P. 86°, and anhydrous, M.P. 146°; occurs in grapes, and with *fructose* (levulose) in fruit juices, roots and leaves of plants, and honey; easily soluble in water, almost insoluble in alcohol; not so sweet as cane s.; scarcely darkened by warm sulphuric acid, but turned brown by hot, strong, caustic alkali (difference from cane s.); reduces gold, silver, and alkaline cupric (*Fehling*) solutions; fermented by yeast, etc., at 20° to 30°, yielding, besides alcohol and carbon dioxide, small quantities of glycerol and succinic acid; yields an acetyl derivative, $C_3H_6(OCOCH_3)_5.CHO$; may be reduced to sorbitol $CH_2OH.(CHOH)_4.CH_2OH$, and oxidised to saccharic acid $COOH.(CHOH)_4.COOH$; gives an osazone $CH_2OH.(CHOH)_3.C.CH:N.NHC_6H_5$ / $N.NHC_6H_5$, identical with that of levulose.

Fructose, levulose, or fruit s. ($CH_2OH.(CHOH)_3.CO.CH_2OH$) crystallises anhydrous, M.P. 95°; occurs with glucose in fruit juices and honey, and in invert s.; separated from glucose by means of its sparingly soluble compound with slaked lime; ferments less rapidly than glucose; reducing power similar.

Invert sugar is an equimolecular mixture of dextrose and levulose formed by the hydrolysis of sucrose. It is levorotatory (*i.e.* rotating the plane of polarisation to the left), and owes its name to the inversion of activity of dextrorotatory (*i.e.* rotating plane of polarisation to right) sucrose which takes place in its formation.

Commercial glucose is a solid or syrup prepared by the hydrolysis of starch: $(C_6H_{10}O_5)_n+nH_2O=nC_6H_{12}O_6$; besides dextrose it contains maltose, dextrin, etc.

Bioses.—*Sucrose* (cane sugar): s. was known in early times, but did not come into general use till the XVI. cent. It occurs with other s's in many plants, and is obtained from the s.-cane, the s.-beet, the s.-maple, or the date-palm; nearly all the s. of commerce is cane or beet s. *Cane sugar*: the s.-cane is cultivated in warm, moist climates, *e.g.* the U.S., W. Indies, Philippines, Australia. S.-cane juice contains about 18 % of sucrose. To obtain s. the stripped cane is crushed between revolving rollers, and the juice is strained. Organic acids and nitrogenous substances are neutralised and removed by adding lime, heating with a steam coil, and separating the scum (*defecation*). Excess of lime is removed by carbon dioxide, and the purified juice is evaporated in vacuum pans until crystals separate. After cooling in storage tanks, the crystals are separated from the mother liquor (*molasses*) by centrifugal machines. They are light brown, and contain 95 to 97 % of sucrose. The molasses, which contain 45 to 50 % of sucrose, are further purified and concentrated, yielding another crop of s. The remaining molasses are used for making rum, feeding cattle, or for fuel. Crude s. is refined by being dissolved in water in large tanks heated with steam coils. Gums, organic acids, etc., are removed by defecation and filtration through cotton cloth. The straw-coloured filtrate is decolorised with animal charcoal (bone black), and from the colourless liquor white s. is crystallised by evaporation *in vacuo*. The crystals are dried in hot tubes, and the different sizes separated by sifting. *Loaf* s. is made by running the magma of crystals and syrup into conical moulds, and afterwards draining off the uncrystallised syrup.

Beet sugar was discovered by Marggraf in 1747, and first manufactured in 1769. This industry exists in many continental countries, and is being commenced in England. The roots are cleansed and thinly sliced, and the s. is extracted either by water through dialysis at 60° C., in a series of cylinders (diffusion process), or by maceration with successive quantities of water. In the former process the crystallisable s. diffuses through the cell walls, leaving colloidal substances behind. The liquor is defecated, and otherwise treated as in the manufacture of cane s. From the mother liquor much of the remaining s. is obtained by forming and separating the sparingly soluble strontium saccharate, which is then decomposed by carbon dioxide. Beet s. is identical in chemical composition and properties with cane s. About 16 million tons of s. are now made annually.

Sucrose crystallises in monoclinic prisms, well seen in s. candy. It is very soluble in water, sparingly so in alcohol; melts at 160° to 161°, forming barley s., which slowly crystallises; about 200° forms caramel or burnt s., used for colouring purposes; quickly charred by concentrated sulphuric acid; does not reduce Fehling solution.—*Milk sugar, lactose* ($C_{12}H_{22}O_{11}$, H_2O), occurs in the milk of mammals (about 4 %); much less sweet than cane s.; reduces Fehling solution slowly; readily undergoes lactic fermentation; hydrolysed by dilute acid.—*Malt sugar, maltose* ($C_{12}H_{22}O_{11}$, H_2O), produced by the action of diastase on starch during germination of cereals (as in malting), and by the action of malt extract on starch paste at 60° C.; reduces Fehling solution; readily undergoes alcoholic fermentation (brewing); hydrolysed by dilute sulphuric acid, producing only glucose.

Constitution and Synthesis of Sugars.—The constitutions of glucose and fructose were established by Kiliani, by means of the cyanhydrin reaction:

$$>C=O+HCN=>C\begin{matrix}OH\\CN\end{matrix}$$, followed by hydrolysis:

$$>C\begin{matrix}OH\\CN\end{matrix}+2H_2O=>C\begin{matrix}OH\\COOH\end{matrix}+NH_3.$$

The resulting carboxylic acids when reduced yielded different products, thus:—

$$\underset{\text{Glucose.}}{CH_2OH.(CHOH)_4.CH:O}\longrightarrow CH_2OH.(CHOH)_4.CH\begin{matrix}OH\\COOH\end{matrix}\longrightarrow \underset{\textit{n}\text{. Heptylic acid.}}{CH_3.(CH_2)_4.CH_2.COOH}$$

$$\underset{\text{Fructose.}}{CH_2OH.(CHOH)_3.CO.CH_2OH}\longrightarrow CH_2OH.(CHOH)_3.C(OH)\begin{matrix}CH_2OH\\COOH\end{matrix}\longrightarrow \underset{\text{Methylbutylacetic acid.}}{CH_3.(CH_2)_3.CH(CH_3).COOH}$$

The synthesis of numerous s's by E. Fischer forms a brilliant chapter in organic research. His first synthetic s., α-Acrose, resulted from the following reaction:—

$$\underset{\text{Glycerose.}}{CH_2OH.CHOH.CH:O}+\underset{\text{Dihydroxyacetone.}}{CH_2OH.CO.CH_2OH}=\underset{\textit{a}\text{-Acrose (=inactive fructose).}}{CH_2OH.CHOH.CHOH.CHOH.CO.CH_2OH}$$

SUGGESTION, the communication from without to a mind by which it is uncritically accepted and acted upon of a belief, doubt, expectation, command, or the like. A person who readily accepts what is suggested is said to be in a 'suggestible' state. M'Dougall enumerates four conditions of unusual suggestibility: (1) abnormal states of the brain, as in hypnosis or fatigue; (2) deficiency of knowledge which might oppose the suggested thought—compare the credulity of children; (3) impressiveness of the source of the suggestion; (4) individual peculiarities. The term is also used more widely; *e.g.* when the spectator of dancing unreflectively moves rhythmically, his movements are said to be 'suggested' by what he sees.

SUHL (50° 37′ N., 10° 41′ E.), town, Pruss. Saxony; manufactures firearms. Pop. 14,465.

SUICIDE, self-murder; in former times a suicide was buried at cross-roads, with a stake through his breast, and his property forfeited to the Crown. The latter penalty was abolished many years ago; the former in 1823.

SUIDUN (44° N., 81° 20′ E.), town, capital, province Kulja, China.

SUITE, an old musical form, brought to perfection by Bach and Handel. The name is French, and means a succession or series of pieces. Usually the s. is composed of several dance movements written in the same key.

SUJBULAH, see Saujbulagh.

SUKHUM-KALE (42° 59′ N., 41° E.) (ancient *Dioskurias*), seaport, on Black Sea, Kutais, Russ. Caucasia; exports grain. Pop. 17,000.

SUKKUR, Sakhar (27° 42′ N., 68° 54′ E.), town, on Indus, Sindh, Bombay, India. Pop. 34,000.

SULA, a genus of birds, see Gannets.

SULA ISLANDS, Xulla (1° 40′ S., 125° E.), group, Dutch E. Indies; chief islands are Taliabo, Mangola, and Besi.

SULCI (39° 55′ N., 9° 40′ E.), ancient city, on E. coast of Sardinia.

SULEIMAN I., SOLIMAN (1494–1566), sultan of Turkey; called the Magnificent; conquests made Turkey great realm; played prominent part in Europe; reorganised law courts; enlightened ruler.

SULEIMANIEH, SULEMANIA (35° 35′ N., 45° 26′ E.), town, capital, sanjak Suleimanieh, Asiatic Turkey. Pop. 14,000.

SULIDÆ, GANNETS (*q.v.*).

SULIMAN MOUNTAINS (32° N., 70° E.), range of mountains, on borders of Afghanistan and N.W. India; highest point, Takht-i-Suliman, 11,000 ft.

SULINA (45° 12′ N., 29° 41′ E.), town, at mouth of Sulina, branch of Danube, Rumania. Pop. 5800.

SULITELMA (67° 25′ N., 16° 20′ E.), mountain, Norway; highest point, 6155 ft.

SULLA, LUCIUS CORNELIUS, 'FELIX' (138–78 B.C.), Rom. dictator; showed great military qualities in wars against Jugurtha, 107, Teutones and Cimbri, 104–101; consul, 88; reduced Mithradates to submission, 87–84; found himself proscribed by Marian party in Senate and retained army; defeated younger Marius at Prænesto, 82; won battle of Colline Gate and entered Rome; as dictator carried out wide proscriptions and confiscations; made Senate supreme, limiting power of tribunes.

SULLIVAN, SIR ARTHUR SEYMOUR (1842–1900), Eng. composer; studied in London and Leipzig; became director of the National Training School for Music, London, 1876. He wrote overtures and incidental music for several of Shakespeare's plays; works for orchestra; popular songs, including *The Lost Chord*; three oratorios and three cantatas, one of which, *The Golden Legend*, is frequently performed; and a grand opera, *Ivanhoe*. His name is, however, chiefly associated with the long series of comic operas, written mostly to libretti by Gilbert, and of which *H.M.S. Pinafore*, *The Pirates of Penzance*, *The Mikado*, *The Gondoliers*, and *The Yeomen of the Guard* are the best known.

SULLIVAN, JOHN (1740–95), Amer. soldier; commanded in War of Independence and received thanks of Congress, 1779; pres. of New Hampshire, 1786–89; judge, 1789–95.

SULLY, DUC DE, MAXIMILIEN DE BÉTHUNE (1560–1641), Fr. statesman; succ. father as Baron de Rosny, 1575; Huguenot; wounded, fighting for Henry of Navarre at Ivry, 1590; became superintendent of finances, fortifications, etc., after Henry's accession; abolished farming-out of taxes and export duties on corn and wine; built roads and canals, and commenced construction of great frontier fortresses; marshal of France, 1634.

SULLY-PRUDHOMME, RENÉ FRANÇOIS ARMAND PRUDHOMME (1839–1907), Fr. poet; first amongst Parnassiens, but after a time adopted other methods, and expounded nature, duty, and destiny of man. *Stances et Poèmes* (1865), *Les Epreuves* (1866), *Les Solitudes* (1869), *Les Destins* (1872), and *Le Bonheur* (1888) are his chief volumes of poems; great gift of melody recalls Musset.

SULMONA, SOLMONA (ancient *Sulmo*) (42° 3′ N. 13° 55′ E.), town, on Gizzio, Aquila, Italy; manufactures paper; was a city of the Peligni; birthplace of Ovid. Pop. 14,500.

SULPHONIC ACIDS are stable, monobasic acids derived from sulphuric acid through the replacement of one OH group by an element or compound radicle; *e.g.* ethyl-sulphonic acid $=C_2H_5.SO_2.OH$, phenyl- or benzeno-sulphonic acid $=C_6H_5.SO_2.OH$.

SULPHUR (S=32·07), non-metallic element; called *brimstone*=burning stone; thought by alchemists to be the principle of combustibility; occurs uncombined in volcanic districts, and combined with oxygen or hydrogen in volcanic gases; also as sulphides, *e.g.* iron pyrites FeS_2, copper pyrites $CuFeS_2$, galena PbS, cinnabar HgS; and sulphates, *e.g.* gypsum $CaSO_4+2H_2O$, Epsom salts $MgSO_4+7H_2O$.

S. is found chiefly in Sicily, and is obtained from the stony material with which it is mixed by heating in a furnace. Some burns, but most of it melts and runs away. It is purified by distillation. Condensation of vapour below 110° yields *flowers of s.* (*s. snow*); above, liquid s., which is cast in moulds. Also obtained from coal, as a by-product in manufacture of coal-gas, and recovered from the calcium sulphide which forms alkali-makers' waste.

PROPERTIES: s. shows allotropy. *Rhombic octahedra*, M.P. 114°·5, S.G. 2·05–2·07, form at atmospheric temperature from state of vapour, fusion, or solution in carbon disulphide. *Monoclinic prisms*, M.P. 119°, S.G. 1·96, crystallise from fusion at 96° or above. Prismatic crystals, kept at atmospheric temperature, break down internally to the more stable octahedral form. *Amorphous s.* is precipitated from polysulphide solution by acid. *Plastic s.*, amorphous but unstable, is formed by dropping molten s. near its B.P. into cold water. S. melts to a yellow, mobile liquid, which at 160° grows darker and thicker, till at 260° it is dark red and very viscous; above 260° it becomes more mobile, and boils at 448°·5, forming an orange vapour which contains S_8 molecules and simpler forms. S. burns in air with a blue flame, forming s. dioxide gas.

SULPHURIC ACID, OIL OF VITRIOL (H_2SO_4).—The most important acid is a colourless, oily liquid; S.G. 1·84; crystallises at 10°·5; dissociates partially when heated into SO_3+H_2O, but boils at 338°, yielding distillate containing 98·5 % H_2SO_4; very hygroscopic and corrosive; employed in many manufactures.

S. a. was originally prepared by heating green vitriol: $4FeSO_4+O_2=2Fe_2S_2O_9$; $Fe_2S_2O_9+2H_2O=Fe_2O_3+2H_2SO_4$.

Two processes of manufacture are now in use: (i.) lead chamber process (England); (ii.) contact process (Germany).

Lead chamber process.—Sulphur dioxide, obtained by roasting iron pyrites in special burners, reacts with nitric acid vapour, formed by decomposing Chili saltpetre with sulphuric acid in nitre pots, and afterwards with nitrous fumes and steam in leaden chambers.

Probable reactions:—

$$\left.\begin{aligned} 4FeS_2+11O_2&=2Fe_2O_3+8SO_2\\ 3SO_2+2HNO_3+2H_2O&=3H_2SO_4+2NO\\ 2NO+O_2&=2NO_2\\ SO_2+NO_2+H_2O&=H_2SO_4+NO \end{aligned}\right\}$$

Nitric oxide (NO) is oxidised by air to NO_2, and is again reduced; thus it serves as an oxygen carrier to oxidise SO_2 catalytically in presence of water.

The chamber acid reaches a concentration of 62 to 70 %, and is further concentrated in glass or platinum.

Contact process.—Sulphur dioxide and oxygen unite to form sulphur trioxide in presence of hot platinised asbestos (catalysis). The product dissolves in water yielding sulphuric acid ($2SO_2+O_2+2H_2O=2H_2SO_4$), now manufactured on a large scale by this means.

SULPICIUS, RUFUS PUBLIUS (c. 124–88 B.C.), Rom. statesman; tribune, 88; with Marians led opposition to Sulla; put to death after Sulla's march on Rome.

SULTANPUR (26° 16′ N., 82° 7′ E.), town, capital, Sultanpur district, United Provinces, Brit. India. Pop. 10,000; (district) 1,090,000.

SUMACH (*Rhus*), genus of trees and shrubs, order Anacardiaceæ; Sicilian S. (*R. coriaria*), yields *sumac* or *shumac*, used in tanning and dyeing.

SUMATRA (5° 40′ N. to 6° S., 95° 30′ to 106° E.), great island of Malay Archipelago, belonging to Holland; separated from Malay Peninsula by Strait of Malacca, and from Java by Sunda Strait; area, 161,612 sq. miles; surface is crossed by a line of volcanic mountains running lengthwise along S.W., and reaching heights of from 11,000 to 12,000 ft., the highest point being Mt. Korinchi; from these mountains the greater part of the N.E. undulates rapidly down to marshy and sandy plains; watered

by Palembang, Jambi, Indragiri, and other streams; principal ports, Padang, Palembang, Benkulen, Achin; there are many small islands off the coasts. Climate is hot, but healthy, except in the lower districts; rainfall heavy; average temperature in low ground, 80° F.

S. was reached by Marco Polo, 1292. It was settled early in the XVI. cent. by the Portuguese, and in the following century settlements were made by the Dutch and later the English. In 1824 the English settlements were ceded to the Dutch; and the Dutch victory over Achin in 1874 brought the whole island to the possession of Holland, although native risings continued to occur from time to time. Administered by a governor. S. has dense forests of teak, oak, and other timber trees; produces rice, maize, sugar, coffee, pepper, millet, sago, cocoa-nuts, tobacco, betel, guttapercha, ginger, gums; minerals include coal, gold, petroleum, tin, iron, salt, sulphur. Pop. (1905) 3,447,328.

SUMBA, CHENDANA, SANDALWOOD (10° S., 120° E.), one of Lesser Sunda Islands, Dutch E. Indies; edible birds' nests. Pop. *c.* 220,000. Chief town, Waingapu.

SUMBAWA (8° 30′ S., 118° E), one of Sunda Islands, Dutch E. Indies; mountainous, volcanic, fertile; comprises states of Sumbawa, Dompo, Sangar, and Bima; exports rice, horses. Pop. *c.* 85,000.

SUMBUL, drug consisting of dried slices of the fibrous root of a plant, *ferula sumbul*, of natural order *umbelliferæ*, growing chiefly in Asiatic Russia; has a musk-like odour and bitter taste, the chief constituents being a volatile oil and two resins; employed as a stimulant for the stomach and intestines, and in hysteria.

SUMMARY JURISDICTION is the jurisdiction of a court to give judgment summarily, a court that consists of justices of the peace or magistrates empowered to deal with various offences and complaints without the intervention of a jury. It can commit to prison for contempt, punish malpractice in a solicitor, and deal generally with petty misdemeanours or infractions of police rules. It can also deal with affiliation cases and bastardy proceedings, grant matrimonial separation orders, and orders between employers and employees. Youthful and juvenile offenders must be tried summarily. The highest penalty that can be inflicted under summary jurisdiction is three months' imprisonment or a fine of £20.

SUMMIT (40° 47′ N., 74° 19′ W.), city, Union County, New Jersey, U.S.A.; residential suburb of New York; silk industry. Pop. (1910) 7500.

SUMMONS.—A justice of the peace, a stipendiary magistrate, or a metropolitan police magistrate, has the power to grant a s. on information being laid before him, or on complaint being made to him. On the issue and delivery of the s. the person named therein must appear at a certain time and place to answer the charge stated in the s. On failure to appear a warrant may be issued for arrest.

SUMMUM BONUM.—The highest good: that which has greatest worth. See ETHICS.

SUMNER, CHARLES (1811–74), Amer. statesman; as lawyer acquired legal knowledge then considered unequalled; Boston speech, 1845, on 'The True Grandeur of Nations' first established his fame as orator; devoted himself, with Horace Mann, to social reform and abolition of slavery; Free Soil member of Senate, 1851, and by vehement speeches largely responsible for Civil War; murderously attacked by southerner, 1856; chairman of committee on foreign relations, 1861–71; insisted on emancipation after war; became fanatical as time went on, and at last health was broken by political controversy.

SUMNER, CHARLES RICHARD (1790–1874), bp. of Llandaff, 1826, Winchester, 1827–69.

SUMNER, EDWIN VOSE (1797–1863), Amer. general, distinguished in Civil War.

SUMNER, JOHN BIRD (1780–1862), bp. of Chester, 1828; abp. of Canterbury, 1848.

SUMNER, WILLIAM GRAHAM (1840–1910), Episcopal clergyman in U.S.A.; prof. of Political Science, Yale, 1872; wrote economic works.

SUMPTUARY LAWS, enactments to check private extravagance.

Plato's *Republic* praises Lacedæmonian regulations enforcing simplicity of life; early Romans possessed Spartan frugality, but sumptuary laws became necessary by close of III. cent. B.C.; mediæval kingdoms limited expense in dress, food, retinue, etc., first important Eng. laws being passed, 1336 and 1363; disused in XVI. cent.; statute of Livery and Maintenance passed by Henry VII. with political purpose; later laws purely for purposes of revenue.

SUMTER (33° 55′ N., 80° 20′ W.), city, capital, Sumter County, S. Carolina, U.S.A.; cotton manufactures. Pop. (1910) 8109.

SUMTER, THOMAS (1736–1832), Amer. general of War of Independence; thanked by Congress, 1781.

SUMY (50° 53′ N., 34° 59′ E.), town, on Psiol, Kharkov, Little Russia; sugar refineries. Pop. 29,000.

SUN.—The sun may be regarded as a huge sphere 867,000 miles in diameter, surrounded by a brilliant layer of gases, and composed of materials on the average about 1·4 times heavier than water; but the temperature of the sun is so great that its constituents must be far above the 'critical temperature,' and so must be in the gaseous state. These gases are under enormous pressure, give a continuous spectrum, and have a sharp boundary. This portion of the sun is known as the *photosphere*, and when viewed through a telescope is seen to have a 'granular' structure; it shows at times depressions (*sun-spots*), which occur in greater numbers periodically, the period being 11 years; more rarely eruptive prominences are observed. Outside the photosphere there is the gaseous 'reversing layer' of the *chromosphere*, of average thickness about 5000 miles, and giving a bright line spectrum. Outside the chromosphere again is the gaseous envelope of the *corona*, extending to a great distance, and of very small density. Its spectrum shows, in addition to others, a brilliant green line of unknown origin.

Observations of the sun-spots show that the sun rotates in about 25 days, but the lower latitudes rotate faster than the higher. The continuous spectrum yielded by the photosphere is crossed by thousands of dark lines (*Fraunhofer lines*) due to absorption by the gases of the chromosphere. Comparison of these with the spectra of terrestrial substances has led to the identification of many elements in the sun. The lower layers of the chromosphere consist chiefly of metallic vapours, which give the so-called 'flash' spectrum of bright lines at total solar eclipses. Prominences are now observed by means of the *K* line of calcium, which element is present to a notable extent in the chromosphere. Quiescent prominences, consisting chiefly of hydrogen and helium, are of various forms and may reach an altitude of 70,000 miles. Eruptive prominences show metallic lines at their bases, and rush upwards at enormous speeds, sometimes to a height of 360,000 miles. Various theories have been advanced to account for the persistence of the sun's heat. It seems probable that in addition to the heat from contraction the energy of radioactive transformations plays an important part.

Sunshine.—Owing to the large variations in the intensity of the sun's light, due to such causes as mist or cloud, for recording purposes it is necessary to adopt an arbitrary definition of what is meant by bright s. The minimum standard usually taken is that which will produce scorching on certain specially prepared papers. The recording instruments are automatic, the sun's rays being either focused by means of a spherical crown-glass lens on to a strip of paper inside portion of a hemisphere (as in the *Campbell Stokes recorder*), or admitted through a small hole and allowed to trace a line on sensitised paper carried on a revolving drum (as in the instrument used by the U.S. Weather Bureau).

Sunstroke, term applied to effect of sun's heat or

of artificial heat; is of three types: *heat exhaustion*, in which there is a feeble pulse and prostration; the patient should be put in a cool place, his clothing loosened, and stimulants may be necessary; *heat apoplexy*, or s. proper, in which the face is flushed, the breathing stertorous, the pulse bounding, and death may result sometimes suddenly; the patient should be douched with cold water and put in a cool room on light diet; and *thermic fever*, in which the temperature may rise to over 110° with rapid full pulse, pain in the limbs, nausea, and other signs of high fever; the onset is generally gradual; this form is the most dangerous; the temperature should be reduced by a cold bath or ice pack, and a mustard blister applied to the nape of the neck. A person once affected with s. should seek a cooler climate.

SUN ANIMALCULÆ, see HELIOZOA.

SUNBIRDS (*Nectariniidæ*), a family of small perching birds with a long, curved, compressed beak, and a moderately long tail. Their colours are bright, and in their grace they resemble Humming-Birds; found in Africa, S.E. Asia, and Australasia.

SUN-BITTERNS (*Eurypyga*), so called from their fondness for the warmth of the sun; two species of long-necked, slender-billed, marsh-loving birds, found only in Central and S. America.

SUNBURY (40° 50′ N., 76° 53′ W.), town, on Susquehanna, capital, Northumberland County, Pennsylvania, U.S.A.; manufactures silk. Pop. (1910) 13,770.

SUNBURY-ON-THAMES (51° 25′ N., 0° 24′ W.), village, on Thames, Middlesex, England. Pop. (1911) 4607.

SUNDA ISLANDS (8° S., 115° E.), collective name for group of islands, Malay Archipelago; divided into the Great S. (Borneo, Sumatra, Java, Celebes, etc.) and the Little S. (Bali, Lombok, Sumbawa, etc., E. to Timor).

SUNDAY.—By the S. Observance Act, 1677, on 'the Lord's Day, commonly called Sunday, no tradesman, artificers, workmen, labourers, or other person whatsoever shall do or exercise any worldly labour, business, or work of their ordinary callings, works of necessity and charity only excepted.' This Act is still in force, but can only be put into operation with the consent of chief officer of police, two justices of the peace, or stipendiary magistrate. Rent may be paid and cheques and promissory notes dated on a S., and arrests for crime made, but no other legal proceedings can be taken on that day. S. entertainments open to the public for money are forbidden by the S. Observance Act, 1781. Public houses of refreshment may only be opened within certain hours on S., except to travellers. In Scotland, and Wales, and where a 'six-day licence' only has been granted, entire S. closing is required.

Certain unrepealed statutes of Charles I. forbid boating and other sports on S., but these Acts are largely obsolete. By the Factory and Workshop Act of 1901 the S. employment of women, young persons, and children is forbidden, but exemption is granted to Jews. Bread may not be baked on S. by bakers, but it may be delivered till 1.30, and bakers' shops may be opened from 9 till 1 for the sale of bread and the baking of S. dinners. Law courts and public bodies cannot meet on S., and a contract made and completed on S. is void. Prisoners whose term of sentence expires on Sunday are discharged the previous day. In France the Civil Code contains no reference to S. observance, and, while customs vary, generally throughout the Continent in Catholic and Lutheran countries S. observance is regulated not by law but by public feeling and religious practice.

SUNDAY SCHOOLS, see under EDUCATION.

SUNDERBUNDS, SUNDARBANS (22° N., 89° E.), tract of swamps, jungle, and forest, in lower part of Ganges-Brahmaputra delta, India; intersected by a labyrinth of channels and creeks.

SUNDERLAND (54° 54′ N., 1° 23′ W.), seaport, mouth of Wear, Durham, England; large trade in coal; shipbuilding centre; includes, besides Sunderland proper, Bishopwearmouth and Monkwearmouth. Pop. (1911) 151,162.

SUNDERLAND, CHARLES SPENCER, EARL OF (1674?–1722), Eng. statesman; member of Whig Junta, under Queen Anne, who dismissed him, 1710; First Lord of Treasury, 1718; fell through South Sea Bubble; s., Charles, succ. as Duke of Marlborough, 1733.

SUNDERLAND, ROBERT SPENCER, EARL OF (1640–1702), Eng. statesman of personal and intellectual distinction, but dishonoured by political treachery; as Sec. of State, 1679–81, hot anti-Papist; became submissive minister of James II. on his accession, but intrigued with France and William of Orange; forced to retire amid general obloquy, 1697.

SUNDEW (*Drosera rotundifolia*), an insectivorous plant found in bogs; leaves, spoon-shaped and reddish, capture prey by tentacles with glistening secretion.

SUNDIAL, instrument for measuring time of day from sun's shadow cast by a style or gnomon upon a graduated surface. S's were used from early times (mentioned *Isaiah* 38[8]), while the Arabs were familiar with the principle in 700 B.C.; also used by Egyptians, Chaldeans, Hebrews, Greeks; introduced into Rome c. 290 B.C.

S's may be horizontal, vertical, or inclined, but the effect of all is to show the distance of the sun from the meridian. The style, which is generally a metal plate, points to the earth's pole, and must therefore be parallel with the earth's axis to coincide with the axis of diurnal rotation, so that, as the sun moves to the westward, the shadow moves in the opposite direction, falling on the plate which is marked with graduations, showing the hours, half-hours, and quarters; these have to be marked off by trigonometrical calculations based on the latitude of the place where the dial is used. S's give solar time only, which differs slightly from clock time except on four days in the year. S's were the only means of telling time before clocks and watches were invented; cheap clocks and watches have now done away with s's altogether, and they are only kept as curiosities. Dial-making is essentially a branch of mathematics.

S's are named from the position of the dial plane, as—north, south, east, west, polar, declining, or equinoctial dials. Cylindrical and ring dials have also been used, while dials for use at night have been made. Owing to the absence of the moon on many nights per annum, and its irregular motions when it is visible, moon dials were found to be most unsatisfactory and were little used.

SUNDSVALL (62° 20′ N., 17° 11′ E.), seaport, on Gulf of Bothnia, län of Vesternorrland, Sweden; sawmills; exports timber, iron. Pop. (1911) 16,894.

SUN-FISHES (*Molidæ*), round, laterally flattened bony fishes, with body so shortened that the fins appear to arise from the back of the head; found in tropical and temperate seas.

SUNFLOWER (*Helianthus annuus*), member of the *Compositæ* (q.v.), which often attains height of 6 ft. and bears immense heads of yellow florets.

SUNIUM (37° 38′ N., 24° 1′ E.) (modern *Cape Colonna*), promontory, Attica, Greece; contains ruins of a temple of Poseidon.

SUNN, OR INDIAN HEMP, leguminous plant largely cultivated for stem, from which fibre somewhat similar to flax is obtained.

SUNNITES (Arab. *sunnah*, the custom or tradition), the most orthodox of Muhammadans; self-styled in contradistinction to the Shiites, who claimed peculiar authority for Ali, as sole legitimate successor of Muhammad, and developed views and secret societies. Struggle between Sunnites and Shiites was free-thinking, political, and theological, and lasted for 250 years. Sunnism, triumphant in Arabia, 1100 A.D., remains the predominant orthodoxy in the Ottoman Empire. Its chief exponents were Al Ashari (b. 882 A.D.) and Al Gazali. Politically Sunnism

is not attached to the Ottoman Sultan at Constantinople, who is merely Sultan by force of arms, and is unconcerned at the fall of the Ottoman Power, which has ceased to be theocratic, the Sheik-ul-Islam, of the Ulema, at Constantinople, being the chief spiritual authority in Islam. Four different schools of law exist amongst the Sunnites, and are permitted, Sunnism having ceased to be a compact body of doctrine.

SUPERANNUATION, see PENSION.

SUPEREROGATION, WORKS OF (in R.C. Church), works not essential for salvation, but done for greater perfection of spirit.

SUPERIOR (46° 43′ N., 91° 59′ W.), city, port of entry, on Lake Superior, capital, Douglas County, Wisconsin, U.S.A.; shipbuilding yards; flour- and lumber-mills; large commerce. Pop. (1910) 40,384.

SUPERIOR, LAKE (47° 40′ N., 88° W.), largest freshwater lake in the world, and most westerly of the five great lakes of N. America, lies between U.S. and Canada; length, 420 miles; breadth, 160 miles; area, 32,000 sq. miles; elevation above sea-level, 600 ft.; receives over 200 tributaries; discharges by St. Mary's into Lake Huron.

SUPPLY AND TRANSPORT, see TRANSPORT AND SUPPLY.

SUPPURATION, see PARASITIC DISEASES.

SUPRARENAL EXTRACT is extracted from the fresh suprarenal glands of sheep, and, as it is a powerful constrictor of the walls of blood vessels, is employed in med. to control and check hæmorrhage. In cases of surgical shock it may be injected to raise the blood-pressure; while it has also been used in the treatment of Addison's disease (*q.v.*).

SUPREME COURT OF JUDICATURE, see JUDICATURE ACTS.

SURABAYA (7° 14′ S., 122° 44′ E.), seaport, on N. coast, Java; has government dockyards and arsenals; exports coffee, rice. Pop. 160,000.

SURAJ-UD-DOWLAH (d. 1757), Nabob of Bengal who caused confinement of Brit. in Black Hole of Calcutta, 1756.

SURAKARTA, see JAVA.

SURAT (12° 10′ N., 72° 32′ E.), city, seaport, on Tapti, capital, Surat district, Bombay, India; was chief commercial centre of India in XVI. and XVII. cent's; became seat of an Eng. presidency, 1612; manufactures cotton and silk. Pop. (1911) 114,863; (district) 640,000.

SURBITON, residential suburb of Kingston-on-Thames, Surrey, England. Pop. (1911) 17,713.

SURD, in algebra, a quantity not expressible in rational numbers, *e.g.* $\sqrt{3}$ and $\sqrt[3]{7}$.

SURETY, see GUARANTEE.

SURFACE TENSION, see CAPILLARITY.

SURGERY.—The science of healing diseases, injuries, and deformities by operative or mechanical methods, is as old as the human race itself, the necessity for a certain skill in treating wounds or fractures being naturally an early discovery of man; and the art had reached a stage of some advancement when the sister art of med. proper was still in embryo. Among the ancient Egyptians s. was, comparatively, highly developed (see SURGICAL INSTRUMENTS), while their ophthalmic surgeons were particularly renowned. In India several cent's before the Christian era, abdominal conditions were treated by surgeons, who were also physicians, by laparotomy; lithotomy was performed, as well as minor operations, and numerous steel cutting and cauterising instruments were used.

Before the time of Hippocrates, the 'father of rational med.,' the Greeks had considerable skill in s., chiefly gained in the wars, and Hippocrates in his surgical treatises describes the instruments and preparations for surgical operations, including splints, bandages, measures for arresting hæmorrhage; he deals with dislocations, fractures, hernias, injuries of the skull, and other conditions, with their methods of treatment.

The Roman Celsus, although not a surgeon himself, gives an exhaustive account of the surgical procedures of his time, being the first of the ancient writers to describe an amputation. Galen added little new to s., and after him little progress was made up to the Byzantine period (*c.* 650 A.D.), Paulus of Ægina, who flourished at this time, covering in his writings the whole knowledge of ancient s. Of the Arab. school Abulcasim, who lived *c.* 1100, is the most noted as regards s., but the school as a whole neglected the art.

S., with all other arts, made a great advance at the Renaissance. Paracelsus (1493–1541) made valuable observations in surgical conditions; Paré (1510–90) introduced the ligature to arrest hæmorrhage of arteries, and substituted a simple bandage for boiling oil in the treatment of wounds; and Vesalius (1514–64) laid the foundations of modern s. in a sound knowledge of anatomy.

In England the Company of Surgeons of London was founded in 1511, uniting with the Company of Barbers in 1540; in 1745 the Surgeons were separated from the Barbers again, and in 1800 the Royal Coll. of Surgeons was founded. The Coll. of Surgeons of Edinburgh had an earlier foundation, its first charter being obtained in 1505, becoming the Royal Coll. in 1778. In the XVII. cent. s. shared in the fruits of scientific discovery, among which may be mentioned Harvey's discovery of the circulation of the blood. A notable figure in the development of the art was Richard Wiseman (*c.* 1620–76), who has been called the 'father of Eng. s.,' the author of valuable treatises on surgical subjects. In the XVIII. cent. s. made rapid advances along the broad lines which had been laid down, the increased attention paid to anat., physiology, and pathology as applied to s., rendering the art more exact as well as giving it a higher status. William Hunter (1718–83), the three Monros of Edinburgh, and, most notable of all, John Hunter (1728–93) had a great share in the development, the medical schools of London, Edinburgh, and Dublin being at this period esteemed above all others in Europe in regard to s. In the first half of the XIX. cent. the development of s. was still more advanced, due again to the discoveries in anat., physiology, and pathology, and the methods of teaching s. were greatly improved.

A revolution, however, took place in s. through the discoveries of Lord Lister (1827–1912). Influenced by the experiments of Pasteur regarding fermentation and putrefaction, he introduced carbolic acid, employed in various ways, as an antiseptic to prevent the septic infection of wounds, and immediately reduced the enormous death-rate from surgical operations. Another valuable discovery by Lister was that of absorbable ligatures. From the antiseptic s. of Lister developed the modern aseptic s., the basis of which is the prevention of the presence of micro-organisms as contrasted with the destruction of micro-organisms present, although antiseptics are used in conjunction with the measures taken to ensure asepsis.

One of the most valuable aids to s. is the application of the X-rays, by means of which fractures, dislocations, calculi, and other conditions can be exactly diagnosed.

Surgical Instruments, lancets, forceps, vaginal specula, and other instruments have been found in ancient Egyptian remains. The ancient Ind. surgeons practised laparotomy and lithotomy several cent's before the Christian era, and over a hundred steel instruments employed by them are extant. Hippocrates describes various s. i. in his writings, as also does Celsus. In mediæval times s. i. were often large and clumsy, and frequently decorated with relief work and chasing, which, although of much merit, would scarcely tend to cleanliness.

By the middle of the XIX. cent. ornament had been discarded and s. i. had a more business-like appearance and were well made, but still without any care for cleanliness. The importance of this only became recognised after the far-reaching discoveries of Lister, and to-day instruments are made from one piece of

steel, or at least entirely of metal, with as few joints as possible, smooth and easily cleansed, without the slightest possibility, when sterilised, of carrying infection.

All instruments before an operation are sterilised by boiling, with the exception of knives, the cutting edge of which would be spoilt by this method, and they are washed carefully, placed in an antiseptic lotion, and then dipped in distilled water before using.

See MEDICINE, LISTER, HUNTER (JOHN).

SURINAM, see GUIANA: *Dutch Guiana*.

SURMA, BARAK (25° N., 93° 30′ E.), river, Assam, India; N. branch of the Barak.

SURPLICE, ecclesiastical vestment, generally made of white linen, worn in Christian Church certainly since V. cent.; its origin is disputed, but it is probably a form of the alb, the regular vestment of the Anglican clergy, but not confined to those in orders.

SURRA, see under TRYPANOSOMES.

SURRENDER, see CAPITULATION.

SURRENTUM, Rom. name of Sorrento.

SURREY (51° 15′ N., 0° 20′ W.), inland county, S. England; bounded N. by Berks, Bucks, and Middlesex, E. by Kent, S. by Sussex, and W. by Hants; area, 708 sq. miles. Surface is generally undulating; crossed by the N. Downs; drained by Thames, Wey, Mole, and other streams; county town, Guildford. Geological formation is chiefly clay and chalk. Agriculture is important industry; wheat, oats, barley, and pulse are grown; hops and various vegetables cultivated; market-gardening is largely carried on; live stock raised. Minerals include fuller's earth, fireclay. Principal manufactures are hosiery, gloves, paper, beer, bricks. Has few historical associations except that Magna Charta was signed at Runnymede; a few Rom. remains and ruined abbeys of Waverley and Newark. Pop. (1911) 675,985.

SURREY, EARLDOM OF.—First holder probably William de Warenne, cr. earl, *c.* 1088; descendants, Warennes and Fitz Alans, held it till 1415; John Mowbray was cr. earl, 1451; it passed like other Mowbray possessions to Howards.

SURREY, HENRY HOWARD, EARL OF (*c.* 1518–47), Eng. poet and soldier; s. of Lord Thomas Howard (cr. Duke of Norfolk, 1524); m. Frances de Vere, 1532; one of Henry VIII.'s retinue in journey to France, 1532; Earl Marshal at trial of Anne Boleyn, 1536; took part in expedition against Pilgrimage of Grace; imprisoned for breach of peace, 1542; accompanied his father to war against Scotland; again imprisoned for misdemeanour; took part in war against France; governor of Boulogne, 1545; executed on slender charge of treason, 1546.

S., who was devoted to Ital. lit., wrote *Songs and Sonnets* (pub. 1557) in sweet and graceful style, abounding in love sentiment, though his sonnets are frequently faulty in construction; translated Vergil, *Æneid*, books ii. and iv., into blank verse.

SURVEYING, the art of determining accurately the position of the chief features of a certain area, in order to obtain data for the construction of a map or plan. In a rudimentary form the art must be very ancient, for as soon as land came to be divided up for purposes of agriculture some method of land measurement must have been necessary. S. in the modern sense of the term, however, does not date back further than the Middle Ages, when nautical charts based upon actual measurements replaced maps constructed from rough and often quite inaccurate astronomical observations. Land s. proper came later, and probably was the outcome of observations made for the purpose of ascertaining the exact size and shape of the earth.

Briefly stated, land s. comprises two main operations: the dividing up of the ground to be surveyed into a number of triangles, and the calculation of the area of these triangles. When the sides of a triangle are accessible they are measured with the chain, and the area may be found in terms of their length. Again, the height of the triangle may be measured, and the area stated as half the product of height and base. In s. on an extended scale a base line of convenient length is selected and measured with the utmost care, for upon this measurement depends the accuracy of the whole survey. Signals, such as poles or cairns of stones, are set up at each end of this line, and a third point, at some distance outside the base line, is chosen and similarly marked. From each end of the base line is measured the angle between the other end and the third point, and from these angles and the length of the base may be calculated the remaining elements and the area of the triangle. By the same method, using each of the sides of this triangle as a new base line, other triangles are constructed, and by continuing the process the whole area is covered with a network of triangles. These large triangles are then split up into smaller ones, from which are determined the positions of all the principal places. The operations are extremely complicated, for in addition to difficulties due to the physical features of the country such factors as refraction, height above sea-level, temperature, and the curvature of the earth have to be taken into account. In every case the points determined by observation and calculation are projected to scale upon paper.

An important branch of s. is levelling, or the determining of the relative heights of various points on the ground with reference to an ideal surface, everywhere cutting the direction of the plumb-line at right angles. The heights may be determined directly by observing how the horizontal plane passing through the eye of the observer cuts graduated staffs, which are placed vertically over the required points; or, if the distances apart of certain points are known, the relative heights of these points may be ascertained from measurements of their vertical angles. At one time the level of low-water at spring-tides was used as the zero plane for levelling purposes, but now the mean sea-level is used.

Nautical surveys are mostly carried on by Government ships, and are under the general direction of the Admiralty hydrographer. They are executed on similar lines to land surveys, but with less accuracy, astronomical observations being employed to check the triangulation. Amongst the important special features to be noted in nautical s. are soundings, currents, high- and low-water levels, submerged rocks, and shoals. The chain most used in land s. consists of 100 links, its total length being 66 ft. It is thus $\frac{1}{10}$ of a furlong, or $\frac{1}{80}$ of a mile, while 10 sq. chains equal 1 acre. The THEODOLITE (*q.v.*) is the most important instrument used in s. for measuring angles, horizontal or vertical.

SUS (30° 30′ N., 9° W.), province, Morocco, bordering Atlantic; mountainous; drained by Sus. Pop. *c.* 225,000. Chief town, Tarudant.

SUSA.—(1) (Biblical *Shushan*, modern *Sûs*) (32° N., 48° 24′ E.) ancient capital of Susiana or Elam and chief residence of the Achæmenian kings; between rivers Kerka (*Choaspes*) and Dizful; said to have been founded by Darius Hystaspes. (2) (Rom. *Segusio*) (45° 8′ N., 7° 2′ E.) town, Turin, Italy; XI.-cent. cathedral; Roman antiquities. Pop. 5100. (3) (ancient *Hadrumetum*) (35° 50′ N., 10° 34′ E.) fortified seaport, on Gulf of Hammamet, Tunisia; exports olive oil, phosphates. Pop. *c.* 30,000.

SUSANNAH, HISTORY OF, see APOCRYPHA.

SUSQUEHANNA, see under PENNSYLVANIA.

SUSSEX (51° N., 0°), coast county, S. England; bounded N. by Surrey, Kent, E. by Kent, S. by English Channel, W. by Hants; area, 1436 sq. miles; in S. surface is crossed by S. Downs, which run from Beachy Head to W. boundary; Weald of Sussex occupies interior, and in N.E. are the Forest Hills; drained by Rother, Brede, Ouse, Adur, Arun, and other streams; county town, Lewes. Geological formation is chiefly chalk. Chief industry is agriculture; principal crops, wheat, barley, pulse, potatoes; excellent pasturage, both in the marshland of the S.E. and on the Downs,

and great numbers of cattle, sheep, and horses are raised; market-gardening is carried on, and fruits and vegetables are extensively grown for London markets. Manufactures include paper, bricks, pottery, cement, leather, spirits. County suffered from inroads of Danes in IX. and XI. cent's, and was scene of William the Conqueror's final victory at Hastings. There are various traces of Rom. occupation, and a number of ruined castles and monasteries. In December 1912 a human (feminine) skull, supposed by experts to be the oldest that has yet been found, was discovered here. Pop. (1911) 418,476.

SUSSEX, EARLDOM OF, probably first granted to Roger de Montgomery by William I.; after passing through many families and repeatedly becoming extinct, was granted, 1874, to Prince Arthur of Connaught.

SUSSEX, KINGDOM OF, ancient kingdom, Anglo-Saxon Britain; founded by Ælle, who landed at Cymenes, 477; corresponded generally to modern Sussex; united to Wessex, *c.* 700.

SUSSEX, THOMAS RADCLYFFE, 3RD EARL OF (1525?–83), Eng. statesman; cr. Lord Fitzwalter, 1553; Lord Deputy of Ireland, 1556; annexed territory of future King's County and Queen's County; Lord-Lieut., 1560; took part of Matthew O'Neill against Shane O'Neill, but failed to subdue Shane, and obtained recall, 1564; as Lord Pres. of North put down northern rising of 1569; prominent courtier.

SUTHERLAND, EARLDOM AND DUKEDOM OF.—Earldom, first held by Freskin family, passed through heiress to Gordons, early XVI. cent.; and in XVIII. cent. through another heiress to Leveson-Gowers, who received ducal rank in 1833.

SUTHERLANDSHIRE (58° 15′ N., 4° 30′ W.), county, N. Scotland, extending from Atlantic to Moray Firth; area, 2028 sq. miles; surface is generally mountainous with wide moorlands and some fertile valleys; highest points are Ben More and Ben Clibreck, both over 3000 ft.; drained by Oykel, Brora, Helmsdale, and other streams; has numerous lakes, including Lochs Assynt and Shin; county town, Dornoch. Agriculture is carried on, and sheep are extensively raised; there are salmon, herring, and other fisheries, and a considerable area consists of deer forests and grouse moors; minerals include lignite. Pop. (1911) 20,180.

SUTLEJ (29° N., 74° E.), river, Punjab, Brit. India; rises in Tibet; flows generally W.; joins Indus at Mithankot; length, 900 miles.

SUTRI (52° 15′ N., 12° 15′ E.) (ancient *Sutrium*), town, Rome, Italy; cathedral; Etruscan and Rom. antiquities.

SUTTEE, Ind. custom by which a widow threw herself on her husband's funeral pyre; abolished by Lord Bentinck, 1829.

SUTTON (51° 22′ N., 0° 12′ W.), town, Surrey, England. Pop. (1911) 21,275.

SUTTON COLDFIELD (52° 35′ N., 1° 50′ W.), town, Warwickshire, England; residential suburb of Birmingham. Pop. (1911) 20,132.

SUTTON-IN-ASHFIELD (53° 7′ N., 1° 16′ W.), town, Nottinghamshire, England; manufactures hosiery. Pop. (1911) 21,707.

SUTURES, stitches in surgery; are removed when of wire, silk, horsehair; absorbed when of catgut.

SUVÁROV, ALEXANDER VASILIEVICH (1729–1800), Russ. soldier; rose in Seven Years War; captured Cracow, 1768; won fame against Turks, especially at Kosludscki, 1774; sacked Ismail with great cruelty, 1790; reduced Warsaw, 1794; won brilliant victories against French in Italy.

SUWALKI (54° 10′ N., 23° 30′ E.), government, Russ. Poland, bordering E. Prussia. Pop. (1910) 367,300. Capital, **Suwalki** (54° 10′ N., 22° 57′ E.); trades in timber and woollens. Pop. 26,000.

SUZERAINTY, term in common use in France in Middle Ages to express the relation of a feudal lord to his vassal, the king being the chief suzerain; in modern times it expresses the power of a country over a vassal state, or over a state independent subject to certain reservations, or a protectorate over native states.

SVANE, HANS, SVANING (1606–68), Dan. abp.; bp. of Copenhagen, 1655; led democratic royalist party in opposition to nobles and established despotism of Frederick III.

SVANETIA (42° 40′ N., 42° 30′ E.), mountainous region, on S. slopes of Caucasus, Kutais, Russia.

SVASTIKA, see under CROSS.

SVEABORG, town, Finland; the 'Gibraltar of the North'; taken by Russians, 1808.

SVENDBORG (55° 3′ N., 10° 36′ E.), seaport, on island of Funen, Denmark; manufactures tobacco; exports agricultural produce. Pop. (1911) 12,667.

SVERDRUP, JOHAN (1816–92), Norweg. democratic leader; Prime Minister, 1883–89.

SWABIA, SUABIA, SCHWABEN (48° 30′ N., 10° E.), ancient duchy, Germany; corresponded generally to Württemberg, Baden, and W. part of Bavaria; capital, Augsburg.

SWABIAN LEAGUE, federation of Swabian and other Ger. cities, 1488–1534; Ger. disunity proved social evil in XIII. cent. In 1331 twenty-two towns, including Augsburg, Heilbronn, and Ulm, formed union for defence; fought fiercely with baronial league; emperor succeeded in establishing S. L., 1488, against feudal forces; it did good service to cause of peace.

SWADLINCOTE (52° 46′ N., 1° 33′ W.), town, Derbyshire, England; manufactures earthenware. Pop. (1911) 18,676.

SWAFFHAM (52° 39′ N., 0° 41′ E.), town, Norfolk, England. Pop. (1911) 3234.

SWALLOW HOLE, a funnel-shaped cavity occurring in limestone regions; also known as 'sink-hole.'

SWALLOWS (*Hirundinidæ*), family of about 150 perching birds distributed all over the world except in New Zealand. They are typical migratory birds, and are distinguished by broad beaks, opening almost to the eyes, small, weak feet, and long, forked tails. Familiar British visitants are the Common Swallow (*Hirundo rusticus*) and the House and Sand Martins (*Chelidonaria* and *Clivicola*); the latter nests in burrows excavated by itself in sand-pits; these winter in Central Africa.

SWAN, SIR JOSEPH WILSON (1828–), Eng. physicist; b. Sunderland; made improvements in photography—rapid dry plates, carbon printing; invented incandescent electric lamp with carbon filament; knighted, 1904.

SWANAGE (50° 37′ N., 1° 58′ W.), town, watering-place, on Isle of Purbeck, Dorsetshire, England. Pop. (1911) 4689.

SWANS, see under DUCK FAMILY.

SWANSEA (51° 37′ N., 3° 56′ W.), port, Glamorganshire, S. Wales, at mouth of river Tawe; has fine public buildings, including the Royal Institution of S. Wales, public library with science and art schools, numerous churches and several philanthropic establishments; there are several fine parks, of which the largest are Llewellyn and Victoria Parks; the ruined castle dates from XIV. cent. S. has a fine harbour which takes the largest ships; there are four docks, of which the largest and most recent is the King's Dock, covering about 67 acres; total net tonnage of arriving and departing vessels, apart from coasting trade, was 3,835,408 in 1900. S. is also a great centre of copper trade, and has large copper-smelting and tin-plate manufactures; exports iron, and iron and steel manufactures, coal, zinc, alkali, arsenic, machinery, and mill-work; imports cereals, iron ore, silver, lead, zinc, copper, tin, etc. Pop. (1911) 114,673.

SWAT (35° N., 72° 40′ E.), region, N.W. Frontier Province, India, consisting of the upper valley of the Swat River, which flows with a southerly course of about 400 miles; joins the Kabul.

SWATOW, SHANTOW (23° 20′ N., 116° 43′ E.), treaty port, on Han, Kwangtung, China; centre of sugar industry. Pop. (1911) 66,000.

SWAZILAND (c. 26° 21′ S., 31° 35′ E.), part of Brit. S. Africa, in S.E. of Transvaal; area, 6536 sq. miles; surface is a plateau, drained by Komati and tributaries, and Maputa; climate, healthy; agriculture is carried on; chief crops are maize, millet, tobacco, beans; cattle and sheep raised; minerals include gold, tin, coal.

S. was formerly in subjection to the Zulus, but attained independence, 1843; placed under the rule of the S. African republic in 1894; now under the control of Brit. Government. Pop. (1911) 99,959, including 1083 whites.

SWEARING, see OATH.

SWEAT, see SKIN.

SWEATING SYSTEM, a phrase first used about 1848 to describe system of sub-contracting in tailoring trade. Orders from master-tailors were undertaken by sub-contractors, who farmed the work out to needy workers, who made the articles at home, receiving 'starvation wages.' A report by a Committee of the House of Lords was issued on the subject in 1890, and an Anti-Sweating League has been for some years in existence. Women workers are the chief victims.

SWEATING-SICKNESS, an acute fever, the first symptoms being headache and cold shivering, then rise of temperature followed by profuse sweating, delirium, and collapse; formerly occurred in epidemic form in England, the last outbreak in 1551 being attributed to the insanitary conditions in which the people lived. *Miliary fever*, which occurs from time to time in France, Italy, and Germany, resembles it, except that the sweating is accompanied by a rash.

SWEDEN, SVERIGE (69° to 55° N., 11° to 24° E.), kingdom of north-western Europe, occupying the E. and greater portion of the Scandinavian peninsula; bounded N.E. by Finland, W. by Norway, S.W. by Cattegat and Skager Rack, S. by Baltic, E. by Baltic and Gulf of Bothnia; extreme length, c. 1000 miles; greatest breadth, 300 miles; area, 173,547 sq. miles; coast-line (c. 1000 miles) with many large bays and *fjords*, and innumerable islands, largest of which are Gothland and Öland in Baltic, Orust and Tjörn on S.E. coast. Prominent bays are Laholms Bay, Skelder Viken, Kongsbackafjord, Hanö Bay, Norrköpings Bay, etc. Sweden is divided into three large regions: Norrland in N., Svealand, central region, and Götaland in S. Surface is generally undulating; mountainous regions in N.N.W., highest peaks, Kebnekaise (7004 ft.), Sarjektjakko (6972 ft.), Sulitelma (6158 ft.), etc., in N.W.; central region generally flat, with fertile plains, and fine arable land in S. The greater part of Sweden consists of Archæan formations (gneiss, granulite, etc.) overlaid by pre-Cambrian, Cambrian, and Silurian strata; in the S., Mesozoic formations (Triassic, Jurassic, Cretaceous) are found; during Glacial Period Sweden was completely covered by ice.

Sweden has numerous rivers and lakes and many fine waterfalls; about 14,000 sq. miles of the total area is under water. Principal rivers are Torneå and Muonio (forming boundary of Finland), Kalix, Luleå, Skellefte, Pieteå, Angerman, Indals, Mottala, Umeå, flowing into Baltic, Dal into Gulf of Bothnia, Klar and Göta-Elf into Cattegat; few navigable; fine waterfalls are Trollhätta (Göta-Elf), Harsprång, Akkatsch Fall (Luleå-Elf), etc.; largest lakes are Vener (area, 2100 sq. miles), Vetter, Hjelmar, Mälar, Siljan, Hornafvon, Storsjörn, Storafvon, etc.; numerous canals (Göta, Dalsland, Seffle canals, etc.).

Climate is variable, but mild in comparison with other northern countries; coldest in N., with rivers frozen about six months in the year; mean annual temperature from 26°·60 in N. to 44°·6 in S.; mean temperature of January at Stockholm, 24°·8; mean rainfall, 20·28 in. (greatest in S.W.). Fauna includes bear, wolf, fox, elk (rare), hare, lemming, red deer, badger; numerous aquatic birds, besides various grouse, ptarmigan, snipe, golden plover, golden eagle, crane, etc. Vegetation is generally poor; immense forests of pine, fir, birch, spruce, oak, elm, especially in N.

HISTORY.

In earliest times Sweden was probably inhabited by Lapps and Finns; these were conquered by Goths and Sver, the former settling in S., the latter in central regions, and first ruled by Ynglingar family until 623; then followed the Skoldungs, who produced some famous Vikings—Harold Hildebrand, Bjorn Jernsida, Olaf Skatkonung, etc. Christianity was first preached by St. Ansgar, IX. cent.; from 1250–1397 Sweden was ruled by the powerful Folkungar family; during this period Stockholm was founded, c. 1255, Finland conquered, 1293, and much was done to encourage trade and commerce. By Union of Kalmar, 1397, Denmark, Norway, and Sweden were united, and Eric (XIII.) of Pomerania, Margaret of Denmark's great-nephew, was proclaimed king; from the beginning the union was unsatisfactory, and eventually led to the Peasant Rising (1433), headed by Engelbrekt Engelbrektsson, and the election of Karl Knutsson Bonde as *Charles VIII.* of Sweden, 1436. Upsala Univ. was founded, 1477.

During tyrannical reign of *Christian II.* of Denmark (succ. 1513) the Stockholm *Blood Bath* (massacre of Swed. nobles, etc.) took place, 1520, and resulted in a successful revolution under Gustavus Vasa, 1521, who was proclaimed king of Sweden at Strengnäs Riksdag, 1523, as GUSTAVUS I. During his reign a hereditary monarchy was introduced, the Reformation (Lutheranism) gradually progressed, and a strong military army and navy were established. Civil war broke out, 1598, caused by religious differences; CHARLES IX., a strong Protestant, became king (1599–1611), after expelling the Catholic Sigismund; and began the wars with Russia, Poland, and Denmark, which were ended by Sweden's greatest king, GUSTAVUS ADOLPHUS (*q.v.*) (1611–32), who not only won for Sweden great military prestige in Europe, as the recognised champion of Protestantism, but also advanced education, commerce, and social well-being; Peace of Knäred (1613) ended war with Denmark (War of Kalmar); peace with Russia (1617) gave Sweden the provinces of Kexholm and Ingria; Livonia and Esthonia were acquired from Poland, 1629, and the provinces Halland, Herjedal, and Jemtland, and islands of Gotland and Ösel (in Baltic) from Denmark, 1645. From 1630 onwards Sweden took a prominent part in the Thirty Years War. Gustavus Adolphus was killed, 1632, and was succeeded by his daughter CHRISTINA, a minor, whose chief councillor was the great Oxenstjerna. By Peace of Westphalia, 1648, Sweden received Upper Pomerania, the islands of Rügen and Usedom, the town of Wismar, the secularised bishoprics of Bremen and Verden, etc. Christina abdicated, 1654; her half-cousin, CHARLES X. (1654–60) invaded Poland, and obtained from Denmark by Peace of Roeskilde (1658) Trondhjem, Bornholm, Schonen, Halland, etc.; under his son, CHARLES XI. (1660–97), who was only four on accession, Livonai was secured from Poland (1660), Trondhjem and Bornholm lost to Denmark; only Fr. support averted further territorial losses in unfortunate war with Brandenburg and Denmark (1675–79); the nobles' power was curbed, and finance reorganised. The chivalrous CHARLES XII. (1697–1718), after initial success against Denmark, Russia, and Poland in Northern War, was crushed at *Poltava*, 1709; escaping from Turkish captivity he renewed the war, but fell at Fredrikshald, 1718; absolute monarchy died with Charles, whose sister, Ulrike Eleonore, ushered in the *Frihetstiden* (period of freedom), and resigned the crown to her husband, FREDERICK I. (1720–51); Sweden obtained a constitution, but lost territory and prestige, weakened by the continuous party strife between *Caps* and *Hats*; the war policy of the *Hats* brought fresh humiliation to Sweden. ADOLPHUS FREDERICK (1751–71) was first of the Holstein-Gottorp house; his son, GUSTAVUS III. (1771–92), restored absolute monarchy, checked Russ. aggression, promoted literature and industry, supported Louis XVI. of France against Revolutionaries, provoked a conspiracy, and was assassinated. Under

Gustavus III.'s son, GUSTAVUS IV., ADOLPHUS (deposed 1809), and brother, CHARLES XIII. (1809–18), Sweden lost Finland to Russia, and Pomerania to Prussia, but secured Union of the crown with Norway, 1814. Napoleon's general, Bernadotte, Prince of Ponte Corvo, was elected crown prince, 1810; succeeded as CHARLES XIV., JOHN, and made good Sweden's claim to Norway as against Denmark. OSCAR I., his son (1844–59), helped to bring about Truce of Malmö (1848) in Danish-German War over Schleswig-Holstein; made a defensive alliance with Britain and France, 1855; under his son, CHARLES XV. (1859–72), religious freedom was established, and the present constitution of Sweden adopted, 1866. OSCAR II., brother of Charles XV., ruled over Sweden till 1907, over Norway till 1905, when Norwegians at last succeeded in severing the crowns. GUSTAVUS V., Oscar II.'s son (1907–), now reigns.

Language.—Swedish belongs to the Scandinavian group of Teutonic languages, and is closely akin to Danish and Norwegian. See TEUTONIC LANGUAGES.

Literature.—Before the Reformation there are few names of importance in Swedish lit. In the old Scandinavian Sagas, Sweden has a certain share. Runic inscriptions preserve a few early metrical fragments. Christianity produced a number of religious and historical works—mostly in Latin, and mediæval romances of chivalry were translated into Swedish. In the XIV. cent., when Danish triumphed over Old Norse, Swedish held its own. Most notable writer of this period is St. Bridget (d. 1373). The XV. cent. saw the foundation of Upsala Univ. (1477), and the XVI. cent. the Reformation. Olaus Petri (1493–1552) and Laurentius Petri (1499–1573) translated the Bible; Olaus also wrote a chronicle of Sweden, and Laurentius wrote plays. The XVII. cent., Sweden's most glorious age, found an ardent patron of learning in Queen Christina (1632–54), who invited scholars (including Descartes) to Sweden. The 'father of Swedish Poetry,' George Stjernhjelm (1598–1672), adorned and entertained her court. In the XVIII. cent. the Academy of Science (1753) and Academy for the Improvement of the Swedish Language (1786) were founded. Among writers of this period may be mentioned the religious poet, Peter Lagerlöf (d. 1699), Jakob Frese (d. 1729), the lyrist, Olof von Dalin (1708–63), historian and poet, who followed Fr. and Eng. models. The poet-counts Creutz (1731–85) and Gyllenborg (1731–88) frequented the distinguished *salon* of Carlotta Nordenflycht (1718–63). Under Gustavus III., himself a scholar and dramatist, the classical school reached its height in the poet Oxenstjerna (1750–1818), the critic Kellgren (1751–95), and the satirist Leopold (1750–1829). In his truly national ballads and songs Karl Michael Bellman (1740–95) and others threw off Fr. influence, and the XIX. cent. brought reaction, and saw the introduction of a Romantic movement with Ger. influence predominant. Of this school may be mentioned the 'Phosphorists,' Atterbom (1790–1855), Dahlgrén, and Hammarsköld. The 'Gothic Union,' however, which included Esias Tegnér (1782–1846), author of celebrated *Frithjofs Saga*, and the historian Geijer (1783–1847), turned from foreign patterns and devoted itself to purely national themes. Swedish modern writers may be mostly divided into two groups, neo-romantics or idealists, and realists; to the former belong Victor Rydberg (1829–96) and Count Snoilsky (1841–1903), while pre-eminent among the latter is August Strindberg (1849–1912). Among Swedes who have won European fame as philosophers, scientists, explorers, etc., are Swedenborg, Linnæus, the Nordenskiölds, Sven Hedin, etc.

Defence.—Swedes are liable to military service between 21 and 40; army consists partly of volunteers, partly of conscripts; peace strength, c. 70,000. Navy consists of small coast-defence vessels, but larger battleships (6800 tons) are now under construction. Chief fortresses are Stockholm, Boden, Karlskrona, Karlsborg; principal naval stations, Karlskrona and Stockholm.

Government.—Sweden is a hereditary monarchy whose sovereign must be a Lutheran. Legislation is carried out by Diet, consisting of First Chamber (150 members elected for 6 years) and Second Chamber (230 members elected for 3 years). For local administration Sweden is divided into 25 *Län* or governments, each with a prefect and *Landsting* (council); the larger towns have separate municipal councils; the 25 län are Blekinge, Cristianstad, Elfsborg, Göteborg and Bohus, Gottland, Gefleborg, Halland, Jemtland, Jönköping, Kopparberg, Kalmar, Kronoberg, Malmöhus, Norrbotton, Ostgotland, Örebro, Södermanland, Stockholm (län), Stockholm (city), Skaraborg, Upsala, Wermland, Westerbotten, Westernorrland, Westermanland. Principal towns are Stockholm (capital), Göteborg, Malmö, Norrköping, Hälsingborg, Gäfle, Örebro, Eskilstuna, Karlskrona, Upsala, Jönköping. Protestant (Lutheran) religion predominates. Primary education is free and compulsory, and maintained chiefly by local taxation; univ's at Upsala (1477) and Lund; private univ's at Stockholm (faculties of Philosophy and Law) and Göteborg (faculty of Philosophy), Caroline Institute for Medicine (Stockholm), besides naval and military schools, agricultural, mining, commercial, art, music, and other institutions.

Total railway mileage (1910), 8594 miles, over 2500 belonging to the State. Over 50 % of total area is under forest. Principal products are rye, oats, barley, potatoes, live stock, timber, wool, bacon; rich in minerals—iron ore, zinc, copper, manganese, silver, cobalt, sulphite of iron. Mining is one of chief industries; also lumbering, manufacturing of woodwork, iron and steel smelting, flour-milling, sugar-refining, cotton and wool weaving, machinery, distilling and brewing, etc.; important fisheries; chief exports—wood, wood-pulp, iron, butter, paper, matches, skins, fish. Total value of imports (1910), £37,000,000; exports, *c.* £32,500,000. Pop. (1900) 5,136,441; (1911) 5,561,799. For Map, see NORWAY.

Sundbärg, *Sweden, its People and Industries* (1904); Baedeker, *Norway, Sweden, and Denmark* (1903); Bain, *Scandinavia: A Political History of Denmark, Norway, and Sweden, 1513–1900*; Nordlund, *The Swedish-Norwegian Crisis* (1905).

SWEDENBORG, EMANUEL (1688–1772), Swed. theologian and founder of sect bearing his name, studied at Upsala, then in England and elsewhere; assessor to Swed. board of mines, 1716; became able scientist, anticipating many modern discoveries. At first not profoundly religious, but became an intense mystic; devoted himself entirely to religious work after 1747; his supernatural experiences rest on good authority. He lived latterly partly in London. S. wrote numerous scientific works; his religious works include *Arcana Celestia, Apocalypse Revealed, Apocalypse Explained, New Jerusalem, Canons of the New Church, Heaven and Hell, The Last Judgment.* He did not intend to found a new denomination, but one, still existing, grew up after his death (*Swedenborgians*, or *New Jerusalem Church*). See Warren, *Compendium of the Theological Writings of Emanuel Swedenborg*; *Life*, by Hyde, Swainson, Trowbridge.

SWEET BAY, see LAUREL.

SWEET PEA (*Lathyrus odoratus*), annual plant of order Leguminosæ; Everlasting Pea (*L. latifolius*) is scentless; both are of many colours.

SWEET POTATO (*Batatas*), genus of plants, order Convolvulaceæ; *B. edulis*, of many tropical countries, is nourishing.

SWEET WILLIAM (*Dianthus barbatus*), plant of order Caryophyllaceæ; one of pink genus.

SWEETBREAD, see PANCREAS.

SWELLENDAM (33° 59′ S., 20° 23′ E.), town, Cape Province, S. Africa.

SWEYN I. (d. 1014), king of Denmark; s. of King Harold Bluetooth; forced Ethelred the Unready to pay tribute, 994; avenged Massacre of St. Brice's Day, 1002, by ravaging England till his death.

SWIFT, JONATHAN (1667–1745), Brit. satirist,

novelist, essayist, pamphleteer; greatest prose-writer of XVIII. cent.; b. Dublin; of Eng. parents; ed. Kilkenny and Trinity Coll., Dublin; studied desultorily, but granted degree by special grace; app. sec. to Sir Wm. Temple, 1688; ordained in Ireland, 1694; returned to Temple, on whose death (1699) S. was app. chaplain to Lord-Lieut. of Ireland; received livings of Laracor and Rathbeggin (Meath). During visits to London he met Addison, Steele, and other Whigs; his *Dissensions of Athens and Rome* (a pamphlet) defended Whig ministers, 1701. In allegorical *Tale of a Tub*—pub. 1704, with *Battle of the Books* (written 1697), a brilliant mock-heroic prose epic on quarrel of Ancients and Moderns—S. satirises in masterly fashion the shams and excesses of the Churches of Rome, England, and Scotland (Peter, Martin, and Jack). Leaving Whigs for Tories (1710), S. raked his former political friends with telling pamphlets (e.g. *Conduct of the Allies*, 1711; *Public Spirit of the Whigs*, 1714), and received Deanery of St. Patrick's (1713), instead of expected bishopric. On fall of Tories (1714) S. returned to Ireland, hopelessly embittered. Here he married 'Stella' (Esther Johnson), whom he had met at Temple's and to whom his remarkable *Journal* was addressed. A disappointed admirer was Esther Vanhomrigh, the 'Vanessa' of S.'s poem (*Cadenus and Vanessa*). By *Drapier's Letters* (1724) he saved Ireland from 'Wood's halfpence' and became a national champion. *Gulliver's Travels*, his best-known work, appeared 1726, anonymously, like almost all his writings. His last years were darkened by insanity.

S.'s satirical power was colossal. Nothing escaped his merciless scourge. *Gulliver* is all-embracing in its lash; every human weakness and vice is subjected to his savage irony and sarcasm. His splendid imagination, story-telling gift, and command of language, rank him among foremost writers of fiction. Circumstantiality (by means of vivid, minute details) and simplicity of language are among his chief effects. The imaginary travels of Captain Lemuel Gulliver fascinate young and old alike. S.'s poetry is mediocre; as Dryden said, 'Cousin Swift, you will never be a poet.' He aimed at purifying the Eng. language (cf. Letter on *Correction of Language*). For S. the times were out of joint. He is one of the most tragic, one of the greatest figures in Eng. lit.

Life, by Craik (1894), Churton Collins (1898), Leslie Stephen (1889), Herbert Paul (1901), Smith (1910); Moriarty, *Life and Writings* (1893).

SWIFTS (*Cypselidæ*), a family of 100 species of Picarian Birds found throughout the world; insectivorous and typically birds of the air; swallow-like, with long, narrow wings, forked tail, and beak slit to the level of the eyes. *Collocalia* builds the edible birds' nests used by the Chinese; the Common Swift (*Cypselus apus*) is familiar in the Brit. Isles.

SWIM-BLADDER, AIR-BLADDER, outgrowth of gut found in many Fishes, and generally used as a hydrostatic organ, *e.g.* in balancing, and in regulating internal pressure to compensate external pressures in water. Sometimes its function is respiratory, and it is lung-like in the case of the Lung-Fishes or DIPNOI (see under FISHES).

SWIMMING, method of progression practised from earliest times by man, though not natural to him; chief styles are *breast stroke* (used for long distances), in which arms are stretched in front of body and deliberately swept round till at right angles to direction, movement accompanied by strong kick with both legs, which are drawn up during stroke; *overhand stroke* (for speed), in which arm is carried out of water and over swimmer's head; *side stroke*, swimming on side, thereby offering less resistance. Swimming on back is generally used as rest from side stroke, to which it is similar in action.

As pastime, s. has long been popular in Britain; cross-Channel s. frequently attempted. Webb swam from Dover to Calais, 1875; after many attempts, feat was repeated by Burgess (*q.v.*), 1911.

SWIMMING-BELL, see under HYDROMEDUSÆ.

SWINBURNE, ALGERNON CHARLES (1837–1909), Eng. poet; b. London; s. of Admiral S.; ed. France, Eton, and Balliol Coll., Oxford. In 1860 he pub. *The Queen Mother* and *Rosamund*, which attracted little attention. After travelling in Italy, he returned to London and lived in Chelsea with Rossetti, Meredith, and the pre-Raphaelites. In 1864 appeared his masterpiece, *Atalanta in Calydon*, which at once brought him recognition as a master of lyrical expression. This was followed by *Chastelard*, and in 1866 by *Poems and Ballads*, which, in spite of their lyrical power, aroused a storm of criticism on the score of immorality, against which charge S. defended himself with customary vigour. Thenceforward he continued writing almost to the last, living always in or near London. Among his later works were *Songs of Italy* (1867), *Songs before Sunrise* (1871), *Erectheus* (1876), *Poems and Ballads*, second series (1878), *Tristram of Lyonesse* (1882), *Locrine* (1887), *Astrophel* (1894), and *A Channel Passage* (1908). He also wrote several essays (on Shakespeare, Hugo, Byron) of flamboyant and often violent prose.

S. is admittedly the greatest master of metre in Eng. lit., and his poetry always shows great fire and energy. Sometimes, however, his love of mere musical expression leads him to allow sense to swoon into mere melody, and in his earlier poems his passion is erotic.

Life, by Woodberry, MacKail.

SWINDON (51° 33′ N., 1° 46′ W.), town, Wiltshire, England; large railway works. Pop. (1911) 50,771.

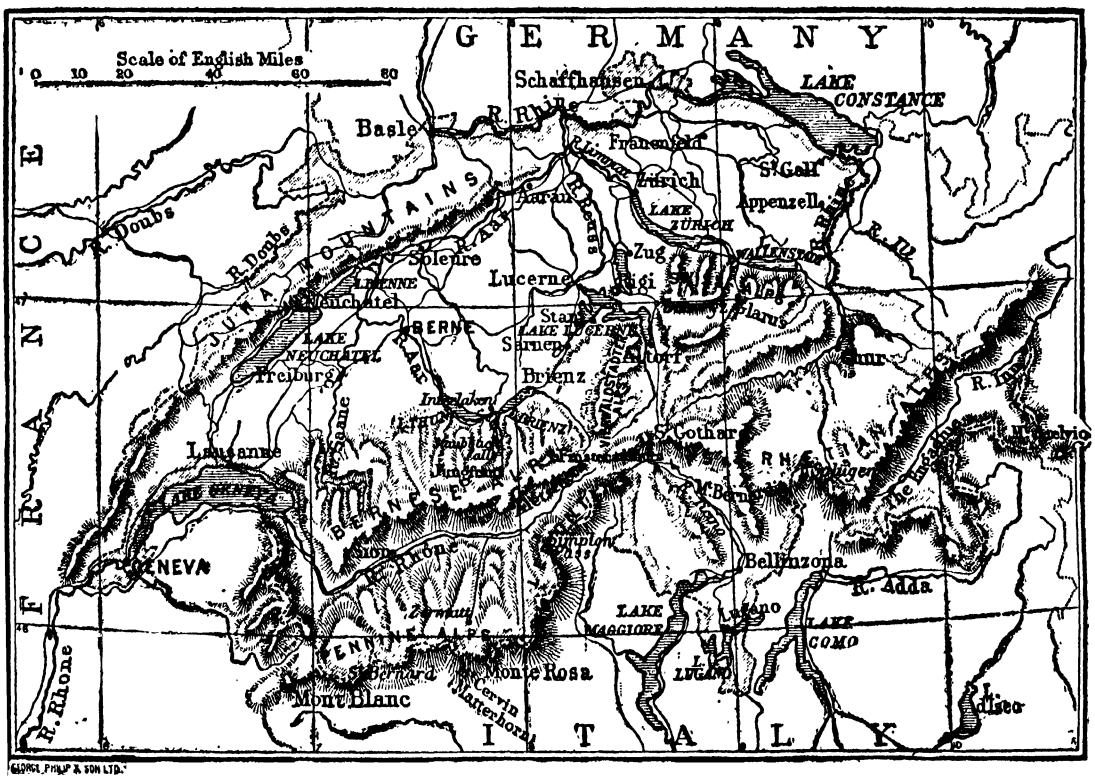
SWINE, a name applied indiscriminately to the members of the Ungulate group SUINÆ, to the PIG FAMILY (*q.v.*) in general, or to Domestic Pigs.

SWINEMÜNDE (53° 56′ N., 14° 14′ E), fortified seaport, watering-place, on island of Usedom, Pomerania, Prussia; shipbuilding yards. Pop. 14,200.

SWING DAVID (1830–94), Presbyterian minister in U.S.A.

SWINTON (53° 29′ N., 1° 19′ W.), town, W. Riding, Yorkshire, England; manufactures glass, iron. Pop. (1911) 13,586.

SWINTON AND PENDLEBURY (53° 30′ N., 2° 20′ W.), town, Lancashire, England; cotton-mills; coal-mines. Pop. (1911) 30,759.



SWISS GUARDS, body of mercenaries serving in Fr. army from 1616 on; distinguished themselves at the Tuileries, Aug. 10, 1792.

SWITHUN, ST., bp. of Winchester; d. 862, according to *A.S. Chronicle*; his association with rain probably signifies attachment to his day of some pagan festival.

SWITZERLAND, a Central European republic, called sometimes the 'Swiss Confederation.' Its dimensions are roughly 230 by 140 miles, its area, nearly 16,000 sq. miles. It is bounded S. by the Alps, N. by the Rhine and other mountains, but it extends S. of the Alps in some places; comprises the valleys of the Rhine, Rhone, and Jura; abounds in lakes and mountains and is hardly a geographical unity; ethnologically and linguistically comprises several different races. Of a population of (1910) 3,741,971, about 70 % are German-speaking, French 22 %, and Italians 6 %, while in the Grisons, Romansch is spoken. The capital is Bern, though it is smaller than Zürich, Basel, and Geneva. Foreign visitors give employment to 33,000 people and spend about £7,500,000. The land itself is pastoral rather than agricultural; there are about 1,500,000 cattle, 500,000 swine, 360,000 goats, and 200,000 sheep. Most of the corn is imported. Vineyards are on the decrease. Of manufactures the chief is textiles, especially silk. Watchmaking has for some centuries been carried on at Geneva. In 1911 the exports were about 50 millions, and imports 71 millions.

History.—The origin of the Swiss Confederation is to be found in the special political circumstances of a part of the Middle Kingdom (as it was in the early Middle Ages)—the debatable land between France and Germany, and in the South, equally closely related

with Italy. It remained normally a part of the Holy Rom. Empire long before its real independence. The first definite step was the alliance of the men of Uri, Schwyz, and Unterwalden against the power of the House of Hapsburg, which tried to crush out local liberty. Albert of Hapsburg became emperor in 1298, but did not attack the rights of the cantons as it was later said that he had done. The League was renewed in 1315 after the victory at Morgarten over Leopold of Hapsburg and an agreement made with the Hapsburgs in 1318 in which the Hapsburg possessions of certain lands was recognised: their political authority was not alluded to. Lucerne joined the League in 1332, and Zürich in 1351. Glarus joined in 1352 on an inferior footing, and Zug just afterwards. Bern, which had made a treaty with the forest cantons in 1323, joined in 1353. Thus there were now eight cantons instead of three. Meanwhile there was continued friction with Austria, and in 1386 war broke

GEORGE PHILIP & SON LTD.

out afresh, but the Austrian forces suffered a crushing defeat at Sempach.

In 1394 a treaty was made by which the freedom of the League from Hapsburg interference was guaranteed, and all feudal powers were finally relinquished by the Hapsburgs by the 'Everlasting Compact' in 1474. In the XV. cent. the League steadily progressed. In 1411 Appenzell came under its protection, obtaining full membership in 1513. The town of St. Gall, which had a struggle with its overlord, the abbot, was likewise protected in 1512, but did not become a member until 1803. In the XV. cent. also the beginning of Ital. conquest took place.

But, like other communities which have themselves become free, the Confederate cantons often treated their subject lands harshly. Disputes began with the Confederates, and Zürich, quarrelling with Schwyz, called in Austrian aid. An alliance was made with France in 1452, and in 1458 war broke out between the Confederates and the Empire. In 1474 the Burgundian War began. An alliance had been formed between various Rhine cities, the Confederates, and the Emperor Sigismund against Charles the Bold, Duke of Burgundy. Charles was defeated, and the Confederate victories greatly increased the prestige of the cantons. Switzerland was now practically independent of the Empire, but an attempt of the Emperor Maximilian to enforce his imperial rights led to a war in 1499. Relations were still undefined, but there was no further interference, though independence was not recognised till 1648. The new members in the XV. cent. were Freiburg and Solothurn in 1481, Basel and Schaffhausen in 1501. Thus, with Appenzell, there were now thirteen. The Swiss Confederation extended its influence south of the Alps in the early XVI. cent.

The Reformation opens a fresh period in Swiss history. The reformer Ulrich Zwingli was a man not only of religious but of political importance, and under his leadership the city of Zürich rose into prominence. Zwingli's Protestantism was of the more extreme type; from his time onwards Switzerland has been religiously divided, and in 1529 the principle was recognised that each centre could choose its own faith. Bern won conquests in Vaud, and Geneva passed for a time beneath the political and religious sway of John Calvin. At the Counter-Reformation some parts were won back to Catholicism. The Confederation kept itself clear of the conflicts of the Thirty Years War, and by the Peace of Westphalia in 1648 its independence of all imperial authority was recognised. From this time to 1798 three important facts stand out: (1) the predominant Fr. influence, with the result that France almost held towards the Confederation the position formerly held by the Empire; (2) continual religious quarrels among the Confederates. The result was that in each parish religious equality was recognised, (3) though the Confederation owed its rise to a movement in favour of popular freedom burgership became hereditary in a few families, and thus an aristocratic rather than a democratic government arose; also the cities tended to oppress the country districts. A peasant rising broke out in 1653 which was sternly suppressed, but no reforms followed. Switzerland,

therefore, at this time was not politically progressive; the country was becoming famous, and it was at Lausanne that Gibbon wrote part of his *Decline and Fall*.

The Fr. Revolution could not be without its influence on Swiss affairs, and the ideas of the revolutionaries were re-echoed in Switzerland. Fr. troops entered the country and it was soon won for the Revolution. The 'Helvetic Republic' was established in 1798. The capital was fixed at Lucerne and a new constitution was formulated. This consisted of a great council, senate, and five directors. But the Fr. government was overbearing, Geneva was annexed, and an executive committee was established instead of the Directory. The constitution was reorganised by Napoleon in 1803 with the addition of other cantons, Graubünden and St. Gall, which till then had only been associated, the rest, Aargau, Thurgau, Ticino, and Vaud, subject cantons; in some cantons the government was placed in the hands of a legislative assembly under an executive and legislative council. This constitution was really more in accordance with Swiss tradition than that of the Helvetic Republic. But this state of things was modified by the fall of Napoleon, and in 1813, on Austrian instigation, the Swiss Diet annulled the constitution. In 1814 Geneva, Valais, and Neuchâtel were raised from associateship to membership of the Association. Basel got its territory increased by the Congress of Vienna with the lands of the old prince-bp. A new constitution was formulated in 1815. Subject territories and class privileges were abolished, and each of the 22 cantons got practical autonomy. The European Powers declared Switzerland neutral, and so the Confoderation was loosed from the leader-strings of France.

The Fr. Revolution of 1830 made its influence felt in favour of recasting the constitution of the cantons. For several years there were violent quarrels between the Radicals on one side and the Catholics on the other. In 1843 a league was formed by the R.C. cantons of Uri, Schwyz, Unterwalden, Lucerne, Valais, Freiburg, and Zug, by way of protest against the suppression of the monasteries in the Prot. canton of Aargau. The league became an armed alliance in 1845, and war broke out in which the forces of the league (or Sonderbund) were defeated. Several schemes were now put forward for revising the Federal constitution. This was actually accomplished in 1848. A Council of 2 deputies from each of the 22 cantons was set up, and a National Council of elected deputies. A judicial court of 11 was likewise established. French, German, and Italian were recognised as official languages; all Christian denominations were tolerated, but members of any religious order were forbidden to enter the Confederation. Coinage, the post telegraphs, roads, canals, and railways have gradually been brought under national control. In 1857 Neuchâtel became a member of the Confederation on the same footing as the other cantons, whereas previously she had been a principality of which the king of Prussia was prince. Part of Savoy was ceded to France in 1860. The constitution was again revised in 1874 and various reforms introduced, among them the referendum and national elementary education.

Also a citizen going into another canton could in three months obtain rights in the canton where he settled. The initiative was introduced in 1891. Thus Switzerland became really a state, not merely a group of states. Centralisation if not carried so far have left her too disunited to be efficient, if carried further would have robbed her of not only her peculiar character but of her peculiar value for the Swiss themselves. Owing to the referendum and the group system of parties the government of Switzerland is directly democratic and not simply by representatives. There are really four important parties, the Liberal and Conservative being split into a moderate and extreme wing. The initiative has not resulted in very much, rather contrary to expectation. There have been several experiments in State Socialism which have tended to centralisation. The nationalisation of railways, which took place partly in 1898 and partly later, may have important effects on future strikes. In 1909 two new schemes were rejected, one for 'proportional representation,' the other for the members of the Federal Council to be elected from the country as a whole and not separately in the cantons.

Switzerland has recently become strongly protectionist, and the money acquired by the tariffs has been spent in various national works. Railways are very important economically and even politically, and the construction of several lines through the Alps has attained a vast expenditure, and cantonal rivalries are influenced by railway exploit.

Literature.—There is no Swiss language peculiar to the country, but four languages are spoken. Until 1798 all the Swiss cantons were almost entirely German speaking. The earliest vernacular lit. was that of the Minnesingers in the XIII. and XIV. cents. Various monastic chronicles are mediæval. Most learned works were until the XVII. cent. written in Lat., but Johannes Stumpf wrote a great work on Switzerland in German. Zürich was the centre of literary activity in the XVIII. cent. Literature of all sorts was written—much about Switzerland itself. Among the most famous of Swiss (writing in German in the XIX. cent.) have been Albrecht Bitzius, Jakob Burckhardt, and Gottfried Keller, all novelists.

Fr. lit. begins in the XIV. cent. Much was written in the XVIII. cent., particularly by the Huguenot refugees. Several famous men lived and wrote in Switzerland at the end of the XVIII. cent.—among them Gibbon, Voltaire, and Rousseau—though their works can hardly be said to belong to Fr. lit. Of the large subsequent Fr. lit. much has been written on the geography and history of Switzerland itself.

Ital. lit. is not so extensive—what there is consists mostly of poetry.

The Romansch and Ladin dialects of Grisons have little original lit., though some lyric poetry, but there are a fair number of translations.

Government.—Switzerland is made up of 22 cantons, which are largely independent, and is therefore a Confederation of states and not a closely centralised unity. Each canton is divided into a number of *Gemeinden* (communes) which are the units of all local government—largely, indeed, of government as a whole. Every male citizen over 20 is a member. The cantons have their own assemblies, in which a magistrate is annually elected, and also their own judicatures. The central or Federal government of the Swiss Confederation has a Council of Estates with two members from each canton, and also a National Council of representatives, elected from the whole population on the principle of one member to 20,000 inhabitants. The two houses elect the Federal executive of seven members, the president, and vice-pres. There is a Federal Supreme Court. The present system of Federal government only dates from about 1848.

The annual receipts and expenditure are about £5,000,000. The relation of Church and State varies in different cantons, either Catholicism or Protestantism being established; in some both.

Education.—Primary education is free and compulsory, and is administered separately in each canton. The 'religious question' is solved by the majority in any one commune teaching their religion. Secondary schools, as they are called, are generally free, but above these are 'middle schools,' corresponding to our grammar and technical schools. Switzerland has seven univ's, which are supported by the cantons.

Army.—Military service is compulsory from 20 to 40 years of age. Recruits have to pass a medical and gymnastic examination. The length of training varies in the different arms, in the first year from 65 to 90 days. Men serve 12 years in the *Elite*

(*Auszug*), 8 in the *Landwehr*, and 8 in the Reserve. The training in each is only for a few days a year. The total in 1911 was about 211,567 (Élite and Landwehr), and the cost nearly £1,720,000. Certain taxes have to be paid by those who are for any reason exempt from service.

Baker, *The Model Republic* (1895); Crawford, *Switzerland of To-day* (1911); Dawson, *Social Switzerland* (1897); MacCrackan, *The Rise of the Swiss Republic*.

SWORD is the most ancient of all weapons now in use, and in the hands of an expert, against sword or bayonet, it takes the place of armour as well as proving a means of attack. The heavy infantry ('hoplites') of the Greeks used the s. as well as the spear. A short cut and thrust s. was the common weapon of the Rom. legion. The Norman invaders of England overcame with s.-thrusts the host of Harold, who fought with bills and practised a cleaving stroke; yet the cutting sword has always been favoured by Oriental armies. Damascus, in Syria, was famous for its steel, which was kept in a magazine for the making of s's. Solingen and Toledo were noted for blades for duelling purposes. The s. is found in many types, *e.g.* the sabre, the cutlass, the rapier.

Sir R. Burton, *Book of the Sword* (1884).

SWORD-FISHES (*Xiphiidæ*), family of bony fishes, containing six species; remarkable on account of their 'sword,' an enormous prolongation of the upper jaw, which forms an effective weapon of attack; distributed in warm seas throughout the world, and generally found in open waters following schools of mackerel; flesh considered excellent food.

SWYNFORD, KATHARINE (*c.* 1350–1403), mistress, afterwards wife, of John of Gaunt, and mother of Beauforts (*q.v.*).

SYAGRIUS (d. 487), Rom. gov. of Gaul, 464–86; defeated by Clovis at Soissons, and fled, 486.

SYBARIS (40° 22′ N., 18° 10′ E.), ancient city, on Gulf of Tarentum, Magna Græcia; founded by Achæans, 720 B.C.; famed for its wealth and luxury, hence term *Sybarite*, a voluptuary.

SYBEL, HEINRICH VON (1817–95), Ger. historian; b. Düsseldorf; ed. Berlin; prof. at Bonn, Marburg, Munich; app. director of Pruss. Archives, 1875. S. took an active part in politics; wrote *Geschichte des ersten Kreuzzugs*, *Die Entstehung des Deutschen Königtums*, *Geschichte der Revolutionszeit*, *Die Begründung des Deutschen Reiches durch Wilhelm I.*, etc.; founded the *Historische Zeitschrift*.

SYCAMORE (*Sycomorus*), genus of trees, order Moraceæ; Egyptian S. (*Ficus Sycomorus*) is grown as a shade. See MAPLE, PLANE.

SYCON, see under SPONGES.

SYCOPHANT (Gk. *sukophantes*, etymology doubtful), one who brought a public charge against another, generally with a view to pecuniary advantage. The system arose from the fact that, by the Athenian constitution, any citizen could act as public prosecutor, but it became open to abuse, although restrictions against blackmail, etc., existed. In modern usage, a flatterer or parasite.

SYDENHAM, southern suburb, Lewisham, London; near it is the Crystal Palace.

SYDENHAM, THOMAS (1624–89), Eng. physician; b. Wynford Eagle, Dorsetshire; fought for Parliament in Civil War; afterwards studied at Montpellier, and practised med. in London, bei licensed in 1666; grad. M.D. of Pembroke Ha Cambridge, 1676. S. wrote *Observationes Medicæ*, a treatise on fevers, works on various other diseases, particularly gout, on which he was an authority, and *Processus Integri*, an outline of pathology and therapeutics. He is most famous for his ideals of practice, his conceptions of the physician's first duty being to get his patient well, and his methods, watching and assisting nature's efforts, treating chronic diseases by changing the patient's dietary and mode of life, and paying little attention to contemporary theories.

SYDNEY.—(1) (33° 52′ S., 151° 14′ E.) chief town, New South Wales, Australia; situated on Port Jackson, one of the finest natural harbours in the world; newer part is regularly laid out with wide streets and fine public buildings, including the governor's residence, National Art Gallery, fine library, museum; seat of univ. (1850); has Anglican and R.C. cathedrals; fine system of parks; there are natural deep-water frontage and wharves, and S. is chief station of Brit. navy in southern hemisphere; outlet for great coal-field; manufactures joinery-ware, coaches, wagons, machinery, iron goods, tweeds; climate very healthy. Pop. (1911) 636,353. (2) (64° 6′ N., 60° 11′ W.) seaport town, Cape Breton, Nova Scotia; coal-mining industries. Pop. (1911) 17,617.

SYENITE, a granitoid igneous rock of deep-seated origin; composed of hornblende and orthoclase felspar, and sometimes traces of quartz, oligoclase, sphene, and zircon; found in veins and bosses in Upper Egypt. The ancients obtained it from Syene, hence name.

SYLHET (24° 53′ N., 91° 54′ E.), town, on Surma, capital, Sylhet district, Assam, India. Pop. 16,000; (district) 2,260,000.

SYLLABUS (outline or scheme), *Syllabus errorum*; document pub. (1864) by Pius IX. appended to encyclical *Quanta cura*, condemning 80 'principal errors of our time'; mainly concerned with pantheism, naturalism, rationalism, indifferentism, socialism, communism, secret societies, liberalism, the temporal power, civil society, marriage, and ethics; not universally held to be *de fide*.

SYLLOGISM, process by which from two propositions (premises) containing a common term as the bond of connection, we pass to a third proposition (conclusion), the truth of which follows from the truth of the premises. Every syllogism must contain a universal proposition, whence the reasoning is from the more to the less general; this is deduction as distinguished from induction, where we reach a more general proposition. See LOGIC.

SYLT (54° 54′ N., 8° 21′ E), island, North Sea, belonging to province Schleswig-Holstein, Prussia.

SYLVESTER, JAMES JOSEPH (1814–97), Eng. mathematician; b. London; ed. Liverpool and Cambridge; second wrangler, 1837; app. Savilian prof., Oxford (1883). Author of numerous and brilliant papers on mathematical analysis, especially theory of invariants, reciprocants, etc.

SYLVIIDÆ, WARBLERS (*q.v.*).

SYME, JAMES (1799–1870), Scot. surgeon; b. Edinburgh; ed. Edinburgh High School and Univ.; established Minto House Hospital, where he put into practice his method of clinical lecturing, the patients being brought into a lecture-room in front of the students, who took notes of the cases; had a large surgical practice, and was app. (1833) prof. of Clinical Surgery at Edinburgh Univ.; when Liston went to London (1835) was recognised as the leading surgeon in Scotland; author of many surgical works, and greatly promoted surgical and medical education.

SYMMACHUS, Rom. family of *gens Aurelia* (fl. IV.–VI. cent's A.D.); QUINTUS AURELIUS S. (*c.* 340–402), consul, 391, was noted for eloquence and old Rom. spirit; works often show turgid rhetoric. Descendants held curule offices till execution of historian, Q. AURELIUS MEMMIUS S., 525.

SYMONDS, JOHN ADDINGTON (1840–93), Eng. poet and critic; b. Bristol. Of a very delicate constitution, his studies were prosecuted with a severe physical strain. His *magnum opus* was an exhaustive study of the *Renaissance in Italy*, pub. in 7 volumes.

SYMOND'S YAT, hill (740 ft.), on Wye, 4¼ miles N.W. of Monmouth, England; noted view-point.

SYMPATHETIC INKS, see INK.

SYMPATHETIC SYSTEM, see NERVOUS SYSTEM.

SYMPHONY, a composition for full orchestra consisting of several movements (*e.g.* adagio, allegro,

andante, scherzo, finale); in the XVII. cent. term applied to purely orchestral parts of masses, cantatas, operas, etc., also to overtures and ritornelli. See HAYDN, MOZART, BEETHOVEN, SCHUMANN.

Symphonic Poem, TONE POEM (*poème symphonique, tondichtung*), an orchestral composition, generally in one movement, expressing a poem or literary idea, *e.g.* Strauss' *Don Juan*, Saint-Saens' *Roust d'Omphale*, Tschaikowsky's *Manfred*, Elgar's *Cockaigne*, and Debussy's *L'Après-Midi d'un Faune*. The term was first used for Liszt's twelve *Symphonische Dichtungen*.

SYNAGOGUE, a religious assembly of the Jews, as distinct from the Temple; dates from about time of Ezra; now used of place of worship.

SYNAGOGUE, UNITED, London Jewish society incorporated, 1870: centre of work for Eng. Jews.

SYNASCIDIA, suborder of TUNICATA (*q.v.*).

SYNAXARIUM, term for martyrology (*q.v.*) in Eastern churches.

SYNCARIDA, see under MALACOSTRACA.

SYNCARPOUS, see FLOWER.

SYNCELLUS, chaplain of Gk. bp.

SYNCOPE, heart failure. See DEATH.

SYNCORYNE, see under HYDROMEDUSÆ.

SYNCRETISM, union of conflicting principles on the basis of some common ground; denotes principles of a Lutheran sect in the XVII. cent., under Calixtus, aiming at agreement between Lutherans and the Reformed, through common tenets; came to imply indifferentism through opposition of Catholics.

SYNDERESIS, scholastic term meaning innate power towards good.

SYNDICALISM aims at control of the means of production by trade unions; socialism is political. S. is opposed to parliamentary reform; its weapon is the general strike, which will compel capitalism to hand over control of industry to the workers. See books by J. Ramsay Macdonald and by J. H. Harley.

SYNDICATE, company of persons formed to promote a business or undertaking, cf. TRUST (*q.v.*).

SYNESIUS (373–414), elected bp. of Ptolemais, 410, when still a pagan; philosopher, but was unsuccessful; wrote oration *On Kingship* and other works.

SYNGE, JOHN MILLINGTON. See DRAMA (p. 495).

SYNOD, term for various ecclesiastical assemblies.

SYNTHESIS.—(1) The act of putting together; (2) the resulting combination; opposed to analysis. Mental s.—(1) The act of mentally combining, *e.g.* in comparison; (2) the mental combination.

SYPHILIS, an infective disease due to a specific micro-organism, the *Spirochæte pallida*, which is a microscopic thread-like spirilla, infection taking place either by direct contact, most commonly in sexual intercourse, although other modes of infection are not unknown, such as touching infected articles or in the medical examination of syphilitic patients, *acquired s.*; or the disease may be due to infected persons transmitting it to their children, *inherited s.*

There are three stages of the disease, the FIRST STAGE lasting from four to eight weeks, and including the period of incubation, usually about three or four weeks, the development of the primary lesion, which is a hard, shiny nodule, becoming later a sharply cut ulcer with a hard base, accompanied by the swelling of the nearest lymphatic glands.

The SECOND STAGE lasts from one to two years, the general health may not be affected, or the patient may be feverish, anæmic, there may be headache, loss of appetite, and a feeling of tiredness; a rose-coloured rash usually appears on the skin, becoming brownish, and then disappearing, and followed by a scaly, papular eruption, which may less commonly become pustular; whitish, rather sodden-looking, raised papules termed *condylomata* may occur in such positions as the corners of the mouth, the arms, or external genitals; the hair becomes dry and brittle, and may fall out, and the nails also become brittle and easily broken; there are frequently mucous patches and ulcers on the mucous membrane of the mouth and throat, while the eyes may be affected, most commonly with *iritis*, the bones or joints may be affected, and the blood vessels are affected by proliferation of their internal lining, or *endarteritis*, so that they are narrowed.

The THIRD STAGE of the disease has no time limit, and occurs generally only in such persons as have neglected the treatment of the disease, or whose powers of resistance to the virus is weak through debility; the chief characteristic is the development of granulation tissue, usually as a definite tumour-like mass termed a *gumma*, or the granulation tissue may infiltrate through the connective-tissue of an organ; the gumma usually becomes soft in the centre, and, if on the surface, may develop into an ulcer.

The treatment of s. differs in the various stages, and few diseases are so amenable to treatment if it is properly carried out. In the first stage the primary lesion has applied to it a dusting powder of zinc carbonate and calomel, but if it is ulcerous it has a dressing of 'black wash,' while mercury is administered by the methods mentioned below. In the second stage the person affected should have a nourishing diet and plenty of fresh air, and mercury is administered either by the mouth (in the form of grey powder or the liquid perchloride), or by inunction (rubbing it into the skin in the form of an ointment), or by injection (an oily emulsion injected into the muscles of the buttock); in addition the mouth should be rinsed and the throat gargled with an antiseptic mouth-wash.

Ehrlich has recently introduced the compound dioxy-diamido-arseno-benzol, also termed *salvarsan* or *606*, for the treatment of s. in the first, second, or third stages; it is a yellowish powder, which is dissolved, diluted, and injected intravenously, and causes a rapid disappearance of the manifestations of the disease, the spirochætes disappearing completely in from twenty-four to thirty-six hours; it is not, however, suitable for the treatment of all cases, and, being of a poisonous nature, requires careful administration in the hands of skilled medical men. In the third stage of the disease the drugs employed are either, as just noted, salvarsan, or potassium iodide, which causes absorption of the gummata or the infiltrations of granulation tissue; an ulcerating gumma should have a dressing of 'black wash' applied to it, while the general health should be looked after as in the second stage. Potassium iodide has a depressing effect, to neutralise which ammonium carbonate is prescribed along with it, while in cases where the system cannot tolerate the potassium iodide, sodium or ammonium iodide is administered in its place.

Inherited s. is manifested by a discharge in the nasal passages causing 'snuffles,' by the typical skin eruptions and condylomata, inflammation and mucous patches of the mouth, throat, and nose, swelling of the ends and thickening of the long bones, and the joints or eyes may be affected. At a later stage there may be gummata, the teeth are typically notched and peg-shaped, the nose has a sunken bridge (saddle-nose), and there may be a haziness of the cornea of the eye due to keratitis. The treatment is the administration of mercury (grey powder internally and mercury ointment externally, *e.g.* rubbed on the infant's binder), salvarsan, in smaller amount than in the cases of adults, and treatment of the general health with cod-liver oil and iron.

SYRA, SYROS (37° 26′ N., 24° 55′ E.), island of the Cyclades, Greece; rocky, mountainous; exports sponges. Pop. 18,150. Chief town, Hermoupolis.

SYRACUSE:—(1) (37° 3′ N., 15° 15′ E.) ancient city, on E. coast of Sicily, founded by Corinthians, 733 B.C.; at first the settlers only occupied small island of Ortygia, but later extended area gradually till it included the quarters of Achradina, Tyche, Neapolis, and Epipolæ; grew steadily in power and splendour until it became chief Gk. city in the W.; earliest history is not fully known; in V. cent. Gelo of Gela

established tyranny, and under him the city increased in strength and prosperity; at Himera he defeated the Carthaginians. His successor, Hiero, encouraged art and culture; during democratic period which followed, famous Athenian siege took place, when, after hard struggle for two years, the Syracusans completely defeated the Athenians (415–413 B.C.); despotic government restored by Dionysius the Elder, who enlarged city and constructed fortifications, docks, and warships. S. was now at zenith of its greatness; reigns of next two tyrants were unsettled, but peace and liberty were restored by Timoleon, 343 B.C. Agathocles revived tyranny in 317 B.C. The city prospered greatly in long reign of Hiero II., who established friendliness with Rome; his grandson, Hieronymus, joined Carthaginians against Rome and so helped to bring on celebrated siege (214–212 B.C.), which resulted in destruction of S. by Romans; many of the finest works of art were carried off by the enemy, and S. became subject to Rome; though city never recovered its greatness, it still continued to be centre of art and culture; in 878 A.D. S. was plundered by Saracens, and since then has been of very little importance.

Ruins of ancient S. are extensive and of great interest; among most notable are two Doric temples (cath. built into one in 640 A.D.); fountain of Arethusa; Agora, with remains of Rom. colonnade; vast fortress, believed to be Euryalus; Necropolis, containing hundreds of tombs; Christian catacombs, Gk. theatre, Rom. amphitheatre, Olympieium, foundations of great altar of Hiero II., quarries, aqueducts, ancient roads, Rom. houses, and many other buildings; church of San Giovanni (XII. cent.) is one of finest mediæval remains.

Modern S., capital of province of S., mainly occupies Ortygia, which is now an isthmus; streets are mostly crooked and dirty; exports fruits, wine, and oils. Pop. (1911) 40,587; (province) 476,991.

(2) (43° 2′ N., 76° 10′ W.) city, on Erie and Oswego Canals, midway between Albany and Buffalo, New York, U.S.A.; public buildings include Federal Government building, city hall, free library, and various philanthropic institutions; seat of Methodist Episcopal Univ. (1870); fine system of parks; great railway centre; has well-known brine springs, but the production of salt is less important than formerly; manufactures typewriters, boilers, engines, machinery, iron and steel goods, saddlery, boots. Pop. (1910) 137,249.

SYR-DARYA.—(1) (44° N., 65° E.) province, Russ. Turkestan, bordering Sea of Aral; includes part of the Tian-shan range and Karatau chain; traversed by the Syr-Darya; generally infertile; inhabitants mainly Kirghiz; pursuits chiefly pastoral. Pop. (1910) 1,858,200. Capital, Tashkend. (2) JANARTES (46° N., 61° 25′ E.), river, W. Turkestan, Asiatic Russia; has its source in Tian-shan Mts., flows W. and N.W. through Ferghana and Syr-Darya, and enters Sea of Aral by three channels; has a length of *c.* 1600 miles, and drains an area of *c.* 325,000 sq. miles; joined by many tributaries.

SYRIA (*c.* 31° to 37° 30′ N., 34° 15′ to 39° 45′ E.), part of Turkish Empire in Asia, generally understood to extend from Mt. Taurus in N. to Arabian Desert in S., and from Levant in W. to Euphrates and Syrian Desert in E. This region, *c.* 114,530 sq. miles, includes Palestine and Phœnicia (*qq.v.*), and some of the most ancient cities of the world. Surface generally is elevated; the Lebanon and Anti-Libanus mountain-ranges extend along Mediterranean coast; E. of these is a plateau which slopes gradually downwards to the eastern desert; chief river is the Jordan, which flows through a deep valley running N. and S. through Palestine; lakes include Dead Sea and Sea of Galilee. Damascus, the chief city, is mentioned in Abraham's time, and, though situated near border of desert, lies among gardens and orchards and still remains centre of great caravan trade with Persia and the East. Aleppo, Beirut, and Jerusalem also continue to flourish, but Tyre and Sidon have sunk into obscurity.

Syria belonged partly to Egyptians, partly to Hittites, about middle of II. millennium B.C.; Phœnicians became powerful a few cent's later, and a kingdom was founded by the Hebrews; country came successively under the domination of Assyria, Babylonia, Persia, Macedon, the Seleucids, Rome, Byzantium, and the Arabs; it was taken by Turks in 1516.

Chief ports are Jaffa, Acre, and Beirut. Syria produces wheat, olives, grapes, and other fruits; sheep and goats are raised; exports silk, cereals, fruit, olive oil. Inhabitants are mostly Muhammadans, but in Palestine there is an increasing number of Jews, and near Mt. Lebanon a sect of Christians called Maronites. Pop. *c.* 3,675,000.

SYRIAC LANGUAGE is the Eastern dialect of Aramaic, which was prevalent in Mesopotamia and the surrounding territory, and was used by many early Christian writers. The language is much more elastic than Hebrew, owing probably to the influence of the more flexible Gk. tongue, from which Syriac also borrows a large portion of its vocabulary; alphabet differs slightly from Hebrew; the accent shifts from last syllable to penultimate. S. is now dead, and remains chiefly in ecclesiastical writings.

SYRINGE, cylindrical instrument having nozzle at one end; fitted with piston; place nozzle in water, draw back piston, and atmospheric pressure forces water to follow piston. Force down piston to eject water.

SYRNIUM, TAWNY OWL, see under OWLS.

SYRPHIDÆ, see HOVER-FLIES.

SYRUP, see SUGAR.

SYRUS, EPHRAEM, see EPHRAEM SYRUS, ST.

SYZRAN (53° 13′ N., 48° 37′ E.), town, Simbirsk, Russia; manufactures leather; active commerce. Pop. (1910) 41,300.

SZABADKA, MARIA THERESIOPOL (46° 8′ N., 19° 42′ E.), town, Bacs-Bodrog, Hungary; agricultural centre. Pop. (1910) 94,618.

SZALAY, LADISLAS (1813–64), Hungarian patriot who wrote early history of Hungary (pub. 1856–60).

SZARVAS (46° 52′ N., 20° 34′ E.), town, on Körös, Hungary; horse fairs. Pop. (1910) 25,879.

SZATMAR-NEMETI (47° 49′ N., 22° 51′ E.), town, on Szamos, Hungary; cathedral; pottery, wine. Pop. (1910) 34,892.

SZÉCHENYI, ISTVAN, COUNT (1791–1860), Hungarian soldier and statesman; one of founders of Hungarian academy, Danube navigation company, and other schemes for developing Hungary; political caution led him to oppose Kossuth; minister of ways and communications after revolution, 1848.

SZE-CH'UEN (29° 50′ N., 104° 20′ E.), largest province of China, in centre of W.; area, 218,480 sq. miles; surface mountainous, reaching an extreme height of *c.* 19,000 ft.; drained by Yang-tse-kiang and its affluents Min, Kialing, and Fu-sungho; capital, Cheng-tu; Chung-king is a treaty port on the Yang-tse-kiang; soil fertile; produces oil, sugar, tea, cotton, opium, tobacco, rhubarb, white wax, silk; minerals include coal, iron, salt, copper, zinc. Pop. (1911) *c.* 16,392,105.

SZEGED, SZEGEDIN (46° 16′ N., 20° 10′ E.), town, at junction of Theiss and Maros, capital, County Csongrad, Hungary; manufactures soap, cloth, leather; held by Turks from 1541–1686. Pop. (1910) 118,328.

SZÉKESFEHÉRVÁR, STUHLWEISSENBURG (Lat. *Alba Regalis*) (47° 10′ N., 18° 24′ E.), town, Hungary; cathedral; was place of coronation of Hungarian kings from X. to XVI. cent's; trade in horses, wine. Pop. (1910) 36,625.

SZENTES (46° 40′ N., 20° 16′ E.), town, on Theiss Hungary; wine. Pop. (1910) 31,593.

SZOLNOK (47° 10′ N., 20° 12′ E.), town, on Theiss, Hungary; thread, tobacco, salt. Pop. (1910) 28,778.

SZOMBATHELY, STEINAMANGER (47° 12′ N., 16° 36′ E.) (Rom. *Sabaria*), town, capital, County Vas, Hungary; cathedral; Rom. antiquities; manufactures agricultural machinery. Pop. (1910) 30,947.

T, 20th letter of alphabet; a dental mute; derived from Semitic *tau*, a 'cross.'

TAAFE, Irish-Austrian family; Irish knight, Sir John T., cr. viscount, 1628, was f. of royalist, Theobald, cr. Earl of Carlingford, 1661; Francis, 3rd earl (1691), count of Holy Rom. Empire, was prominent European figure; earldom became extinct, 1738, while viscounty descended to Nicholas, Count T. (Germany), imperial field-marshal and chamberlain; family continue important in Austria, of which 11th viscount, Edward Francis Joseph, Count von T., was premier, 1879–93.

TAAL (13° 50′ N., 120° 50′ E.), seaport, on Balayan Bay, Batangas, Luzon, Philippine Islands; agricultural produce. Pop. 20,000.

TABACO (13° 15′ N., 123° 50′ E.), town, on Gulf of Tabaco, Albay, Luzon, Philippine Islands. Pop. 23,000.

TABANIDÆ, see Gad-Flies.

TABARI (838–923), Arab. scholar who wrote important annals and commentary on Koran.

TABASCO (17° 20′ N., 92° 40′ W.), maritime state, Mexico; surface generally low, forest covered and marshy, soil fertile. Pop. (1910) 187,574. Capital, San Juan Bautista.

TABERNACLE, sacred tent traditionally erected by Moses for the worship of Jehovah in the wilderness; it was divided into a 'holy place' and a 'holy of holies' (wherein lay the ark containing the two tables of stone). According to the critical view a tabernacle such as this was impossible in early times. It was certainly realised in Solomon's temple.

Tabernacles, Feast of, agricultural feast of Judaism, ranking with Pentecost and Passover as three greatest; its origin may be Canaanitish. F. of T. is connected with harvest, and was specially a time of joy. One part of its celebration was to dwell in booths, a custom some Jews still attempt to follow.

TABES DORSALIS, Locomotor Ataxia (*q.v.*).

TABLE, originally flat stone, then of wood or metal. Greeks and Romans reclined at meals and used low t.; cumbrous mediæval t. replaced by 'flap-t.' with hinged sides; legs elaborately shaped and carved; with use of mahogany gradually came more massive types.

TABLE MOUNTAIN (33° 58′ S., 18° 24′ E.), mountain (3550 ft.), Cape Colony, overlooking Cape Town and Table Bay; named from its peculiar shape and flattened summit.

TABLETS, WRITING, see Palæography.

TABLE-TURNING, name given to movement of a table on which people seated around put their hands, supposedly due to spiritual action, really to automatism of the people.

TABOO, Polynesian word meaning 'sacred, sanctified,' also with the opposite significance 'impure' or 'unclean'; these two apparently opposite conceptions are really the same, as, specially among savage peoples, various objects are thought to possess supernatural qualities. A supernatural force, *mana*, may be in a thing naturally, or it may be got by contagion from some other thing. Thus certain foods are forbidden, or, if partaken of, have a bad effect, and men, having eaten what was forbidden, and finding out their mistake, have died of fright. Purity was at first ceremonial, not physical or moral.

T. is often royal or priestly, and a king is hedged about with a complicated ritual. He is forbidden to do anything which might injure the crops, of which he is imagined to be the protector. Often t. is permanent, but that which has been acquired can be cast off by lustration.

T. is found all over the world, and exists, too, in the higher forms of religion, *e.g.* Judaism. The ritual law is largely concerned with t., though the term has come to be associated rather with the Gentile religions; thus certain animals were forbidden as food, ritual uncleanness was acquired by the touch of a corpse, certain diseases, etc.

Robertson Smith, *Religion of the Semites*; Frazer, *The Golden Bough*.

TABRIZ, Tauris (38° 2′ N., 46° 12′ E.), town, capital, Azerbaijan province, Persia; most notable architectural features are the citadel and the 'Blue Mosque'; important transit trade; several times destroyed by earthquakes. Pop. *c.* 195,000.

TACHEOMETRY, a system of rapid surveying in which the positions of points are measured in regard to one another by means of a theodolite, the size of which depends on the nature of the work, and a pole which is marked with heights from its base to top. This is held by a man at the required spot, while the observer determines the difference between the uniform level and the level of the pole.

TA-CHIEN-LU, Ta-tsien-lu (30° N., 120° 20′ E.), town, Sze-chuen, China.

TACHYLYTE, a natural glass, formed by rapid cooling of molten basalt; black and dark brown, with a greasy appearance like pitch; very brittle; occurs in basaltic obsidians in dikes, veins, and intrusive masses.

TACHYPETES, Frigate Bird (*q.v.*).

TACITUS, MARCUS CLAUDIUS (d. 276 A.D.), Rom. emperor, 275–76; patron of lit.

TACITUS, PUBLIUS, or **CAIUS CORNELIUS** (*c.* 55–*c.* 120), Rom. historian; s.-in-law of Agricola; quæstor, 79; prætor, 88; consul, 97; nothing known of family, and little of private life, but intimate friend of younger Pliny, and held favour of successive emperors; orator of best type, but chiefly famed for literary work; writings, besides hist. value, are among prose masterpieces. *Life of Agricola*, written *c.* 76, giving account of Britain, is model biography; *Germania* (*c.* 98) is political treatise of which hist. part bears some traces of being merely hearsay; *Annals*, account of events, 14–68, part lost; *Histories*, events, 69–97, greater part destroyed. Style shows marked Vergilian influence.

TACNA (19° S., 70° W.), province, Chile, bordering Peru; largely occupied by desert; nitrate of soda, silver, copper obtained. Pop. 43,000. Capital, **Tacna** (17° 59′ S., 70° 16′ W.), on Tacna; scene of victory of Chilians over Peruvians and Bolivians, 1880. Pop. *c.* 14,000.

TACOMA (47′ 12° N., 122° 19′ W.), city, on Puget Sound, capital, Pierce County, Washington, U.S.A.; railway terminus and one of most important seaports on N. Pacific coast; excellent harbour; exports lumber, flour; large smelting-works; seat of University of Puget Sound. Pop. (1910) 83,743.

TACTICS.—The manœuvres by which a general seeks to defeat his enemy in battle are called Grand T., the methods of fighting adopted by the several arms and units are called Minor T. The two broad principles on which Grand T. are based are that a superior force can surround an inferior one by dispersing its units (*envelopment*), and that an inferior force kept together can break through a cordon at its centre (*penetration*). All battles are won, when skill is employed at all, by the application of these principles to situations created by ground, weather, morale, and equipment. An inferior force will generally allow its opponent to take the initiative, and will act defensively until an opportunity occurs to deliver its counter-attack

(*e.g.* Wellington at Salamanca). The battle formations of armies at various epochs tend to show which principle was in vogue: linear formations favoured envelopment, column formations favoured penetration. Similarly envelopment implies great reliance on fire action, penetration on shock action.

The general having formed his plan of battle must distribute his troops so that each arm may develop its characteristics. Cavalry desires to display its mobility, artillery its destructive power at long ranges, and infantry its capacity for coming to grips with the enemy. The three arms must co-operate. Infantry will discover a target for artillery, while the artillery bombardment in its turn enables the infantry to get to close quarters. Cavalry is the weapon of opportunity, and will exploit any situation in which the enemy can be taken at a disadvantage. Finally, the general must retain a reserve with which to deliver a decisive blow at any point discovered to be vulnerable. The combinations are infinite in variety, and, as tactical situations change rapidly, the field telegraph and telephone are utilised to convey information to the rear, and orders to the front, of a battlefield which covers many square miles.

TADORNA, Sheld Duck; see under Duck Family.

TADPOLE, see Frogs.

TAEL.—(1) Chin. weight (also called *liang*) = 1⅓ oz. avoirdupois by treaty. (2) Chin. silver coin—value 2s. 10⅝d. A Haikwan (*i.e.* Customs) tael weighs 575·642 grains; a K'up'ing (*i.e.* Treasury) tael weighs 581·47 grains, and is now standard scale.

TÆNIA, a Tapeworm (*q.v.*).

TAFILALT, Tafilet (31° 10′ N., 2° W.), oasis, Morocco; noted for its dates. Pop. *c.* 95,000. Chief village, Abuani.

TAFT, WILLIAM HOWARD (1857–), 27th Pres. of U.S.A.; Solicitor-Gen., 1890; circuit judge, 1892; dealt severely with railway strikers, 1894; administered Philippines, 1900–4, and skilfully established new civil government, 1901; Sec. for War in Roosevelt Cabinet, 1904; Republican nominee at elections, 1908; Pres., 1909, elected by large majority; mainly through Roosevelt's influence; Payne-Aldrich Act, tariff reform measure, passed, 1909; pledged to discountenance abuses of Trusts, etc.; stood for re-election, 1912, but was defeated by Dr. Woodrow Wilson (*q.v.*); Professor at Yale University, 1913.

TAGANROG (47° 13′ N., 38° 56′ E.), seaport, on Sea of Azov, Don Cossacks, Russia; bp.'s see; exports grain; tanneries; bombarded by the Anglo-Fr. fleet, 1885. Pop. (1910) 70,330.

TAGLIACOZZI, GASPARO (1546–99), Ital. surgeon; prof. of Surgery, later of Anatomy, at Bologna; author of once famous work on surgery.

TAGLIACOZZO (42° 5′ N., 13° 14′ E.), town, Aquila, Italy; scene of defeat, Charles of Anjou by Conradin, 1268. Pop. (commune) 9500.

TAGLIONI, MARIA (1804–84), famous Ital. dancer.

TAGUS (38° 40′ N., 9° 18′ W.), largest Span.-Portug. river; rises in Sierra de Abarracín, passes Aranjuez, Toledo, Abrantes, Santarem; enters Atlantic Ocean at Lisbon; length, 550 miles; navigable to Abrantes.

TAHITI, Otaheite (17° 44′ S., 149° 28′ E.), largest of Society Islands, Pacific Ocean; belongs to France; area, 600 sq. miles; irregular in shape and of volcanic formation. Surface is mountainous, reaching extreme height of 7340 ft.; surrounded by coral reefs; fertile lands along coast; chief town, Papeete; produces bread-fruit, oranges, bananas, and other fruits, sugar, coffee, cocoa, vanilla, cotton; principal exports are copra, pearl-shell, vanilla, cocoanuts. The native inhabitants belong to the Polynesian group; most of them have been converted to Christianity by R.C. and Protestant missionaries. T. came under French protection 1843, and became a Fr. colony 1880. Pop. 11,691.

TAILLE, Fr. tax imposed on the ordinance of the States-General, 1439, as a land tax (or in some cases on presumed profits of land) for support of standing army. The nobles were exempt, and the tax became merged in general revenue. By the XVIII. cent. practically all were exempt except the agriculturists, upon whom it fell with excessive harshness.

TAILLESS HARES, see Picas.

TAILOR, cutter and maker of clothes; in mediæval times formed guilds, *e.g.* Merchant Taylors Company. Nowadays much sweated labour in connection with tailoring.

TAIN (57° 48′ N., 4° 3′ W.), town, on Dornoch Firth, Ross and Cromarty, Scotland.

TAINE, HIPPOLYTE ADOLPHE (1828–93), Fr. historian and critic; b. Vouziers, in the Ardennes; studied at the *École Normale*, Paris; early evolved plan for scientific treatment of hist. events; idea not new, but T. was first to insist on its application; he expounded the theory in his *Histoire de la Littérature Anglaise* (1864); weak point was that moral side was left out; this the author felt and tried to introduce it in his æsthetic studies, *Travels in Italy* (1866), *The Ideal in Art* (1869), and in his great hist. work, *Origines de la France contemporaine* (1876–90), for first time analyses minutely causes of Fr. Revolution; other works are the essays on Livy, Fr. philosophers of XIX. cent., criticism, history, and on La Fontaine; admirable concise writer, whose influence will be lasting.

T'AIPING REBELLION, see China (History).

TAIREN, Dalny (38° 57′ N., 121° 34′ E.), seaport, on Talienwan Bay, Manchuria; large commerce; taken by Japanese, 1904. Pop. 43,000.

TAIT, ARCHIBALD CAMPBELL (1811–82), abp. of Canterbury; b. Edinburgh, and brought up a Presbyterian; ed. Glasgow Univ., and Balliol, Oxford. Headmaster of Rugby, 1842; bp. of London, 1856; supported Divorce Bill, 1857, Irish Church Disestablishment, Public Worship Regulation Act (against ritualists), 1874, and Burials Bill, 1880. Opposed use of Athanasian Creed in public service; abp., 1869.

TAIT, PETER GUTHRIE (1831–1901), Scot. physicist; b. Dalkeith; senior wrangler and Smith's prizeman, Cambridge, 1852; prof. of Math's, Belfast, and later, of Natural Philosophy, Edinburgh; works on *Properties of Matter* (1885), and, with Kelvin, *Treatise on Natural Philosophy.* His s., **Lieut. F. G. Tait** ('Freddie Tait'), the noted golfer, was killed in S. African War.

TAIWAN, see Formosa.

TAJ MAHAL, see Agra, Shah Jehan.

TAJIK, Parsiwan, Afghan, possibly Aryan, race, scattered over rural Asia; dull and brachycephalic.

TAKHTSINGJI (1858–96), Maharaja of Bhaunagar, India; introduced Western institutions, and maintained friendship with Britain.

TAKLA MAKAN (39° N., 83° E.), W. section of the Gobi Desert, lies N. of the Kuen-lun ranges and is bordered N.W. and E. by the Tarim River, Chin.-Turkestan; area, 115,000 sq. miles.

TAKU FORTS (38° 58′ N., 117° 40′ E.), on Pei-ho, Chi-li, China; taken by European Allies, 1900.

TALAVERA DE LA REINA (39° 55′ N., 4° 45′ W.), town, on Tagus, Toledo, Spain; Rom. and Moorish relics; scene of defeat of French by Wellington, 1809. Pop. 10,800.

TALBOT, family of Welsh descent; John, first Earl of Shrewsbury (*c.* 1388–1453), spent the greater part of his life in the Fr. wars.

TALBOT OF HENSOL, Charles Talbot, 1st Baron (1685–1737), Eng. lord chancellor; of family of Earls of Shrewsbury; patron of Thomson and Butler.

TALC, soft, soapy-feeling, silver-white, or greenish mineral, silicate of magnesium, with traces of potash, alumina, etc.; sometimes with slaty structure and sometimes transparent, with a pearly lustre; a lubricant; a variety, Steatite or Soapstone, is used as tailors' chalk.

TALCA (35° 5′ N., 71° 55′ W.), province, Chile; fertile; manufactures woollens. Pop. 135,000. Capital, **Talca.** Pop. 40,000.

TALCAHUANO, Talcaguano (36° 48′ S., 73° 5′ W.), seaport, on T. Bay, Concepción, Chile. Pop. 16,000.

TALENT, Gk. weight; varied in different states; Attic t. *c.* 58 lb.; value in silver about £211; Æginetan t., commercial measure of weight; term also used for sum of money.

TALGARTH (51° 59′ N., 3° 14′ W.), market town, Brecknockshire, Wales.

TALIENWAN (39° N., 121° 50′ E.), bay, on E. coast, Liaotung Peninsula, Manchuria; important in Russo-Japanese War.

TALISMAN, an astrological charm, usually a figure engraved upon stone or cast in metal; cf. modern 'mascot'; one of most notable, the Abraxas Stone.

TALLADEGA (33° 26′ N., 86° 10′ W.), city, capital, Talladega County, Alabama, U.S.A.; cotton manufactures. Pop. (1910) 5854.

TALLAGE, tax levied by Eng. kings on royal cities, boroughs, and demesnes; abolished, 1340.

TALLAHASSEE (30° 16′ N., 84° 18′ W.), city, winter resort, capital, Florida state, U.S.A., and of Leon County; seat of Florida state college; cotton manufactures. Pop. (1910) 5018.

TALLEYRAND-PÉRIGORD, CHARLES MAURICE DE (1754–1838), Fr. statesman; e. s. of prominent courtier, Lieut.-Gen. Charles Daniel de T. P.; lamed by accident as child, and by family consent inheritance of family honours was settled on younger bro.; sad, neglected youth explains cynicism of later years; adopted ecclesiastical career and received rapid promotion; bp. of Autun, 1789; representative of diocese in States-General, 1789, as ardent democrat and reformer; helped to draft new constitution and advocated confiscation of church lands, 1789; resigned bishopric, 1791, and was excommunicated; drew up scheme of educational reform; disliked rising anti-monarchical feeling, and accepted mission to England, 1792; placed on list of émigrés, 1792; expelled from England, 1794; allowed to return to France, 1795; foreign minister, 1797–99; brief period of disgrace, for accepting bribes from U.S.A., 1797; foreign minister under Napoleon from establishment of consulate till 1807; doubtful how much influence he exercised as to plans, but invaluable as to their execution; vainly opposed invasion of Russia and deserted to Bourbons, 1814; in his relations with Napoleon he showed every treachery; upheld democratic cause and supported Louis Philippe, 1830; after further diplomatic usefulness retired, 1834. His political ability was invaluable to France, but exposed him to charge of being mere opportunist; mysterious character; few illusions and many vices; dubbed by De Quincey, 'eminent knave.'

TALLIEN, JEAN LAMBERT (1769–1820), Fr. revolutionist; pub. and posted twice weekly on walls of Paris *Ami des citoyens*, Jacobin periodical, 1791; voted for death of king; member of committee of Public Safety; fell in love with victim of proscription, his future wife, Thérese de Fontenay, henceforth prominent republican figure; pres. of Convention, 1794.

TALLIS, THOMAS (*c.* 1515–85), Eng. composer; 'the father of Eng. cathedral music'; organist of Waltham Abbey until 1540; T. and William Byrd obtained Letters Patent (1575), giving them 'the exclusive right of printing music and ruled music paper for 21 years'; famous forty-part song, anthems, motets, etc.

TALLOW, fat of sheep and ox; extracted by melting; used in soap and candle manufacture and as lubricant; solidity due to stearin. See OILS.

TALLY, stick formerly used in keeping accounts. It was split in two longitudinally, the pieces receiving corresponding notches, and debtor and creditor each took half. Old Exchequer Tallies are preserved in museum at Record Office, London.

TALMA, FRANÇOIS JOSEPH (1763–1826), Fr. tragedian; as Proculus, in Voltaire's *Brutus*, he appeared in a toga, thus breaking the absurd tradition of playing in 'modern' costume.

TALMAGE, THOMAS DE WITT (1832–1902), Amer. Presbyterian minister.

TALMUD, the sacred Jewish book and commentary on the Old Testament, was of gradual growth and attained its present form about 500 A.D. It exists in two versions, the Palestinian (sometimes called the Jerusalem T.) and the Babylonian. It is composed of the *Mishnah*, 'teaching a drawing out and elaboration of the law of the Old Testament,' and the *Gemara* (legal and other matter). The Mishnah is divided into six Orders, themselves divided into chapters, and deals with many different matters—agriculture, festivals, the position of women, criminal law, sacrifices, ritual, etc. Additional matter is found in the Babylonian T. The date is uncertain. As the Mosaic law in its present form is only V. cent. B.C., though compiled from older material, so the T., though compiled much later, contains traditional material, much of it probably handed down orally and modified in the course of centuries.

After the fall of Jerusalem and the dispersion of the Jews the law continued to be studied. The work of Ezra had been followed by the age of the scribes; to *c.* 200 A.D. is the age of the 'teachers,' and from then is to be dated the growth of the Mishnah; 200–500 is called the age of the 'interpreters,' when the Gemara grew up as a sort of commentary on the Mishnah. The Palestinian T. has partially perished, but the Babylonian exists in full. The arrangement of material seems confused, for it is more like an encyclopædia than a Biblical commentary. The basis is strictly legal and to some it has seemed trivial. Naturally, it is uneven, but it is an invaluable storehouse for Jewish lore. Many of its elaborate discussions deal with ritual and legal details of great intricacy and, as it seems to us, of little importance. But to the devout Jew there was no separation of the moral and ceremonial side of religion.

Rodkinson, *History of the Talmud*; Herford, *New Testament in Talmud and Midrash*; Montefiore, *Synoptic Gospels*.

TALPA, see under MOLE FAMILY.

TALPIDÆ, see MOLE FAMILY.

TAMAQUA (40° 46′ N., 76° 6′ W.), town, on Little Schuylkill, Schuylkill County, Pennsylvania, U.S.A.; coal-mining industries. Pop. (1910) 9462.

TAMARIND (*Tamarindus*), tropical tree of order Leguminosæ; pods contain sweet pulp and are valued as fruit and medicinally as a laxative.

TAMARISK (*Tamarix*), genus of plants, order Tamaricaceæ; Common T. (*T. gallica*) is a Brit. seaside tree.

TAMATAVE (18° 3′ S., 49° 11′ E.), seaport, Madagascar; chief commercial centre of the island. Pop. *c.* 7500.

TAMAULIPAS (24° N., 98° 30′ W.), maritime state, Mexico; surface low on E., and occupied by a series of lagoons; chief industry, agriculture; copper, asphalt, petroleum obtained. Pop. (1910) 249,641. Capital, Ciudad Victoria.

TAMBOURINE, percussion instrument of ancient origin; hoop covered with vellum and furnished with bells or jingling metal plates; played by beating, rubbing, and shaking; popular in S. Europe and among negroes. The Provençal *tambourine* is a long, narrow drum.

TAMBOV (53° N., 41° 30′ E.), government, Russia; level and undulating; belongs to Don and Oka basins; very fertile; cereals, hemp, flax, sugar-beets grown; horses and cattle reared; minerals include iron, coal, gypsum; chief export, grain. Pop. (1910) 3,412,900. Capital, **Tambov** (52° 41′ N., 41° 30′ E.), on Tsna; manufactures woollens. Pop. (1910) 68,400.

TAMBUR, see PANDURA.

TAMERLANE, see TIMUR.

TAMIL, principal Dravidian language (see INDIA, LANGUAGE). Spoken by *c.* 20 millions in S.E. part of Indian peninsula and northern half of Ceylon. Writing is modified square form of Devanâgari (Sanskrit). Literary language, SEN-TAMIL, differs widely from

spoken language, KODUN-TAMIL. Lit., more or less independent of Sanskrit, has attained to high degree of ethical and artistic beauty. Chronology of extant works is very uncertain. Madura is chief early literary centre and seat of *Sangam* (Board of Censors). Augustan age (II. and III. cent's A.D.), period of greatest *Sangam* activity under royal patronage and principally under Jain and Buddhist influences. Many extant classics belong to Pallava period (V.–IX. cent's A.D.), showing Hindu revival. Principal compositions: Tiruvallavan's *Kural* (ethical apothegms); his sister Avvaiyār's poems; *Silappadhikāram* ('Epic of the Anklet'); *Manimēkhalai* ('Jewel-Belt'); *Nāladiyār* (ethical poem); *Chintāmani* and Kamban's *Rāmāyanam* (romantic epics); *Pattupāttu* ('Ten Idylls').

See *Linguistic Survey of India.*

TAMLUK (22° 18′ N., 87° 58′ E.), town, Midnapore district, Bengal, Brit. India; formerly a famous maritime city. Pop. 9000.

TAMMANY HALL, political association of New York, U.S.A., founded as democratic organisation, having its headquarters in Tammany Hall, which belongs to the Tammany Society or Columbian Order. T. H. was established in New York, 1789; incorporated as a benevolent society, 1805; seat from 1867, in Fourteenth Street, where meets separate organisation of T. H. In theory T. H. has no relation to T. Society, but both are branches of one political system, which is usually paramount in New York city politics.

TAMMERFORS (63° N., 22° E.), town, capital, Tavastehus province, Finland; textile industries. Pop. (1910) 44,147.

TAMPA (27° 55′ N., 82° 25′ W.), city, seaport, winter resort, on Tampa Bay, capital, Hillsborough County, Florida, U.S.A.; manufactures and exports cigars. Pop. (1910) 37,782.

TAMPICO (22° 16′ N., 97° 50′ W.), seaport, Tamaulipas, Mexico; exports ores, fibres. Pop. 25,000.

TAMSUI KAI, see FORMOSA.

TAMWORTH.—(1) (52° 39′ N., 1° 42′ W.) town, at junction of Tame and Anker, Staffordshire and Warwickshire, England; its ancient castle was the residence of the kings of Mercia; coal- and fire-clay mines. Pop. (1911) 7738. (2) (31° 10′ S., 150° 57′ E.) town, on Peel and Cockburn Rivers, Inglis County, New South Wales; gold- and diamond-fields. Pop. 6500.

TAN, FLOWERS OF, see MYCETOZOA.

TANA (1° 40′ S., 40° E.), river, Brit. E. Africa, rises near Mt. Kenia; enters Indian Ocean.

TANAGERS (*Tanagridæ*), family of New World Finch-like passerine birds, with nearly 900 species; especially characteristic of tropical forest areas; exceedingly diverse and brightly coloured; feed on fruits and insects.

TANAGRA, city on Asopus, Bœotia, site of many battles in ancient Greece; numerous terra-cotta statues unearthed.

TANAIDACEA, see under MALACOSTRACA.

TANAIS, see DON.

TANAUAN (14° 10′ N., 121° 10′ E.), town, Batangas, Luzon, Philippine Islands. Pop. 19,000.

TANCRED (1078–1112), Prince of Galilee on taking of Jerusalem; famous for exploits in First Crusade, 1096; immortalised by Tasso in *Gerusalemme Liberata*; Prince of Antioch on death of his uncle, Bohemund.

TANDY, JAMES NAPPER (1740–1803), Irish politician; first sec. of Soc. of United Irishmen, founded 1791; became popular and attacked Eng. officials; forced to fly after coalition with Defenders, 1793; with Fr. troops invaded Ireland, 1798, capturing Rutland; sentenced to death, but liberated.

TANEGA-SHIMA (30° 35′ N., 131° E.), island, S. of Kiushiu, Japan.

TANEY, ROGER BROOKE (1777–1864), Chief-Justice of U.S. Supreme Court (1836–64); advocate of States' rights; delivered famous judgment, in Dred Scott case, 1857, in favour of Southerners.

TANGA (5° 6′ S., 39° 5′ E.), seaport, Ger. E. Africa; terminus of the Usambara railway; exports copra, rubber. Pop. 6000.

TANGANYIKA (6° S., 30° E.), lake, Central Africa, surrounded by high mountains; length, 420 miles; breadth, 15–18 miles; 2700 ft. above sea-level and 600 miles from coast. W. part borders on Belgian Congo, S. on Rhodesia, N. and E. on German E. Africa; discovered by Burton and Speke, 1858; explored by Livingstone, Stanley, Cameron, Thomson, Weissmann, Grogan, etc.; on Cape-to-Cairo route; sleeping-sickness rife; steamer-service; railways approaching from Rhodesia and Dar-es-salaam.

TANGENT, line at right angles to point where radius of a circle meets circumference. See GEOMETRY.

TANGERMÜNDE (52° 32′ N., 11° 55′ E.), town, at junction of Elbe and Tanger, river-port, Pruss. Saxony; manufactures iron; shipbuilding yards. Pop. 14,000.

TANGIER (Rom. *Tingis*) (35° 42′ N., 5° 55′ W.), seaport, on Strait of Gibraltar, Morocco; chief centre of commerce in Morocco; diplomatic headquarters; was capital of Rom. province of Tingitana; taken by the Portuguese in 1471; formed part of dowry of Catharine of Braganza; abandoned by the British, 1648. Pop. 46,300.

TANJORE (11° N., 79° E.), district, Madras, Brit. India. Pop. 2,260,000. Capital, **Tanjore** (10° 47′ N., 79° 10′ E.), on Cauvery; literary and religious centre; contains palace of former rajahs and famous XI.-cent. pagoda; manufactures jewellery. Pop. 60,000.

TANNAHILL, ROBERT (1774–1810), Scot. poet and weaver; b. Paisley; drowned himself; wrote *The Bonnie Wood o' Craigielea* and *Jessie the Flower o' Dunblane.*

TANNHÄUSER, in Ger. legend a knight who in his wandering comes to the Venusberg, the abode of sensual love; after tarrying there he repents and sets out to seek pardon from Rome; Pope tells him that he has as little chance of mercy as his staff has of budding again; T. returns to Venus and a few days later the Pope's staff bears leaves. A minnesinger of the name flourished in XIII. cent. Story is elaborated in Wagner's *Tannhäuser.*

J. Cuthbert Hadden, *Tannhäuser* ('*The Great Operas*' Series).

TANNIN, TANNIC ACID ($C_{14}H_{10}O_9$), gallic anhydride, extracted from galls, sumach, etc., by boiling water; occurs in tea; crystalline, astringent; uses—tanning, dyeing, ink-making.

TANNING, see LEATHER.

TANN-RATHSAMHAUSEN (earlier **TANN**), **LUDWIG SAMSON ARTHUR, BARON VON DER** (1815–81), Bavarian soldier; blamed for disasters of Austro-Prussian campaign, 1866; distinguished in Franco-Ger. War.

TANSA (19° 30′ N., 73° E.), river, Salsette Island, Bombay, India; reservoir for water-supply of Bombay is on its course.

TANSY (*Tanacetum*), genus of plants, order Compositæ; flowers yellow and corymbose; Common T. or Buttons (*T. vulgare*) was formerly used as a tonic.

TANTA (30° 48′ N., 31° 1′ E.), town, capital, Gharbieh province, in Delta, Egypt; noted for its fairs. Pop. 57,000.

TANTALUM (Ta=181·5), silvery-looking, rare metal obtained by strongly heating oxide *in vacuo*; S.G. 16·64, M.P. 2250–2300° C.; made into wire for electric lamps. Compounds (no basic oxide), TaO_2, Ta_2O_5 (acidic), TaF_5.

TANTALUS (classical myth.), son of Zeus and king of Corinth or perhaps Argos; punished in Hades by being placed so that water rose to his chin and receded as he tried to drink; fruit hanging overhead drew back as he grasped; his name gives the verb 'tantalise.'

TANTIA TOPI (d. 1859), Ind. rebel, second in rank to Nana Sahib (*q.v.*); executed.

TANTRA, see LAMAISM.

TANYU, KANO (1602–74), Jap. artist and poet; painter of strong individuality; the last of the four great masters of the Kano school; landscapes and figures.

TAOISM, a development of Chin. religion.

TAORMINA (37° 50′ N., 15° 17′ E.) (ancient *Tauromenium*), town, winter resort, Messina, Sicily; founded 397 B.C.; ruins of theatre founded by the Greeks and rebuilt by the Romans. Pop. 4000.

TAPESTRY, ornamental cloth used as curtains and as covering for furniture, walls, etc.; two kinds—*haute lisse* (high warp), with warp-threads stretched vertically, and *basse lisse* (low warp), horizontally, the former being most elaborate in pictorial designs; t. was made of silk or wool, and designs represented historical scenes, animals, etc. (cf. the Bayeux t., a record of Norman Conquest); Arras in Flanders produced much of the best t. of the Middle Ages.

TAPEWORMS, CESTODA, long, tape-like, creamy-white worms of considerable importance on account of their parasitism in the higher animals and man, to which habit most of their distinctive features may be traced. The head is furnished with hooks for adhesion; there is neither mouth nor food canal, for the animals simply absorb the nutritive fluids of the host; they are hermaphrodites and self-fortilising, and great adaptations occur for the carrying on of the race. A T. is (with a few exceptions) divided into many, sometimes thousands of joints (*proglottides*), which are budded off from the neck, and are set free, laden with ripe eggs, to carry infection farther afield. The eggs are swallowed by an intermediate host, within the organs of which a larva develops (often a Bladder-Worm, or *Cysticercus*); the intermediate host is eaten by another vertebrate, and in the latter the Larval T. develops into the segmented adult. 'Measly' beef—beef containing bladder-worms—is eaten raw or half-cooked by man, and in his food canal there develops the adult Beef T. (*Tænia saginata*), the commonest human T. in Western Europe.

A solid (*Pterocercoid*) larva occurs in freshwater fish—Trout, Perch, etc.; the fish is eaten by man, and there results an adult Broad T. (*Bothriocephalus latus*), which may reach a length of 60 ft. The Pork T. (*Tænia solium*) is also a formidable human parasite, known wherever the pig is domesticated. Almost all vertebrates are infested by T's, which are sometimes so numerous in fishes, birds, and mammals, as almost to block the food canal. They are especially frequent in fish and flesh-eating creatures and cause much trouble amongst domestic animals—one brain-dwelling larval form, *Cœnurus cerebralis*, causing the fatal disease of 'staggers' or 'gid,' most common in sheep, but occurring also in horses, oxen and goats, in the dromedary, and in deer.

Cestodes form a class (*Cestoda*) in the group of FLAT WORMS—*Platyhelminthes* (q.v.).

TAPIOCA, starchy food obtained from root of Cassava or Manioc by drying on hot plates.

TAPIRS (*Tapiridæ*), a family of Odd-Toed, Hoofed Mammals; shy, nocturnal, forest-loving, vegetarian animals, with short, mobile proboscis, four toes in fore feet, and three in hind. One species is found in S.E. Asia and four in Central and S. America.

TAPTI (21° 6′ N., 72° 42′ E.), river, W. India, flows into Gulf of Cambay; length, 450 miles.

TAR, see COAL-TAR, DYEING.

TARA (53° 34′ N., 6° 37′ W.), village, County Meath; an early residence of the Irish monarchs.

TARAI, TERAI (29° N., 79° E.), district, near the Himalayas, Kumaun division, United Provs., India; covered with marshes and jungle. Pop. 120,000.

TARANTO (40° 28′ N., 17° 15′ E.) (ancient *Tarentum*), fortified seaport, Lecce, on Gulf of Taranto, Italy; castle, cathedral, and museum antiquities; taken by Robert Guiscard, 1063. Pop. 61,000.

TARANTULA, genus of Arachnid Pedipalpi, but usually applied to T. spiders, members of family Lycosidæ; fabulous accounts of danger of their bite being prevalent in S. Europe. In America, BIRD-CATCHING SPIDERS (*Mygale*, etc.) are known as T's.

TARAPACÁ (20° 3′ S., 69° 58′ W.), maritime province, Chile; rainless desert region; rich nitrate deposits. Capital, Iquique. Pop. 120,000.

TARARE (45° 53′ N., 4° 16′ E.), town, on Turdine, Rhône, France; manufactures muslins, silks. Pop. 12,400.

TARASCON (43° 49′ N., 4° 39′ E.) (ancient Tarasco), town, on Rhône, Bouches-du-Rhône, France; various industries; trade in fruit. Pop. 9200.

TARAXACUM, term applied in medicine to the dandelion (natural order *Compositæ*), from the root of which extracts are made, which are bitter and are used medicinally as slight stimulants for the stomach.

TARBERT (55° 52′ N., 5° 25′ W.), fishing village, at head of peninsula of Kintyre, Argyllshire, Scotland.

TARBES (43° 14′ N., 0° 6′ E.) (ancient *Turba*), town, on Ardour, Hautes-Pyrénées, France; has a cathedral and museum; horse-breeding centre; manufactures leather; was capital of old province Bigorre; an Eng. possession, 1360–1406. Pop. 26,000.

TARDIGRADA, SLOTHS, see under EDENTATES, ARACHNIDA.

TARE, see VETCH.

TARENTUM.—(1) TARANTO (40° 28′ N., 17° 15′ E.), ancient city, on Gulf of Tarentum, Italy; founded by Spartans, c. 705 B.C.; became chief city of Magna Græcia; taken by Romans (272 B.C.), by Hannibal (212 B.C.); retaken by Fabius (209 B.C.); subsequently formed part of the Byzantine Empire. (2) (40° 38′ N., 79° 45′ W.) town, on Allegheny, Allegheny County, Pennsylvania, U.S.A.; manufactures glass. Pop. (1910) 7414.

TARGET, mark to shoot at; objective for shooting; in rifle practice t. is of paper, divided by concentric circles, called the bull's eye, inner, magpie, and outer; figure t's have largely superseded plain bull's-eye pattern; for sea-firing, floating screens are towed along. Word was formerly name of a shield.

TARGUM, term applied to translations which are also expansions and commentaries on the Old Testament. The T's were written in Aramaic, which became the ordinary language of the people when Hebrew was practically a dead language—about the time of Christ. The Hebrew Scriptures were read in the synagogue, and the custom grew up of translating what had been read into Aramaic, and with translation came interpretation. The T's were handed down orally for some time, and can hardly have assumed their present form before about 400 A.D. Of T's on the Pentateuch there are (*a*) T. of Onkelos (c. V. cent. A.D.), (*b*) T. of Jerusalem (only fragmentary), T. of Jonathan ben Uzziel—these both derived from an earlier Jerusalem T. The T. on the Prophets is called by the name of Jonathan, and is probably IV. cent.; there was probably a Jerusalem T. on the prophets too. Less important T's also exist on the Hagiographa (except Daniel, Ezra, and Nehemiah).

TARIFA (36° 1′ N., 5° 37′ W.) (ancient *Josa*, or *Julia Traducta*), seaport, on Strait of Gibraltar, Cadiz, Spain; tunny and anchovy fisheries. Pop. 13,800.

TARIFF, a duty on imports, levied either for revenue or to protect home industry from foreign competition. It was not till 1824 that Great Britain began to abandon tariffs in favour of free trade, and between 1842 and 1860 a complete change was effected. The Corn Laws were repealed in 1846, after the Income Tax had been introduced in 1842 for revenue purposes. The following is a complete list of all articles subject to Import Duties in the U.K.: beer, blacking, chicory, chloral hydrate, chloroform, cocoa, chocolate, coffee, collodion, condensed milk, ether, ethyl, fruits—dried (currants, figs, French plums, prunes, and raisins), and bottled or canned fruit jellies, glucose, jams, marmalade, marzipan, molasses, motor spirit, playing cards, saccharin, spirits (including naphtha, brandy, rum,

Geneva liqueurs, and cordials), sugar (including confectionery, ginger, liquorice, sweetmeats, and all crystallised fruits), tamarinds, tea, tobacco (cigars, cigarettes, and snuff), and wine. In each case where these articles are also produced within the U.K. an excise duty equal to the tariff is also imposed. In the above list it is from tea, sugar, beer, coffee, cocoa, spirits, tobacco, and wine that substantial customs revenue is drawn. Mr. Joseph Chamberlain proposed (1903) that there should be placed upon foreign grain (except maize) a duty of 2s. per quarter; upon foreign manufactured goods, 10 %; upon foreign meat (except bacon) and dairy produce, 5 %. A preferential tariff would be employed towards Colonial goods. A Tariff Reform Amendment to the Address was defeated (258 to 193), Feb. 1912. See PROTECTION.

TARIJA, TARIXA (21° 50′ S., 64° 40′ W.), town, on Tarija, Bolivia. Pop. 8000; (department) 120,000.

TARIK, HILL OF, see GIBRALTAR.

TARIM (40° 12′ N., 87° 10′ E.), river, Central Asia; has its source near Mt. Godwin-Austin in Karakorum Mountains, and after crossing Kuenlun Range flows E. through Turkestan and empties itself into the Lop Nor; receives waters of the Khotan, Aksu, Cherchen, etc., and has a total length of *c.* 1000 miles.

TARKINGTON, NEWTON BOOTH (1869–), Amer. novelist.

TARN.—(1) (43° 50′ N., 2° 10′ E.) department, France, formed from part of ancient Languedoc; hilly or mountainous; belongs chiefly to basin of Garonne; produces wheat, wine; principal mineral, coal. Pop. (1911) 324,090. Capital, Albi. (2) Rom. *Tarnis* (43° 55′ N., 1° 55′ E.), river, S. France; joins the Garonne; length, 230 miles.

TARN-ET-GARONNE (44° N., 1° 10′ E.), department, France, formed from parts of ancient Guienne, Gascony, and Languedoc; mostly tableland; watered by Garonne, Tarn, and Aveyron; cereals, fruit, and wine largely grown. Pop. (1911) 182,537. Capital, Montauban.

TARNOPOL (49° 34′ N., 25° 37′ E.), town, Galicia, Austria; trade in horses, grain. Pop. (1910) 33,871.

TARNOW (50° 3′ N., 21° 1′ E.), town, Austria; cathedral; agricultural implements. Pop. (1910) 36,731.

TARNOWSKI, JAN (1488–1561), Polish soldier; won victories over Moldavians, Tartars, and Turks, and upheld crown against peasants; wrote work on tactics.

TAROM (37° N., 51° E.), district, Persia; exports alum; inhabited by Turks.

TARPAULIN, TARPAULING, canvas covering for ships' hatches, wagons, etc.; rendered waterproof by tarring or painting.

TARPEIAN ROCK, see ROME.

TARPON, see under HERRING FAMILY.

TARQUINII, CORNETO (42° 15′ N., 11° 45′ E.), ancient town, Etruria; one of chief cities of Confederacy; native place of Tarquinius Priscus, king of Rome: became Rom. colony.

TARQUINIUS SUPERBUS, LUCIUS (534–510 B.C.), 7th king of Rome. His reign was a period of cruel despotism and violence. The rape of Lucretia by his son Sextus resulted in the abolition of the kingship and the banishment of the family.

TARRAGONA (42° N., 1° 30′ E.), province, Catalonia, Spain, bordering Mediterranean; mountainous; produces wine, grain, fruit. Pop. (1910) 334,535. Capital, **Tarragona** (41° 8′ N., 1° 12′ E.), on Mediterranean coast; abp.'s see, has XII.-cent. cathedral and abp.'s palace; old walls still surround town, and there are Rom. remains including aqueduct, ruined amphitheatre, and palaces; manufactures silks, wine; large shipping trade; successfully besieged by French, 1811. Pop. (1910) 23,292.

TARRASSA (41° 35′ N., 1° 59′ E.), town, Barcelona, Spain; manufactures textiles. Pop. 16,300.

TARRING AND FEATHERING, method of punishment formerly popular in U.S.A.; obnoxious persons were dipped in tar, coated with feathers, and ridden through the town on a rail.

TARRYTOWN (41° 4′ N., 73° 27′ W.), village, on Hudson, Westchester County, New York; scene of Major André's capture, 1780; later residence and burial-place of Washington Irving. Pop. (1910) 5600.

TARSUS (36° 54′ N., 34° 43′ E.), town, on the Cydnus, S.E. Asia Minor; chief town of Cilicia in ancient times; passed into possession of Greece at time of Alexander's conquest of Persia; noted for learning in Rom. times; birthplace of St. Paul; came into possession of Turks after decline of Byzantine Empire. Exports hides, skins, cotton, wool, etc. Pop. *c.* 28,000.

TARTAGLIA, NICCOLO, TARTALEA (*c.* 1506–59), Ital. mathematician; b. Brescia; self-educated; taught math's chiefly at Verona and at Venice; discovered solution of cubic equations usually known as Cardan's solution.

TARTAN, woollen cloth of square pattern spun and worn in Scot. Highlands; coloured patterns indicative of clan; t. kilt, Highland costume; uniform of Highland regiments; also used for making plaids and rugs.

TARTAR, refined argol, a crystalline deposit in wine casks. When pure known as CREAM OF TARTAR, potassium hydrogen tartrate ($KHC_4H_4O_6$).

TARTARIC ACID ($H_2C_4H_4O_6$), crystalline, M.P. 170° C., obtained from argol. Is dihydroxy-succinic acid: $\begin{matrix}CH(OH).COOH\\|\\CH(OH).COOH\end{matrix}$; known in dextro- and levo-rotatory and inactive forms. Chars when heated; dibasic; salts, *e.g.* $KHC_4H_4O_6$ (cream of tartar), $K_2C_4H_4O_6$.

TARTARS, see TATARS.

TARTARUS (classical myth.), deep gulf below Hades, into which Zeus hurled the Titans; place of torture for the dead.

TARTINI, GIUSEPPE (1692–1770), Ital. composer and violinist; app. solo violinist at famous Capello del Santo, 1721, and founded a violin school in Padua, 1728; best composition, *The Devil's Sonata*; wrote a treatise on music; discovered 'differential tones.'

TASHKEND, TASHKENT (41° 12′ N., 68° 52′ E.), town, capital, Russ. Turkestan; has an observatory and museum; manufactures silk and cotton goods. Pop. (1910) 192,000.

TASHKURGAN, KHULM (36° 30′ N., 68° 18′ E.), town, fort, Khulm district, Afghan Turkestan; trade centre. Pop. 11,000.

TASMAN, ABEL JANSZOON (*c.* 1603–59), Dutch sailor and explorer; b. Lutgegast; became a sailor; commanded Van Diemen's expedition to circumnavigate Australia, 1642, and discovered Tasmania (calling it Van Diemen's Land), New Zealand, and Friendly and Fiji Islands; pub. account of this (reprinted 1722 and 1860), and made second voyage to East Indies, discovering the Gulf of Carpentaria; also made two important voyages of discovery in the Pacific.

TASMANIA (40° 34′ to 43° 40′ S., 144° 40′ to 148° 23′ E.), island, off S. extremity of Australia; bounded N. by Bass Strait, E. and S. by Pacific, W. by Indian Ocean; area, 26,215 sq. miles. Surface is crossed by numerous mountain ridges, between which are fertile valleys and plains; highest points, Cradle Point and Ben Lomond, both over 5000 ft.; large area forested; drained by Arthur, Pieman, Gordon, Derwent, Tamar, and other streams; numerous lakes, including Great Lake, Arthur and Sorell Lakes; coast much indented. Climate fine, and healthy. Flora and fauna resemble those of Australia; animals peculiar to T. include the Tasmanian devil and the thylacine.

T. was first visited in 1642 by Tasman, who named it Van Diemen's Land; it was subsequently surveyed and explored by various travellers, including Cook and Bass, and in 1803 a penal settlement was established near Hobart. T. was administered as part of New South Wales until 1825, when it became a separate colony; it received its present name in 1853. Ad-

ministration is carried out by a governor, who is appointed by the Crown, and assisted by a council of Ministers; legislative power is vested in a Legislative Council of 18 members and a House of Assembly of 35 members.

Chief towns are Hobart (capital), Launceston, Zeehan, Ulverstone. Agriculture is principal industry; wheat and other crops produced; sheep and cattle extensively raised. Minerals include gold, silver, copper, tin, lead, coal. Chief exports are wool, timber, fruits, various metals. Education is free and obligatory. Chief religions, Anglican, R.C., Methodist, Presbyterian. Pop. (1911) 190,898.

TASMANIAN DEVIL, see DASYURES.

TASSIE, JAMES (1735–99), Scot. gem-engraver; made some 15,000 copies of famous ancient and modern gems, and cameo portraits of many distinguished contemporaries.

TASSO, TORQUATO (1544–95), Ital. poet; b. Sorrento; ed. Naples and Padua; forsook study of law for lit., and wrote *Rinaldo*, a narrative poem, 1562; became courtier at Ferrara, 1565. Diffidence and inexpert criticism prevented his publishing his masterpiece, *Gerusalemme Liberata* (completed, 1574), although *Aminta* (1573), a simple pastoral drama, had won him fame. Worn out by overwork he became fretful, subject to delusions, a burden to his friends and a laughing-stock to his detractors. A passionate devotion to Leonora d'Este heightened this malady. Leaving Ferrara, he wandered from place to place, always well received but discontented. Returning a third time to Ferrara, he so provoked Duke Alfonso that he was incarcerated as a lunatic (1579–86), and while he was confined others edited his *Gerusalemme Liberata* and minor poems. After his release he again wandered from place to place, and his later poems (*Monte Oliveto, Gerusalemme Conquistata*, a mangled version of the *Liberata*, *Le Sette Giornate*) show but little genius. In 1594 he was befriended by Cardinal Aldobrandini and again journeyed to Rome, only to die before he could take full advantage of his patron's generosity.

T. was a master lyricist, but a genius who blossomed young and lacked stability. *Gerusalemme Liberata* exercised a strong influence on other poets, notably Milton.

Boulting, *Tasso, Torquato: Life and Times* (1907).

TASTE is the function of special sense-organs situated mainly in the tongue. The mucous membrane of the tongue has on it a great number of little projections, or papillæ, which are of three kinds—*filiform*, scattered over the whole of the superior surface of the tongue, comparatively long projections, with several fine filaments at their free ends; *fungiform*, chiefly present towards the point, and at the sides of the tongue, rounded mushroom-like projections; and *circumvallate*, about ten or twelve in number, situated at the back of the tongue, arranged in a V pointing backwards, which, instead of being actual projections, are simply little areas of the mucous membrane separated off by little circular trenches, in the inner walls of which are situated the *taste-bulbs*.

The t.-bulbs are minute circular bodies, from an opening in one end of which fine hairs project, while an end filament of a nerve enters at the other end. In addition to the t.-bulbs there must be other sense-organs of t. in the tongue which have not yet been recognised, for the sensation of t. can be perceived elsewhere on the tongue. Many so-called t's are, however, in reality smells, the olfactory sense being much more sensitive than the sense of t.; if the nose is closed an apple cannot be distinguished from a potato by t. alone. The nerves from which branches come to the t. sense-organs are the lingual, which supply the front of the tongue, and the glosso-pharyngeal, which supply the back.

TATAR PAZARJIK, TATAR BAZARJIK (42° 6′ N., 24° 26′ E.), town, on Maritza, E. Rumelia, Bulgaria. Pop. (1910) 18,098.

TATARS (less correctly **Tartars**), inhabitants of Central Asia, were a Slavonic people akin to the Mongols, and seem to have occupied part of Manchuria in the X. cent. The name was given by Europeans to the followers of Jenghiz Khan, who took Pekin and overran Russia in XIII. cent., and afterwards to members of all the Mongol hordes which appeared in W. Asia and E. Europe; at present amount to 2 to 3 millions, mostly Muslim, inhabitants of European or Asiatic Russia.

TATI (21° 24′ S., 27° 50′ E.), district, Brit. Bechuanaland Protectorate, S. Africa, in S.W. of Matabeleland; gold mines.

TATIAN (fl. II. cent.), Christian writer; b. Mesopotamia; lived in Rome, but returned to the East on adopting Encratite heresy that matter was essentially evil; wrote several books, of which survive the *Diatessaron*, a parallel harmony of the Gospels, and *Speech to the Greeks*.

TATRA MOUNTAINS (49° 12′ N., 19° 40′ E.), group of the Carpathians in N. Hungary, and on frontier of Galicia; highest point, Gerlsdorf, 8737 ft.

TATTA (24° 44′ N., 68° E.), town, Sind, Bombay, Brit. India; formerly important city. Pop. 10,500.

TATTOOING, custom of ornamenting the skin by inserting colouring material through small punctures. The practice seems to be universal among savage peoples, and isolated examples of it are still found among civilised people—notably sailors. Among the Polynesians, Maoris, and Japanese, t. became a high art—the body being completely covered with elaborate designs.

TAUNG-GYI (97° N., 25° 50′ E.), town, S. Shan states, Burma; political and official centre. Pop. *c.* 14,000.

TAUNTON.—(1) (51° 2′ N., 3° 7′ W.) county town, on Tone, Somersetshire, England; has a Norman castle and fine Gothic church; manufactures silk, gloves; here the Duke of Monmouth was proclaimed king, 1685, and Judge Jeffreys held the 'Bloody Assize.' Pop. (1911) 22,563. (2) (41° 52′ N., 71° 10′ W.) city, on Taunton, Bristol County, Massachusetts, U.S.A.; manufactures locomotives, silver-plated goods. Pop. (1910) 34,259.

TAUNUS (50° 12′ N., 8° 20′ E.), wooded mountain range, Germany, extending 55 miles E. to W. between Rhine and Main on S., and Lahn on N.; highest point, Grosser Feldberg, 2887 ft.; the vine is cultivated on lower slopes; contains numerous mineral springs.

TAUPO (38° 46′ S., 176° 10′ E.), town, health-resort, N. Island, New Zealand: hot springs, geysers, and mud volcanoes in district.

TAURIDA (46° N., 34° E.), government, Russia, bordering Black Sea and Sea of Azov, drained by Dnieper; mainly low steppes; agriculture and cattle-breeding; fisheries; chief mineral, salt. Pop. (1910) 1,876,200. Capital, Simferpol.

TAUROBOLIUM, sacrificial rite in Mithraism, in which the devotee was purified by being bathed in blood of bull.

TAUSEN, HANS (1494–1561), Dan. reformer; b. a peasant, lived for some time as a monk; as prisoner at Viborg, converted town; released and preached reformed faith; Frederick I. summoned him to Copenhagen, 1529; bp. of Ribe, 1542.

TAVASTEHUS (60° 55′ N., 24° E.), län of Finland. Pop. (1910) 324,321. Capital, **Tavastehus**. Pop. 5300.

TAVERN, see INN.

TAVERNIER, JEAN BAPTISTE (1605–89), BARON D'AUBONNE, Fr. traveller; pub. *Six Voyages*, 1676; additional, *Recueil*, 1679. The six journeys were: (1) Constantinople, Persia to Ispahân, back by Bagdad, Malta, Italy, 1631–33; (2) Aleppo, Persia, India (as far as Golconda), 1638–43; (3) Persia, Java, Cape, 1643–49; (4–6) Explored Persia and India, 1651–68; important commercial results to France.

TAVIRA (37° 7′ N., 7° 32′ E.), seaport, Algarve, Portugal; fisheries; coasting trade. Pop. 12,500.

TAVISTOCK (50° 33′ N., 4° 8′ W.), town, on

Tavey, Devonshire, England; has remains of an abbey, founded X. cent.; copper-mining centre; arsenic refinery. Pop. (1911) 4392.

TAVOY (14° 7′ N., 98° 18′ E.), seaport, on Tavoy, Tennasserim, Burma; silk-weaving industry. Pop. 23,000; (district) 115,000.

TAXATION.—Nowadays t. takes the form of a money payment in civilised countries, but in feudal times military service and forced labour were both forms of t. The rent of the royal dominions was sufficient for the Crown in Anglo-Saxon times. No definite principle is seen in England till Parliament controlled taxes, and not till the XVIII. cent. was there any serious attempt to define the proper methods of t. Adam Smith's four maxims are still sound—

(1) Subjects of every state should contribute towards the support of the government in proportion to the revenue they respectively enjoy under state protection; (2) form, manner, and quantity of payment ought to be clear to all; (3) taxes should be levied at the time, or in the manner, in which it is most likely to be convenient for the contributor to pay it; (4) taxes should be so contrived as to take out and keep out of the people's pockets as little as possible over and above what it brings into the public treasury.

The main thing is that t. should be profitable to the community; that is, the money taken from the people should be so expended as to ensure greater security, freedom from disease, less crime, and a higher standard of education. Collection should be as inexpensive as possible. Heavy t. by checking personal expenditure and by reducing to poverty will inflict lasting hurt on a community.

T. is either *direct* on income, or *indirect* on commodities. In the former case it will be levied on land, houses, or on the actual income in salary, or from investments. In the latter it will be raised by customs, taxes on foreign imports, and by excise, a tax on commodities of home production. Import duties are a convenient form of t. in young rising countries, distributing the burden over the whole population. Such duties may be levied either for revenue purposes or to protect home industries and producers against foreign competition, and by rebates or remission give preference to colonial goods. 'Food taxes' are duties levied on imported food-stuffs; even in Free Trade Britain tea, coffee, cocoa, dried fruits, sugar, wines and spirits, and several other articles of imported food and drink pay customs duties (see TARIFF). A certain amount of direct taxation also takes the form of government duty on various articles of luxury or comfort and on agreements that require a stamp.

Bastable, *Public Finance*; M'Culloch, *Principles of Taxation.*

TAXIDERMY, the skinning and stuffing of birds and beasts; skins are treated with arsenical soap, but chloride of lime, alum, soft soap, camphor, corrosive sublimate are all used in various preparations; feathers are cleaned with plaster of Paris. Birds are stuffed with tow supported on wires. See books by Oliver Davie and Paul Hasluck.

TAXIS, THURN UND, name of noble Ger. family, members of which were hereditary postmasters of parts of the Holy Rom. Empire from the late XV. cent., until right was ceded to Pruss. government in 1867.

TAY (56° 28′ N., 3° 22′ W.), longest Scot. river; rises in Ben Lui, traverses Loch T., passes Aberfeldy, Dunkeld, Perth, Dundee, and enters German Ocean by Firth of T.; length, 118 miles; navigable to Perth; fine scenery; excellent salmon fisheries.

TAY, LOCH (56° 30′ N., 4° 10′ W.), lake, Perthshire, Scotland; length, 14½ miles; traversed by river Tay.

TAY BRIDGE, railway bridge (opened 1887), crossing Tay at Dundee; 3600 yds. long; earlier bridge blown over, with passing train (about eighty lives lost), during gale, Dec. 28, 1879.

TAYABAS (14° 10′ N., 121° 30′ E.), town, Tabayas province, Luzon, Philippine Islands; fertile district. Pop. 16,000; (province) 160,000.

TAYGETUS (37° N., 22° 21′ E.), mountain range, Peloponnesus, separating Laconia and Messenia; highest point, 7900 ft.

TAYLOR (30° 35′ N., 97° 21′ W.), town, Williamson County, Texas, U.S.A.; railway-shops; cotton industries. Pop. (1910) 5314.

TAYLOR, BAYARD (1825–78), Amer. author and traveller; b. Kennett Square, Pennsylvania. His travels were world-wide and were recorded by him in many interesting books. His best poems are *Rhymes of Travel, Book of Romances, etc., Poems of the Orient,* and *Lars.*

TAYLOR, BROOK (1685–1731), Eng. mathematician; b. Edmonton; ed. Cambridge; secretary of Royal Soc., 1714–18; discovered *Taylor's Theorem,* of extensive application in higher math's. Chief work, *Methodus Incrementorum Directa et Inversa.*

TAYLOR, JEREMY (1613–67), Eng. clergyman; b. Cambridge; Fellow of All Souls, Oxford, 1636; obtained rectory of Uppingham, 1638; probably chaplain in Royalist army; spent 12 years in Wales, where he was schoolmaster for a time; imprisoned for his political and religious views during protectorate; at Restoration became Bp. of Down, Connor, and Dromore, and Vice-Chancellor of Dublin Univ. T. wrote *Liberty of Prophesying,* 1647, *The Life of Christ,* 1649, *Holy Living,* 1650, *Holy Dying,* 1651; his glory lies in form rather than matter; he is a poor logician, and is lacking in originality, but his rhetoric is magnificent and his description great.

TAYLOR, JOHN (1580–1654?), the 'Water-poet,' was a waterman on the Thames; wrote *Penniless Pilgrimage,* a description of a walk from London to Edinburgh.

TAYLOR, PHILIP MEADOWS (1808–76), Anglo-Ind. governor; rose from position of clerk to that of administrator of Shorapore; wrote novels of Ind. life.

TAYLOR, RICHARD (1826–79), s. of Zachary T. (*q.v.*); confederate general in Amer. Civil War.

TAYLOR, SIR HENRY (1800–86), Eng. poet and civil servant; author of *Philip van Artefelde,* a remarkable drama which had no success on the stage, and *The Statesman*; held appointment in the Colonial Office, and wrote for the *Quarterly* and *London Magazine*; opposed abolition of slave laws and West Ind. legislative assemblies.

TAYLOR, TOM (1817–80), Eng. dramatist, prof. of English (London Univ. Coll.), lawyer, politician; editor of *Punch,* 1874; wrote *Our Amer. Cousin, Still Waters Run Deep,* etc.

TAYLOR, ZACHARY (1784–1850), 12th Pres., U.S.A. (1849–50); as captain in army inflicted defeats on Indians, 1812 onwards, and in 1832 was given command against Illinois; made general of brigade after crushing Seminoles, 1837; sent to protect newly annexed territory of Texas, repelled Mexican invasion, 1846, and seized Matamoros and Victoria; enormously outnumbered, but defeated Santa Anna at Buena Vista, 1847. The 'rough and ready' general now turned Whig politician; election as Pres. enthusiastically received, but he was soon involved in disputes on slavery in newly acquired territories; during brief office successfully maintained balance between Whigs and Democrats.

TAYPORT, formerly FERRY-PORT-ON-CRAIG (56° 27′ N., 2° 52′ W.), town, watering-place, on Firth of Tay, Fifeshire, Scotland; manufactures linen and jute; imports much esparto grass. Pop. (1911) 3273.

TAYUG (16° N., 120° 40′ E.). town, Pangasinan, Luzon, Philippine Islands. Pop. 11,500.

TAZIEH, see PERSIA (LANGUAGE AND LIT.).

TCHELYABINSK, see CHELYABINSK.

TCHERINGOV, see CHERNIGOV.

TE DEUM, Lat. hymn; so called from opening words, *Te Deum laudamus,* 'We praise Thee, O Lord.'

TEA, commonest beverage; consists of the dried leaves and shoots of a tropical shrub of the order Ternstrœmiaceæ, called *Thea sinensis*; two distinct varieties—*T. viridis,* attaining considerable height,

and *T. bohea*, a dwarf. The leaves of the t. plant are spear-shaped; the flowers somewhat resemble those of the strawberry plant. T. is chiefly grown in China, Japan, India, and Ceylon, and thrives best on sunny slopes; first introduced into England in early XVII. cent., and it was for more than a cent. regarded with suspicion.

Duty paid on t. was until within quite recent history enormously high, and consequently various unpalatable methods of infusing it economically were taken. The leaves were boiled and reboiled, and the strong flavour of tannin was highly appreciated. Even the old leaves were cherished and eaten with salt. Domestic science has now made t.-making a high art. The t. should be kept in an air-tight caddy or canister. The t.-pot is heated and the dry t.-leaves are placed in it. The boiling water is then poured on the leaves and allowed to stand from three to five minutes. A scientific t.-pot should be used by which the leaves can then be stranded to prevent a longer infusion; otherwise the infusion should be poured off into another vessel. T. infused for a longer period has bad effects on the nerves. T. contains 2 to 4 % of caffeine which stimulates the heart and kidneys, and c. 10 % of tannin, but t.-poisoning is not entirely understood.

The method of drying and preparing the newly gathered leaves in the plantations is interesting. The leaves are laid out on trays and tossed in the sun, which induces a saccharine fermentation. The leaves thus treated give off a peculiar odour, and at this stage they are placed in iron vessels and roasted. The leaves are then rolled and finally dried over a charcoal fire. *Green t.* is prepared by a different process. The leaves are placed in the iron vessel as soon as they are gathered, and are immediately roasted. They are then rolled and replaced in the vessel for the final drying. Various precautions are taken in the preparation of green t. to prevent fermentation, *e.g.* the leaves are constantly stirred and fanned.

TEAK (*Tectona grandis*), included in the Verbenaceæ; indigenous to the Indo-Malasian region, and now extensively cultivated for its valuable timber. The tree is high, and bears paniculate inflorescences composed of small white flowers; wood principally used in shipbuilding, owing to extreme hardness and durability. Its close texture makes it very heavy, and before it is fit for use thorough drying and seasoning are essential. For this purpose a ring of the bark and green wood is removed from the basal part of the trunk ('girdling'), thus causing its speedy death. The tree is not felled for two years after girdling.

TEAL, see under Duck Family.

TEANO (41° 15′ N., 14° 6′ E.) (ancient *Teanum Sidicinum*), town, Caserta, Italy. Pop. 6200.

TEANUM APULUM (41° 50′ N., 15° 10′ E.), ancient town, on Frento, Apulia, Italy.

TEAR, see Eye.

TEASEL (*Dipsacus*), genus of plants, order Dipsaceæ; Fuller's T. (*D. fullonum*) is used in cloth-dressing.

TEATE (42° 20′ N., 14° 10′ E.) (modern Chieti), chief town of the Marrucini, Italy.

TEBESSA (35° 25′ N., 8° 5′ E.) (ancient *Theveste*) town, Constantine, Algeria; Rom. ruins. Pop. 7300.

TECHNICAL EDUCATION, see Education.

TECK (48° 30′ N., 9° 28′ E.), small duchy, belonging to Württemberg, Germany.

TECUCIU (45° 53′ N., 27° 25′ E.), town, on Berlad, capital, department Tecuciu, Rumania. Pop. 14,500; (department) 130,000.

TECUMSEH, Tecumthe, Tecumtha (c.1768–1813), Shawnee Indian chief; with his bro. organised Indians against Americans, who by obtaining concessions of territory were driving Indians to north and west; defeated by Harrison at Tippecanoe, 1811; aided British, 1812; slain at battle of Thames.

TEDDINGTON (51° 24′ N., 0° 20′ W.), town, near Thames, Middlesex, England. Pop. (1911) 17,840.

TEES (54° 37′ N., 1° 12′ W.), Eng. river, flows between Durham on N., Westmoreland and Yorkshire on S., to North Sea.

TEETH are the organs of mastication, grinding down the food so that it can be easily swallowed. Situated in the upper and lower jaws they are developed not from bone but from the same tissue as the dermis, or true skin. The body of a tooth is formed of a somewhat hard substance termed *dentine*, composed of minute tubules containing earthy matter closely packed together; the dentine body is hollow, the cavity being termed the *pulp cavity*, and containing arteries, veins, and a branch of a nerve which supplies the t. Covering the dentine in the region of the root of the tooth, contained within the gum, is a layer of *cement*, which protects the lower part of the body, while covering the body towards the crown, outside the gum, is a layer of *enamel*, the hardest tissue in the human body, composed almost entirely of earthy matter, enabling the tooth to carry out its functions effectively.

The different types of t. are adapted for different purposes: the *incisors*, for cutting the food, have a single root and a somewhat thin vertical crown which is bevelled behind so as to present a sharp cutting edge; the *canines*, for tearing, are highly developed in carnivorous animals such as the dog, and have a single deep root and a rounded, pointed crown; the *premolars* or *bicuspids* have single or sometimes two roots, and a rather square crown on which are two slight projections; the *molars*, with the *premolars*, for grinding down the food, are much larger than the other t., and have from two to five roots, which are comparatively short, square crowns, on which are from three to five slight projections or cusps.

A child has only 20 teeth, termed 'milk teeth,' which begin to appear at the age of 6 months and persist till about the age of 7 years, when they fall out and begin to be replaced by the permanent teeth. An adult has 32 teeth, comprising, in each half of each jaw, 2 incisors, 1 canine, 2 premolars, and 3 molars.

The most common disease of the teeth is *caries*, consisting of a progressive decay of the substance of a tooth, predisposed to by hereditary weakness in the tissues of the tooth substance, by debilitated conditions, disorders of the digestive system, or neglect and consequent retention of putrefying particles of food between the teeth; caries has been shown to be caused by a micro-organism, and should at once be treated by a properly qualified dentist.

See Dentistry.

TEETOTALISM, see Temperance.

TEGEA (37° 28′ N., 22° 26′ E.), town, Arcadia, ancient Greece; contains remains of famous temple of Athena Alea, built by Scopas; frequently engaged in warfare against Sparta; eventually destroyed by Alaric.

TEGERNSEE (47° 42′ N., 11° 44′ E.), lake, Upper Bavaria; drained by Mangfall to the Inn; length, 4 miles.

TEGETTHOFF, WILHELM VON, BARON (1827–71), Austrian naval commander; employed in Dan. War, 1863; won brilliant victory over Italians at Lissa, 1866; commander-in-chief of navy, 1868.

TEGGIANO (40° 20′ N., 15° 30′ E.) (ancient *Tegianum*), town, Salerno, Italy. Pop. 5000.

TEGNER, ESAIAS (1782–1846), Swed. writer of eminence; his *War-Song* (1811) brought him fame. This was followed by the *Song of the Sun* and *Axiel*. His masterpiece is *Frithiof's Saga*, a cycle of Scandinavian epics.

TEGUCIGALPA (14° 8′ N., 87° 7′ W.), capital of Honduras; cathedral and university; in vicinity, gold mines. Pop. 38,000.

TEHERAN, Tehran.—(1) (35° 30′ N., 51° E.) province, Persia; capital, Teheran. (2) (35° 44′ N., 51° 25′ E.) city, capital, Persia; strongly fortified; the citadel contains the Shah's palace, with its kiosks, beautiful gardens, and museum with many priceless jewels; there are many mosques, and both Armenian

and Muhammadan baths; trading centre for caravans; newer part of town is well laid out with wide streets and fine buildings. Pop. *c.* 280,000.

TEHRI (22° 44′ N., 78° 53′ E.), native state, in Himalayas, India. Pop. 275,000. Capital, **Tehri**, on Bhagirathi; trades in rice. Pop. 3500.

TEHUANTEPEC.—(1) (17° 30′ N., 95° W.) isthmus, between Gulfs of Campeche and Tehuantepec, Mexico; width at narrowest part, 125 miles. (2) (16° 30′ N., 95° 25′ W.) town, on Tehuantepec, state Oaxaca, Mexico. Pop. 8300.

TEIGNMOUTH (50° 33′ N., 3° 29′ W.), seaport, watering-resort, at mouth of Teign, Devonshire, England; herring fisheries. Pop. (1911) 9221.

TEINDS, Scot. name for Tithes (*q.v.*).

TELAV (41° 55′ N., 42° 25′ E.), town, Tiflis, Russ. Transcaucasia; trade in wine; founded 893; capital of Kakhetia till 1797. Pop. 12,500.

TELEGONY, theory that the offspring of a female may be born under the influence of a mate preceding its immediate father. This theory, in spite of the firm adhesion of many practical breeders, cannot be corroborated by any satisfactory scientific proof. Indeed, scientific experimental work, such as that carried out with horses and zebras by Prof. Cossar Ewart, has failed to furnish evidence of pre-paternal influence on offspring.

TELEGRAPH, any form of signalling, but lately the word has become confined in its application to the electric t. solely. Although practical telegraphy only dates from the middle of the XIX. cent., the idea of utilising the electric current for signalling arose quite early in the history of electricity. Since the t. has come into daily use, inventions and improvements of apparatus connected therewith have been very numerous, and as a result various systems have arisen and come into practice.

If a galvanometer be connected with an electric circuit the needle will be deflected either to the right or left according to the direction in which the current is flowing. The direction of the current can, at will, be altered by means of a reversing key or switch, and a *galvanometer needle* thus be utilised for signals by means of some prearranged code. This was the method employed in the early days of telegraphy. Later, an *electromagnet* was used; on the current passing through its coils a lever was attracted, and released again by a spring when the current was cut off. This lever worked a stylus embossing a mark on moving paper, the length of the mark depending on the time during which the current was *on*. Thus very short marks became dots, and the present *dot-and-dash* method of signalling arose. It was found in practice that the operators could read the signals by means of the clicks of the lever against the magnet, and the old form gave way to the present *Morse sounder* (described below) which is now in common use, except where written records are required for reference.

For working an electric t. the requisites are: an electric current (produced by a battery of cells), a transmitting apparatus for completing and breaking the circuit, a wire or 'line' for conveying the current, and a receiving instrument for reproducing the signals.

The *battery* consists of a number of cells (from 20 to 60) either of the Daniell, bichromate, or Leclanché form—the first named being the one most commonly used in Britain. In large offices accumulators are used.

The *transmitter* is merely a key so connected that on being pressed down it completes the electric circuit, and when released springs back and thus breaks the circuit.

The *line* is either overhead or underground. In both cases the wire must be thoroughly *insulated*. For the 'return' portion the earth is used, one pole of the battery being connected to a plate fixed in the ground; the end of the line at the receiving station is similarly 'earthed.' The wire is of copper, which offers a small resistance to current. As copper is expensive, iron is coming largely into use, especially since methods have been discovered of greatly reducing its electrical resistance. In the overhead system the wire is bare and supported on insulating cups made of porcelain or other non-conducting substance, these cups being attached to wooden cross-bars nailed to upright poles fixed in the ground. In the underground system the wire is wrapped in carefully dried paper of a special kind, and a large number of such wires are placed *loosely* together in leaden pipes laid in the ground. The insulator here is really the air between the wires, the paper coverings preventing actual contact.

The Morse sounder *receiving apparatus* consists of a small electromagnet. When the current passes through the instrument a light, soft-iron armature or hammer is attracted to the pole, making an audible click, and is released again by a strong spring when the current is cut off. A short interval between two clicks represents a dot and a longer interval a dash. The code of dots and dashes, known as the **Morse Code**, is as follows:—

A . —	J . — — —	S . . .	2 . . — — —
B — . . .	K — . —	T —	3 . . . — —
C — . — .	L . — . .	U . . —	4 . . . . —
D — . .	M — —	V . . . —	5 . . . . .
E .	N — .	W . — —	6 — . . . .
F . . — .	O — — —	X — . . —	7 — — . . .
G — — .	P . — — .	Y — . — —	8 — — — — . .
H	Q — — . —	Z — — . .	9 — — — — .
I . .	R . — .	1 . — — — —	0 — — — — —

For long-distance signalling *relays* have to be employed, as the resulting current, after traversing a long wire, is too small to affect the 'sounder.' The relay is a local battery whose circuit is closed or broken by a light delicately poised armature of an electromagnet controlled by the sending current—and it is this local battery which works the receiving apparatus.

Duplex Telegraphy.—A device whereby two messages, one in each direction, can be sent simultaneously over the same wire (*Duplex Telegraphy*) is now in common use. The requisite is an arrangement of connections such that the operator's receiving instrument is unaffected by his own key and at the same time free to respond to signals from the other end of the line.

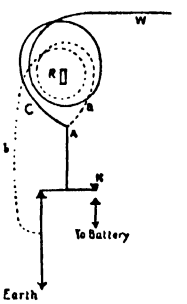


DIAGRAM 1.

In both cases, on pressing the key K the current divides at A and travels along paths A*a*b (dotted) and ACW. In System I. (Diagram 1) the resistances of the two circuits are made equal, and hence the currents in them, and since the currents traverse the instrument R in opposite directions they neutralise each other and do not affect it. In System II. (Diagram 2) resistances are arranged along ACP, and A*a*P so as to bring P_1 and P_2 to the same potential, in which case no current will flow through R. On the other hand, a signal sent along W from another station *will* affect the instrument, since in the one case the current travels through one of the coils only and in the other along P_1RP_2.

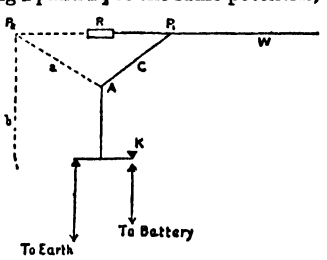

DIAGRAM 2.

In *Multiplex Telegraphy* complicated arrangements are in use whereby many messages can be sent in both directions simultaneously along the same wire.

Mention must also be made of *Hughes' Type-Printing Telegraph*, wherein an electric current works automatically one or more typewriters.

Submarine Telegraphy.—In *submarine telegraphy* precisely the same principles apply as in land telegraphy. Very great care is taken to insulate the wire (a strand of copper wire laid on the sea-bed) from contact with the water; the wire and surrounding protecting coverings form the 'cable.' The coverings consist of gutta-percha, jute, brass tape, and tarred tape, and vary in thickness according to the wear and tear the cable is liable to be subjected to—thus experience has shown it to be more quickly worn away in shallow water than in deep. The laying of the cable is done from a ship, the cable being paid out and allowed to sink under its own weight as the vessel slowly steams on its course. The signals are read by means of a sensitive mirror galvanometer, an instrument having a small, very light mirror attached to the fibre from which the needle is suspended. A spot of light is reflected from this mirror on to a screen, and the movements of the needle are thus greatly magnified. Motions of the spot of light to right and left take the place of dashes and dots respectively in the Morse Code.

Wireless Telegraphy, which has proved itself of vital value to ocean-going vessels especially, is the outcome of Hertz's investigations on electric waves (*q.v.*). MARCONI (*q.v.*) devoted himself to perfecting a system whereby the scientific results obtained could be applied to practical purpose. At first he only succeeded in signalling over short distances, but as experiment succeeded experiment he quickly increased the distances until he finally bridged the Atlantic.

In this form of telegraphy the transmitting apparatus is an induction coil producing sparks between two small copper balls a few millimetres apart. One of these balls is 'earthed' and the other connected to a long upright wire, called the *aerial*, insulated at the upper end. The production of the sparks causes a surging of electricity up and down the wire and results in the liberation of loops of electric waves travelling through space in all directions. These waves can be sent out in long or short trains corresponding to the dashes and dots of the Morse Code. At the receiving station, the detecting instrument, called a *coherer* (see ELECTRIC WAVES) has one end connected to earth and the other to an aerial similar to the one at the transmitting station. The electric waves impinging on the aerial set up oscillations which affect the coherer. The last is arranged in series with a battery relay, which in turn works an ordinary telegraphic receiving instrument and also an electromagnet to do the necessary tapping of the coherer.

Marconi is also the inventor of *Syntonic Electric Wave Telegraphy*, in which the receiver will respond only to waves of certain length; it is then said to be in 'tune' with the transmitter producing such waves. The arrangement is analogous to that of a swinging pendulum given an impetus from an outside source. If the impetus be given each time at the correct phase of the swing, the result will be to aid and increase the amplitude of the swing, whereas if given at the wrong moment the motion will be impeded. This form of Wireless Telegraphy has the twofold advantage of preventing a message being intercepted by any for whom it is not intended, and of requiring less powerful electric waves for successful transmission.

Marconi has further succeeded in solving the problem of *Directive Telegraphy*, i.e. how to limit the radiations to any one direction. This is done by constructing the aerial so that only a small part of it is vertical and the remainder horizontal, the latter end being the insulated one. The electric waves then travel *in the plane of the wire* and in a direction opposite to that to which the free end is pointing. If such a wire acts in the capacity of a receiver the greatest effect is obtained when the free end is pointed directly away from the transmitting station. Consequently, such a wire, fixed so as to be capable of being turned to point in any required direction, provides also a means of locating the direction of an unknown signalling station.

Preece and Sivewright, *Telegraphy*; J. A. Fleming, *The Principles of Electric Wave Telegraphy and Telephony*; O. Lodge, *Signalling across Space without Wires*.

Earth Currents.—Ever since the institution of telegraphy it has frequently been observed that the lines are traversed by momentary currents (due to some outside cause) which have sometimes been sufficiently great to interfere seriously with the transmission of messages. These currents, called earth-currents, not only occur in telegraphic circuits, but also affect all magnetic and electrical instruments. They are supposed to be due to electromagnetic induction, caused by changes in the earth's magnetism—a hypothesis based on the following observations: they are of more frequent occurrence in lines running due N. and S.; both aerial and underground lines are similarly affected; they are of great intensity during magnetic storms, when they are accompanied by brilliant aurora; periods of great activity synchronise with periods of maximum sun-spots. Earth currents may also be due to purely local and artificial causes, such as electric traction, the transmission of electric power in great quantity, or the presence of generating stations. Local causes have in many cases so seriously interfered with instruments in magnetic observatories as to necessitate a change of site. See ELECTRICITY.

TELEGU, see DRAVIDIAN, INDIA (LANGUAGE).

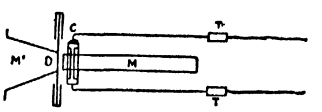
TEL-EL-KEBIR, see EGYPT (HISTORY).

TELEMARK, THELEMARK (59° 50′ N., 9° E.), mountainous region, amt of Bratsberg, Norway.

TELEMETER, see RANGE-FINDER.

TELEOLOGY.—(1) The study of the end or purpose of things as explaining them; (2) the theory that what is has an end or purpose by which it may be explained.

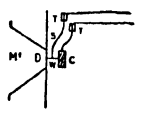
TELEOSTEI, see under FISHES.



TELEOSTOMI, see under FISHES.

TELEPATHY, called also 'thought transference,' is the communication of minds which are apart in space. It has been much studied recently, and its existence generally, though not universally, admitted. Images, whether voluntary or involuntary, are generally conveyed from one brain to another. One form of telepathic appearances are apparitions of a dying person to friends far distant, of which many seem authentic.

TELEPHONE, an instrument for reproducing speech at a distance from the source. It is to Graham Bell that it owes its present commercial importance.



The telephone consists of two pieces of apparatus—(*a*) the transmitter, which is spoken into, and (*b*) the receiver, which reproduces the sound, the two being joined by wires to form an electric circuit.

Bell's transmitter consisted of a steel magnet M, suitably encased, with one pole close to the mouthpiece M′, over which was clamped a thin soft-iron diaphragm D. Surrounding this pole was a coil C, having its ends connected to the terminals TT, from which ran wires to the terminals of an exactly similar instrument (the receiver). The magnet M magnetically affects the diaphragm D, which in its turn reacts on the magnet, causing lines of magnetic induction to thread the coil C. On speaking into the mouthpiece the diaphragm is set vibrating and causes changes in the magnetic induction of the coil, resulting in a current being set up in the circuit. This current affects the magnetism of the magnet in the receiver in such a way as to set *its* diaphragm in

motion exactly in unison with that of the diaphragm in the transmitter. The receiver thus sets up vibrations in its neighbourhood exactly similar to those produced at the transmitter, and since sounds are produced by vibrations of the air falling on the tympanum of the ear, the result is an exact reproduction of the words spoken into the transmitter.

Blake's receiver is now universally used. The transmitter is, however, obsolete, being replaced by a microphone—the invention of Prof. Hughes—which necessitates an electric current in the circuit from an outside source. The Blake form of microphone transmitter contains a platinum wire W, supported by a spring S, so as to touch both the diaphragm D and a piece of carbon C. The vibrations of the diaphragm cause this wire to press against the carbon with varying pressure, which introduces changes in the electrical resistance of the circuit, with consequent changes in the current, which in turn affect the magnet in the receiver in the way already described. The current required in each telephonic circuit is supplied by dynamos from a central station.

For long-distance telephony, the granulated carbon transmitter—especially the 'solid back' form—is used. This contains a small cylindrical brass box placed in an upright position with one face clamped to the diaphragm. The curved surface of the box is insulated, and to each of the circular faces is attached a thin carbon disc, the space between being almost filled with granulated carbon. These granules form microphonic contacts, and the large number of them produce the strong changes of current necessary to be effective over long distances.

Users of telephones (subscribers) are put into communication with each other by means of exchanges. The wires of all subscribers in a neighbourhood are brought to a central station, where any two sets of wires can be joined up.

Recently great advances have been made in wireless telephony, electric waves being utilised in the same way as in wireless telegraphy (see TELEGRAPH). This promises to become of extensive use, especially over long distances and to enable ships to communicate with lighthouses and each other.

J. Poole, *Practical Telephone Handbook*; W. J. Hopkins, *Telephone Lines and their Properties*.

TELESCOPE, an instrument which magnifies distant objects. T's are of two kinds—the refractor and reflector. The former was the first to be invented, and the principle was discovered by a watchmaker's apprentice in 1609. The lad was playing with some of his master's spectacle glasses and happened to so arrange them as to magnify a distant church tower. The discovery was taken up by the watchmaker, Hans Lippershey, and a report of it reached the ears of Galileo, who constructed a t. of his own on the same principle. This he applied to a study of the heavenly bodies and was so encouraged that he made several larger and more powerful instruments, and in 1610 discovered the satellites of Jupiter and the mountains on the moon.

A refracting t. consists of an object-glass which collects the rays of light, from a star, to a focus where a tiny image is formed. Here is placed an eyepiece which magnifies this image, and through this eyepiece the observer looks. In Galileo's time the object-glass consisted of a single simple convex lens, but owing to the dispersion of light, objects seen through these early t's were seen to have a fringe of colours surrounding them. The power of a t. depends on the size of the object-glass, and as this was increased so did this chromatic aberration increase. Early astronomers tried to overcome the defect by making their t's very long; for instance, some of the instruments constructed by Huygens and Cassini in the XVII. cent. were over 100 ft. in length, and so unwieldy that little or no scientific work could be done with them. Isaac Newton decided that it was impossible to overcome chromatic aberration in refracting telescopes, and determined to devise a new form of instrument, and he invented the Reflecting Telescope.

In this type a mirror is placed at the bottom of an open tube. The mirror being ground to a certain curvature, the rays of light from a star are reflected back up the tube to a prism, suspended near the top in such a manner as not to interfere with the passage of the light rays from the star to the mirror. This prism diverts the rays to an eyepiece placed in the side of the tube, through which the observer looks. Sir William Herschel further improved the reflector, and in 1789 constructed an instrument, the focal length of which was 40 ft., and with this he discovered the inner satellites of Saturn.

Attention was again turned to the despised refractor, and in the XVIII. cent. it was found that, by constructing the object-glass in two pieces (the outer piece convex and made of crown glass, the inner piece concave, and made of flint glass), chromatic aberration was largely overcome. The difficulty now was the obtaining of suitable glass discs, of a size large enough for the requirements of the makers, while also the polishing and grinding of four separate surfaces had to be done only by the highest skilled workmen. However, in 1823, a lens of 12 in. diameter was manufactured by a firm of Swiss opticians, and in 1847 a t. having a 15-in. lens was set up at Harvard Univ. Observatory, U.S.A. A 23-in. lens was made by an Eng. amateur astronomer in 1868, whilst a few years later, Alvan Clark, of America, succeeded in making a 26-in. lens for the Washington Observatory, and with this instrument Prof. Hall discovered the two satellites of Mars. The observatories of Nice and Pulkowa followed the making of this t. by erecting instruments having object-glasses of 29½ in. and 30 in. respectively, and for some years the latter was the largest refractor in the world. James Lick, an Amer. millionaire, left a sum of money for erecting a 36-in. t. on Mount Hamilton (Cal., U.S.A.), and in 1888 the work was completed, and for ten years the Lick t. was the biggest in the world; but in 1898 another huge t., the money for which was provided by Mr. Yerkes, was set up at the observatory of the Chicago Univ. at Williams Bay (Wis., U.S.A.), the diameter of the object-glass being 40 in.

The largest reflecting t. of modern times, until a few years ago, was an instrument of 72-in. aperture, made by Lord Rosse and kept in his grounds at Parsonstown, Ireland. It was erected in 1845 and is over 54 ft. in length, but, owing to the climate of Ireland, has been of little value in research, and is little more than an astronomical curiosity. The National Observatory of France, Paris, has a 48-in. reflector, whilst the Carnegie Solar Observatory at Mount Wilson near Pasadena (Cal., U.S.A.) has a 60-in. mirror recently made by Professor Ritchie. The mirror is made from a great disc of glass, and is 7⅞ in. thick and weighs some 1900 lb. The total weight of the huge instrument is something like 23 tons, but the bearings are relieved of the great strain by an ingenious plan, for the instrument is fixed to a hollow drum, which floats in a metal bath of mercury.

The reflector is cheaper and easier to make than the refractor, whilst not only can it be made much larger, being less cumbersome to mount, but a very accurate rendering of the natural colours of the object observed is given, and this is not the case with the refractor. On the other hand, the closed tube of this latter type of t. is a great advantage when any air currents are present in the observatory, for they tend to disturb the vision in the open tube of a reflector. The reflecting t. is generally employed in celestial photography, for the visual and chemical focal points are identical, and this is not the case with the other type.

TELESE (41° 14′ N., 14° 30′ E.) (ancient *Telesia*), village, Italy; hot sulphur springs.

TELESIO, BERNARDINO (1509–88), Ital. philosopher and scientist; attacked Aristotelianism prevalent at Padua; proposed an inquiry into sense data; forerunner of Bacon.

TELFORD, THOMAS (1757–1834), Scot. civil engineer; b. Eskdale. His works include the Caledonian and Ellesmere Canals, the Gota Canal in Sweden, a system of main roads in Scot. Highlands, the Menai Bridge, and the Clyde Bridge at Glasgow.

TELL, WILLIAM, a peasant of Uri, Switzerland, prominent in the resistance to Austria, XIV. cent. According to legend, T., taken prisoner by the Austrian governor Gessler, was promised his liberty if with an arrow he could hit an apple on his son's head. T. accomplished the feat, but avowed that a second arrow was ready for Gessler if he had failed. Gessler thereupon seized him and carried him off to prison. But T. made his escape and subsequently shot Gessler through the heart. The general revolt which followed against Austria ended in the victory of Switzerland. A monument stands to his memory at Altorf.

TELL-EL-AMARNA (27° 30′ N., 31° E.), ruins of a residence of Amenophis IV., near Nile, Upper Egypt; in 1887–88 about 300 clay tablets with important cuneiform inscriptions were discovered here.

TELLER, WILHELM ABRAHAM (1734–1804), Prot. theologian; prof. at Helmstedt, 1761; became a rationalising theologian, issued various works, and tended to substitute for distinctively Christian rites and doctrines a purely ethical system.

TELLICHERRY (11° 45′ N., 75° 32′ E.), seaport, Malabar, Madras, Brit. India; exports coffee. Pop. 29,000.

TELLURIUM (Te=127·5), a silvery, brittle, rare non-metal in sulphur group; occurs native, and as metallic tellurides; S.G. 6·27, M.P. 452° C., B.P. 478° C., molecule Te_2.—Compounds: TeH_2, combustible gas (cf. SH_2); TeO, $TeCl_2$; $TeCl_4$; TeO_2, H_2TeO_3, and tellurites; TeO_3, H_2TeO_4, H_6TeO_6, and tellurates.

TELOSPORIDIA, a sub-class of SPOROZOA (*q.v.*).

TEMENOS (Gk.), sacred precinct of a god, sometimes containing a temple.

TEMESVÁR (45° 47′ N., 21° 14′ E.), town, on Bega, capital, County Temes, Hungary; XVIII.-cent. cathedral (R.C.); manufactures tobacco; active trade. Pop. (1910) 72,555.

TEMPE, VALE OF (39° 50′ N., 22° 35′ E.), valley, Thessaly, Greece.

TEMPERA, DISTEMPER, process of spreading mixture of paint and glutinous material on flat surface; used by artists, especially of early Ital. school, for applying to canvas, and by house painters.

TEMPERANCE, from its original meaning of 'moderation,' t. has come to mean almost exclusively 'moderation in the use of alcoholic liquor,' or total abstinence from such liquor. Throughout the ages the records of civilised man contain references to the want of t., and deal with it both as a shameful thing and as a matter for ridicule. From earliest times men and women have been found to deny themselves the use of alcoholic liquors. Wine in the grape-growing countries, ale and mead in the more northerly regions were the common liquors that called for t., until the XVIII. cent. when spirits by the process of the distillery came into general use throughout the north of Europe. The absence of all Excise Duty in Great Britain on spirits enabled gin to be sold so cheaply that drunkenness—always a failing of the races in the colder climates of the world—was conspicuous in London, and according to Smollett the gin sellers advertised that their customers might be 'Drunk for a Penny, and Dead Drunk for Twopence; clean straw provided.' The rise in the price of spirits ended these incitements to intemperance, and with the early years of the XIX. cent. the t. movement, at first entirely directed against the drinking of spirits, came into being.

New York claims to have started the first t. society (1808), and Ireland the second. Father Mathew preached his great t. crusade in Ireland, 1838–42, with marked results in the decrease of consumption of alcoholic liquors, and soon after 1830 t. societies are found in Lancashire and Yorkshire. These societies are the first teetotal societies, requiring *total* abstinence from their members, and their inauguration made a great cleavage in the t. parties. To-day, however, the 'temperance' man is generally understood to be a teetotaller, though occasional exceptions are found.

The U.K. Alliance was started in 1853 for the 'total and immediate suppression' of the trade in alcoholic liquor, and for 60 years has pushed a demand for Local Veto and Prohibition. Besides the U.K. Alliance, the chief t. societies are the Church of England T. S.—with two sections, one for teetotallers and one for moderate drinkers—the Independent Order of Good Templars (Friendly Society), the Brit. Women's T. Assoc., and the League of the Cross (R.C.).

In America several states have adopted *Prohibition*, forbidding all sale and purchase of alcoholic liquor, but success of the policy in promoting t. is disputed. In 1912 Kansas, Maine, Mississippi, N. Carolina, N. Dakota, Oklahoma, Tennessee, Virginia, and W. Virginia were prohibition states, and there was local prohibition in several others. The International Order of Good Templars and the Order of the Sons of Temperance are the chief societies in U.S.A. Consumption of alcoholic liquors has increased as it has declined in Britain.

The difficulty of obtaining reliable statistics on the growth of t. is very great. The most sober countries are admittedly Italy, Spain, and Portugal, and generally it is true that t. belongs to the wine-drinking lands, and intemperance to the country where spirits are the popular beverage. Many t. reformers have claimed that alcohol is a source of crime and disease; but against that must be placed the fact that many persons have only abstained from alcohol to indulge in excessive tea-drinking and drug-taking, both disastrous to health and sanity. The indulgence that t. would restrain weakens the will, and whatever form the self-indulgence takes, t. is necessary for the preservation of body and soul.

Formerly mere drunkenness was punished by a fine of 5s. and confinement in the stocks in lieu of distress. To-day, drunkenness in a public place and drunken disorderliness are punishable by fine or imprisonment with hard labour. A habitual drunkard, *e.g.* a 'person who, not being amenable to any jurisdiction in lunacy, is notwithstanding by reason of habitual intemperate drinking of intoxicating liquor, at times dangerous to himself or herself, or to others, or incapable of managing himself or herself, and his or her affairs,' may be detained, by the Act of 1898, if convicted of an offence when drunk, in a certified inebriate reformatory for a term not exceeding three years. There are also 'Retreats' licensed by county and borough councils, and in such retreats habitual drunkards voluntarily submitting themselves may be detained compulsorily for not more than two years.

Drunkenness is no excuse in law for a crime; but a contract made by a person too drunk to understand what is being done is voidable in law, if the other person was aware of the fact, but may be ratified when the drunken person becomes sober.

Rowntree and Sherwell, *T. Problem and Social Reform*; A. Shadwell, *Drink, T., and Legislation.*

TEMPERATURE, see HEAT.

TEMPIO PAUSANIA (40° 53′ N., 9° 10′ E.), town, Sassari, Sardinia. Pop. 6500.

TEMPLARS, KNIGHTS (*Pauperes commilitiones Christi templique Salomonici*), military religious order, founded XII. cent.; named from mosque known as 'temple of Solomon' at Jerusalem by which their house was at first established. Originated in necessity of protecting bands of pilgrims who

after First Crusade sought Holy Land; like Hospitallers (*q.v.*), essentially Fr. order; in 1119, Hugues de Payns and Godeffroi de St. Omer formed nucleus of future order; they and six other Western knights accepted rule of St. Benedict, swore to devote their lives to protection of pilgrims, and received their quarters in palace of Baldwin I., king of Jerusalem, near above-mentioned mosque; like Hospitallers, at once received grants of territory in all countries; by command of council of Troyes, 1128, and of St. Bernard, abbot of Clairvaux, the rule was drawn up; privileges confirmed by papal bull, 1163.

Order was divided like that of Hospital into knights, chaplains, and servants (*fratres servientes armigeri* and *fratres servientes famuli*). Poverty and absence of ostentation were salient principles of rule, but figure on seal (also stamped with Temple) of two riders on one horse represents knight and rescued pilgrim, not two knights. Dress of knights and higher chaplains was white robe, white girdle, red Maltese cross on left shoulder; married men, admitted under certain conditions, might not, however, wear white, but, with lower chaplains and servants, black or brown mantle with red cross; robe of chaplains closed; standard half black, half white, with inscription, *Non nobis, non nobis, Domine, sed nomini tuo da gloriam*; primitive order puritanical rather than ascetic, but rule emphasised need for shunning companionship of women; among functions was that of public treasury, which brought considerable banking profits; wide privileges and independence of local control led to subsequent corruption; already roused bitter jealousy and gave rise to criticisms in XII. cent.; failure of crusaders' attacks on Damascus and Ascalon, 1148–49, charged to their falsity and avarice, while they were suspected by Frederick II. of betraying his plans to sultan, 1229; nevertheless, played great part in XII. and XIII. cent's.

Grand Master Odo de St. Amand in 1177 avenged at *Ascalon* previous disaster, though Saladin's power was not seriously diminished; Gerard de Riderfort, his successor, secured throne of Jerusalem for Guy de Lusignan, 1186, but in following year Jerusalem was captured by Saladin and all members of military orders taken were slain; those who escaped garrisoned Acre till it fell, 1191; with aid of T's and in Templar robe, Richard Cœur de Lion escaped from Palestine. Acre, recovered, was T's next home, where ruined Castle Pilgrim, built *c.* 1217, is still to be seen; T's won great fame at capture of Damietta, in Fifth Crusade, 1219; civil wars with Frederick II. and Hospitallers closely followed by final Muhammadan capture of Jerusalem, 1244, when nearly all members of military orders were slain; T's assisted crusade of Louis IX., 1250; almost confined to Acre by 1268; Acre fell, 1291, and T's made final settlement in Cyprus; opposition to order now came to a head; Philip IV. of France took advantage of popular feeling to secure suppression, probably in interests of strong government, to which its riches and immunities made it enemy; heresies and nameless sins ascribed, not known on how much foundation, to order; warrants for arrest obtained from pope, 1307; confessions made under extreme torture; numbers, including grand master, burned; example of arrest followed in other countries (England, 1308); order suppressed by council of Vienne, 1312; possessions granted to Hospitallers.

Froude, *Templars* (1886).

TEMPLE, term used to describe a place of worship of ancient Hebrew and pagan religions as opposed to 'church' of Christianity or synagogue of later Judaism; the Hebrew has been translated 'god-house' (better than 'house of God'), but the existence of such cannot have been characteristic of the primitive phase of Semitic religion. Only when the nomads had settled down were the gods housed in permanent abodes. A t. always had an altar, for sacrifice was the central act of worship. In Judaism the first great t. was that of Solomon, described in *1 Kings* 6 and 7, itself probably drawn from earlier sources of information. Its site is now marked by the Mosque of Omar (or Dome of the Rock) (this is not mentioned in Kings, but is supported by the evidence of archæology and tradition). Mount Moriah, on which it is built, was artificially levelled at the top, and the spot had probably been sacred from prehistoric times.

The T. proper was divided into the 'Holy Place' and the Holy of holies, only entered once a year by the high priest. Outside was a porch, and all around a lower building consisting of small chambers. It was magnificently built and overlaid with gold. In the Holy Place were the table of shewbread and the golden candlesticks, and in the Holy of holies the ark. East of the T. was the altar of burnt-offering—a great slab of rock. The whole T. is architecturally typical of Syrian art.

Solomon's T. was destroyed by Nebuchadnezzar, 86 B.C., and was succeeded by that of Zerubbabel, built on similar lines. It had, however, a large square outer court, then an inner court, for the priests alone. The altar was larger than in Solomon's T., and there was an arrangement for draining off the blood of the slaughtered animals into the Kidron. Zerubbabel's T. was built 520–516 B.C., but before the return from exile an ideal T. had presented itself to the mind of Ezekiel, and Zerubbabel generally followed Ezekiel's idea. It was outraged by Antiochus Epiphanes in 168 B.C. and by Pompeius. The last T. was that of Herod the Great, begun about 20 B.C. It contained a large outer court. The eastern part of the interior building was the Court of the Women; a door led thence to the Court of the Israelites, then the Court of the Priests containing the altar of burnt-offering, then the T. porch proper, Holy Place, and Holy of holies. It was destroyed at the siege of Jerusalem, A.D. 70.

Gk., Rom., Egyptian, and Assyrian t's were built on somewhat similar plans, containing a sanctuary with chambers at either end and colonnades.

Fergusson, *The T's of the Jews* (1878); Bannister, *T's of the Hebrews.*

TEMPLE (31° 5′ N., 97° 20′ W.), city, Bell County, Texas, U.S.A.; agricultural region; cotton industries. Pop. (1910) 10,993.

TEMPLE BAR, famous London 'barrier' erected (1670) between Strand and Fleet Street; city boundary; removed, 1878, and replaced by commemorative monument.

TEMPLE, EARLDOM OF, Hester I., Viscountess Cobham, heiress of T's of Stowe, was cr. Countess T., 1749; succ. by s., Richard (*q.v.*); his nephew and heir, George, cr. Marquess of Buckingham, 1784, was f. of Richard, cr. Duke of Buckingham and Earl T. of Stowe, 1822; earldom of first creation became extinct, 1889, but that of T. of Stowe descended to William Stephen Gore-Langton, descendant of T's and f. of present earl.

TEMPLE, FREDERICK (1821–1902), Anglican divine; ed. Oxford; ordained, 1846; became a school inspector, 1858, and headmaster of Rugby, 1858; bp. of Exeter, 1869, of London, 1885; abp. of Canterbury, 1896. A man of strong and noble character, he became very popular as headmaster, though his force and fire alarmed some people in London; his s., Rev. William T. (1881–), became headmaster of Repton, 1910.

TEMPLE, INNER and MIDDLE, see INNS OF COURT.

TEMPLE, RICHARD GRENVILLE-TEMPLE, EARL (1711–79), Eng. statesman; s. and heir of Richard Grenville of Wootton by Hester, dau. of Sir Richard T., Bart. William Pitt m. his sister and advanced him; Privy Seal, 1757; on bad terms with bro., George, First Lord of Treasury, 1763 (see GRENVILLE), and ultimately worked mischief to Pitt; incapable, bad-tempered, of restless ambition.

TEMPLE, SIR WILLIAM, Bart. (1628–99), Eng. statesman and writer; e. s. of Sir John T., Master of Rolls, Ireland; m., 1655, Dorothy Osborne, whose *Love Letters* were edited by Gollancz, 1903; ambassador

to Brussels, 1665; deeply imbued with Country Party's mistrust of France; negotiated Triple Alliance (1668) of England, Holland, and Sweden to resist encroachments of France in Netherlands, nullified by Charles's secret Treaty of Dover; ambassador at Hague, 1668, and opposed war with Holland; arranged marriage of William and Mary; returned home, 1679; retired to Sheen on King's dissolution of Parliament; essays praised by Lamb.

TEMRYUK (45° 17′ N., 37° 22′ E.), seaport, on Sea of Azov, Kuban, Russ. Caucasia; flour-mills; exports grain. Pop. 16,000.

TENAILLE, see FORTIFICATION.

TENANT, see LANDLORD AND TENANT.

TENASSERIM.—(1) (13° 30′ N., 98° 30′ E.) division, Lower Burma, between Siamese mountains and Bay of Bengal. Pop. 1,170,000. Capital, Moulmein. (2) (12° 6′ N., 99° 3′ E.) town, on Tenasserim, Tenasserim division, Lower Burma. Pop. 10,000.

TENBURY (52° 18′ N., 2° 36′ W.), market town, on Teme, Worcestershire, England. Pop. (1911, in rural district) 4727.

TENBY (51° 41′ N., 4° 42′ W.), town, watering-place, on Carmarthen Bay, Pembrokeshire, Wales; fisheries. Pop. (1911) 4362.

TENEBRÆ, Passion Week service in R.C. Church.

TENERIFFE (28° 25′ N., 16° 40′ W.), largest of Canary Islands (*q.v.*); traversed by volcanic mountains with famous Peak (highest point—El Piton—12,000 ft.; crater, 300 ft. in diameter and 70 ft. deep); capital, Santa Cruz de T. (*q.v.*); drawn linen, maize, wheat, potatoes, wine, tropical fruit, etc.; area, 7828 sq. miles; tourist and invalid resort. Pop. 150,000.

TENIERS, two Flemish artists, f. and s., both b. Antwerp. DAVID TENIERS, the elder (1582–1649), a pupil of Rubens, dealt chiefly with homely subjects; distinguished for charm of colour and a pleasing freedom of handling. DAVID TENIERS, the younger (1610–90), enjoyed great distinction, and painted, it is calculated, about 700 pictures. His forte lay in scenes of happy outdoor life.

TENISON, THOMAS (1636–1715), Anglican divine, of Prot. sympathies; bp. of Lincoln, 1691; abp. of Canterbury, 1694; upheld Hanoverian dynasty, crowning George I.

TENNESSEE (35° to 36° 40′ N., 81° 50′ to 90° 13′ W.), S.E. central state, U.S.A.; bounded N. by Virginia, Kentucky, W. by Missouri, Arkansas, S. by Mississippi, Alabama, Georgia, E. by N. Carolina; area, 42,050 sq. miles. Surface is mountainous in E., where the Great Smoky and other ranges of the Appalachians separate the state from N. Carolina, and reach an extreme height of 6636 ft. in Mt. Guyot; in centre is valley of E. Tennessee, and in W. is the great plateau of the Cumberland Mountains. Drained by Mississippi, which forms W. boundary; and the Ohio receives waters of Cumberland and Tennessee Rivers and their tributaries, and unites with Mississippi in lat. 37° N. Cambrian formation prevails in E.; centre is Silurian and the W. is chiefly of Cretaceous and Tertiary date; extreme W. is more recent, being of Pleistocene formation. Climate is healthy, with long, fine summer. Flora includes pine, oak, beech, and other valuable timber trees, persimmons, crab-apples, and other fruits. Fauna includes bears, deer, rattlesnakes.

T. was first visited by Spanish explorers, *c.* 1541; settled by English in middle of XVIII. cent. Organised as a territory in 1790, it was admitted as a state to Union, 1796; seceded from Union on outbreak of Civil War, although a large party in the state was in favour of the Federal Government; readmitted to Union, 1866.

Executive power is in hands of a governor and four other officers of state; legislature consists of a Senate of 33 members and a House of Representatives of 99 members, all of whom are elected for two years by popular vote. T. sends 2 Senators and 10 Representatives to Federal Congress. State is divided into 96 counties for purposes of local administration. Chief towns are Nashville (capital), Memphis, Knoxville, Chattanooga. Agriculture is important industry, large crops of maize and wheat being grown as well as oats and vegetables; fruit is extensively grown; tobacco and cotton are cultivated. Live stock raising is less important than formerly. Minerals include coal, petroleum, iron, copper, zinc, limestone. Principal industries are lumbering, flour-milling, manufacture of iron and steel goods, cotton-seed oil and cake, furniture, leather, textiles. Railway mileage (1912), 4193. Education is free and in some parts obligatory, and there are separate schools for white and coloured; Knoxville, Nashville, Chattanooga, Sewanee, and Cumberland are univ. towns. Principal religions are Baptist, Methodist, Presbyterian, R.C. Pop. (1910) 2,184,789.

TENNESSEE RIVER (35° N., 88° W.) is formed by union of two streams in E. part of Tennessee, U.S.A.; flows S.W. through Tennessee, then N.W. through Alabama, W. Tennessee, and Kentucky; enters Ohio at Paducah; length, 1200 miles; most of its course navigable.

TENNIEL, SIR JOHN (1820–), Eng. caricaturist; widely and familiarly known by his cartoons in *Punch*, the staff of which he joined in 1851; notable also as a book-illustrator, his most successful work in this line having been done for *Alice in Wonderland*, and *Through the Looking-Glass*.

TENNIS, development of a game, *longue paume*, played by French and Italians and now represented by Fives (*q.v.*); popular in France and England by XIV. cent.; retained favour till ousted by lawn-tennis (*q.v.*) towards end of XIX. cent.; still played, although expense of building courts make the game impossible for most.

T. is played by two or four players in rectangular court, partially covered by penthouse roof directly beneath which lie openings, the *dedans*, *grille*, and *galleries*; and net, 5 ft. high at ends, 3 ft. in middle, separates 'service' from 'hazard' side; racket is of ash, strung with gut, about 16 oz. in weight and 2 ft. 2 in. long. A series of lines one yard apart is drawn across floor at each end of court.

The server, standing on service side of court, delivers ball so as first to strike lateral penthouse and then to drop into service court; the striker-out may return it by volleying or on first bounce; stroke is scored when ball is hit into last gallery on hazard side, dedans, or grille, or lost when ball is hit out of court, into net, or when *chase* is lost (when ball enters any gallery except last or bounces for second time between lines drawn across court) note is taken, and, when opponent makes chase, results are compared, stroke nearest end wall wins.

The first point is 15, second 30, third 40, fourth game. 'Love' means that player has not scored; 40 all is known as 'deuce,' and for next point, two consecutive strokes must be scored. Player who scores six games first wins set.

Julian Marshall, *Tennis* (1889).

TENNYSON, ALFRED, LORD (1809–92), Eng. poet; b. Somersby, Lincolnshire, s. of a clergyman; ed. at Louth and Trinity Coll., Cambridge. With his bro., Charles, he pub., in 1826, *Poems by Two Brothers*, in 1830 and 1833 two volumes of *Poems* that met with very unfavourable criticism. In 1842, however, the publication of a third volume brought him instant recognition, and thenceforward his life was one of uninterrupted success. His chief works were *The Princess* (1847), interspersed with charming lyrics; *In Memoriam* (1850), an elegy begun in 1833 on the death of his college friend, Arthur Hallam; *Maud* (1855), *Idylls of the King* (1859, 1869, 1872), *Enoch Arden* (1864); *Queen Mary* (1875) and *Harold* (1876), plays; *Locksley Hall* (1886), *Demeter* (1889), and *The Death of Œnone* (1892). In 1850 he became Poet Laureate and m. Emily Sellwood, and in 1884 he was raised to the peerage. He was buried in Westminster Abbey.

In his lifetime his poetry was almost extravagantly admired, and has, in consequence, suffered in its popularity since his death. His work always shows beauty of expression and purity of thought, but is marred, especially in his longer poems, by too much refinement and too little passion. His lyrics rank among the best of Eng. lit.

Life, by his s. (2 vols., 1897); works by Waugh (1892), Stopford Brooke (1894), Sir A. Lyell (E.M.L.).

TENT, portable shelter; a light shelter made of animal skins and leaves of trees, before production of canvas; bark, hides, straw, and mud used by Rom. soldiers; always a necessary habitation for military forces, from the time of Gk. and Macedonian wars; common dwelling-place of Arabs and Persians.

TENTERDEN (51° 4′ N., 0° 42′ E.), town, Kent, England. Pop. (1911) 3376.

TENTHREDINIDÆ, see SAW-FLIES.

TENURE, see LANDLORD AND TENANT, SMALL HOLDINGS.

TEPIC (21° 22′ N., 104° 52′ W.), territory, on Pacific coast, Mexico; fertile; agricultural and mining industries. Pop. (1910) 171,173. Capital, **Tepic**. Pop. (1910) 16,805.

TEPLITZ, TEPLITZ-SCHÖNAU (50° 39′ N., 13° 43′ E.), town, watering-place, Bohemia, Austria; warm mineral baths; manufactures machinery, textiles. Pop. (1910) 26,777.

TERAI, TARAI (*q.v.*).

TERAMO (42° 40′ N., 13° 43′ E.) (ancient *Interamnium*), town, at junction of Tordino and Vezzola, capital, Teramo province, Italy; cathedral; Rom. antiquities; manufactures silk. Pop. (1911) 24,538; (province) 307,284.

TERATOLOGY, the science concerned with the occurrence of monstrosity in organic life. The term 'monster' is applied to creatures which depart greatly from the normal parental appearance, and is thus in part synonymous with the terms 'freak,' 'sport,' and 'discontinuous variation.' But it also includes defective states which are not true variations at all. A monster, in short, is a greatly abnormal specimen whether its condition be due to germinal variation or to defective nutrition. Monstrosities may be divided into those characterised by superabundance of parts, by deficiency of parts, or by transposition or confusion of parts. Human examples of deformities of excess are those where more than five fingers occur on each hand (*polydactylism*), or where the head (*macrocephalia*) or body (*macrosomatia*) is abnormally large. Defect is illustrated by the presence of only one eye-orbit (*cyclopia*), by the absence of a heart (*acardia*), or by diminutive head (*microcephalia*).

Imperfect separation of parts is well seen in, for example, the Siamese twins, where two bodies remain united during life. Such junctions of bodies, altogether or in varying degree, is commonly exhibited by the embryos of trout or salmon bred in hatcheries.

The true causes of monstrosities are mostly unknown, but it has been shown that in times of stress, such as war periods, or periods of famine, many monstrous children, with deformities of defect or imperfect development, due to malnutrition, are born.

TERCEIRA (38° 38′ N., 27° 20′ W.), island, Azores, belonging to Portugal. Pop. 55,000. Capital, Angra.

TEREBELLA, a Bristle-Worm, see under CHÆTOPODA.

TEREDO, see LAMELLIBRANCHIATA.

TEREK.—(1) (43° N., 45° E.) province, Russ. Caucasia, on N. slopes of Caucasus; chief occupation, agriculture. Pop. (1910) 1,182,700. Capital, Vladikavkaz. (2) (43° 48′ N., 47° 10′ E.) river, Russ. Caucasia; rises on Mt. Kasbek, flows by delta into Caspian Sea.

TERENCE, PUBLIUS TERENTIUS AFER (*c.* 192–158 B.C.), Rom. playwright, though not of Rom. birth, probably African; brought to Rome as slave of Terentius Lucanus and soon obtained freedom after being kindly treated and well educated by his master; first play produced, 166, last in 160, after which he left Rome to travel in Greece; mode of death uncertain, there are varying accounts, all of doubtful value. In spite of his foreign origin, T.'s Latin is pure and elegant and was admired by such severe critics as Cicero and Quintilian. He drew his plots from Menander and other Gk. playwrights of New Comedy. Unlike Plautus (*q.v.*) he did not adapt his plays to contemporary Rom. life, but portrayed Gk. manners of the time in which the originals were written. He wrote six plays, *Andria*, *Hecyra*, *Heauton Timorumenos*, *Eunuchus*, *Phormio*, *Adelphæ*. Molière (*q.v.*) has copied Phormio in *Les Fourberies de Scapin*.

TERESA, see THERESA, ST.

TERGESTE, ancient name of TRIESTE (*q.v.*).

TERLIZZI (41° 8′ N., 16° 32′ E.), town, Bari, Italy. Pop. 25,000.

TERM, day fixed for payment of rent; term days in England are Lady Day (March 25), Midsummer Day (June 24), Michaelmas Day (Sept. 29), Christmas Day (Dec. 25); in Scotland are two—Whitsunday (May 15) and Martinmas (Nov. 11), while Candlemas (Feb. 2) and Lammas (Aug. 1) are purely conventional term-days; Scot. removal t's are May 28 and Nov. 28; Oxford Univ. has four t's—Michaelmas, Hilary, Easter, Trinity (formerly legal t's), Cambridge has three—Lent, Easter, Michaelmas; Scot. univ's have a three-term session.

TERMINI IMERESE (37° 58′ N., 13° 41′ E.) (ancient *Thermæ Himerenses*), seaport, Palermo, Sicily; warm mineral springs. Pop. 23,000.

TERMITES, WHITE ANTS (*Isoptera*, Gk. *isor*, equal; *pteron*, wing), or (*Termitidæ*), separate order of Insects, till recently included with Neuroptera. Of greatest interest on account of their complex social habits. There are wingless and winged forms; latter possess four long, equal membranous wings, which lie flat on the back, and can be readily cast off. The larva is either like the adult, or becomes adult-like by slight, gradual changes. T. build 20-foot high domes of nests, constructed of earth or chewed wood. Within are rooms and galleries for distinct purposes, palaces, nurseries, store-rooms, etc.

The t. themselves are of various orders, king, queen, workers, and soldiers, each with its own duties; and within the nest, in which they remain except during the swarming flight, social order in perfectly established. T. are most common in tropical and sub-tropical regions, but a few are found beyond this limit.

TERMONDE, DENDERMONDE (51° 2′ N., 4° 6′ E.), town, E. Flanders, Belgium; fortified. Pop. 10,000.

TERNATE (1° 15′ N., 127° 45′ E.), residency, Dutch E. Indies; including Ternate Island, part of Celebes, Dutch New Guinea, and the N. islands of the Moluccas; Capital, **Ternate**, on E. coast, Ternate Island. Pop. *c.* 210,000; (town) 4000.

TERNI (42° 34′ N., 12° 40′ E.) (ancient *Interamna*), town, Perugia, Italy; iron- and steel-works; Rom. antiquities; scene of defeat of Neapolitans by French, 1798. Pop. 22,000.

TERNS, see under GULL FAMILY.

TERPANDER (VII. cent. B.C.), Gk. musician and poet; a Lesbian; invented 7-stringed lyre.

TERPENES are hydrocarbons, $C_{10}H_{16}$ or $(C_5H_8)n$, occurring in turpentine and essential oils derived from plants. They are liquid or solid, inflammable, and possess characteristic odours, and solvent and other valuable properties.

Crude Turpentine, obtained from stems of pine trees, yields, by steam distillation, oil of turpentine and colophony resin. OIL OF TURPENTINE is a colourless, odorous liquid, S.G. 0·86, B.P. 158–160° C., gradually oxidised by moist air to a kind of resin; used for varnishes and paints; does not mix with water, but dissolves phosphorus, sulphur, iodine, resins, and caoutchouc.

Pinene, $C_{10}H_{16}$, a colourless liquid, S.G. 0·858, B.P. 155°, smelling like turpentine, occurs in pine trees, and essential oils of eucalyptus, lemon, thyme, etc. Pinene

from Amer. turpentine is dextro-rotatory, that from Fr. turpentine levo-rotatory. Forms with bromine $C_{10}H_{16}Br_2$, and with HCl $C_{10}H_{17}Cl$. When heated, the dibromide yields cymene, $C_{10}H_{14}$.

Camphene, $C_{10}H_{16}$, is a solid, M.P. 48°, B.P. 160°, occurring in oil of ginger, etc.; forms the dibromide $C_{10}H_{16}Br_2$, and hydrochloride, $C_{10}H_{17}Cl$; oxidised by chromic acid to camphor.

Limonene, $C_{10}H_{16}$, B.P. 175°, occurs in oil of lemons, lime, lavender, caraway, bergamot, turpentine, etc.; forms the tetrabromide, $C_{10}H_{16}Br_4$, and dihydrochloride, $C_{10}H_{18}Cl_2$, optically active.

Constitution: that terpenes combine directly with bromine shows them to be unsaturated; and their conversion into cymene shows them to be closely related thereto. Pinene, which unites with two bromine atoms, contains one double linkage.

These compounds are said to contain bridged rings on account of the mode of linkage across the ring. Limonene contains no bridged ring, but two double linkages. The constitution of the terpenes has in some instances been proved by actual synthesis; *e.g.* inactive limonene has been prepared by Perkin. Closely related to the terpenes are camphor (a ketone), menthol (an alcohol), and thymol (a phenol).

TERRA DEL FUEGO, see TIERRA DEL FUEGO.

TERRACINA (41° 17′ N., 13° 17′ E.) (ancient *Anxur* or *Tarracina*), town, on Mediterranean, Rome, Italy; bp.'s see; cathedral and ruins of temple of Venus. Pop. 11,300.

TERRA-COTTA, Ital. term for clay, moulded and baked; uses are varied—statuettes, vases, and ornaments; bas-reliefs and groups; cornices, friezes, and other architectural ornaments; in its coarser processes, bricks, tiles, and rough pottery. T. may be glazed (see POTTERY). Prevalent colours are natural brown, yellow, or red, but t. is often impregnated with various colour-pigments. Greeks, Etruscans, Phœnicians, and Romans specialised strongly in t. work. Mediæval, and especially Renaissance times, produced much fine work; a distinct revival is noticeable in XX. cent. in Germany, France, and Britain for large decorative purposes, and the materials wear very slowly. Some of the best XVII.-cent. work is English, notably by Doulton and Tinworth. Coarser terra-cotta work is a rising industry in Flanders.

Davis, *Manufacture of Brick and Terra-cotta* (1889).

TERRANOVA (37° 3′ N., 14° 16′ E.), seaport, on site of ancient Gela, Caltanisetta, Sicily; tunny and sardine fisheries. Pop. 23,000.

TERRANOVA PAUSANIA (40° 54′ N., 9° 30′ E.), small seaport, on N.E. coast, Sardinia. Pop. 4500.

TERRAPIN, see under TORTOISES.

TERRA HAUTE (39° 24′ N., 87° 27′ E.), city, on Wabash, capital, Vigo County, Indiana, U.S.A.; coal-mining and distillery industries. Pop. (1910) 58,157.

TERRELL (32° 40′ N., 96° 10′ W.), city, Kaufman County, Texas, U.S.A.; cotton industries. Pop. (1910) 7050.

TERRESTRIAL MAGNETISM, see MAGNETISM.

TERRIERS, see DOG FAMILY.

TERRITORIAL WATERS, see under FISHES.

TERRITORIALS, see VOLUNTEERS.

TERRY, ELLEN ALICIA (1848–), Eng. actress; famous for greatness of her acting with Irving; mother of Edward Gordon Craig (1872–), actor and master of the Art of the Theatre.

TERTIAN FEVER, see MALARIA.

TERTIARIES, persons connected with the monastic orders, but not under vows of poverty, chastity, and obedience; they developed owing to the work of St. Francis, who did not admit to the order all who sought for admission, but organised them as T's.

TERTIARY, CAINOZOIC, all rock strata above Cretaceous system, and including Eocene, Oligocene, Miocene, and Pliocene.

TERTULLIAN, Q. SEPTIMUS FLORENS TERTULLIANUS (*c.* 155–222 A.D.), Christian theologian; s. of a Rom. centurion; became a presbyter in the Carthaginian Church when about forty; early began work as a controversialist, and most of his writings have fortunately been preserved; though at first a passionate defender of Catholic tradition against heresy, his very bitterness against laxity led him into heresy, and he became a Montanist. Lat. Christianity has been said to start with him, and he deals with practical problems in contrast to the speculative tendency of Gk. theologians. Though earnest, he is violent and harsh and extremely rhetorical; among his most famous works are *Apologeticum*, *De Præscriptionibus*, *De Baptismo*.

See English trans. in *Ante-Nicene Fathers*; Harnack, *History of Dogma*; Glover, *Conflict of Religions in the Early Rom. Empire*.

TERUEL (40° 30′ N., 1° W.), province, Aragon, Spain; mountainous. Pop. (1910) 254,998. Capital, **Teruel** (40° 22′ N., 1° 5′ W.), on Guadalaviar; bp.'s see; XVI.-cent. cathedral. Pop. 11,200.

TERVUEREN (50° 50′ N., 4° 30′ E.), town, Brabant, Belgium. Pop. 4200.

TESCHEN (49° 45′ N., 18° 38′ E.), town, Austria; ruined castle; manufactures furniture; was capital of ancient duchy of Teschen. Pop. (1910) 22,489.

TESLA, NIKOLA (1857–), Servian physicist and electrician.

TESSIN, CARL GUSTAF, COUNT (1695–1770), Swed. statesman; leader of the 'Hats,' representatives of national dignity, against 'Caps,' who desired peace at any price; great personal distinction, cultured speaker and writer; chief minister, 1746–52.

TEST ACTS, Eng. laws under which oath of religious conformity was tendered. Corporation Act, 1661, directed members of corporations to receive sacrament according to ritual of established church; same for magistrates by Test Act, 1673; Scot. Act, 1681; Test Act, 1685, extended test to all holders of public offices; repealed, 1829; univ. tests remained till Univ. Tests Act, 1871.

TESTAMENT OF THE THREE PATRIARCHS, THE TESTAMENT OF ABRAHAM, a Gk. apocryphal work, written in Egypt, *c.* 150 A.D.; T's of Isaac and Jacob also exist.

TESTAMENTS OF THE TWELVE PATRIARCHS, apocalyptic work and pseudonymous, written in the name of the Patriarchs, and in Hebrew, according to Dr. Charles, *c.* 109–106 B.C. The author, probably a Pharisee, extols the dynasty of John Hyrcanus, but a second writer vehemently attacks the vices of the later Maccabees. Its influence on the New Testament has been considerable; some passages supply close parallels to the teaching of Our Lord, who may have known the book, and it is quoted by St. Paul in *Rom.* 1^{32}, *1 Thess.* 2^{16}. The Hebrew original only exists in fragments, but there are Gk., Slavonic, and Armenian versions.

Charles, *Testaments of XII. Patriarchs.*

TESTAMENTUM DOMINI, TESTAMENT OF THE LORD, an early Christian apocryphal book, only fragments of which were known till recently, but now fully (in Syriac). It purports to have been spoken by Christ in the post-Resurrection period; it is partly eschatological and partly concerned with ecclesiastical discipline; exact date uncertain, but must be II. or III. cent.; first edit. by the Syrian patriarch, Rahmani, 1899; since then by Eng. scholars, last by Maclean.

TESTES, TESTICLES, see REPRODUCTIVE SYSTEM.

TETANUS, see PARASITIC DISEASES.

TETRABRANCHIA, a sub-order of Cephalopoda.

TETRAHEDRON, figure formed by joining by straight lines four equidistant points in space, three of the points forming an equilateral triangle.

TETRAO, see GROUSE.

TETRAODONTIDÆ, see GLOBE-FISHES.

TETRAZINES, compounds containing a ring of two carbon and four nitrogen atoms.

TETRAZZINI, LUISA (1874–), Ital. soprano, has won brilliant success in colorature rôles.

TETSCHEN (50° 46′ N., 14° 14′ E.), town, on Elbe, river port, Austria; chemical works. Pop. 10,650.

TETUAN (35° 32′ N., 5° 22′ W.), seaport town, on Martil, Morocco; manufactures slippers, firearms. Pop. 30,450.

TETZEL, JOHANN (*c.* 1465-1519), Catholic theologian; famed as seller of indulgences, 1517, to raise money for rebuilding St. Peter's; the abuse of these indulgences produced Luther's revolt. T. was at length denounced from the Catholic side.

TEUTOBURGER WALD (52° N., 8° 15′ E.), range of hills, Germany; extending for 70 miles from near Osnabrück, Hanover, S.E. through Westphalia and Lippe.

TEUTONIC KNIGHTS, ORDER OF, an Order similar to the Templars and Knights of St. John, but restricted to Germans; founded at Acre in 1190, originally to tend wounded Crusaders, it soon took up aggressive warfare against the heathen, and in the XIV. and XV. cent's was constantly at war with Wends and Lithuanians. On the conversion of these races the Order, which had become possessed of large landed possessions, steadily declined, and it was entirely suppressed in Germany by Napoleon in 1809. A Prot. branch still exists at Utrecht, and it has survived in Austria, where the Order has resumed its care for the wounded in war. The headquarters of the Order were formerly at Marienbad, and its rule extended to the Gulf of Finland. The Order never numbered more than 1000 knights, and now it numbers only 20 knights in Austria.

TEUTONIC LANGUAGES.—A group of languages some of which have fallen into disuse, others being widely prevalent now. They belong to the Indo-European family, and are marked by their adherence to Grimm's Law. The oldest Teutonic language in which documents are still extant was Gothic (*e.g.* Ulfila's translation of the Bible, IV. cent.); the modern representatives of the group may be classed as follows: (1) Germanic, (2) Scandinavian, and (3) Anglo-Saxon. The Germanic class comprises modern German, and its high and low dialects, Flemish, Frisian, Dutch, and Cape Dutch; the Scandinavian numbers four members, Danish, Swedish, Norwegian, and Icelandic; the Anglo-Saxon class is perpetuated in English, which has undergone more changes than the others, due mainly to additions from Lat. and Fr. sources. The modern representatives of Teutonic languages vary markedly, though some are mutually intelligible, *e.g.* Flemish and Dutch in their purer forms. Norwegian and Danish show almost complete similarity save in pronunciation.

TEUTONIC PEOPLES, general term, with no present-day geographical significance, for those peoples who speak one of the languages of the Teutonic group; originally massed together in Northern and Central Europe, they have become widely dispersed, and there are now important settlements of Teutonic peoples in America, Australia, and Africa. While the test of language is a convenient one, and broadly true, it is no arbitrary one; important sections of the Brit. people are of undoubted Celtic origin, while large portions of Germany and Austria are inhabited by German-speaking Slavs. The geographical area held by Teutonic peoples before the IV. cent. is doubtful, though archæological research points to an area comprising Schleswig-Holstein, the continental part of Denmark, some of the Baltic islands, southern Sweden, Mecklenburg, Frisia, and the whole basin of the Elbe. In Cæsar's time the Teutonic boundaries seem to have been roughly the North Sea, the Rhine, the Alps, and the Vistula, with offshoots in Scandinavia. The decay of the Rom. Empire and pressure of new races from the East brought about a great westward and southward expansion, part of which (*e.g.* Britain, Holland, and Flanders) was of a permanent character, while in France, Spain, and Italy the Teutonic elements did not long withstand the higher culture of the native races. By the VIII. cent. the Teutonic area, with the exception of Britain and the Low Countries, had returned broadly to the state of affairs in Cæsar's time. In the IX. cent. the Scandinavian branches expanded by a series of raids, and founded a number of new kingdoms none of which permanently altered the situation, excepting Iceland and Finland. With the growth of Dutch and English sea-power there came a notable extra-European expansion in the XVI. cent., which has lasted to the present day. The Teutonic peoples of the present day may be roughly divided into three groups: the Scandinavian, comprising Danes, Swedes, Norwegians, Finns, and Icelanders; the German, comprising Germans proper, Austrians, Dutch, Boers, and the populations of part of Belgium and Switzerland; the Anglo-Saxon, comprising the inhabitants of Great Britain, and its daughter-countries across the seas. The population of U.S.A. may be reckoned, if Latin and Slavonic elements be deducted, as partaking of all three groups.

TEVIOTDALE, name given to part of Roxburghshire in valley of Teviot, Scotland.

TEWFIK PASHA (1852-92), khedive of Egypt; succ. f., Ismail, who was deposed by the Powers, 1879; later in year, England and France established Dual Control; greatly assisted Sir Evelyn Baring in introducing reforms and in development of Egypt.

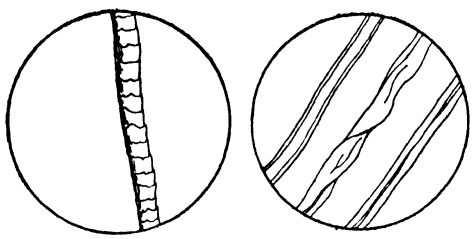
TEWKESBURY (51° 59′ N., 2° 9′ W.) (Rom. *Etocessa*), town, at junction of Avon and Severn, Gloucestershire, England; the abbey church (XII. cent.) is a fine specimen of Norman architecture; scene of a battle in Wars of Roses, 1471. Pop. (1911) 5287.

TEXARKANA.—(1) (33° 18′ N., 93° 57′ W.) city, Bowie County, Texas, U.S.A.; cotton manufactures. Pop. (1910) 9790. (2) (33° 22′ N., 94° 2′ W.) city, Miller County, Arkansas, U.S.A.; lumber and oil mills. Pop. (1910) 5655.

TEXAS (25° 50′ to 36° 30′ N., 93° 27′ to 106° 43′ W.), south-westerly state, U.S.A.; bounded N. by Oklahoma and Indian Territory, E. by Arkansas and Louisiana, S.E. by Gulf of Mexico, S.W. by Mexico, and W. by New Mexico; area, 265,896 sq. miles. Surface consists of a mountainous district in the W., where an extreme height of 8382 ft. is reached in Baldy Peak, prairie lands and forests in the centre, and coastal plain in the E. Drained by Grande, Guadalupe, Colorado, Brazos, Trinity, Neches, Sabine, and other rivers. The greater part of the state is of Cretaceous and Tertiary Age, but in the W. older Archæan rocks occur. Climate is healthy, except in some of the low-lying districts. Flora includes many kinds of cactus and a large variety of valuable timber trees. Fauna includes the opossum, armadillo, bear, coyote, and numerous insects.

T. was first discovered by Span. explorers early in XVI. cent.; included in the Span. province of Mexico, and remained in the possession of Mexico after the emancipation from Spain in 1821; in 1835 T. proclaimed its independence, and for 10 years retained its separate existence as a republic, after which it was admitted as a state to the Union, 1845. Was one of the seceding states in the Civil War, and was readmitted to the Union, 1870.

Executive power is in hands of a governor, assisted by a lieutenant-governor and five other officers of state. Legislature consists of Senate of 31 members and a House of Representatives of 142 members, all of whom are elected by popular vote—Senators for 4, and Representatives for 2, years. Sends 2 Senators and 18 Representatives to Federal Congress.



Chief towns are San Antonio, Dallas, Houston, Fort Worth, El Paso, Galveston. Agriculture is a highly important industry; maize, wheat, oats, rice, and potatoes are extensively cultivated; cattle, horses, sheep, and pigs raised in great numbers; cotton is largely produced, T. being the principal cotton-producing state of Union. Other important products are timber, tobacco, fruits. Minerals include coal, petroleum, mercury, salt, cement, gold, and silver. Principal manufactures are lumber, flour, cotton-seed oil and cake, beer, hardware; and meat-packing is carried on. Railway mileage (1911), 14,777. Education is free, and there are separate schools for whites and blacks; Austin,

Fort Worth, Waco, Georgetown, and Waxahachie are univ. towns. Chief religions are Baptist, Methodist, R.C. Pop. (1910) 3,896,542.

TEXAS FEVER, see under MITES AND TICKS.

TEXTILE FIBRES.—The term 'fibres' in general indicates the threads or filaments of which the tissues of animals or plants are composed, but textile fibres constitute a limited assortment of such or similar threads used commercially in the manufacture of cloth. Regarded from this point of view fibres fall into two great groups—animal fibres and plant fibres—each characterised by different properties and values.

Animal fibres consist of two classes—the most important containing hair and its varieties, growths originating in the outer skin or epidermis and forming

HIGHLY MAGNIFIED WOOL AND COTTON FIBRES.

the natural coverings of mammalian animals. The most valued and most widely used of these is wool, such as that of the many breeds of domestic sheep, Cashmere, alpaca, and vicuna goats. Wool varies in length, texture, and felting properties, the last depending on the development of microscopic ridges characteristic of such fibres. Hair, such as that of camels, is also much used. The second class contains animal secretions, the most important being the silk fibres spun into a cocoon by the larva of the silkworm moths (*Bombyx*).

Useful plant fibres consist of elongated complex fibrovascular bundles from the stems of such plants as flax, jute, and hemp, or of the simpler hairs which protect the seeds of such as the cotton plant.

In general quality animal fibres are distinguished from vegetable fibres by the greater non-conducting properties of the former—their greater power of retaining and excluding warmth. The former are nitrogenous in nature, the latter are composed of a carbohydrate-cellulose.

A simple discriminating test is that of fire—animal fibres frizzling with a horny odour, vegetable fibres blazing without smell. More delicate is that of boiling in a weak solution of caustic soda in water, wherein animal fibres dissolve while vegetable fibres remain. Microscopic structure also furnishes a sure guide to the nature of fibres.

TEXTILE PRINTING, see PRINTING.

TEXTUAL CRITICISM, that branch of literary science which deals with the actual verbal condition of documents. Before the invention of printing all texts were either MSS. or inscriptions; inscriptions could be and often were defaced, and the skill and knowledge of the textual critic had to be called in to supply what was wanting (*i.e.* so far as it could be supplied). When MSS. are examined it will generally be found that if there are several MSS. of a given work they differ in a number of points, possessing different readings. It is often possible to divide MSS. into groups or families; sometimes several will be seen to be derived from a lost copy or 'ancestor'; a proper pedigree of MSS. can then be constructed, and thence the original document can be reconstructed. Often there are various complications which render the reconstruction of the original MS. extremely different; *e.g.* known MSS. will contain readings from a number of different sources.

Sometimes important works of Gk. and Rom. writers are preserved only in a few very late MSS., or even in a single one. There are, however, many opportunities left open for error and corruption. Thus a scribe may misunderstand a rare word, and put a more intelligible one in its place; what is written in the margin may get incorporated in the text. Sometimes when the same word occurs twice running it will be omitted, or conversely the same will be written twice over. Words may get transposed, or be divided wrongly; whereas, as with ancient MSS., there is hardly any space left between words; passages may be interpolated to fill up where there seems something wanting.

One problem of textual criticism is 'conjectural emendation.' When by comparison of MSS., and removal of all possible errors, an effort has been made to get as near the original text as possible, there still remain points in which all known MSS. have a reading which is not merely unusual, but presents very serious difficulties, the critic suggests that the author must have written something else. One test that can be applied is intrinsic probability, whether an author would have been likely to write a given passage or not. Many critics are too 'conservative,' *i.e.* allow an impossible reading to stand rather than emend.

Textual criticism is a specially important branch of Biblical study. The New Testament, it has been said, presents a more complicated literary problem than any other known book. Even here more work is left for conjectural emendation than is often imagined.

TEZPUR, TEJPUR (26° 37′ N., 92° 53′ E.), town, on Brahmaputra, capital, Darrang district, Assam, India; tea industry. Pop. 5200.

THACKERAY, WILLIAM MAKEPEACE (1811–63), Brit. novelist and humorist; b. Calcutta; f. in Company's Service; ed. Charterhouse and Trinity Coll., Cambridge; m., 1836, Isabella Shawe, who went mad; abandoned law for journalism; studied painting in Paris; pub. *Paris Sketch Book* (1840), *Irish Sketch Book* (1843). With *Vanity Fair* (1848) he attained celebrity as a novelist; *Pendennis* followed (1850), *Henry Esmond* (in XVIII.-cent. style, 1852), *Newcomes* (1855), *Virginians* (1858). Other works are *Hoggarty Diamond*, *Book of Snobs* (1848), *Barry Lyndon*, and an unfinished story, *Denis Duval*; Lectures on *Eng. Humorists of XVIII. Century* (1851), and *The Four Georges* (1855). T. edited *Cornhill Magazine* (1860–62), and was earlier a contributor to *Punch*.

Like Dickens, T. is a master of humour and pathos combined. He affects cynicism and satirises the upper ranks of Victorian Society. He does not exhale the same kindly humanity as Dickens, but he is a better and more cultured craftsman. No finer hist. novel than *Esmond* has been written. His style is easy but always gentlemanly.

Monographs by Trollope, Merivale and Marzials, Melville, Whibley, Chesterton; Mudge and Sears, *Thackeray Dictionary*.

THALASSICOLA, a genus of RADIOLARIA (*q.v.*).

THALE (51° 45′ N., 11° 5′ E.), watering-place, on Bode, Pruss. Saxony; saline springs; manufactures ironware. Pop. 13,260.

THALEICHTHYS, see under SALMON FAMILY.

THALES of Miletus is usually accounted the first Western philosopher. His exact date is uncertain, but he was contemporary with Crœsus and Solon, and is said to have predicted an eclipse of the sun, *c.* 585 B.C. He was a politician of some note, and was reckoned one of the Seven Sages; he is said to have introduced Egyptian geometry into Greece. The chief philosophical (or physical) problem which he tried to solve was that of the substance of which the world is composed, and his answer was that all things are made of water.

THALIA, see MUSES.

THALIACEA, an order of TUNICATA (*q.v.*).

THALLIUM (Tl=204·0), a bluish-white crystalline metal discovered by spectrum analysis (Crookes, 1861), occurs in pyrites and blende; colours gas flame green; spectrum is one green line; S.G. 11·8 marks paper; tarnishes, M.P. 290°; thus resembles lead physically, and lead, silver, and potassium chemically. Forms thallous (Tl′) and thallic (Tl‴) compounds, TlO strongly

basic, TlOH alkaline, salts stable; Tl_2O_3 behaves as basic peroxide, salts unstable.

THALLUS, see PLANTS (ANATOMY).

THALWEG, lowest part of valley; watercourse.

THAMES.—(1) (51° 30′ N., 1° E.) river, S. England; length, 240 miles, and a basin, including that of Medway, of over 6000 sq. miles. From the N. the chief tributaries are the Cherwell, Thame, Colne, Lea; from the S., the Kennet, Mole, and Medway; but of these only the Medway is of importance. The river flows between Oxon, Bucks, Middlesex, and Essex on N., and Berks, Surrey, and Kent on S. Breadth at Gravesend is *c.* 800 yds., and from this to the Nore the distance from bank to bank gradually widens to 6 miles. Communicates by canal with Severn, Bristol, Midland Counties, and S. coast. (2) (37° 30′ S., 175° 40′ E.) seaport, on Thames, N. Island, New Zealand; gold-mining centre. Pop. 4000.

THANA, TANNA (21° 34′ N., 71° 50′ E.), town, on Salsette Island, Bombay, India. Pop. 17,000; (district) 815,000.

THANE, see THEGN.

THANESAR (29° 59′ N., 76° 52′ E.), town, on Saraswati, Punjab, Brit. India; place of pilgrimage. Pop. 5100.

THANET, ISLE OF (51° 22′ N., 1° 22′ E.), district, Kent, England, at N.E. extremity; insulated by the Stour. Pop. (1911) 12,929.

THANN (47° 47′ N., 7° 7′ E.), town, on Thur, Alsace-Lorraine; textile industries.

THAPSACUS (35° 50′ N., 38° 12′ E.) (Biblical *Tiphsah*), ancient city, Babylonia; most important crossing-station on Euphrates.

THAPSUS (37° 10′ N., 15° 20′ E.) (modern MAGNISI), peninsula, on E. coast of Sicily.

THAR AND PARKAR, THUR AND PARKER (25° N., 70° E.), district, Sind, Bombay, Brit. India. Pop. *c.* 400,000. Capital, Umarkot.

THARANDT (50° 58′ N., 13° 35′ E.), town, on Wilde Weisseritz, kingdom of Saxony; seat of an academy of forestry (1811). Pop. 3000.

THARRAWADDY (17° 40′ N., 95° 51′ E.), town, Pegu division, Lower Burma. Pop. 17,000; (district) *c.* 400,000.

THARROS (39° 50′ N., 40° 25′ E.), ancient town, on Gulf of Oristano, Sardinia.

THASOS (40° 42′ N., 24° 38′ E.), mountainous island, Ægean Sea; trade in timber and oil; noted in antiquity for its gold-mines; colonised by Parians, VIII. cent. B.C.; belonged to the Delian Confederacy; revolted, 465 B.C.; subdued by Cimon, 463; made free city by the Romans, 197. Pop. *c.* 8400.

THATÔN (16° 53′ N., 97° 23′ E.), town, Tenasserim division, Lower Burma; was capital of the Talaing kingdom. Pop. 15,500; (district) *c.* 350,000.

THAYETMYO (19° 18′ N., 95° 15′ E.), town, on Irrawadi, Minbu division, Lower Burma. Pop. 16,000; (district) *c.* 240,000.

THEATRE.—The Rom. theatre followed the Gk. theatre (*q.v.* under DRAMA) as to plan, but introduced innovation; it abolished the chorus, and the 'orchestra,' *i.e.* part set aside for chorus, became the equivalent of the modern 'stalls.'

In England *Mysteries* and *Miracle Plays* were played 'on tour' from a small stage on wheels. During Elizabethan period plays were produced in courtyards of inns, tennis-courts, etc., and theatres like the Globe or the Swan were yards on promotion. There was no roof; the common folks stood in the 'pit,' while the aristocrats sat in boxes; a few gallants sat on the edge of the stage which jutted out into the pit. There was no curtain—hence Shakespeare's habit of introducing people who will carry off the corpses. Scenery was practically unknown; Shakespeare's characters paint their own scenery in words. Cards, dice, etc., were played while the play proceeded; the stage fights were real fights—the audience took sides, and a stage duel would sometimes end in a general scrap.

The advent of excellent lighting and the modern 'box' stage, *i.e.* a room with one wall removed, revolutionised the theatre; artificial lighting killed the 'aside' and half-killed the soliloquy. Hydraulic power and electricity enable producers to represent anything from a thunder-storm to a railway smash; and fire-proof curtains, dividing stage from auditorium, render disaster from fire almost impossible.

THÉATRE FRANÇAIS, COMÉDIE FRANÇAISE, Parisian theatre; dates from 1680, when Louis XIV. ordered Molière's company of actors to amalgamate with those of the Théâtre du Marais; has produced the greatest drama from Molière's works to present day; destroyed by fire, 1900, and rebuilt with State aid.

THEBES.—(1) (25° 38′ N., 32° 38′ E.) ancient capital of Upper Egypt, situated on both banks of Nile, 300 miles from Cairo; founded *c.* 2500 B.C.; reached the height of its power during the years 1600–1100 B.C.; began to decline as the Delta region became more important, and finally the capital was transferred to Memphis; site is now marked by the village of Luxor, in neighbourhood of which are many magnificent ruins of temples, tombs, and obelisks; principal temples are those at Karnak and Luxor on E. bank of Nile, and those of Rameses II. and III. on W. bank. (2) (38° 19′ N., 23° 19′ E.) ancient city of Bœotia, Greece; was for a long time leading member of Bœotian League; supported Persians against Greeks in invasion of V. cent.; sided with Sparta against Athens in Peloponnesian War, but subsequently became rival of Sparta, whom she defeated at Leuctra, 371 B.C., thus obtaining supremacy among Gk. states; came under domination of Macedon, 338 B.C., destroyed by Alexander, 335; subsequently rebuilt. Modern town has pop. of *c.* 3600.

THEFT in its simple form is known to the law as LARCENY, the act of dealing with anything capable of being stolen, with the intention of permanently converting the thing to the use of any other person than the owner. Thus, if a carter converts his master's cart to his own use; or a man finds lost property, and, knowing the owner, converts it to his own use; or if a man finds money in a bureau sent to him for repairs, and appropriates it; or if a post-office clerk destroys letters to hide his mistake in sorting—all these acts amount to larceny. To receive stolen goods, or money, knowing them to have been stolen or unlawfully obtained, is a crime. It is also a crime to take any money or reward directly or indirectly, on the pretence of helping any person to recover any stolen property, unless the receiver uses due diligence to cause the offender to be brought to trial. T. from buildings was formerly treated as a separate offence of many kinds—stealing in a dwelling-house, church-breaking, house-breaking, burglary, etc.

Burglary is the breaking and entering a dwelling-house between 9 p.m. and 6 a.m., with intent to commit a felony, or the breaking out after having committed one inside, or after having gone in with the intention of committing one. 'Breaking means the breaking of any part, internal or external, of the building itself, or the opening by any means whatever of any door, window, shutter, or other place of entry. 'Entering' means entrance into the house of any part of the offender's body, or of any instrument used for the purpose of intimidation, or for removing goods. The maximum penalty upon conviction is penal servitude for life.

House-breaking between 6 a.m. and 9 p.m. is not burglary, and includes t. from outhouses, shops, schools, etc.; the slighter nature of the offence probably dates from O.E. legislation—maximum punishment, 14 years' penal servitude. Burglary may also be **Robbery**, which is theft with violence or the show of violence, and formerly a capital felony.

Highwaymen, mounted road-robbers of XVII. and XVIII. cent's, glorified by romantic fiction as 'gentlemen of the road'; famous highwaymen were Claude Duval (1643–70), John Nevison (hanged at York, 1684),

Jack Sheppard (1702–24), Dick Turpin (1705–39), Jerry Abershaw (1773–95).

Brigandage (O.Fr. *brigand*, irregular soldier), robbery by armed bands of outlaws, is historically important in Italy, Spain, and Greece. Similar bands appear in early history of all countries, *e.g.* Robin Hood and 'merry men' in England, 'broken men' of debatable land, or borders. B. grew up in Greece under Turk. rule and flourished in early days of independence; brigands of Naples and Sicily are notable. Famous brigands are 'Jack the Skinner' (Johann Buckler), Pietro Mancino and his banditti, and Roque Guinart (character in *Don Quixote*).

Piracy is 'robbery within the jurisdiction of the admiralty.' The Act now in force is that of 1837, by which piracy, accompanied by attempt to murder, is felony. According to Coke a pirate is *hostis generis humani*, and therefore (Blackstone) every community may inflict punishment upon him; he is distinguished from privateer, who carried letters of marque. Masters of Eng. ships of certain size were forbidden to surrender to pirates without resistance by statute 22 & 23 Charles II. In the course of history various bands of pirates have attained celebrity; they were frequently formed by outlaws; the chief are—(1) The pirates who infested the Mediterranean, 67 B.C. (2) Barbary pirates. (3) Buccaneers of Span. Main. (4) Irish 'sea tories' of XVII. cent. Eng. colonial governments of XVII. and XVIII. cent's lived in continual dread of piratical descents. West Indies and North Africa remained homes of daring and famous pirates till beginning of XIX. cent.; lingered in Sicily and Gk. islands; now relegated to Far East. Those of North Africa were famous as the BARBARY PIRATES, whose chief port was Algiers, but who also sailed from Tripoli, Tunis, Salle, and other places. Their depredations were most widespread during the XVI. cent., and their power was not finally broken until 1830. They preyed upon the shipping of all nations, and their captives were condemned to slavery. Many of the richer victims were enabled to buy their freedom, but few of the ordinary captives ever escaped from the clutches of their cruel masters. Many attempts were made to suppress the pirates. Blake led an expedition against Tunis in 1655, and during the reign of Charles II. both the English and Dutch undertook frequent operations against their common enemy. The French bombarded Algiers in 1682–83; the English, under Admiral Neal, in 1824; but not until 1830 did France finally reduce it.

The name **Buccaneers** was given to pirates who infested Span. territory in XVII. cent. The term was originally applied to Fr. hunters of St. Domingo, who dried and smoked flesh on *boucan*, then to freebooters of all nations, for whom St. Domingo was original centre and illicit trade in meat first started; Tortuga, Span. island, N.W. of Hispaniola, final headquarters, and all b's united in enmity to Spain, whose trading monopolies they infringed with the connivance of England, Holland, and France. Span. colonies plundered by b's under Britons, Mansfield and Morgan, 1654; Panama sacked with view to capturing Span. ingot, 1671; Span. merchantmen driven from the seas, 1680–85. Political changes put an end to buccaneering: England and France became enemies, while both sought alliance of Spain; but b's had played important part in commercial and colonial decline of Spain. Lloyd's still insure against 'pirates, rovers, and thieves,' for whose depredations the shipowner is not liable.

The **Camorra**, a Neapolitan secret society, was formed about 1820 for purposes of murder, robbery, and blackmail. It had twelve centres in Naples and branches in all the chief Ital. towns. At first its energies were directed against private individuals, but acquired political scope. In March 1911 the famous C. trial commenced at Viterbo, and, after over 300 sittings, closed in July 1912, the prisoners receiving sentences of from 4 to 30 years' imprisonment.

Bushrangers, the name given to bands of robbers who formerly infested parts of Australia and Tasmania. They first appeared in Tasmania c. 1815, but were most troublesome in New South Wales and Victoria 20 years later. Earliest were escaped convicts; they terrorised whole districts, robbing and [illegible]rs and stealing cattle. In several cases martial law had to be proclaimed to rid the infested districts of them. The last to give any trouble was the Kelly gang in 1879.

THEGN, THANE, an Anglo-Saxon word signifying a retainer; ranked beneath the *æthel*, but above the *ceorl*. The status of t. was either inherited or acquired by service. The order was subsequently divided into king's t's and t's ordinary.

THEINE, see CAFFEINE.

THEINNI (23° 30′ N., 98° E.), Shan state, Upper Burma. Area, 8730 sq. miles. Pop. *c.* 200,000.

THEISM may be roughly defined as belief in a God or gods, but it is important at the outset to distinguish T. and related or contrasted theories of the universe. At the present time T. is generally used of belief in a *personal* God as distinct from an *impersonal* God, belief in which is called Deism. In the ordinary sense therefore T. may be either Christian or non-Christian; thus Jews and Muhammadans, like Christians, are Theists, while, *e.g.*, Buddhists are not. Besides this usual sense, T. was employed (1) in the XVIII. cent. to mean what we mean by Deism; (2) by certain XIX.-cent. thinkers, such as F. W. Newman and Charles Voysey, to mean non-Christian T.—a type of religion naturally finding in England few adherents. Atheism signifies the absolute denial of God's existence, and Agnosticism the attitude 'We do not know.'

T. may be, but is not generally, used to cover *polytheism*—belief in many gods—or *pantheism*, a philosophical religious theory according to which God has no existence outside the universe which contains Him, and in which, so to speak, He is imprisoned.

The existence of God, according to some thinkers, came under the domain of 'Natural Religion' as distinct from what was distinctively Christian and therefore the special subject of revelation. But the term now employed is 'Philosophy of Religion.' Though for the Christian the Theistic and distinctively Christian elements can hardly be sundered, one is primarily metaphysical, the other primarily historical, and the theologian who wishes adequately to treat of T. has to deal not only with philosophy and dogma but with Comparative Religions.

But T. not only has to be brought into relation with other aspects of religion, it has several problems to face in itself. We cannot believe in God at all without some idea of what God we worship, even though He be largely incomprehensible. Our belief in God is modified according as we believe in (1) human immortality, or (2) freedom of the will. (1) If we be immortal beings and of like spiritual nature with God the fact cannot be without its significance for our relation to Him. (2) Are we free agents who can help or hinder God, or creatures set here with divine foreknowledge of our future lot? One must remember that certain aspects of the Divine nature which we are wont to assume cannot be accepted without question. Thus, in what sense can we say that God is omnipotent? Or how far is He capable of sacrifice or suffering? We have no right to assume that He is not. In the XVIII. cent. the tendency was to make an external view of God: He created the universe and then left it to itself. In reaction from this there is the tendency as in the New Theology to regard God as only a Spirit acting in and through the world; the difficulty is to balance the transcendent and the immanent. The one ends in the idea either of an autocratic monarch acting only from the outside—or else in materialism, the other in pantheism.

T. can be studied in relation to the various philosophical theories by which it is defended or attacked. Thus *Empiricism* furnishes the 'argument from design'

which colours XVIII.-cent. thought. *Intuitionalism* stands between this and *Idealism*. These cannot be discussed in detail, but this last raises some important points. The idealistic argument for T. is not a very safe one, though it was defended by Bp. Berkeley. His position is: the world only really exists in so far as it exists in the mind of God. An Idealist is not necessarily a Theist nor a Theist an Idealist.

A rigid scientific Materialism, if combined with Determinism, leaves no room for God. A spiritual interpretation is not necessarily Theism or at any rate Monotheism: James is really Polytheistic.

The historical development of t. cannot here be treated, but we may note (1) Christian T. owes much to Gk. philosophy—for a theistic theory was evolved by Gk. thinkers. (2) The spirit of any age affects the method of thought of all thinkers, whatever side they may take. Thus the XVIII., XIX., and XX. cent's all give the problem of T. a fresh complexion. It must never be forgotten that we are too apt to conceive of God as like ourselves—this applies especially to thinkers whose conception of God is personal, and while we are bound to speak in accents of our time they cannot be ultimate as the truths they seek to express.

Flint, *Theism, Antitheistic Theories, Agnosticism*; Martineau, *Study of Religion*; Caldecott and Mackintosh, *Selections from the Lit. of T.*

THEISS, Tisza (ancient *Tissus* or *Tisia*) (47° 58′ N., 21° E.), river, Hungary, formed by the union of Black and White T.; flows with a winding southerly course of 800 miles to the Danube, near Titel.

THELOHANIA, a genus of Sporozoa (*q.v.*).

THEMISTOCLES (*c.* 515–449 B.C.), Athenian statesman and general; in many ways formed model for later unprincipled Athenian Alcibiades (*q.v.*), though without his birth and culture; builder of Athenian sea-power, securing ostracism of conservative Aristides, 483; won great naval victory of *Salamis* over Xerxes, 480, and restored Athens; ostracised, *c.* 476.

THEOBALD, prior of Bec, 1127; abbot, 1137; abp. of Canterbury, 1138.

THEOBALD, LEWIS (1688–1744), Eng. writer and Shakespearean critic; in 1726 pub. pamphlet attacking Pope's edit. of Shakespeare, to which Pope replied by making him the hero of the *Dunciad*. His edit. of Shakespeare is, however, much superior to Pope's.

THEOCRITUS (III. cent. B.C.), Gk. pastoral poet; b. Syracuse. There are few reliable details regarding his life, save that he lived at Cos, Alexandria, and Syracuse, and was a friend of the poet-astronomer Aratus and the physician Philinus. Many poems attributed to him, some of doubtful authenticity; all written in Doric dialect. Like Burns, T. sang the simple life and rustic pleasures of the peasant, but he also wrote short epics on mythological subjects, and sketches of contemporary life and events. His most famous idyll is his 15th, which describes the festival of Adonis at Alexandria. Vergil imitated him (see Vergil), and there is much of similar nature in Romaic ballads.

THEODOLITE, surveying instrument used for measuring horizontal and vertical angles; really an altitude and azimuth instrument, consisting mainly of a small telescope mounted on a vertical segment of a graduated circle, which again is mounted on a horizontal graduated circle, the whole supported on a light tripod.

THEODORA (fl. VI. cent.), Byzantine lady, said to have been disreputable dancer and actress, but it was 'impossible for unaided man to describe or portray her beauty'; m. Justinian, 525, and on his accession, 527, became empress with equal powers and *de facto* sole ruler; high-spirited woman; chid Justinian when he wished to fly at outbreak of Nika revolt, 532; differed from emperor as to Monophysite heresy; character vilified by Procopius in biased *Anecdota*.

THEODORE, name of three tsars of Russia: Theodore I. (1557–98), tsar, 1584; governed by boyar Boris Godunov, who succ. and left s., Theodore II. (1589–1605), tsar, 1605; was murdered. Theodore III. (1661–82), tsar, 1676; great reformer.

THEODORE (602–90), abp. of Canterbury, 668; often called 'T. of Tarsus,' from name of birthplace.

THEODORE LASCARIS (d. 1222), founder and emperor of new Rom. state of Nicæa, 1206; captured Byzantine emperor, Alexius III., 1210; grandson, Theodore II. of Nicæa, wrested Thrace from Bulgarians, 1255–56.

THEODORE OF MOPSUESTIA (350–428), Christian writer of Antiochene school; bp. of M. in Cilicia, 392; very learned; T. wrote commentaries on nearly all Biblical books; he interpreted them historically, more like modern scholars than men of his time, who allegorised; of his dogmatic writings some were condemned after his death and some lost. Some were preserved by the Nestorians in Syriac translation.

THEODORET (*c.* 393–457), theologian; b. Antioch. As bp. in Syria devoted himself to the conversion of Marcionites, and built numerous churches, bridges, etc. Active in the Antioch school of theology on behalf of Nestorius against Cyril of Alexandria. Deposed by the Robber Council of Ephesus, but reinstated by Council of Chalcedon.

THEODORIC (*c.* 455–526), king of the Ostrogoths; ed. at Byzantine court, but returned when about eighteen to Pannonia and commenced series of semi-mythical victories; perhaps at emperor's invitation invaded Italy to displace Odoacer, 488; conquered Italy except Ravenna, 489; took Ravenna and slew Odoacer, 493; established Ostrogothic kingdom; long, peaceful reign of great benefit to Italy; executed Symmachus and Boethius (*q.v.*).

THEODOSIA (formerly Kaffa) (45° 3′ N., 35° 20′ E.), seaport, watering-place, Taurida, Russia; large export trade in grain; founded by a colony from Miletus; in Middle Ages became chief port on Black Sea; taken by Turks, 1475. Pop. 29,000.

THEODOSIUS I., 'the Great' (*c.* 346–95), Byzantine emperor; s. of Theodosius (d. 376), general in Britain; became joint-emperor with Gratian, 379, receiving eastern division; subdued Goths, 382; defeated rebel Maximus at Aquileia, 388, and confirmed Valentinian II. as Western emperor; defeated Arbogast and Eugenius, 394; f. of Emperors Honorius and Arcadius. **Theodosius II.** (401–50), Byzantine emperor, 408; met encroachments of Huns weakly. **Theodosius III.** seized Eastern empire, 716–17.

THEODOSIUS OF TRIPOLIS (*c.* I. cent. B.C.), Gk. mathematician; wrote treatise on pure geometry of surface of a sphere, probably derived from similar work of IV. cent. B.C.

THEODULF, bp. of Orleans, 781–818; minister of Charles the Great; d. 821.

THEOGNIS OF MEGARA (VI. cent. B.C.), Gk. poet; b. Megara; banished by oligarchs. Of his elegiacs only a few lines remain, quoted by Plato.

THEOLOGY, may be defined as the science of religion, in its narrower significance being concerned simply with the being and attributes of God; also ordinarily confined to Christian t., but scientifically this is not admissible. T. can only be valid if we believe in spiritual realities; otherwise it is either philosophy or mere speculation, or a jumble of words devoid of meaning. If t. is a science at all, it is the queen of sciences. The student of t. is met at the outset by many religions, some local or national, some, pre-eminently Christianity and Buddhism, claiming to be universal. In the earlier stages of any religion t. is implicit rather than explicit; the working out of dogma as of ecclesiastical authority only comes with time. But religion without t. is impossible; men cannot, except during a short period of intense excitement, believe without knowing what they believe.

The t. of the non-Christian is best studied separately under each religious system, or together as part of the new science of Comparative Religion. Christian t. is a unity in itself and of obviously special importance. T. being first and foremost the science of God, and Christianity being monotheistic (if such a phrase be admitted), we should expect to find in the forefront theories about the Deity, but Christian t. has naturally focused itself on the person of Christ. The doctrines of the Trinity and the Incarnation are both attempts to state and reconcile the unity of God, the deity of Christ, and the unity of His person. Hence the first stage in the development of Christian t. was marked by Christological controversies; the great landmarks here are the Councils of Nicæa (325) and Chalcedon (451); disputes have continued at intervals ever since. Our own day has seen fresh outbursts of Christological controversy.

Christian theologians were only endeavouring to develop what was in Scripture, but t. was growing before the canon was completed. St. Paul was the first Christian theologian, but after the Johannine writings there is a lull, till we come to the Gk. thinkers Origen and Clement of Alexandria, and also Irenæus and Tertullian. But none approached St. Paul till St. Augustine. Inheriting the Gk. thought in which Christianity had been steeped almost from the outset, he fused it in his own spiritual experience and founded Western t. He had little influence in the East, which remained fossilised at an earlier stage of development. St. Augustine stands at the meeting-point of the ancient and mediæval worlds, and there were no great theologians after him till the scholastics of the XII. and XIII. cent's.

Nothing can be more unfair than to condemn scholastic thought as futile; in many ways it shows as much intellectual power as that of any age or time, but it moved entirely within certain lines. Though mediæval t. moved in Orthodox lines, there are more than slight traces of rationalism in Abelard and others. The Renaissance opened up an old world and created a new one, and the Reformation t. started with practical rather than theoretical points. The idea of 'justification by faith' lay at the root of Reformation disputes, but it has lost much of its interest at the present day, other points being the centre of controversy. On the Prot. side Luther and Calvin were the greatest men. Catholic t. was the outcome of the Church as a whole rather than the work of individuals. Eng. t. in the XVI. and XVII. cent's was occupied with the struggle of Puritanism with other types of religion.

The XVIII. cent. was for the most part a period of theological stagnation, but the XIX. has seen important work done in all Churches. The two main lines have been the return to tradition, witnessed by the Oxford Movement and the growth of Catholicism; on the other side, with the growth of science and the rise of hist. criticism, a liberal movement.

T. can also be approached from the side of psychology, as by William James and others.

T. in an academic sense includes everything that has any bearing on Christianity or other religions, doctrine and history and the sacred languages in which the Scriptures are written. See RELIGION, CHRISTIANITY, THEISM.

Gwatkin, *The Knowledge of God*; James, *Varieties of Religious Experience*; Bethune Baker, *Introduction to Study of Christian Doctrine*.

THEOPHANES, THE CONFESSOR (758–817), Gk. monk, persecuted by iconoclasts; exiled to Samothrace; wrote *Chronographia*; rebuked by Emperor Leo. IV. for his extreme unworldliness.

THEOPHANO (956 ?–91), dau. of Byzantine emperor Romanus II.; exercised strong influence on her husband, Otto II.

THÉOPHILE DE VIAU, VIAUD (1590–1626), Fr. poet; b. Gascony; disapproved of reforms of Malherbe (*q.v.*); wrote play, *Pyrame et Thisbé*; *L'Histoire Comique* shows him as critic; died after long imprisonment; influenced several great authors.

THEOPHILUS (829–842), Byzantine emperor; suffered great disasters from Muhammadans at *Dasymon* and in sack of Amorium, 838, but fortunate in internal policy.

THEOPHRASTUS (fl. IV. cent. B.C.), Gk. philosopher; b. Eresus, Lesbos; for thirty-five years head of Peripatetics at Athens after Aristotle's death.

Jebb, *Characters of Theophrastus* (text and trans.).

THEOPHYLACT, Gk. theologian; d. early XII. cent.

THEOPOMPUS (b. c. 380), of Chios; Gk. historian and rhetorician; became a pupil of Isocrates; banished from Chios, 305 B.C. His works, now lost, were a *History of Greece* and a *History of Philip of Macedon*.

THEORBO, lute-like instrument with double neck and sets of pegs; used especially XVI.–XVII. cent.

THEOSOPHY (Gk. 'wisdom of God'), term used of certain forms of thought which claim special contact with the Divine. The theosophist makes the Divine the centre of everything and believes he can come into special contact with God. On its speculative side it merges into mysticism, and theosophists formulate fantastic theologies. T., however, is a loose term and includes various systems, such as that of the Kabbalah, also forms of Gnosticism and Neo-Platonism. Of a similar nature are the systems of the mystics Eckhart and Boehme (*qq.v.*).

In 1875 the Theosophical Society was founded, and thus the term has acquired a special meaning. Its chief purposes are to encourage the brotherhood of man, and to follow up the world-religions, particularly Oriental mysticism and occultism. The chief source of its inspiration is Buddhism—indeed, it may almost be said to represent Buddhism in the West. Its leading spirit was Mme Blavatsky (*q.v.*), who developed occult powers, and the Society has been rather one of propagandism than of study. Theosophists also have Brahman elements in their belief, and their central doctrines are those of Karma, and the 'Path,' or way of emancipation, culminating in the attainment of Nirvana.

Annie Besant, *Theosophy* (Jack, 1912); *The Ancient Wisdom: An Outline of Theosophical Teaching* (1897).

THÉOT, CATHERINE, Fr. religious fanatic; d. 1794.

THERALITE, group of rare Plutonic rocks, nepheline, basic plagioclase, augite, and olivine; found in West Alps, Madagascar, and Montana, U.S.A.

THERAMENES (d. 403 B.C.), Athenian statesman and general; leader of anti-democratic movement which followed misfortunes in Peloponnesian War; proposed to restrict franchise; distinguished himself at battles of *Cyzicus*, 410, and *Arginusæ*, 406; negotiated peace, 404; failed to establish moderate democratic constitution; forced by Critias to drink hemlock.

THERAPEUTÆ, ancient Jewish ascetic order closely resembling Christian monks and also the Essenes. They lived in Egypt and are only known to us from the description by Philo in *De Vita Contemplativa*. They spent their time studying the Scriptures and fasted severely; abstained from meat and drank only water.

THERAPEUTICS, term applied to that branch of med. which deals with the means employed for the maintenance of health or the cure of disease. Some remedies are used without any knowledge of how they act upon the system, merely because they have proved of benefit before in similar conditions, such as colchicum for gout. But the more valuable remedies are employed in a rational manner, their mode of action having been ascertained by observation and experiment, so that, by understanding the action of the remedy, the condition may, to some extent, be prevented; such a remedy is thyroid extract, which has a striking effect in myxœdema, a child who, through

deficiency in the thyroid gland, is a stunted idiot, becoming, under its influence, both healthy and intelligent.

The most important cause of disease is the action of micro-organisms, which enter the body in various ways, grow and multiply, and produce toxins or poisons which injure or even destroy the tissues. The skin and mucous membranes act as barriers against the micro-organisms, while after they have gained access to the blood and to the tissues they are attacked by the white blood corpuscles, which ingest and destroy them, while antitoxins are formed by the blood to neutralise their toxins. In order to assist nature, various methods are employed. The amount of blood at the affected part is increased by hot fomentations, or by bandages or suction bells passive congestion of the veins is brought about (Bier's method), so that more white blood corpuscles are brought to the part to resist the invading micro-organisms. In addition, antitoxins and antiserums are prepared artificially from bacteria and bacterial products of various diseases, and are injected to overcome the effect of the toxins of the specific bacteria; by modern research and experiment the number of diseases which can be treated in this way is gradually growing larger.

Following the results which have been obtained by the use of the thyroid extract of sheep in cases of myxœdema and cretinism, due to deficiency of thyroid secretion, certain other organs or extracts from them have been made use of in t., such as pepsin, extracted from the stomach of calves, for dyspepsia, bone marrow for anæmia, pituitary gland extract for acromegaly, suprarenal gland extract for Addison's disease.

The term t. must be understood as meaning much more than the application of drugs for the cure of disease; fresh air and nourishing food are often far better therapeutic agents than any drugs, and suitable exercises, dietary, and health resorts have the most valuable effects in different conditions. The following articles should be consulted: DIETETICS, GYMNASTICS, HYDROPATHY, HYPNOTISM, ELECTRO-THERAPEUTICS, BATHS, PHARMACOLOGY, HOMŒOPATHY, MASSAGE, TUBERCULOSIS (treatment), INSANITY (treatment), and the treatment of other diseases under their different headings.

Cushing, *Text-Book of Pharmacology and Therapeutics* (1910); Bruce, *Materia Medica and Therapeutics* (1907).

THERESA, ST., TERESA (1515–82), Span. mystic; entered Carmelite convent of Incarnation, 1533; converted, 1554, and fell into a trance, after which she constantly had visions. Finding discipline not strict enough, she started a new order at Avila, 1562, obtaining a bull from the pope; later she founded new houses; canonised, 1622. A great mystic, she was also a very able woman of affairs.

THEREZINA (5° 47′ S., 41° 58′ W.), city, on Parnahyba, capital, Piauhy state, Brazil; manufactures cotton, soap. Pop. *c.* 45,000.

THERMAL SPRINGS, see MINERAL WATERS.

THERMOBIA, 'FIRE-BRAT' (*q.v.*).

THERMO CHEMISTRY, see CHEMISTRY.

THERMODYNAMICS—branch of ENERGETICS (*q.v.*)—treats of the relation between Heat and Work. The subject is governed by two laws. The first is the result of experiments carried out by Joule, who measured the heat developed by the performance of a known amount of work on various substances, and stated that 'Whenever work is converted into heat or heat into work the ratio of the work to the heat is constant.' This ratio, called *Joule*, is equal to 42,000,000 *ergs*.

The second law has been expressed by Lord Kelvin thus: 'It is impossible, by means of inanimate material agency, to derive mechanical effect from any portion of matter by cooling it below the temperature of the coldest of surrounding bodies.' Clausius stated this more simply: 'It is impossible for a self-acting machine, unaided by any external agency, to convey heat from one body to another at a higher temperature.' This is in accordance with experience, for 'unaided by any external agency' heat cannot be transferred from the condenser of an engine to the boiler. When considering Lord Kelvin's statement it must be remembered that it only refers to a *cycle* of operations, that is, a series of operations in which the substance acted upon is finally brought back to its initial state. For example, a gas may, by expansion, do work and become cooled below the temperature of surrounding bodies, but if it is brought back to its initial state work will have to be done *on* it and the law will then be found to hold.

These laws find practical application in the heat engine, which is a contrivance for changing heat, supplied by some source like the boiler, into work. It is proved mathematically that in the case of a 'perfect' engine (one where no heat is lost through friction, etc.), the heat utilised for mechanical work depends on the difference in temperature between the source and condenser. Since the efficiency of the engine is the extent of its ability to do work, it follows that its efficiency depends on the range of temperature between which it is working. The advantage of a steam-engine in which superheated steam can be used at once becomes obvious.

THERMO-ELECTRICITY, see ELECTRICITY.

THERMOMETERS are instruments which indicate on some definite scale the temperature of their surroundings, and that branch of the science of heat which deals with the determination of temperature is known as **Thermometry.**

With one exception, to be noted presently, all SCALES of temperature and all methods of determining temperature are based on changes which take place in one or other of the physical properties of matter in consequence of a change in temperature. That most commonly used is the fact that, generally, a body increases in dimension when heated. For example, the *mercurial* t. depends on the fact that mercury, when heated through a given range of temperature, increases in volume by a greater amount than does the glass envelope in which it is contained. Ordinarily, the instrument consists of a glass tube of very fine bore, at one end of which a bulb is blown. Mercury fills the bulb and a portion of the stem. Air is expelled from the remainder of the stem, the upper end of which is hermetically sealed. The instrument is *graduated* in the following manner: the bulb is immersed in a mixture of ice and water, and when the mercurial column in the stem has reached a steady position, a mark is made on the stem at that position. The instrument is then placed in the steam issuing from water which is boiling under a pressure of 760 mm. of mercury (accurately 760 mm. in latitude 45°), and another mark is made at the point reached by the mercurial column. The length of stem between the two marks so determined is then divided into 100 equal parts if the scale to be used is the *Centigrade* scale, or 180 if the *Fahrenheit* scale is adopted. In the former case the ice point is marked 0 and the steam point 100; in the latter these are 32 and 212 respectively. Each unit on the scale is referred to as 1 degree, Centigrade (C.) or Fahrenheit (F.), as the case may be. Obviously, 1° C. equals $\frac{9}{5}$ degrees F., or 1° F. equals $\frac{5}{9}$ degrees C.

In order that the readings of one mercurial t. may be comparable with those of another, precautions must be taken as regards method of graduation and conditions in which readings are taken. To eliminate all possible sources of error, *corrections* have to be applied to the readings. Among these, the correction for change of zero has to be noticed. The bulb of a thermometer contracts for some time after it has been blown, and this causes a rise in the ice point, which must be allowed for. Again, if the instrument is exposed to a high temperature, the ice point will fall slightly. These changes are minimised by the use of Jena borosilicate glass in the construction of t's. Any good t. may be examined for corrections

necessary, and standardised at the National Physical Laboratory. The mercurial t. is applicable through a range of temperature extending from about −40° C. to + 330° C. For lower temperatures, *alcohol* and *toluol* are used instead of mercury. The upper limit may be extended to about 500° C. by filling the stem with nitrogen under pressure.

The expansion of gases is much greater than that of liquids, and (with certain restrictions) their coefficients of expansion are nearly equal. These facts have led to their employment as thermometric substances. They expand almost equally for equal rises in temperature when kept at constant pressure, and similarly increase in pressure when kept at constant volume. The *hydrogen* t. of the International Bureau of Weights and Measures is now the standard t. for scientific purposes. The use of *Gas* t's is restricted to scientific investigations.

Another property of matter whose variation with temperature has been used for thermometric purposes is the electric resistance of metals. It has been found that in pure metals the resistance increases nearly in proportion to the increase in temperature. This method has been successfully applied to the determination of temperature through a much wider range than is possible with a mercurial or other liquid t. The metal generally employed is platinum. The wire used for the purpose is coiled upon a mica frame inside a bulb, and the t. is calibrated by finding its resistance when placed in melting ice, in steam, and in boiling sulphur. From the data so obtained it is possible to find the temperature corresponding to any other resistance. Temperatures may also be measured by properly calibrated thermo-electric junctions. See THERMO-ELECTRICITY.

The exception to the usual practice of basing thermometry on some physical property of a particular substance is that known as the *thermodynamic* or *work scale* of temperature, first proposed by Kelvin. An ideal heat engine takes in a certain amount of heat from a source of supply, transforms a certain fraction of this amount into useful work, and passes the remainder into a receiver. (In the case of the ordinary steam engine the boiler is the source and the condenser is the receiver.) The fraction converted into heat depends, not on the substance which conveys the heat, but on the temperatures of receiver and condenser, and, in an ideal engine, these temperatures are in the same ratio as the quantities of heat taken in and given out. If all the heat received were transformed into work, no heat would be passed into the receiver, and the temperature of the receiver would be zero on a scale which is in no way dependent on the properties of the particular substance used. This is termed the absolute zero, and it corresponds to −273° C. Temperatures cannot be determined practically and directly on this thermodynamic scale, but it is possible to reduce temperatures otherwise observed and expressed in other scales to the equivalent on that scale.

Preston, *Theory of Heat*; Edgar, *Heat*; Chatelier and Burgess, *Measurement of High Temperatures*; Maxwell, *Theory of Heat*.

THERMOPYLÆ (38° 48′ N., 22° 32′ E.), pass, from Locris to Thessaly, Greece; scene of famous resistance of Spartans under Leonidas against invading Persians, 480 B.C.; Antiochus defeated here by Romans, 191 B.C.

THÉROIGNE DE MÉRICOURT, ANNE JOSÈPHE (1762–1817), handsome Fr. courtesan, who during Revolution devoted herself to inciting mob to violence; seized by women, stripped, and flogged, 1793; went mad, 1794.

THEROMORPHA, extinct REPTILE (*q.v.*).

THEROPITHECUS, see under CERCOPITHECIDÆ.

THESEUS, legendary hero of Attica; s. of Ægeus of Athens; reared at Trœzen, and on reaching maturity proceeded to Athens. During this journey he showed his prowess by slaying various giants and robbers. From Athens T. went to Crete along with the seven youths and seven maidens who were sent as prey to the Minotaur. Ariadne, daughter of Minos, gave him a sword and clue by which to overcome the Minotaur. Theseus abandoned Ariadne at Naxos on the homeward voyage. He was subsequently slain by the treachery of Lycomedes.

THESMOPHORIA, Gk. festival, lasting in all for five days; said by Herodotus to have been imported from Egypt; origin probably *thesmoi*, 'things set down, *i.e.* on the altar,' and *phera*, 'I carry'; celebrated in honour of *Demeter Thesmophorus* by women; during feast prisoners were released and law courts closed. One rite was to throw into caverns flesh or figures of pigs in memory of Eubuleus, who, with his herd, was engulfed in the chasm through which Pluto carried off Persephone (such a chamber with remains has been unearthed at Cnidos). The flesh was afterwards drawn up and divided among the worshippers, who, to ensure a successful harvest, sowed it in the fields. This custom probably represents decay of crops and an appeal for their renewal.

J. G. Frazer, *Golden Bough* (vol. ii.).

THESPIÆ (38° 18′ N., 23° 10′ E.), ancient city, Bœotia, Greece; noted for its mythological associations.

THESSALONIANS, EPISTLES TO THE, chronologically the earliest of St. Paul's writings—the earliest, therefore, of all New Testament books; undoubtedly genuine. In *I. T.* St. Paul writes to strengthen the converts in love; this epistle is specially important for its eschatological teaching (4^{13} *et seq.*), wherein he teaches that at the Second Advent those who are still alive will be caught up to meet the risen dead. *II. T.* is also eschatological, and expounds the doctrine of Antichrist, the man of sin (or lawlessness). The epistles represent the earlier stage of St. Paul's theology.

Milligan, *I. and II. Thessalonians*; Frame in *International Critical Commentary*.

THESSALY (39° 40′ N., 22° 20′ E.), N.E. district, Greece, lying between Ægean Sea and Epirus; surface generally level, plain bordered by mountains, which include Olympus and Pindus. T. was subdued by Philip of Macedon, 344 B.C.; remained under Macedon till 197 B.C., when it had passed into hands of Rome; captured by Turks, 1355, who had to yield most of it to Greece, 1881. During the Turko-Balkan War (*q.v.*) the Greeks invaded Turkish T., and marching through it besieged and captured Salonica.

THETFORD (52° 25′ N., 0° 45′ E.), town, at junction of Thet and Little Ouse, Norfolk and Suffolk, England; breweries; was capital of East Anglia. Pop. (1911) 4778.

THÉVENOT, JEAN DE (1633–67), Fr. Orientalist; b. Paris; travelled widely in Egypt, Palestine, Persia, and India. His *Voyages*, though superficial in observation, contain much interesting information.

THIAZINES, compounds containing a ring of 1 nitrogen, 1 sulphur, and 4 carbon atoms; among their derivatives are dyes.

THIBAUDEAU, ANTOINE CLAIR, COMTE (1765–1854), Fr. politician; pres. of Convention and member of Committee of Public Safety; assisted Napoleon, and fled after 1815; important *Histoire de Napoléon*.

THIBAUT IV., THEOBALD IV. (1201–53), count of Champagne and Brie, and king of Navarre, Fr. soldier and poet; admirer of Queen Blanche of Castille, for whom he wrote most of his *Chansons*; went on crusade, 1239; poetry graceful and delicate.

THIBAUT, ANTON FRIEDRICH JUSTUS (1774–1840), Ger. jurist; ed. Göttingen, Königsberg, and Kiel; prof. of Civil Law at Kiel, 1798; at Jena, 1802–6, and friend of Goethe and Schiller; at Heidelberg, 1806; pub. several important legal works.

THIBAW (22° 15′ N., 97° 28′ E.), Shan state, Upper Burma; area, 5090 sq. miles. Pop. 115,000.

THIBET, see TIBET.

THIELT (50° 59′ N., 3° 23′ E.), town, W. Flanders, Belgium; lace, wool, cotton, linen. Pop. 12,300.

THIERRY, AMÉDÉE (1797–1873), bro. of Augustin; also historian, but of less importance; wrote books on early Fr. history.

THIERRY, AUGUSTIN (1795–1856), Fr. historian; b. at Blois; skilled narrator and accurate, as far as resources of time permitted; set example of research into sources of early Fr. history; blind and partially paralysed for thirty years, but continued to dictate his works.

THIERS (45° 51′ N., 3° 33′ E.), town, Puy-de-Dôme, France; cutlery. Pop. 13,000.

THIERS, LOUIS ADOLPHE (1797–1877), Fr. statesman and historian. In 1830 T. commenced contributions to *National* which prepared July revolution; successively Minister of Interior, of Commerce and Public Affairs, and of Foreign Affairs, 1832-36; won great influence as epigrammatic speaker and sensible politician; adopted aggressive war-policy—a grave mistake; pres. of Council, 1836 and 1840, when he became Foreign Minister again and encouraged Mehemet Ali; unfavourable to Revolution, 1848; opposed Second Empire, and after release from imprisonment led constitutional opposition. His unwise patriotism was largely responsible for the Franco-Ger. War, but he atoned by negotiating 'liberation of the territory,' 1871; Pres. of Republic, 1871–73, did good service in its organisation against opposition of Gambetta, etc.; diffuse, partial, often inaccurate historian, but enthusiastically received at the time.

Rémusat, *Thiers* (Eng. trans., 1892).

THIOPHENE (C_4H_4S), a liquid with a faint odour, found in benzene extracted from coal tar.

THIRLBY, THOMAS (1506–70), bp. of Westminster, 1540, Norwich, 1550, Ely, 1554.

THIRLWALL, CONNOP (1797–1875), Eng. bp. and historian; ed. Charterhouse and Trinity, Cambridge; fellow of coll. and tutor, then barrister; ordained, 1827; liberal theology; author of *History of Greece*; bp. of St. David's, 1840; learnt to preach in Welsh; supported removal of Jewish disabilities, 1848, and Irish Church Disestablishment, 1869; buried in Westminster Abbey, in same grave with Grote.

THIRSK (54° 14′ N., 1° 20′ W.), market town, N. Riding, Yorkshire, England; manufactures agricultural implements.

THIRST, see HUNGER AND THIRST.

THIRTY-NINE ARTICLES, see ARTICLE.

THIRTY YEARS WAR, series of religious wars (1618–48).

Bohemian War, 1618-20.—Bohemian Protestantism threatened by emperor; Bohemians revolted and, in 1619, refused to accept Archduke Ferdinand as king, electing Frederick V., elector palatine, the 'Winter King'; Count Thurn, aided by Prot. Union (formed 1608), won several victories, 1618, and threatened Vienna; but Austria was saved by intervention of Catholic League (formed 1609), under its great commander Tilly; Prot. states alienated by Frederick's accepting throne. Span. force, under Spinola, invaded Palatinate, while Bohemians were finally defeated at *Weisser Berg*, near Prague, 1620, and ruthlessly punished.

Palatinate War, 1621-24.—COUNT MANSFELD had already served Frederick with his mercenary army; joined by Protestant prince, margrave of Baden-Durlack, and famous Christian of Brunswick ('friend of God, enemy of priests'), he defeated Tilly at *Wiesbach*, 1622; but Tilly and Cordova won victories of *Wimpfen* and *Höchst*, conquered Palatinate, and put elector to flight; electorate bestowed on Maximilian of Bavaria. Mansfeld, however, did not disband, and ruthless quartering of his soldiery had much to do with exhaustion of Germany and Netherlands at close of war; he defeated Cordova at Fleurus and relieved Bergen-op-Zoom, 1622; Brunswick's army, however, was nearly annihilated by Tilly at *Stadtlohn*, 1623.

Danish Intervention, 1624-29.—England and France now began to intervene, England as Prot. country and elector palatine being s.-in-law of James I., France because she was uneasy at Hapsburg successes; most Ger. princes alienated by excesses of Mansfeld, but Christian IV. of Denmark insisted on maintaining the struggle; James I. sent no substantial aid, though Eng. volunteers sailed to aid cause, but Danes, with aid of Mansfeld and Christian of Brunswick, marched south to invade territory of League. WALLENSTEIN, Duke of Friedland, brilliant general lately acquired by the League, finally defeated Mansfeld at Dessau, 1626, while Tilly conquered Danes, under Christian IV., at Lutter; Mansfeld made a rapid attack on Austrian dominions, but soon afterwards died; Christian IV. was forced to agree to terms of *Peace of Lübeck*, 1629.

Swedish Intervention, 1630-36.—Aggression of emperor in N. Germany caused Sweden to take up leadership of Prot. resistance, and his Restitution Edict as to church lands alienated many of his own party who had acquired monastic spoils. Occasion of war was Wallenstein's occupation of towns of duchy of Mecklenburg, granted to him, 1628; he failed in siege of Stralsund, and Swedes overran Mecklenburg and Pomerania, 1630. King GUSTAVUS ADOLPHUS of Sweden becomes central figure of war; Magdeburg was sacked by Tilly and Pappenheim, 1631, but Tilly suffered crushing defeat at Breitenfeld, 1631, and on the Lech, 1632; Gustavus occupied Munich, but forced by Wallenstein to retreat; won great victory, but was slain at LÜTZEN, 1632; despite efforts of Oxenstierna, Protestants then lost ground; they formed League of Heilbronn, 1633; Wallenstein, who wished to end war, was murdered, 1634, but Bernhard of Saxe-Weimar, now head of Prot. army, suffered crushing defeat at NÖRDLINGEN, 1634, and Saxony made peace with emperor at Prague, 1635.

French Intervention, 1636-48.—Entire lack of unity. Sweden retained some of conquests of Gustavus Adolphus and defeated imperialists at Wittstock, 1636, Breitenfeld, 1642, Janken, 1645, and threatened Vienna. Guiding spirit, however, RICHELIEU; CONDÉ and TURENNE invaded Netherlands and poured over Rhine, winning great victories at *Rocroi* and *Thionville*, 1643, and *Nördlingen*, 1645; conjunction with Swedes for capture of Vienna planned; Austrians and Bavarians (now their only allies) defeated at Zusmarshausen, and Condé repelled Span. invasion of France at Lens, 1648; war ended by *Treaty of Westphalia*, Oct. 1648.

THISBE, see PYRAMUS AND THISBE.

THISTLE (*Carduus*), genus of plants, order Compositæ; common specimens are: Scotch T. (*Onopordon acanthium*), Spear T. (*Cirsium lanceolatum*), Plume T. (*Cnicus arvensis*); national emblem of Scotland is no one variety.

THISTLE, ORDER OF THE, see KNIGHTHOOD.

THÖKÖLY, IMRE, PRINCE (1657–1705), Hungarian soldier and statesman; led Magyars against Emperor Leopold I.; became prince of Upper Hungary; supported Turks against Austria from 1683 onwards; twice imprisoned by Turks; d. in exile.

THOLUCK, FRIEDRICH AUGUST GOTTREU (1799–1877), Ger. Prot. divine; student of Oriental languages; prof. of Theology at Berlin, 1823, and at Halle, 1826; became leader of evangelical pietism, as against orthodoxy and rationalism, laying great emphasis on spiritual experience.

THOMAR (39° 58′ N., 8° 29′ W.), town, on Nabão, Santarem, Portugal; contains some interesting ecclesiastical buildings. Pop. 7200.

THOMAS, of Bayeux, abp. of York, 1070; d. 1100.

THOMAS À KEMPIS, THOMAS HAMMERKEN (*c.* 1380–1471), Augustinian writer; b. Kempen, Cologne; received orders at the convent of Mount St. Agnes, Zwolle. His monastic life was uneventful in the extreme, but his communion with his own soul gave birth to the *Imitatio Christi*, one of the world's most beautiful religious records.

THOMAS, ARTHUR GORING (1850–92), Eng. composer; studied in Paris, 1873, Royal Academy,

London, 1877; *Esmeralda, Nadeshda* (operas); cantata, *The Sun-Worshippers*, etc.

THOMAS, CHARLES LOUIS AMBROISE (1811–96), Fr. composer; well-known opera, *Mignon* (1866); *Hamlet* (1868), *Françoise de Rimini* (1882).

THOMAS, GEORGE HENRY (1816–70), Amer. soldier; commanded in Civil War on Union side, winning battle of *Mill Springs*, 1862; played prominent part in battles of *Stone River* and *Chickamauga*; general of army which stormed Missionary Ridge, 1863; won decisive battle of *Nashville*, 1864.

THOMAS, ST., apostle, mentioned with Matthew in Synoptic Gospels; in *John* doubting Christ's resurrection. Thomas in Aramaic means twin, and in Syriac legend he is called twin-brother of Our Lord. According to doubtful tradition he preached Christianity in India.

THOMAS, SIDNEY GILCHRIST (1850–85), Brit. inventor; b. Canonbury, London; became a police court clerk, but studied chemistry. His great discovery was a means of eliminating phosphorus from iron by means of the *Bessemer converter*.

THOMAS THE RHYMER, THOMAS OF ERCILDOUNE (fl. *c.* 1280), Scot. poet mentioned in *Sir Tristrem* and wrongly supposed author of this romance.

THOMAS, WILLIAM (1819–90), bp. of Gloucester and Bristol, 1861; abp. of York, 1862.

THOMASIUS, CHRISTIAN (1655–1728), Ger. jurist; b. Leipzig; first lecturer in German tongue, Leipzig, 1687; wrote *Historie der Weishert und Thorheit*, etc.

THOMASVILLE (30° 47′ N., 84° W.), city, winter resort, capital, Thomas County, Georgia, U.S.A.; lumber industries. Pop. (1910) 6727.

THOMOMYS, see POCKET GOPHERS.

THOMPSON, FRANCIS (1860–1907), Eng. poet; author of *The Hound of Heaven*, a poem full of gorgeous purple and gold, *Sister Songs* (1895), *New Poems* (1897), a prose monograph on Shelley. See Meynell, *Memoir*; *Works* (1913).

THOMPSON, SIR HENRY, Bart. (1820–1904), Eng. surgeon; ed. University Coll., London; practised as surgeon in London, specialising in the surgery of the bladder and genito-urinary system; surgeon to Univ. Coll. Hospital (1863), prof. of Clinical Surgery (1866), prof. of Surgery and Pathology in Royal Coll. of Surgeons (1884); first pres. of Cremation Society (1874); introduced new methods of surgical treatment, particularly for urinary calculi. In addition he was an artist of merit, wrote two novels, promoted study of astronomy by gifts of valuable instruments to Greenwich Observatory, and made a fine collection of old china.

THOMSON, JAMES (1700–48), Scot. poet; b. Ednam, Roxburghshire; ed. Jedburgh, and Edinburgh Univ.; became tutor in London, 1725; held various appointments, the chief being Surveyorship of the Leeward Islands; lived near Richmond. Like Coleridge, he lacked energy and initiative.

His best-known work, *The Seasons*, is famous historically rather than intrinsically. The poetry of the time followed Pope's 'correctness.' T. broke away from the couplet and wrote in Spenserian stanza and blank verse. *The Seasons* is not free from artificiality; it is marred by T.'s pseudo-Miltonic diction, but goes straight to nature, and is full of glorious descriptive pictures. *The Castle of Indolence* is better poetry; written in Spenserian stanzas it is almost of the highest in poetry. Besides some minor poems T. wrote tragedies, e.g. *Sophonisba*, which are frankly bad. His *Masque of Alfred* contains the song *Rule, Britannia*.

Macaulay, *James Thomson* (Eng. Men of Letters).

THOMSON, JAMES (1822–92), Brit. physicist and engineer; b. Belfast; graduated Glasgow; prof. of Engineering, Belfast, then Glasgow; contributed to thermodynamics, hydraulics, and geology.

THOMSON, JAMES (1834–82), Brit. poet of pessimism and despair; b. Port-Glasgow. To the *National Reformer* he contributed his famous poem, *The City of Dreadful Night*, which later he published in book form with other sombre poems.

THOMSON, JOHN (1778–1840), Scot. painter; minister of Duddingston; best landscapist of his day.

THOMSON, JOSEPH (1858–95), Scot. geologist and explorer; geologist on the Central African expedition for opening up route to northern shore of Victoria Nyanza, 1882–83; led expedition to Sekoti, 1885; explored Atlas Mts., 1888; made extensive additions to geological, zoological, and botanical knowledge of Africa; pub. various works on Africa.

THOMSON, SIR JOSEPH JOHN (1856–), Brit. physicist; Nobel prize, 1906; contributions to electrical theory.

THOMSON, THOMAS (1773–1852), Scot. chemist; prof. at Glasgow; popularised Dalton's atomic theory, investigated atomic weights, and supported Prout's hypothesis.

THOMSON, WILLIAM, see KELVIN.

THOR, ancient Norse god.

THORACIC DUCT, see LYMPHATIC SYSTEM.

THORACOSTRACA, see under MALACOSTRACA.

THORAX, the upper part of the trunk, containing the heart and lungs, and divided from the abdomen by the diaphragm.

THORBECKE, JAN RUDOLF (1798–1872), Dutch politician; prof. at Ghent, 1825, Leiden, 1831; interested in political reform, becoming leader of liberal reform party; wrote *Aanteekeningen op den Grondwet*; *Historische Schetsen*.

THOREAU, HENRY DAVID (1817–62), Amer. writer; b. Concord, Mass.; he graduated at Harvard and became a teacher. In 1839 he made a voyage down the Concord, and later recorded his experiences in *A Week on the Concord and Merrimac Rivers*. In 1845 he retired to the seclusion of a shanty in the woods at Walden, and there wrote his masterpiece, *Walden*.

THORFINN KARLSEFNI (fl. 1000), Norse explorer; voyaged as trader from Iceland to Greenland; thence to 'Markland'—Newfoundland, and Nova Scotia, with large contingent in three vessels; attempted colonisation with part of the company.

THORIUM (Th=232·4), rare, radioactive metal, allied to cerium, obtained from thorianite (Ceylon) and monazite sand (Brazil). S.G. 11·0; burns in air. Oxide, ThO_2, forms salts: $ThCl_4$, $Th(SO_4)_2$, also K_2ThF_6.

THORN (53° 3′ N., 18° 36′ E.), fortified town, on Vistula, W. Prussia; manufactures iron; trade in grain; was a flourishing Hanse town in Middle Ages; birthplace of Copernicus. Pop. (1910) 46,227.

THORNABY-ON-TEES (54° 39′ N., 1° 19′ W.), town, on Tees, N. Riding, Yorkshire, England; ironworks; shipbuilding yards. Pop. (1911) 18,605.

THORN-APPLE (*Datura*), genus of plants, order Solanaceæ; Common T. (*D. stramonium*) yields *daturin*, a drug used in asthma; Soft-Haired T. (*D. metel*) was used by Thugs to overpower victims; Red T. (*D. sanguinea*) is used by Peruvian Indians as an intoxicant.

THORNBACK, see under RAYS.

THORNE (53° 37′ N., 0° 58′ W.), town, on Don, Yorkshire, England; manufactures boats, agricultural implements. Pop. (1911, rural district) 8782.

THORNHILL.—(1) (53° 40′ N., 1° 37′ W.) town, W. Riding, Yorkshire, England; manufactures woollens. Pop. (1911, registration district) 11,305. (2) (55° 15′ N., 3° 46′ W.) village, Dumfriesshire, Scotland; quarries.

THORNHILL, SIR JAMES (1676–1734), Eng. painter; painted St. Paul's dome, parts of Greenwich Hospital and Hampton Court.

THORNY DEVIL, see under LIZARDS.

THORNYCROFT, WILLIAM HAMO (1850–), Brit. sculptor; made his first success with *Artemis*, 1880. The portrait statues of General Gordon, in Trafalgar Square, and of John Bright, at Rochdale, are his.

THORWALDSEN, BERTEL (1770–1844), Dan. sculptor; practised his art chiefly in Rome; excelled in classical and mythological subjects.

THOU, JACQUES AUGUSTE DE (1553–1617), Fr. historian; famous scholar of XVI. cent. His *Universal History*, written in Latin, embraces politics, war, manners, sciences, arts; learned, impartial, and conscientious. His son, **François-Auguste** (1607–42), was implicated in plot against Richelieu, and, although guiltless, was executed with his friend Cinq-Mars.

THOUARS (47° N., 0° 15′ W.), town, on Thouet, Deux-Sèvres, France; manufactures furniture; trade in wine. Pop. 6300.

THOURET, JACQUES GUILLAUME (1746–94), Fr. Girondist and political writer.

THOUROUT (51° 3′ N., 3° 4′ E.), town, W. Flanders, Belgium; linen and hats. Pop. 10,900.

THRACE (41° 25′ N., 26° 30′ E.), name applied in ancient times to extensive district N. of Macedonia, and given by Romans to province between Balkans on N. and Ægean Sea and Sea of Marmora on S.; surface mountainous; drained by Maritza. T. came under domination of Macedon, *c.* 358 B.C., and passed under control of Rome, 133 B.C.; became Rom. province, 46 A.D.; taken by Turks in XIV. cent. Scene of several battles in the Turco-Balkan War (*q.v.*).

THRASYMACHUS, see SOPHISTS.

THREAD, see YARN.

THREAD WORMS, see NEMATODA.

THREAT, if with intent to obtain goods or property, is punishable by law by from three years to penal servitude for life, according to degree of violence.

THREE RIVERS (46° 21′ N., 72° 29′ E.), city, at junction of St. Maurice and St. Lawrence, Quebec, Canada; exports lumber, grain, cattle. Pop. (1911) 14,441.

THRESHING-MACHINES are used to separate the grain from the straw, and to remove the husks or chaff. The process was carried out in early times by rolling the cereal under heavy rollers, by treading it out with oxen, or by beating it with sticks or *flails*; now done by mills operated by steam or water. In all machines the same principle is involved—the beating of the cereal by a revolving ridged roller so that the grain is separated from the straw and may be sieved off. It is then *winnowed*, and grain, chaff, and straw are delivered separately.

THRIFT (*Armeria*), genus of plants, order Plumbaginaceæ; Common T. (*A. vulgaris*) is Sea Pink of Brit. garden borders.

THRING, EDWARD (1821–87), Eng. educationist; app. headmaster of Uppingham, 1853. His high moral calibre, honourable example, and indefatigable energy were invaluable to his school; pub. *The Theory and Practice of Teaching* (1883).

THRIPS, see THYSANOPTERA.

THROAT, part of neck in front of vertebral column, containing pharynx, œsophagus or gullet, larynx, trachea or windpipe.

THROCKMORTON, FRANCIS, THROGMORTON (1554–84), Eng. conspirator; executed for share in plot for Span. invasion of England and restoration of Roman Catholicism.

THROCKMORTON, SIR NICHOLAS, THROGMORTON (1515–71), Eng. diplomatist; fought at *Pinkie*; imprisoned for share in Wyatt's conspiracy under Mary; ambassador to France and Scotland under Elizabeth; imprisoned for assisting northern earls, 1569.

THRUSH FAMILY (*Turdidæ*), large family of Perching Birds, with 600 species distributed throughout the world. They are characterised by their long, slender, somewhat flattened bills, slightly notched near the point—adapted for the soft animal or insectivorous food upon which they live. Their colouring is subdued, but the songs of some are surpassed by none in birdland. Many are residents throughout the year in Britain, such as the BLACKBIRD (*Turdus merula*), the SONG- and MISSEL- or MISTLETOE-THRUSH (*T. musicus* and *viscivorous*), the ROBIN or REDBREAST (*Erithacus rubecula*), and the HEDGE ACCENTOR or HEDGE SPARROW (*Accentor modularis*). Others visit Britain in summer for nesting purposes, among these being the NIGHTINGALE (*Erithacus luscinia*), the REDSTART (*Ruticilla phœnicurus*), the WHEATEAR (*Saxicola*), WHINCHAT and STONECHAT (*Praticola*), and RING OUSEL (*Turdus torquatus*). A few, for example the REDWING (*T. iliacus*), FIELDFARE (*T. pilaris*), and BLUE THROAT (*Erithacus suecicus*), simply winter in the Brit. Isles.

THUCYDIDES (*c.* 460–400 B.C.), Gk. historian; b. Athens of eupatrid parents, Olorus and Hegesipyle, and kinsman of Cimon. T. was a distinguished soldier as well as scholar, possessed gold mines in Thrace, suffered from plague during siege of Athens, 430, was one of ten *strategi*, 424. Deputed to relieve Amphipolis, besieged by Brasidas, he failed, and despite successful defence of Eion, was banished, not returning for twenty years; died before close of Peloponnesian War (*q.v.*), which was main fact of his life. His history of the Peloponnesian War goes down to 411. It is the first hist. work in modern sense of term. His predecessor Herodotus, 'the father of history,' was quite uncritical of legends. Before Thucydides' time Greeks did not distinguish between myth and history. T. was scrupulous about sources of information, and laid down rules of accuracy and impartiality; trustworthiness accepted as absolute (with exception of small school, now silent); great literary gifts of poetical feeling and elegance, conception of political science which has never become antiquated. The long speeches made by his characters were invented, a custom followed by historians till modern times.

Collins, *Thucydides*.

THUGS, N. Ind. professional murderers (usually by strangling); originally a caste; first generally known 1800—after an existence of 500 years; slew their victims in honour of the goddess Kali, wife of Siva, and retained the plunder; finally suppressed by Brit. Government, 1840.

THUGUT, JOHANN AMADEUS FRANZ DE PAULA, BARON (1736–1818), Austrian statesman; entered Austrian diplomatic service, and while at Constantinople acquired Bukowina for Austria; afterwards sent on diplomatic missions to France, Italy, and Belgium; became Foreign Minister, 1793; Chancellor of State, 1794. His chief object was to increase Austrian dominions. His selfish policy aroused anger in other European nations, and he had to retire in 1801.

THUIN (50° 22′ N., 4° 16′ E), town, on Sambre, Hainaut, Belgium; ironworks; shipbuilding-yards. Pop. 6500.

THUJA, see ARBOR VITÆ.

THUMB, TOM, see DWARF.

THUMBSCREW, see TORTURE.

THUN (46° 46′ N., 7° 38′ E.), town, on Aar, canton Bern, Switzerland. Pop. 7540.

THUN, LAKE OF (46° 46′ N., 7° 38′ E.), in canton Bern, Switzerland, traversed by Aar; length, 11½ miles.

THUNDER, see METEOROLOGY (ATMOSPHERIC ELECTRICITY).

THUN-HOHENSTEIN, Austrian noble family; lived at Tetschen, Bohemia, for more than 200 years; wealthy and conspicuous in public service. FRIEDRICH (1810–81), ambassador at Berlin and Petersburg. FRANZ ANTON, gov. of Bohemia, 1889–95. LEOPOLD (1811–88), Minister of Education and Religion, 1849–60, social reformer; supporter of Bohemian autonomy.

THURET, GUSTAVE ADOLPHE (1817–75), Fr. botanist; b. Paris; studied law, which he abandoned in favour of botanical science; travelled in Turkey, Syria, and Egypt; contributed much information on Cryptogams, especially Algæ; wrote *Notes algologiques* and *Études phycologiques* (both published posthumously). Biographical note by Bornet, his colleague, appeared in *Annales des sciences naturelles* (1876).

THURGAU (47° 33′ N., 9° 5′ E.), N.E. canton, Switzerland; area, 381 sq. miles; surface generally undulating; drained by Thur, a tributary of Rhine; capital, Frauenfeld; agriculture is principal industry;

live stock is raised, dairy-farming carried on; fruit and wine produced; manufactures leather, woollens, cottons, embroidery; most of inhabitants are Protestants; was organised as canton of Swiss Confederation in 1803. Pop. (1910) 134,917.

THURIBLE, Gk. word used in R.C. Church for censer.

THURII, THŪRIUM (39° 40′ N., 16° 22′ E.), ancient city, on Gulf of Tarentum, near ancient Sybaris, Magna Græcia; founded by Gk. colonists, 443 B.C.

THURINGIA, THÜRINGEN, region bounded by the Werra, Saale, Herz Mts., and Thuringian Forest; loosely, embracing Saxe-Weimar, Saxe-Meiningen, Saxe-Coburg-Gotha, Saxe-Altenburg, two Schwarzburg and two Reuss principalities, and fragments of Prussia, Saxony, and Bavaria. T. came under Frankish rule, VI. cent.; often split up and reunited; Louis the Springer (d. 1123) made the Wartburg (*q.v.*) seat of Thuringian margraves; passed to Saxony with Ernestine branch of Wettins, 1487; Prussian since 1815.

THURINGIAN FOREST, THÜRINGERWALD (50° 45′ N., 10° 40′ E.), range of hills, Germany; highest point, Grosser Beerberg, 3225 ft.

THURLES (52° 41′ N., 7° 48′ W.), market town, Tipperary, Ireland; abp.'s see (R.C.); scene of defeat of Irish by Danes, X. cent. Pop. 3900.

THURLOE, JOHN (1616–68), Eng. politician; Sec. of State under Cromwell, 1652; controlled postal and intelligence departments; opposed Restoration.

THURLOW, EDWARD THURLOW, 1ST BARON (1731–1806), Eng. statesman; made his name by powerful speeches in Douglas peerage case and other lawsuits; became successively Solicitor-General, Attorney-General, Lord Chancellor of England; held Great Seal under three administrations; retired in 1792.

THURN UND TAXIS, see TAXIS, THURN UND.

THURSDAY ISLAND (10° 33′ S., 142° 10′ E.), small island, Prince of Wales group, Torres Strait, Queensland; pearl fisheries.

THURSO (58° 36′ N., 3° 31′ W.), seaport, on Thurso Bay, Caithness, Scotland; exports flagstones. Pop. (1911) 3335.

THURSTAN, abp. of York, 1114; died 1140; disputed primacy of See of Canterbury.

THYME (*Thymus*), genus of plants, order Labiatæ; Common T. (*T. vulgaris*) of gardens has a stronger fragrance than Wild T. (*T. Serpyllum*).

THYMUS GLAND, temporary ductless gland, consisting of right and left lobes, at base of neck and top of chest; largest in second year, and disappears about puberty; sometimes persists in adult life.

THYROID (Gk. *Thuræides*, shield-shaped), term applied to the largest cartilage of the larynx, and also to the large ductless gland on the lower part of the front of the neck, a two-lobed structure connected by an isthmus across the front of the trachea. The gland is well supplied by blood vessels, the most important being the superior t. artery, a branch of the external carotid. The gland is composed of minute cavities, lined with cubical cells, and filled with an insoluble gelatinous material, while in the walls of the cavities the small blood vessels anastomose freely. The function of the gland is not yet precisely known, but it has been shown that if it is excised mucous degeneration is produced in various tissues of the body, accompanied by derangement of the nervous system. *Myxœdema* (q.v.) and *Cretinism* (q.v.) are conditions due to absence or great diminution of the gland or its internal secretion, while in the condition of *Goitre* (q.v.) the gland is enlarged. Preparations are made from the fresh or dried gland and used medicinally in the treatment of the above conditions.

THYROSTRACA, see ENTOMOSTRACA.

THYSANOPTERA, THRIPS, an order of minute insects with small, round bodies, usually less than a tenth of an inch long, furnished with four very narrow fringed wings, or without wings. They live on soil amongst plants, on flowers, bark, or amongst fungi, and occasionally do damage to corn and onions, by sucking the forming grains and buds, piercing the surfaces to extract the plant juices. There is no sudden change from larva to adult, for the former resembles the latter, but without wings, and feeds similarly. After a few moults the fully developed stage is reached.

THYSANOZOON, a TURBELLARIAN WORM (*q.v.*).

TIAN-SHAN MOUNTAINS, CELESTIAL MOUNTAINS (c. 43° 30′ N., 79° to 96° E.), mountain system, Central Asia, stretching N.E. from the Pamir towards Gobi Desert, and separating Russ. from Chin. Turkestan; the mountains are N. boundary of great Central Asian plateau, and form watershed between basin of Tarim on the S.E. and basins of Balkash and Syrdarya on N.W. Consist of numerous parallel ridges throughout, and reach an extreme height of c. 23,000 ft. in Khan Tengri, not far from which the two ranges of Kirgizin-ala-Tau and Kungi-ala-Tau enclose Issyk-Kul Lake and the river Narym. In province of Kansu range contains volcanic peaks of Turfan, Hochan, and Pidjan. Rivers having their source in the range are the Narym, Ili, Tarim, Zarafshan, Syrdarya. The T. rise to great distance above snowline; many vast glaciers; forest below, region of perpetual snow. Chief pass is Terek in S.W., between Kashgar and Ferghana.

TIARA, triple crown of the pope; a high cap of gold cloth, encircled by three coronets, and surmounted by a cross of gold; second coronet added about 1065, third about 1365; symbolises authority as 'father of princes,' 'ruler of the world,' and Vicar of Christ.

TIARET (35° 20′ N., 1° 18′ E.), town, Oran, Algeria, on site of the Rom. Tingurtia; agricultural trade. Pop. 6000.

TIBBU, TEBU, nomads of E. Sahara; estimated at 70,000, and spread over area of 300,000 sq. miles; include Tedas, Dasas, Bedeyat, Zoghawa, and Bulzeda; Muhammadan in religion; actively engaged on caravan routes across the Sahara.

TIBER (41° 44′ N., 12° 14′ E.), chief river of central Italy; rises in Tuscan Apennines; passes Perugia, Orvieto, Rome, Ostia, and enters Mediterranean; length, 260 miles; navigable to confluence with Nera.

TIBERIAS (32° 47′ N., 35° 33′ E.) (modern TABARIYA), ancient town, on Sea of Galilee, Palestine; founded by Herod Antipas in I. cent. A.D.; was long a great centre of Jewish learning; taken by Saladin, 1187.

TIBERIUS, CLAUDIUS NERO (42 B.C. – 37 A.D.), second Rom. emperor; s. of T. Claudius Nero, Rom. officer, and of Livia, who afterwards m. Octavianus (Augustus); became quæstor, 23 B.C.; aided Tigranes in Armenia, 20; prætor, 17; with Drusus, reduced Rhætia and Vindelicia to submission, 15; consul, 13; suppressed Pannonian rebellion, 12–9 B.C.; divorced Vipsania Agrippina to marry Julia, the licentious dau. of Augustus, 11; withdrew to Rhodes, 6; wife banished from Rome, 2 B.C.

T. returned in 2 A.D. and was adopted by Augustus; waged war against Maroboduus of Bohemia, 6; suppressed risings in Pannonia and Dalmatia, 6–9; in 9 A.D. occurred total destruction of Varus's army by Germans, whereupon T. twice invaded Germany; succ. as emperor, 14; suppressed various risings in early part of reign; warred against Numidia and later against Parthia. His later years were marked by plots, suspicions, and murders. Many of his relatives and friends were put to death; withdrew to Capreæ, leaving conduct of affairs to Sejanus, whom, however, he ultimately put to death for treason; said to have been insane. Tacitus, upon whom we rely for details, is strongly biased against T. and is probably grossly unfair.

TIBESTI (19° N., 18° E.), mountainous region, Central Sahara, Africa; inhabited by the Tibbu.

TIBET, THIBET (c. 27° 30′ to 39° N., 79° to 102° E.), country included in empire of China, Central Asia; stretches from frontiers of China to Pamir, with

Himalayas on S. and Kuen-lun, Akka Tag, and Altyn-Tag on N.; area, 463,200 sq. miles. Surface generally consists of high mountains, plateaux, and great rolling plains traversed by long ridges of hills; and the great elevation of the whole country is its most remarkable physical characteristic. The highest peaks include Ulug-Mustagh (25,300 ft.), Aling-Gangri, and T'a-Chhab Gangri (c. 23,000 ft.). In the W. are desert lands. The great river of T. is the Tsang-po, length, 1300 miles, which traverses the country, and forms head-waters of the Brahmaputra; other rivers are the head streams of the Ganges, Indus, Sutlej, Yang-tse-Kiang, Hoang-Ho, Mekong, and Salwin. There are many lakes, including Horpa Ts'o, Mangtsa Ts'o, Bakka Namur Nor, and Ike Namur Nor, in N.W.; Kökö Nor in N.E., Tengri Nor in S. centre, Manasarowar in S.W. and Yamdok Ts'o to S.S.W. of Lhasa. Hot springs frequently occur, and are one of most noteworthy features of the country. The climate is very severe, and there is a great want of moisture in the air, which renders the fall of rain and snow very small; in summer intense heat by day is followed by great cold at night. Flora includes such characteristic plants as the delphinium, pedicularis, astragalus, ranunculus, gentian, saxifrage. Fauna includes wolves, bears, lynxes, foxes, yaks, goats, antelopes, rodents, and numerous animals peculiar to T.

History.—T. was included in the dominions of Jenghiz and Kublai Khans, the latter of whom granted the chief power to the lama Phagspa in 1270. In 1645 sovereign power was granted by Kushri Khan, conqueror of T., to the Dalai-Lamas, who have continued to rule the country until the present time. Chin. control over foreign affairs dates from 1720; and until 1903 T. remained practically unknown to Europeans, who were forbidden on pain of death to enter the country. Expeditions were from time to time and at great risk undertaken by various travellers, among whom Przevalski, Rockhill, Bower, and Sven Hedin may be mentioned; while a number of 'pundits' from India carried out geographical surveys whereby a considerable amount of information concerning the country was obtained.

In 1903 Colonel Younghusband was sent at the head of a mission to Lhasa to secure the observance by the Tibetans of the terms of the Anglo-Chin. treaty of 1890; he reached Lhasa in 1904 and an agreement was signed by which facilities for trade between T. and Brit. India were granted by the Tibetans. A dispute with China occurred in 1909, and Lhasa was taken by a Chin. force, upon which the Dalai-Lama fled to India; deposed by the Chinese. The Tibetans forthwith rose against the Chinese, gained some successes, and petitioned the Dalai-Lama to return (June 1912). Intervention by the Brit. government prevented more bloodshed, but matters are still unsettled.

Government.—The Dalai-Lama is still nominally the head of the government, and exercises his authority through a regent appointed by China; but it is said that the government of China intends to exercise greater control over the affairs of T. than has hitherto been the case, although at present (1913), owing to the lack of a strong central authority, she has little influence over outlying provinces.

The capital is Lhasa (*q.v.*), and the markets open to Brit. traders are at Yatung, Gyantze, and Gartok. The Tibetans are of Mongoloid stock and are of good physique; they are generally classified in two divisions, dwellers in towns and villages, and a number of nomadic and pastoral tribes; among the former, polyandry is customary, but the nomads are generally monogamous; in some parts of E. and E. central T. polygamy is practised.

The principal industry is agriculture; barley, wheat, various vegetables and fruits are cultivated, and sheep, yaks, pigs, camels, and buffaloes are reared. Minerals found include salt, gold, borax; various precious stones occur; important industries are weaving, knitting, pottery-making, and metal working. Trade is chiefly with China and India, the principal exports being skins, wool, precious stones, live stock. Chief religion is Lamaism, a corrupt form of Buddhism. Pop. c. 6,500,000.

Sandberg, *Exploration of Tibet* (1904); *Tibet and the Tibetans* (1906); Grenard, *Tibet* (1904); Candler, *The Unveiling of Lhasa* (1905); Sven Hedin, *Adventures in Tibet* (1904).

TIBETO-BURMAN LANGUAGES, an important family of Indo-Chinese languages spoken in India; comprises series of dialects spoken from Tibet to Burma, and from Baltistan to Chin. provinces, Szechuan and Yunnan, by c. 20 million people, all Mongolians. Principal groups—Tibetan, Himâlaya, North Assam, Bodo, Nâga, Kachin, Kuki-Chin, Burmese; chief characteristics—real verb wanting; usual word arrangement—subject, object, verb; tones used as in Chinese; rich vocabulary, deficient in words expressing abstract ideas.

Linguistic Survey of India, vol. iii.

TIBULLUS, ALBIUS (c. 54–19 B.C.), Rom. poet; became friend of Messala, under whom he saw military service, 29; returned to Rome to devote himself to literary pursuits; intimate with Vergil and Ovid; joined Messala in a voyage to Asia, but compelled to return through illness. Quintilian gives him highest place among elegiac poets; style is graceful and mellifluous; its lack of dramatic force is redeemed by a vein of melancholy. His first book of elegies was inspired by Plancia, a married woman whom he calls Delia; the second by 'Nemesis,' a courtesan. The authenticity of most of the third and the whole of the fourth book is extremely doubtful.

TIBUR (41° 58′ N., 12° 46′ E.) (modern TIVOLI), ancient town, on falls of Anio, Latium, Italy; favourite residence of many distinguished Romans.

TIBURTINA, VIA (41° 55′ N., 12° 35′ E.), ancient highway, Italy, leading from Rome to Tibur.

TICHBORNE CASE, THE.—Arthur Orton (1829–98), a butcher in Australia, laid claim to the Tichborne estates (worth about £24,000 a year) on the death of Sir Alfred Tichborne, 1866, and came forward as Sir Alfred's bro., supposed to have been lost at sea; was acknowledged by the dowager Lady Tichborne; nonsuited on his claim (which lasted 103 days, 1871–72). Orton was then tried for perjury and forgery, convicted, and sentenced to fourteen years' penal servitude.

TICINO.—(1) (46° 20′ N., 8° 45′ E.) S.E. canton, Switzerland; area, 1088 sq. miles; surface is mountainous in N., sloping to plain of Lombardy in S.; watered by Ticino and its affluents; contains part of Lakes Maggiore and Lugano; capital, Bellinzona; produces olives, grapes, and other fruits, cereals, tobacco, silk, wine; language, Italian; chief religion, R.C.; constituted a canton of Swiss Confederation, 1803. Pop. (1910) 156,166. (2) TESSIN (45° 14′ N., 9° E.) (ancient *Ticinus*), river, Switzerland and Italy; rises in Mt. St. Gothard; joins the Po, near Pavia.

TICINUM (45° 10′ N., 9° 10′ E.) (modern PAVIA), ancient city, on Ticinum, Gallia Transpadana; said by Pliny to have been founded by the Lævi and Marici; an important city under the Romans; in 572 taken by the Lombards, who made it their capital.

TICKET-OF-LEAVE.—Prisoners released from penal servitude before the completion of their term on the licence of the Home Sec. are released on a ticket-of-leave. This licence is forfeited if the prisoner fails to report himself to the police according to the conditions of release, or if he is convicted of another offence before the ticket-of-leave has expired.

TICKNOR, GEORGE (1791–1871), Amer. writer; b. Boston. During his travels in Europe he met many of the leading men of his age, and his journal is full of valuable reminiscences. The *History of Spanish Literature* is his *chef d'œuvre*.

TICKS, see MITES AND TICKS.

TICONDEROGA (43° 50′ N., 73° 30′ W.), town, on outlet of Lake George, Essex County, New York, U.S.A.; manufactures paper-pulp; captured from

British by Americans, 1775; retaken by British, 1777 and 1780. Pop. (1910) 2475.

TIDE, the periodic rise (*flow*) and fall (*ebb*) of the sea. NEWTON was the first to theorise on the causes of t's and fitted them into his gravitation theory. His explanation is simple. The earth must be imagined as consisting of a solid sphere, surrounded by a layer of water of uniform depth. This body is attracted by the moon. The resultant attraction on the solid earth core is the same as if the whole of its mass were concentrated at the centre (C). If points A and B on the earth and in the line joining the centres of the earth and moon, M, be taken, obviously the attraction at A (nearest the moon) is greater, and at B (on the other side of the earth) less than that at C. Consequently, as the water is free to move relatively to the solid earth, it is heaped up at A, and *hangs* away, as it were, from the earth at B.

To compensate for this, depressions take place at D and E (on a line at right angles to the line through the centre of the moon and A, C, and B), and the water as a whole thus takes the shape of a prolate spheroid (the figure obtained by the revolution of an ellipse about its major axis). Further, as the earth rotates (about an axis through C perpendicular to the paper) each point on its surface, such as *A*, will in turn come into line with the moon, resulting in a tidal wave travelling round the earth, the two crests of the wave always pointing directly towards and away from the moon. Were the moon always in the same position at M, two high and two low t's would take place in exactly 24 hours, but while the earth performs one rotation, the moon will have moved to some position such as M', during the course of its revolution about the earth, with the result that A will not experience a high t. when it has returned to its original position, but when it has moved to another position, F. Consequently, high t's follow each other at intervals of 12 hrs. 27 mins. (half a *lunar* day), and similarly with low t's.

The sun causes a similar result, but owing to its much greater distance from the earth, its effect is only about $\frac{4}{11}$th that caused by the moon. If there were no moon, we should still have t's, though much smaller than those actually experienced—high t's at noon and midnight, and low t's at 6 a.m. and 6 p.m. The actual t's are the resultant effects produced by both sun and moon. At New and Full Moon (when the moon is in the same straight line as the sun) these effects are in the same direction, and very high and low t's, called *spring tides*, are the result, while during the 1st and 3rd quarters (when the centre of the moon is at right angles to the line joining the centres of the sun and earth) the effects of the sun and moon are in opposition to each other, and low t's, called *neap tides*, obtain, the ratio of the heights of spring to neap t's being about 8 to 3.

The explanation just briefly sketched is known as the *Statical* or *Equilibrium Theory*, as the water is supposed at every moment to take up a position of equilibrium. Although acceptable as an explanation, it is inadmissible as a scientific theory, since calculations based on it are utterly falsified by observations. It was left to LAPLACE to take the next step. In his *Mécanique céleste* he showed that the problem was not statical, but dynamical. His theory involves much mathematics of an advanced order, but the important points of difference may be summarised thus: Newton's assumption of a layer of water surrounding the solid earth was unjustifiable. Further, he took no notice of the distribution of the land masses or of the varying depths of the ocean affecting the velocity of the tidal wave. Laplace assumed a canal round the earth's equator, took into account the attraction of masses of water on neighbouring masses, and also the fact that during 12 hours the water has not time to take up a position of equilibrium, but that after tending towards such a position it runs beyond it—shoots past the mark like a pendulum in its swing—and as a consequence tidal phenomena are greatly magnified owing to the inertia of the water. Since Laplace's time it has also been proved that t's are affected by winds and atmospheric pressure.

The height and manner of motion of t's vary greatly. In the open ocean the t. is from 3 to 8 ft. in height and is a mere up-and-down movement; in landlocked seas it is hardly perceptible; in narrow channels the tidal wave is one of translation, the water moving up the channel for a period and then down, the rise being greatest in inlets with broad openings and narrowing away from the sea; in river channels the interval between high and low water decreases in length with distance from the mouth, and when this interval becomes very short indeed, a *bore* is the result—the t. rushing up the river in the form of a wall of water.

No general means has so far been discovered for constructing a *tide table* for a port in the same way as an astronomical almanac can be drawn up. Tidal predictions *are* made, but only after a series of accurate observations have been obtained at the port itself, by means of a *tide gauge*, an instrument which automatically records on a revolving drum the height of water at any time of day. These records are analysed into elements which are the results of various causes, and from such analysis predictions of great accuracy as to times and heights of t's are then made for the following year or two. Lord Kelvin, in 1872, suggested a method for constructing a tide table by mechanical means—a suggestion which resulted in the construction of a *Tide Predicting Machine*, now in use at many places.

The effects of t's on the world itself are noteworthy. It is obvious that a resistance is offered to the motion of the tidal wave, and although its effect is very small indeed, it must, in the course of ages, result in increasing the length of the day. The enormous t's which must have been produced by the earth on the moon's surface are supposed to account for an ultimate reduction in the period of the latter body's axial rotation, until it corresponded with the period of revolution about the earth, in which event the same face of the satellite is always presented to the earth, resulting in bringing the tidal spheroid to rest and removing any further frictional resistance. The moon's action on the earth produces a reaction on the moon, having the effect of slowly pushing that body farther away from us. Tracing this effect back, there must have been a time when the moon was very close to the earth and when the t's then raised on the earth's surface were sufficient at high water to submerge the Brit. Isles and at ebb to leave the Eng. Channel dry. Such t's would sufficiently account for certain geological observations which had long puzzled scientists as to how such stupendous work could have been performed within admissible time by ordinary denuding agencies.

According to Lord Kelvin, if the earth were a fluid mass, surrounded by a thin crust of only about 20 to 30 miles' thickness, the earth itself would be sufficiently elastic to so *give* under the moon's attraction that the rise and fall of water would be nil relatively to the earth. The presence of t's, he thought, proved the earth as a whole to be very rigid throughout—more so than glass or steel. That there are actual tidal distortions in the crust of the earth itself has now been proved and the amount measured, and, while the theory Kelvin rejected must be admitted in some form, the earth's effective rigidity has been shown (*e.g.* by the rate of travel of the first tremors of an earthquake) to be, as he thought, similar to that of the hardest steel.

The power of the t's is enormous, and various suggestions have been made in recent times for harnessing this practically inexhaustible store of energy for the purpose of putting it to man's service—suggestions which have, however, not yet materialised into any practical form.

G. H. Darwin, *Tides*.

TIDORE (0° 45′ N., 127° 26′ E.), small volcanic island, Malay Archipelago, belonging to the Dutch. Pop. 9000.

TIECK, JOHANN LUDWIG (1773–1853), Ger. poet and novelist; b. Berlin; wrote *Dichterleben*, *die Verlobung*, *Des Lebens Überfluss* (novels), *Leben und Tod der heiligen Genoveva* (dramatic poem), *Der Gestiefelte Kater* (satirical drama), etc.; edit. Schlegel's trans. of Shakespeare.

TIEDEMANN, FRIEDRICH (1781–1861), Ger. anatomist; prof. of Anat. and Zool. at Landshut; of Anat. and Physiology at Heidelberg, 1816; performed important researches on brain development.

TIEL (51° 53′ N., 5° 27′ E.), town, on Waal, Gelderland, Netherlands; manufactures agricultural machinery; active commerce. Pop. 11,360.

TIELE, CORNELIUS PETRUS (1830–1902), Dutch Remonstrant pastor; prof. of History of Religions at Leiden, 1877; wrote works on history and religions of ancient East; delivered Gifford Lectures *On the Elements of the Science of Religion*, 1896–98.

TIENTSIN (39° 8′ N., 117° 16′ E.), city, treaty port, at junction of Poi-ho and Hun-ho, Chi-li, China; important centre of transit trade; cotton-mills; rice and salt marts; chief import, cottons; export, wool. Pop. (1910) 800,000.

TIEPOLO, GIOVANNI BATTISTA (1692–1769), Ital. painter; dealt chiefly with Old Testament subjects; provided fine series of frescoes for abp.'s palace at Würzburg.

TIERNEY, GEORGE (1761–1830), Eng. statesman; opposed Pitt, with whom he fought duel, 1798; prominent Whig till death.

TIERRA DEL FUEGO (52° 35′ to 56° S., 65° to 74° W.), archipelago off S. end of S. America; area, *c.* 27,100 sq. miles; separated from mainland by Strait of Magellan. Surface is mountainous, reaching an extreme height of 7000 ft. in Mt. Sarmiento; watered by Juarez Celman and other streams; produces timber; sheep raised. Natives are three tribes in a degraded state of barbarism, but are very hardy. Politically the archipelago belongs partly to Chile and partly to Argentina; discovered by Magellan, 1520.

TIFFIN (41° 7′ N., 83° 8′ W.), city, on Sandusky, capital, Seneca County, Ohio, U.S.A.; seat of Heidelberg University; manufactures iron. Pop. (1910) 11,894.

TIFLIS (41° 30′ N., 45° E.), government, Transcaucasia, Russia; mountainous, forested; watered by Kur; rich mineral deposits; chief occupation, agriculture. Pop. (1910) 1,163,600. Capital, **Tiflis** (41° 42′ N., 44° 48′ E.), on Kur; commercial centre; manufactures cotton and silk; formerly capital of Georgia; annexed to Russia, 1802. Pop. (1910) 188,400.

TIGER, see under CAT FAMILY.

TIGER BEETLES, see under CARABOIDEA.

TIGER CATS, see under CAT FAMILY.

TIGLATH-PILESER I. (reigned *c.* 1120–1105 B.C.), king of Assyria; conquered various districts of Mesopotamia. TIGLATH-PILESER III. or IV. (reigned 745–27 B.C.), subdued Babylonia, Syria, Media, Damascus.

TIGRANES, DIKRAN, king of Armenia (*c.* 95–56 B.C.); warred against Parthia; acquired Mesopotamia and Syria; allied himself with Mithridates; twice beaten by Lucullus; surrendered (66) to Pompey, who allowed him to retain kingdom under Rom. suzerainty.

TIGRÉ (14° N., 39° E.), division, Abyssinia, capital, Adowa; formerly independent kingdom.

TIGRIS (31° 30′ N., 47° 13′ E.), river, Turkey-in-Asia; rises in mountains of Kurdistan and Armenia; flows in S.E. direction and unites with Euphrates at Kurna, the united stream being henceforth known as Shat-el-Arab; receives waters of Dyala, Guakr, Zab, and other rivers; important towns and ruins on banks are Diarbekr, Nineveh, Ctesiphon, Mosul, Tekrit, Bagdad.

TILBURG (51° 33′ N., 5° 5′ E.), town, N. Brabant, Netherlands; manufactures woollens. Pop. (1911) 52,754.

TILBURY DOCKS (51° 29′ N., 0° 24′ E.), on Thames, Essex, England; extensive quays for vessels of deep draught; connected with several railways.

TILDEN, SAMUEL JONES (1814–86), Amer. politician; b. New Lebanon; leader of New York Democratic party, 1868; helped to overthrow Tweed, Tammany leader; governor of New York State, 1875.

TILE, plate of baked clay for roofs, walls, pavements, etc. *Wall tiles* were known in Europe in XIII. cent.; some were enamelled, others ornamented in relief; inlaid t's appeared in XIX. cent. See ENCAUSTIC, POTTERY.

TILIACEÆ, natural order of plants; includes *Corchorus capsularis*..

TILLANDSIA, see BROMELIACEÆ.

TILLICOULTRY (56° 10′ N., 3° 44′ W.), town, Clackmannanshire, Scotland; wool, shawls, tartans. Pop. (1911) 3105.

TILLOTSON, JOHN (1630–94), Anglican divine; dean of Canterbury, 1672, abp., 1691; attempted to remedy clerical abuses; renowned for his sermons.

TILLY, COUNT OF, JOHANN TZERCLAES (1559–1632), general who commanded army of Catholic League from 1618 to 1632; only commander of genius on imperialist side till appearance of Wallenstein. See THIRTY YEARS WAR.

TILSIT (55° 4′ N., 21° 53′ E.), town, on Memel, E. Prussia, Germany; iron foundries; treaty between Napoleon and Alexander signed here, 1807. Pop. (1910) 39,013.

TIMÆUS (*c.* 345–*c.* 250 B.C.), Gk. historian; b. Tauromenium, Sicily; most of life spent in exile at Athens; wrote history of Sicily, etc.

TIMARU (44° 23′ S., 171° 17′ E.), seaport town, South Island, New Zealand; exports wool. Pop. 8000.

TIMBER is got from trees of the 'exogen' class, which grow by the yearly addition of a new outer layer of wood. The best age for felling varies with different trees, but in every case the tree should have arrived at maturity. Trees should be felled in the middle of summer or winter, not during spring or autumn when the sap is moving. After felling, the logs are sawn up into planks, and the wood is then known as 'scantling t.' or 'lumber.' It is then stacked in yards to season. Artificial seasoning by boiling or steaming is sometimes adopted to hasten the process, but the t. is much less durable. Decay in t. may be due to several causes. Bad ventilation and alternate wettings and dryings produce wet rot; the wood shrivels up and finally falls to powder. Dry rot is caused by a fungus which makes wood brittle and liable to crumble. This disease spreads rapidly and is accompanied by a musty smell. It is favoured by damp and bad ventilation, but fresh air soon kills the fungus.

TIMBER-LINE, elevation above sea-level at which trees cease to grow.

TIMBUKTU (17° 48′ N., 3° 9′ W.), city of Fr. Sahara, in S. of Sahara, 9 miles N. of Upper Niger; stands 800 ft. above sea; fortified; has two fine mosques; important trading centre, exchanging gold dust, salt, kola-nuts, gums, ivory, ostrich feathers, and dates, for cottons, tea, and general African trade goods; has caravan trade with Algeria and Morocco. T. belonged to the Moors from late XVI. to early XIX. cent., and in the XIX. cent. was held by the Fulahs and Tuaregs in turn; has belonged to France since Dec. 1893. Pop. *c.* 5100.

TIME.—Time is measured by means of regularly recurring phenomena. The celestial sphere apparently revolves once a day, and the interval between two successive returns of a fixed point of the sphere is called a *sidereal day*. Sidereal time is reckoned from the time when the first point of Aries passes the meridian. A *solar day* is the interval between two successive transits of the sun's centre over the meridian. But owing to the varying speed of the earth in its orbit, and also to the inclination of the orbit to the equator, the sun's apparent motion is not uniform. Hence arises the necessity of introducing an imaginary *mean sun*,

which may be supposed to move in the equator with uniform velocity. The 'equation of time' is the difference between apparent (or true) solar time and mean solar time at any instant. It varies from day to day, and is given in the *Nautical Almanac*. A solar day is about 4 minutes longer than a sidereal day, for the sun moves eastward among the stars at the rate of about 1° a day, hence the earth has to turn nearly 361° about its axis to complete a solar day. About March 21 a solar clock agrees with a sidereal clock, but the sidereal clock gains nearly 4 minutes every day; in a year it thus gains just one day.

Time, Standard.—Greenwich time is the standard time throughout Great Britain, and in France, Belgium, Holland, and Spain. In countries of great extent it is impossible to adopt one standard time, and meridians 15° apart have been chosen, all places within 7½° of these meridians having the same standard. Thus at Quebec, Montreal, Toronto, Boston, New York, and Washington the time of 75° W.—five hours earlier than Greenwich—is the standard. See also CALENDAR, CHRONOLOGY.

TIMES, THE, see NEWSPAPERS.

TIMGAD (35° 30′ N., 6° 20′ E.), ruined city, Constantine, Algeria; Rom. Thamugas, founded by Trajan, 100 A.D.

TIMOLEON OF CORINTH (*c.* 411–337 B.C.), Gk. general; defeated Hicetas of Leontini; freed Syracuse from Dionysius; subsequently defeated Carthaginians at Crimissus, and expelled tyrants from other Gk. cities of Sicily.

TIMOR (9° S., 125° E.), one of Sunda Islands, Malay Archipelago; area, *c.* 12,430 sq. miles; surface mountainous; has a number of extinct volcanoes; exports coffee, sandalwood, wax; belongs partly to Holland, partly to Portugal; chief town of Dutch T., Kupang; of Portug. T., Deli. Pop. *c.* 450,000.

TIMOR LAUT (8° S., 131° E.), group of islands, Malay Archipelago, belong to Dutch. Pop. *c.* 25,000.

TIMOTHEUS (d. *c.* 357 B.C.), Athenian general; defeated Spartans, 375; captured Samos, 365; took Torone and other towns; d. at Chalcis.

TIMOTHY, friend of St. Paul, referred to in various places in Acts and Pauline Epistles.

TIMOTHY, FIRST EPISTLE TO, New Testament book, forms, with II. Timothy and Titus, group called 'Pastoral Epistles'; they were generally accepted in the Early Church, but rejected by Marcion; at present time their authenticity is doubted more than any other Pauline epistles. I. Tim. is largely directed against Gnosticism, hence is referred by those who deny Pauline authorship to *c.* 110 A.D.; in any case, part may be Pauline.

TIMOTHY, SECOND EPISTLE TO, New Testament book, and one of 'Pastoral Epistles'; like I. Tim., its authenticity is hotly disputed; it is directed against immoral and wildly speculative tendencies, such as were making themselves manifest in the Ephesian Church; even those who regard it as unauthentic admit that fragments by St. Paul have 'been worked up in it'; if not by St. Paul, its date is *c.* 110 A.D.

TIMOTHY GRASS, see under GRASS.

TIMUR, TAMERLANE (1336–1405), famous Eastern conqueror; b. Kesh; began military career *c.* 1358; subdued Khwarizm and Urganj; after varied adventures established himself as king at Samarkand; subsequently conquered most of Persia and Caucasia; warred against Toktamish, leader of E. and W. Kipchaks, finally defeating him in 1395. Successfully invaded India, 1398. Led expedition to Syria, capturing Aleppo and Damascus; defeated Sultan Bajazet at Angora, 1402; d. while marching to invade China.

TIN (Sn = 119·0). metallic element, allied to lead, occurring chiefly as tinstone or cassiterite in Cornwall, S. America, Australia, China, Nigeria, etc.

METALLURGY.—The crushed ore is roasted to volatilise sulphur and arsenic, and smelted with anthracite, which reduces oxide to metal; purified by 'liquation.'

PROPERTIES AND USES.—White, lustrous, fibrous, and crystalline, emitting crackling sound when rod is bent, may be hammered into foil; M.P. 232° C., S.G. 7·29. Forms allotropic, 'grey t.' at low temperature Displaced from chloride solution by zinc in crystals, constituting 't. tree.' Not oxidised in dry or moist air at ordinary temperature, therefore used for tinning iron goods (t. plate) and copper and brass wire (pins). Pewter, solder, gun-metal, bell-metal are t. alloys. T. amalgam is used for common mirrors. CHIEF COMPOUNDS, SnO, stannous oxide; $SnCl_2+2H_2O$, t. salt, used by dyers, concentrated hydrochloric acid on t.: SnO_2, stannic oxide; $H_{10}Sn_2O_{13}$, metastannic acid, nitric acid on tin; $SnCl_4$, stannic chloride, liquid, B.P. 113·9°.

TINAMIDÆ, TINAMOU FAMILY (*q.v.*).

TINAMOU FAMILY (*Tinamidæ*), partridge-like in appearance, the birds of this family are confined to S. America, where they take the place of ground game birds, their short wings possessing but small power of flight.

TINCAL, see BORAX.

TINCTURE, chemical preparation made by dissolving drug in alcohol or by placing it in alcohol and introducing solvent; *e.g.* T. of Iodine.

TINDAL, MATTHEW (1657–1733), noted Eng. deist; ed. Oxford; became R.C.; recanted after Revolution; held that religion is perfectly discernible by reason, and is the means given by a perfect God to know Him.

TINDER, inflammable material, shavings, charred linen, and touch-paper, used in lighting fires; ignition produced by impact of steel against flint.

TINEO (43° 20′ N., 6° 30′ W.), town, Oviedo, Spain. Pop. 20,000.

TINKAR'S ROOT, see FEVERWORT.

TINNÉ, ALEXANDRINE PETRONELLA FRANCINA (1839–69), Dutch leader of an expedition, which included Heuglin and Dr. Steudner, to Central Africa; explored White Nile region.

TINNEVELLY (8° 43′ N., 77° 44′ E.), district, Madras, Brit. India. Pop. 2,070,000. Capital, **Tinnevelly**; centre of Christian missions. Pop. 43,000.

TINTAGEL, TREVINA (50° 39′ N., 4° 44′ W.), village, Cornwall, England; has remains of Tintagel Castle, the traditional birthplace of King Arthur.

TINTERN ABBEY (51° 42′ N., 2° 41′ W.), ruin (XII. cent.), on Wye, Monmouthshire, England.

TINTORETTO, JACOPO ROBUSTI (1518–94), great Ital. painter; b. Venice, s. of dyer (*tintore*). He had some lessons from Titian, but was largely self-taught; painted pictures of prodigious size—two, *The Worship of the Golden Calf* and *The Last Judgment*, being 50 ft. high. One picture, *Paradise*, 34 ft. high and 74 ft. long, is the largest canvas done by any of the great masters. Many of his pictures are in the leading Continental galleries, and the National Gallery, London, contains his *St. George and the Dragon*. Ruskin celebrates him as one of the 'five supreme painters.'

TIPASA (36° 30′ N., 1° 40′ E.), town, port, Algiers, Algeria; founded by Phœnicians; subsequently Rom. colony. Pop. 3000.

TIPPERA.—(1) TRIPURA (24° N., 91° E.), district, Bengal, India. Pop. 2,130,000. Capital, Comilla. (2) HILL TIPPERA (23° 45′ N., 91° E.), native state adjoining Tippera district, India; chief village, Agartalá. Pop. (1911) 229,613.

TIPPERARY.—(1) (52° 40′ N., 7° 55′ W.) inland county, Munster, Ireland; area, 1659 sq. miles; surface is generally flat, but crossed by Galtee, Knockmeald own, and other hills; watered by Shannon, Suir, and other rivers; produces wheat and other cereals, butter, and dairy produce. Pop. (1911) 151,951. County town, Clonmel. (2) (52° 28′ N., 8° 9′ W.) market town, Tipperary, Ireland; trade in butter. Pop. 6300.

TIPPERMUIR, see GREAT REBELLION.

TIPPOO SAHIB (1753–99), Sultan of Mysore; slain by British at capture of Seringapatam.

TIPTON (52° 33′ N., 2° 3′ W.), town, Staffordshire, England; collieries; ironworks. Pop. (1911) 31,763.

TIRABOSCHI, GIROLAMO (1731–94), Ital. scholar; wrote valuable histories of Humiliati and of Ital. lit.

TIRAH (34° N., 71° E.), mountainous district, on N.W. Frontier, India; inhabited by Afridi and Orakzai tribes; scene of Tirah campaign of 1897.

TIRAH CAMPAIGN, war on N.W. frontier of India, 1897, when Sir William Lockhart led combined Brit. and native force against Orakzais and Afridis, who kept up constant guerilla fighting. Peace, 1898.

TIRANA (46° 13′ N., 10° 9′ E.), town, vilayet Scutari, European Turkey. Pop. c. 11,000.

TIREH (38° 10′ N., 27° 30′ E.), town, Asia Minor; trade in raisins. Pop. c. 15,000.

TIRGOVISHTEA, TERGOVISTE (44° 56′ N., 25° 28′ E.), town, on Jalomitza, Rumania; arsenal. Pop. 9500.

TIRGU JIU (45° N., 23° 20′ E.), town, on Jiu, Rumania; manufactures porcelain. Pop. 6800.

TIRGU OCNA (46° 18′ N., 26° 38′ E.), town, on Trotosh, Rumania; salt-mines. Pop. 8300.

TIRHUT (26° 30′ N., 85° 30′ E.), Bihar and Orissa, India; consisting of districts Darbhanga, Muzaffarpur, Saran, and Champaran.

TIRLEMONT, THIENEN (50° 48′ N., 4° 55′ E.), town, Brabant, Belgium; breweries, tanneries. Pop. 20,000.

TIRNOVO, see TRNOVO.

TIRSO DE MOLINA, pen-name of Gabriel Tellez (1571–1641), Span. dramatist of great eminence; b. Madrid. For many years he was one of the Brethren of Charity at Toledo, and subsequently became prior of the monastery of Soria. His comedies are brilliant and highly original. The most famous are *El Vergonzoso en Palacio*, *El Burlador de Sevilla*, and *Don Gil de las Calzas Verdes*.

TIRUPATI, TRIPETTY (13° 38′ N., 79° 28′ E.), town, pilgrim resort, N. Arcot, Madras, Brit. India; brass-ware. Pop. 16,000.

TIRYNS (37° 36′ N., 22° 47′ E.), ancient town, Peloponnesus, Greece; has remains of Cyclopean walls and of a wonderful citadel; excavations were carried out here by Schliemann, 1884, and brought to light remains of a Mycenæan royal palace of X. or XI. cent. B.C. The town is traditionally connected with Hercules; destroyed by Argives, c. 468 B.C.

TISCHENDORF, LOBEGOTT FRIEDRICH KONSTANTIN VON (1815–74), Ger. Biblical critic; b. Longenfeld; researches in New Testament subjects were epoch-making; discovered *Codex Sinaiticus*.

TISSANDIER, see BALLOON.

TISSAPHERNES (d. 395), Persian satrap with whom Alcibiades (*q.v.*) intrigued; badly defeated by Spartan general Agesilaus, 395; executed.

TISSERAND, FRANÇOIS FÉLIX (1845–96), Fr. astronomer; brilliant mathematician; in *Traité de mécanique céleste* unified researches of Laplace and others; revised Lalande's catalogue.

TISSOT, PIERRE FRANÇOIS (1768–1854), Fr. author; ardent Revolutionist, though admirer of First Consul and author of poems on his victories; prof. of Lat. Poetry at the *Collège de France*; member of Fr. Academy (1833); wrote hist. studies.

TISSUE, element of the body formed by cells.

TISTA (27° N., 88° 30′ E.), river, N. India; joins Brahmaputra; length, 300 miles.

TISZA, KÁLMÁN (1830–1902), Hungarian politician; b. Geszt; entered Hungarian Parliament, 1861; leader of Left Centre party from 1865 till 1875, when he formed new party by uniting with Deak's followers; Minister of Interior, 1875; became Premier same year, holding office almost unintermittently till 1890, when he resigned.

TITANIA, see OBERON.

'TITANIC,' THE, White Star liner, largest vessel in the world (tonnage, 46,382 tons), which struck an iceberg near Cape Race on her maiden voyage from Queenstown to New York, April 14, 1912; the *Carpathia*, summoned by wireless, arrived in time to save 712 of the 2201 souls on board. Among the lost were W. T. Stead (*q.v.*), Colonel John Jacob Astor, Captain Smith, F. D. Millet, the artist; as a result of Lord Mersey's inquiry new regulations concerning life-saving appliances on ships were made, and the White Star Company remodelled the *Titanic's* twin sister, the *Olympic*, increasing the amount of watertight bulkheads and building a double hull.

TITANIUM (Ti=48·1), somewhat rare metal allied to tin; occurs as rutile (TiO_2) in iron ores, etc.; obtained pure with difficulty, S.G. 4·87; brilliant white, hard, brittle; dissolves in acids, combines readily with nitrogen. Oxides and salts: Ti_2O_3, $TiCl_2$, Ti_2O_3, $TiCl_3$ (titanious chloride, reducing agent in analysis), TiO_2 (basic and acidic), $TiO(OH)_2$, $Ti(OH)_4$, $Ti(SO_4)_2$, K_2TiO_3, K_2TiF_6 (isomorphous with K_2SiF_6); TiO_3 (acidic peroxide) forms unstable salts.

TITANOTHERIUM, an extinct UNGULATE (*q.v.*).

TITANS (classical myth.), children of Ouranos and Gaia, against whom they rose, placing Kronos at the head of the gods. Zeus (*q.v.*) warred against them and hurled them into Tartarus.

TITHES (A.S. *teotha*, tenth part), taxes paid for religious purposes. Unit of enumeration, 10, naturally arising from number of fingers of hand, is found in earliest times as measure of offerings to deities or of taxation generally, as in Greece; use of term in *Pentateuch* helped religious appropriation; history of payments in early days of Christianity obscure; claimed by Church from IV. cent.; direct State endowment of Church not found, but State probably enforced payments, as it did other religious duties, from first adoption of new faith; Frankish Capitularies enact rendering of tithes, and Church established policy of excommunicating recalcitrant. Eng. Church and State accepted various papal recommendations, among which was establishment of tithe system, 786.

Tithes, like feudal services, originally paid in kind, became largely commuted by custom; Tithe Commutation Acts, 1836, 1860, and Tithe Act, 1891, arranged for payment of rent-charge in place of tithe in most cases, and rent-charge may be redeemed. Great tithes are prædial (grain, hay, wood, etc.), little tithes all others. Minerals were not subject to payment except by grant of owner of royalty, nor royal forests or chaces, lands of certain religious houses, etc. Selling tithes to laymen was considered an abuse in Middle Ages, but lay rectors became common.

TITIAN, the Anglicised form of TITIAN VECELLO (c. 1477–1576), one of the greatest of Ital. painters. He was sent at the age of ten to Venice, where he studied under Zuccato, the two Bellini, and Giorgione. He soon established himself as an independent artist, with plenty of commissions following, and produced a masterpiece when only 23. In 1532 Charles V. made him a count palatine, and later on he was created Knight of the Golden Spur, thus enjoying the right of *entrée* at Court, with which he was connected in various ways during succeeding years. He was on terms of intimate friendship with Charles V., whose Court he temporarily joined at Augsburg; had many distinguished patrons, including doges of Venice, cardinals, princes, and Pope Paul IV.; and the Venetian government treated him handsomely and with indulgence. His later work at Venice was done chiefly for Philip II. of Spain. T.'s pictures, vast in number, include portraits, religious and mythological subjects, and poetical or allegorical works. The religious pictures are especially grand and noble, and all show the highest technical skill in the matter of design and colouring. Certain continental collections are rich in Titians, and there are five in the National Gallery, London.

TITLE GUARANTEE COMPANIES, formed for the protection of titles to real estate, and successful in U.S.A. and countries where such titles are a matter of public record. First company incorporated, 1864.

TITLES are indicative of rank, dignity, or calling. In the ordinary sense t. means a t. of rank, which in Europe is commonly hereditary, knighthood being

the exception. In England, by the law of primogeniture, only one person can bear the title in a single generation; but in France the various titles are enjoyed by all the sons; and the Russ. title of 'prince' belongs to all male descendants of the great reigning houses of Russia, Poland, and Lithuania. In Germany and Austria the titles commonly pass to all the sons.

The oldest European title is 'count,' which dates from the early Rom. Empire. 'Baron' stood for 'man,' and applied to the king's tenants-in-chief. Then in England come, in ascending rank, earls, viscounts, marquises, dukes—all making up the peerage. Baronets, who are outside the peerage, were first created by James I. In the R.C. Church 'cardinal' is a title of honour, and its bestowal makes the recipient a prince of the Church. The univ's confer titles of honour when they give honorary degrees—usually D.D., D.C.L., LL.D.

TITMICE, see TITS.

TITS, TITMICE (*Paridæ*), a family of minute perching birds found in most parts of the world except S. America and the Arctic regions. They are small bodied, of active habit, with short sharp beaks, and feed mainly on insects.

TITUS, friend of St. Paul; Epistle to T. (*q.v.*) was written to him; see also *Galatians* 2^{1-3}, *II. Timothy* 4^{10}.

TITUS, FLAVIUS SABINUS VESPASIANUS (d. 81), Rom. emperor; took Jerusalem, 70; Arch of T. raised in commemoration; succ. Vespasian as emperor, built baths and gave gladiatorial shows.

TITUS, THE EPISTLE TO, New Testament book, bearing name of St. Paul, written to T., who presides over the Christian churches in Crete. It is uncertain when Christianity was introduced or when Paul went there. The authenticity of T. has been much disputed, but even those who deny it admit that it embodies Pauline ideas and may contain Pauline fragments; it is directed largely against Gnosticism.

TITUSVILLE (41° 40′ N., 79° 42′ W.), city, on Oil Creek, Crawford County, Pennsylvania, U.S.A.; oil-refineries; manufactures machinery. Pop. (1910) 8533.

TIVERTON (50° 54′ N., 3° 29′ W.), town, junction of Lowman and Exe, Devonshire, England; manufactures lace; taken by Parliamentarians, 1645. Pop. (1911) 10,205.

TIVOLI (ancient *Tibur*) (41° 58′ N., 12° 48′ E.), town, on Tiverone, Rome, Italy; bp.'s see; favourite resort in Rom. times; antiquities include ruins of so-called temple of Sybil and temple of Tiburtus; in the environs are remains of many villas. Pop. (commune) 13,500.

TJERIBON, see CHERIBON.

TLAXCALA (19° N., 98° W.), state, Mexico; belongs to central plateau; chief industry, agriculture. Pop. (1910) 184,171. Capital, **Tlaxcala** (19° 18′ N., 98° 2′ W.), on Atoyac.

TLEMCEN (34° 52′ N., 1° 18′ W.), chief town, Oran, Algeria; stands on high rock, surrounded by walls; has numerous splendid mosques, as well as R.C., Protestant, and Jewish places of worship; trading centre; exports cork, ostrich feathers, textiles, carpets. In neighbourhood vines, olives, and other fruits, tobacco, and cereals are cultivated. T. was held in turn by Berbers, Saracens, Spaniards, Turks; taken by French, 1842. Pop. (1911) 39,874.

TOADS (*Bufonidæ*, etc.), a group of Tailless Amphibians differing from true frogs in the wide space which separates the bones of the breast. They occur all the world over, and include terrestrial, aquatic, and even burrowing forms.

TOAST, to drink the health of any one; expression said to be derived from an episode at Bath in XVII. cent. T. was at that time dipped in wine to flavour it, and when one gallant drank his mistress's health in the water in which she was bathing, another swore 'though he liked not the liquor, he would have the toast.' Toasting is a custom of the greatest antiquity. It is believed that our 'three times three' was derived from the classical custom of drinking to the Nine Muses.

TOBACCO PLANT (*Nicotiana tobacum*), belongs to the family *Solanaceæ*, which includes the potato, tomato, nightshade, and many other familiar plants. It is an annual attaining a height of about 6 ft. and becoming branched towards top of the stem. The leaves are very large, sometimes 20 in. long. The flowers are large, tubular, and pink in colour. The whole plant is rendered sticky by a glandular excretion. The home of the t. p. is N. America, but it was brought to Europe by the earliest explorers, having been introduced into England in 1584. Its use in the Old World was strenuously opposed by the Church and frequently also by lay authorities, but it made steady progress, and is now universal.

The culture of the tobacco demands, for the production of the finer qualities, a warm and moderately moist climate, and a very rich soil. It is cultivated most largely in America, which produces half the world's supply, in India, Turkey, Egypt, Hungary, and S. Africa; also grown in Germany, but attempts to introduce it into Britain have hitherto failed, partly because the climate is not suitable for the production of a very high quality, and partly because of excise restrictions. Turkish tobacco is prepared from *Nicotiana rustica*, which, like the commoner *N. tobacum*, is a native of America.

The tobacco plant is ready for harvest about 3½ months after sowing, when it is cut down or has the leaves removed separately. The leaves are made into bundles and dried either in the open air or by means of artificial heat. In so doing they acquire their brown colour. They are then sorted and placed in heaps in closed rooms, where they undergo a process of fermentation. After this they are ready for manufacture into the various forms in which tobacco is used—pipe-tobacco, cigars, cigarettes, snuff, and chewing-tobacco.

The narcotic effect produced by tobacco is due to the presence of the two alkaloids *nicotin* and *nicotianin*.

Smoking 'mixtures' usually contain 2 or 3 of the following t's—York River, Latakia, Black Cut, Turkey (coarse cut), Virginia, Perique. Ground t. is sold as *snuff*.

TOBAGO (11° 16′ N., 60° 42′ W.), mountainous island, Brit. W. Indies; fertile; exports cotton. Pop. (1911) 20,762. Capital, Scarborough; joined administratively to Trinidad (*q.v.*).

TOBERMORY, see MULL.

TOBIT, THE BOOK OF, Old Testament apocryphal story (c. 150–100 B.C.) of T., a blind Jew, who, when taunted by his wife, prayed for death; a woman called Sara, taunted because she has lost her husband, likewise prays; finally T.'s s. Tobias marries Sara, and T. is cured; based on the story of Ahikar; versions in Gk., Lat., Hebrew, Syriac, Aramaic.

TOBOGGANING, see SPORTS, WINTER.

TOBOLSK (63° N., 70° E.), westernmost government of Siberia, extends from Akmolinsk and Semipalatinsk in S. to Yalmal peninsula and Gulf of Ob in N.; surface generally level; watered by Ob and tributaries; fertile in Tobol and Ishim steppes; chief pursuit agriculture. Pop., mainly Russians (1910) 1,818,400. Capital, **Tobolsk** (58° 12′ N., 68° 20′ E.), on Irtish; contains a kreml and cathedral; formerly capital of W. Siberia. Pop. 21,000.

TOBRUK (32° N., 24° E.) (ancient *Antipyrgos*), port, Tripoli; fine harbour; sponge fisheries.

TOCQUEVILLE, COMTE DE, ALEXIS HENRI CHARLES MAURICE CLÉREL (1805–59), Fr. historian; sent by government to study penitentiary system in U.S.A.; wrote *La Démocratie en Amérique* (1835), a work of social philosophy, *L'Ancien Régime et la Révolution* (1856), new generalisation on Revolution.

TODI (42° 47′ N., 12° 25′ E.) (ancient *Tuder*), town, Perugia, Italy; has a cathedral (XI.–XIV. cent.), and a fine Renaissance church; Rom. and

Etruscan antiquities; scene of victory of Narses over Goths, 552 A.D. Pop. (commune) 16,800.

TODIES (*Todus*), form a genus and family of minute red and green Picarian Birds confined to the West Indies, where they tunnel in banks; insectivorous.

TODLEBEN, COUNT, FRANZ EDUARD IVANOVICH, TOTLEBEN (1818–84), Russ. soldier; distinguished in defence of Sevastopol, 1854–55; general, 1860; captured Plevna from Turks, 1877, and became commander-in-chief in Turk. War.

TODMORDEN (53° 43′ N., 2° 6′ W.), town, Yorkshire, England; cotton. Pop. (1911) 25,455.

TOGA, see COSTUME (ROMAN).

TOGGENBURG, THE (47° 15′ N., 9° 5′ E.), upper valley of the Thur, canton St. Gall, Switzerland.

TOGO, COUNT HEIHACHIRO (1847–), Jap. admiral; ed. England; commanded Jap. fleet in Russo-Jap. war, 1904–5.

TOGOLAND (6° to 10° N., 0° to 2° E.), Ger. colony, W. Africa, to E. of Brit. Gold Coast Colony; area, 33,659 sq. miles; surface undulates from coast to extreme height of c. 2600 ft.; drained by Volta and Monu, which respectively form parts of W. and E. boundary; chief town, Lome. Produces dye-woods, caoutchouc, cocoa, oil-palms, maize, fruits; exports palm oil, gums, ivory, rubber, cotton. Administered by Imperial governor, assisted by two officials; German colony since 1884. Pop. (1911) 1,000,400.

TOISON D'OR, see KNIGHTHOOD.

TOKAT (40° 17′ N., 36° 37′ E.), town, vilayet Sivas, Asia Minor; manufactures copper. Pop. *c.* 33,000.

TOKAY, TOKAJ (48° 7′ N., 21° 24′ E.), town, Zemplen County, Hungary; noted wines. Pop. 5300.

TOKELAN, UNION ISLANDS (8° N., 170° W.), small group, in Pacific, belonging to Britain.

TOKYO (35° 40′ N., 139° 46′ E.), chief town of Japan, on S.E. coast of Honshiu; has imperial palace, Russ. cathedral, several temples, and univ.; great part of town built of wood; some beautiful parks; dockyards and manufactures of machinery, silk, lacquer, earthenware, china, and enamels. Pop. *c.* 2,220,000.

TOLAND, JOHN (1670–1722), b. Londonderry; first laid down Deistic principle to require simple and clear explanations of things. Christianity, not in itself mysterious, becomes so through pagan and Judaical influences. Revelation assists ordinary mortals; not necessary for those who exercise their reason.

TOLEDO (39° 50′ N., 4° W.), province, New Castile, Spain; mountainous. Capital, **Toledo** (39° 51′ N., 4° W.), on Tagus; surrounded by old walls; has XIII.-cent. cathedral with beautiful chapels; other churches include those of Santo Thomé and Santo Domingo; prevailing architecture is Moorish, and town has a mediæval appearance; there is an archiepiscopal palace, a former monastery, and a theological college. T. has long been famous for manufacture of swords; other manufactures are gold and silver church ornaments, cloth, beer. Was the Visigothic capital in Spain, and was in 714 seized by the Moors, in whose hands it remained till 1085, when it was conquered by Alfonso of Castile and Leon. Formerly site of a univ. (1498). Pop. (1910), province, 413,648; city, 23,116.

TOLEDO, city, capital of Lucas County, Ohio; important railroad centre; grain, lumber, iron. Pop. (1910) 168,497.

TOLEDO, COUNCILS OF.—Numerous mediæval synods held at this important Span. city exercised great influence on canon law.

TOLENTINO (43° 13′ N., 13° 17′ E.) (ancient *Tolentium*), town, Italy; cathedral; scene of peace treaty between Bonaparte and the pope, 1797. Pop. 13,800.

TOLERATION, liberty of worship granted to those holding beliefs different from the State religion. Peace of Westphalia (1648) gave freedom to Rom. Catholics, Calvinists, Lutherans of Germany; Act of T. (1689) excluded Rom. Catholics and anti-Trinitarians from its benefits, but gave t. to Quakers and Dissenters.

TOLFA (42° 10′ N., 11° 55′ E.), **town,** Rome, Italy; exports alum. Pop. 4100.

TOLL, originally any tax; but especially charge for landing at a pier, crossing a bridge, using a market-place for sale of goods; Eng. highway tolls abandoned in the XIX. cent.

TOLL, JOHAN KRISTOFFER (1743–1817), COUNT (1814), Swed. statesman and general; helped to organise and effect revolution, 1772; carried out reforms, but favoured absolutist schemes of Gustavus III.; successful war minister; after securing Swed. retreat from Rügen, 1807, made marshal.

TOLSTOY, LEO NIKOLAIEVITCH, COUNT (1828–1910), Russ. novelist and social reformer; b. Yasnaya Polyana, in government of Toula; ed. at home till 1843, when he entered Univ. of Kazan; here he studied Eastern languages and law, but without much success; in 1851 he entered the army, and later served in Crimean War; it was about this time that T. began his literary career by writing *Childhood, Boyhood, and Youth, The Cossacks, Sebastopol,* and other works; retired to St. Petersburg, 1855, where he mixed with many distinguished men.

T. now began to interest himself seriously in the peasants; between 1857 and 1861 he travelled over the Continent, and on his return from his last sojourn abroad, settled down at Yasnaya Polyana, and lived simply among the people; m. Sophia Behrs, dau. of a Moscow doctor, 1862; some years after his marriage appeared his two greatest works, *War and Peace,* and *Anna Karenina.* T. now devoted himself to the study of social and religious problems, and most of his works after this period were written with didactic aim; in 1888 he gave up all claim to his estates, and handed them over to his wife and family; during the famine of 1891–92 T. worked untiringly amongst the poor; in 1910 he died of pneumonia at Ustapova.

Among his other works are *Family Happiness, The Three Deaths, Polikushka, What the People Live by, My Confession, My Religion, Ivan Ilyitch, The Dominion of Darkness, Where Love is there God is also, Kreutzer Sonata, The Kingdom of God is within You, Master and Man, Politics and Religion, Patriotism and Christianity, What is Art?,* and *Resurrection.*

T. developed strong views on religion, and in order to discover reasonable faith studied Buddhism, Muhammadanism, and Christianity; he considered the Sermon on the Mount to be the highest law of Christian life, and particularly emphasised the command, 'Resist not evil'; certain doctrines of the Church, and all sacraments and ceremonies, repelled him, and in 1901 he was formally excommunicated; to Tolstoy the poor seemed the only happy and truly religious people.

Life, by Aylmer Maude (1910), Birnkoff (1911); Merejkowski, *Tolstoy as Man and Artist.*

TOLSTOY, PETS ANDREEVICH, COUNT (1645–1729), Russ. statesman; skilful, unscrupulous instrument of Peter the Great; greatly feared in Turkey, where he was ambassador and thrown into prison.

TOLTECS, semi-mythical people of Mexico, traces of whom are found at Tula, near Mexico City, in the serpent pillars erected to Quetzalcoatl, their chief god.

TOLUCA (19° 11′ N., 99° 25′ W.), city, Mexico; manufactures cotton fabrics; said to have been settled by the Toltecs. Pop. (1910) 31,247.

TOMAHAWK, small hatchet of Red Indians; originally of stone; later, steel handles had hollow stem and were used as tobacco pipes.

TOMASZÓW, TOMASHOV (50° 30′ N., 23° 20′ E.), town, Piotrkow, Russ. Poland; woollen-mills. Pop. 24,000.

TOMATO (*Lycopersicum esculentum*), plant of order Solanaceæ; native to S. America, but grown in Britain under glass.

TOMB, see BURIAL, BARROWS, CATACOMBS, CAIRN.

TOMPKINSVILLE, former village, Richmond County, New York, U.S.A., on Staten Island; now part of borough of Richmond, New York City.

TOMSK (56° N., 85° E.), government, W. Siberia; includes part of the Altai Mountains in S.E.; surface

mostly low towards N., with steppes and marshy tracts; drained chiefly by Ob and its tributaries; rich deposits of silver, gold; agriculture and cattle-breeding industries; climate severe. Pop. (1910) 3,170,300. Capital, **Tomsk** (56° N., 85° E.), on Tom; has a univ. (1888); tanneries; trade centre. Pop. (1910) 105,620.

TON, see WEIGHTS AND MEASURES.

TONALITE, igneous rock of granitic structure composed of plagioclase, biotite, and hornblende; of darker colour than granite.

TONAWANDA (42° 58′ N., 78° 54′ W.), village, on Niagara, Erie County, New York, U.S.A.; iron- and steel-works; lumber industries. Pop. (1910) 8290.

TONBRIDGE, TUNBRIDGE (51° 12′ N., 0° 17′ E.), town, on Medway, Kent, England; wooden articles, gunpowder. Pop. (1911) 14,797.

TONDERN (54° 56′ N., 8° 50′ E.), town, Schleswig-Holstein, Prussia. Pop. 4500.

TONE, THEOBALD WOLFE (1763–98), Irish agitator; b. Dublin; called to the Bar, 1789; became involved in political intrigue as sec. of Catholic committee; gave information about Ireland to a Fr. spy, and had to emigrate to America, 1795; thence he sailed to France, 1796, to obtain Fr. assistance for the United Irishmen, and urged a Fr. invasion of Ireland. Served under Hoche; captured on Fr. vessel; condemned, but committed suicide.

TONGA, OR FRIENDLY ISLANDS (15° to 23° 30′ S., 173° to 177° W.), islands in Pacific, under Brit. protection since 1900; number about 180, of which only 32 are inhabited; divided into Tonga, Haapai, and Vavau groups; area, 390 sq. miles; of coral and volcanic formation, with active volcanoes, one of which is over 2700 ft.; chief town, Nukualofa; climate healthy but damp. Produce and export, copra, candle-nuts, oranges, bananas, pines, pearl-shell, bêche-de-mer. Natives are Polynesians. Pop. (1911) 23,737.

TONGKING (*c.* 21° 40′ N., 105° 20′ E.), dependency of France, Fr. Indo-China; bounded N. by Kwangsi and Yunnan, E. by Gulf of Tongking, S. by Annam, W. by Laos; area, 46,400 sq. miles; surface consists of delta of Red R., with its great tributaries, Black R. and Clear R. in the S.E., plateaux in N., and forest region in W. Delta is very fertile, owing to soil brought down by rivers; two harvests yearly. Chief towns are Ha-noi (capital) and Hai-phong, an important port. T. produces great quantities of rice, as well as pea-nuts, castor oil, sugar-cane, spices, mulberries, coffee, tobacco, cotton; manufactures silk, beer, spirits, hardware, matches. Minerals include coal, iron, copper; acquired, 1885, by France, after struggle for possession with China. Pop. (1911) 6,117,954.

TONGRES (50° 47′ N., 5° 27′ E.), town, Limburg, Belgium; has spring mentioned by Pliny, also old cathedral. Pop. 10,250.

TONGUES, GIFT OF, a phenomenon the precise nature of which is not absolutely certain, but probably consisted in the emission of unintelligible sounds when in great excitement. It is referred to several times in the New Testament. St. Paul says he spoke with tongues more than any, but he discourages the view that it was to be thought better than other spiritual gifts. Similar phenomena have been witnessed during religious revivals. Some have thought it referred to speaking foreign languages.

TONIC SOL-FA, see SOL-FA.

TONITE, see BLASTING.

TONK (26° 11′ N., 75° 50′ E.), native state, Rajputana, India. Pop. 280,000. Chief town, **Tonk.** Pop. 41,000.

TONNAGE, load of a vessel, estimated by dividing number of cubic feet of space by 100; thus vessel whose capacity is 500,000 cubic feet would be 5000 tons register. Board of Trade officials are appointed to measure cubic capacity of all vessels to be registered. Amount payable in dues, etc., is determined by t.

TONNAGE AND POUNDAGE.—Tonnage, a duty of 3s. on each *tun* of wine, and poundage, a duty of 1s. on each pound of merchandise, were first levied in mid.-XIV. cent., and were payable to the king; Eng. Parliament granted t. and p. to Charles I. for one year only, instead of for life, but Charles II. and James II. obtained grants for life; abolished by Customs Consolidation Act, 1787.

TONNERRE (47° 53′ N., 3° 55′ E.), town, on Armançon, Yonne, France; produces wines. Pop. 4100.

TÖNSBERG (59° 15′ N., 10° 28′ E.), seaport, amt Jarlsberg and Laurvik, Norway; whale- and seal-oil refineries. Pop. 9000.

TONSILLITIS, inflammation of the tonsils, may be acute (quinsy) or chronic; in the former the onset of an attack is usually sudden, with pain, swelling, and redness of the tonsils, rise of temperature, and sometimes constitutional disturbances, and an abscess may form in a few days; the treatment is first to give a saline purge to reduce the temperature, steam inhalations and cold compresses externally to relieve congestion, sodium salicylate internally, and if an abscess forms it should be incised, improvement following immediately; in the chronic form the tonsils are enlarged, the condition often being associated with adenoids (*q.v.*), and the treatment is the administration of iron and other tonics, painting the tonsils with tannic acid or other astringents, and if the condition does not improve the tonsils should be removed.

TONSURE, minor order in R.C. and Eastern churches, shaving the crown or whole of the head; no one could enjoy clerical status without it. Cause of dispute between Celtic and Roman Churches, settled by Council of Whitby, 664.

TOOKE, JOHN HORNE (1736–1812), Eng. politician and scholar; senior optime, St. John's, Cambridge, 1758; ordained, but gave up clerical work; refused admission to the Bar, and on being made M.P. for Old Sarum, 1801, was excluded from Parliament by Act which made clergymen ineligible. A radical in politics, and a man of considerable wealth. Fined for political libels, but acquitted of high treason, 1794. Author of *Diversions of Purley,* a philological work.

TOOLE, JOHN LAWRENCE (1830–1906), Eng. comedian; toured U.S.A., 1874–75, Australia, 1890; became lessee of Folly Theatre (later Toole's Theatre), London, 1879.

TOOLS may be roughly divided into hand- and machine-t's. Hand-t's are held and manipulated entirely by the hands, as in the case of a hammer or chisel; machine-t's are those operated by some kind of mechanism. A further division is into cutting-t's, which include chisels; shearing and scraping t's; percussive and detrusive t's, represented by the hammer and the punch; and moulding t's, such as the trowel. If a cutting t. is intended for light work, as with the wood-cutting chisel, keenness of cutting edge is the most important consideration; but, if it is to cut steel or iron, strength and rigidity are the essential features, and to attain these it is often necessary to forgo a certain amount of keenness. Many cutting t's may be used either for cutting or scraping, the action depending upon the angle at which they are held. The exact form of a cutting t. depends upon the material for which it is to be used—that is, upon its hardness and its crystalline or fibrous nature.

T's vary also in shape according to the holder in which they are to be gripped. Roughing t's usually have a narrow edge, and finishing t's a broad one, but there are exceptions to this. T's may be solid or made for use only in a holder. In the former the cutting part is worked from a solid bar, and as the best steel is costly, such t's are more expensive than those of the latter class, which consist of the cutting portion only. A certain amount of shearing action takes place in the use of some cutting t's, and the cutting strain is thereby reduced.

The CHISEL group includes all chisels proper, gouges, and planes, and also chisels used percussively, such as the adze and stone-working chisels. BORING t's may be cutting t's proper or scrapers. Wood-working bits

act by cutting, but the common metal-working drill has really a scraping action. Amongst the true cutting borers are the twist-drills, while reamers have a scraping action. Boring t's may be supported at one end only or at each end, the latter having greater accuracy, especially for long bores. SAWS combine cutting and scraping action, and are used in many varieties for both wood and metal, the pitching of the teeth varying with the material to be cut. Closely allied to the circular saw is the milling cutter. FILES are strictly scrapers, but they have also a certain amount of shearing action. Shears and punches are similar in so far as both have a detrusive action. HAMMERS take a great variety of forms for different trades. To avoid bruising the t's or the work, wooden hammers are often used, and these are classed as mallets. In some cases hammers have flexible handles to lessen the shock to the hands, but mostly the handles are quite rigid. Moulding t's are operated by percussion or pressure according to circumstances.

One of the most important machine t's is the LATHE. Its essential feature is the rotating of the work against a fixed t.; it is used for all kinds of turning, boring, and screw-cutting. The many varieties of lathe may be divided into four groups: so-called engine lathes, turret lathes, special lathes, and hand lathes. Engine lathes are in most general use. Turret lathes have turrets carrying a number of t's, and many of them are capable of performing several separate operations simultaneously. In planing-machines, for producing flat surfaces, a table carries the work against the cutting t. and back again, while the t. has only the transverse movement required for feeding. The shaping-machine does similar work, but the arrangement is reversed, the cutting t. moving over the work. In the vertical shaper or slotting-machine the t. slide moves vertically. MILLING-MACHINES have rotary cutters with many cutting edges. The rotary planer is really a milling-machine, and has certain advantages over the ordinary planer. In some milling-machines the angle of the table can be altered for milling spirals. For boring or turning work of large diameter the vertical boring and turning mill is used instead of the engine lathe. There are also horizontal boring-machines (modified lathes) for boring at any angle, and special machines for boring the cylinders of engines or pumps.

DRILLING is mostly done by the upright drilling-machine. The ordinary form has the vertical axis of the spindle fixed, side adjustments being made by moving the work; but the universal radial drill will drill holes at any angle. Multiple drills are used for the simultaneous drilling of a number of holes. The superiority of cut gears to those with cast teeth has led to the universal employment of gear-cutting machines. There are plain hand-indexed machines, automatic gear-cutters in which cutting and indexing are done automatically, gear-shapers which automatically generate the tooth outline, and gear-planers for bevel gears. The thread-milling machine is used for producing specially accurate screw-threads, and the bolt cutter for large bolts not demanding great accuracy and finish. Pressure punching and shearing machines are largely used in sheet-metal working, and to a smaller extent in general machine-shops. Special types are made for embossing and pressing sheet-metal forms, punching holes in flanges, etc.

During the past few years emery-wheel grinding-machines have assumed great importance for accurately finishing metal parts, and particularly for surfacing chilled-iron or hardened steel parts, which resist the ordinary steel-cutting tool. Surface grinders produce plane surfaces only, and are generally used to remove thin layers of metal, as in finishing to size work which has been roughed out on the planing-machine. Other machines produce cylindrical or conical surfaces, as required for spindles and shafts, and special attachments allow inside grinding to be done. Grinding-machines are used for grinding twist-drills, milling-cutters, gear-cutters, and the t's of lathes, planers, slotters, and other machines. GRINDING may be done either wet or dry, according to the work in hand. Sawing-machines are used for cutting shafts, rails, girders, etc., and there are various types of steam, pneumatic, and other hammers.

The immense size of modern engineering constructions has led to the rapid development of portable machine t's, which can be applied to any part of the work at any time. These include drilling, screwing, planing, riveting, hammering, and other machines. Reciprocating movements, as in hammering, are usually obtained by the action of compressed air upon a solid piston working in a cylinder, and electric or pneumatic motors are used for rotary motions. Amongst the more important wood-working machines are the saws —reciprocating, band, and circular. Planing-machines may have a fixed blade or revolving cutters, and some combine the two, the work passing from a revolving cutter to a fixed t. There are also wood-working lathes, and sandpapering, boring, mortising, tenoning, and dovetailing machines. The various measuring instruments, such as gauges, ordinary and screw-thread, callipers, and micrometers, are also to be included amongst t's.

TOOMBS, ROBERT (1810–85), Amer. political leader, introduced Toombs bill concerning slavery, 1856; served in Confederate army, 1861–63.

TOOWOOMBA (27° 34′ S., 152° E.), town, on Darling Downs, Queensland, Australia; agricultural district; breweries; flour-mills. Pop. 10,300.

TOP, see GYROSCOPE.

TOPAZ, a gem-stone composed of alumina and silica; occurs in primitive rocks in Russia and Siberia, Scotland (blue), Saxony, and (the finest) Brazil (yellow). T. may also be colourless, green, pink, and orange; it is transparent and harder than quartz and occurs massive and in crystals.

TOPEKA (39° 5′ N., 95° 45′ W.), city, on Kansas, capital, Kansas, U.S.A., and of Shawnee County; seat of Washburn College (Congregational); Bethany College (Prot. Episcopal) and other educational institutions; railway-shops; manufactures flour, machinery. Pop. (1910) 43,684.

TOPES, see ARCHITECTURE, INDIAN.

TOPLADY, AUGUSTUS MONTAGUE (1740–78), Anglican hymnologist.

TOP-SHELL, see GASTEROPODA.

TORCELLO, small island, 6 miles N.E. of Venice; contains cathedral of Santa Maria (VII. cent.); church of Santa Fosca (XII. cent.).

TORDENSKJOLD, PEDER (1691–1720), Dan. admiral; b. Trondhjem; during Great Northern War distinguished himself by audacity and seamanship in engagements with Sweden. In 1716 destroyed Swed. fleet in strait of Dynekil and forced Charles XII. to raise siege of Fredrikshald.

TORENO, JOSÉ MARIA QUIEPO DE LLANO RUIZ DE SARAVIA, COUNT OF (1786–1843), Span. historian; held various State appointments; wrote *History of the Rising War and Revolution of Spain*.

TORGAU (51° 36′ N., 13° E.), fortified town, on Elbe, Pruss. Saxony; chief building is the Hartenfels castle; glove-making industry. Pop. 13,490.

TORMENTIL (*Potentilla*), genus of plants, order Rosaceæ; root of Common T. (*P. tormentilla*) is an astringent.

TORNADO, see WHIRLWIND.

TORO (41° 32′ N., 5° 26′ W.), town, on Douro, Zamora, Spain; important mediæval city; produces wine. Pop. 8700.

TORONTO (43° 41′ N., 79° 28′ W.), chief town, on shore of L. Ontario, 39 miles N.E. from W. end of lake, Ontario, Canada. Anglican bp.'s see; R.C. abp.'s see; has Anglican and R.C. cathedrals; seat of univ.; has provincial government buildings and law courts; important railway, lake-shipping, manufacturing, and trading centre, dealing in lumber, cattle, grain, and agricultural produce; coal and fruit. Pop. (1912) 421,387.

TORPEDO, see under RAYS.

TORPEDO, a movable submarine case charged with explosive which acts on contact with under part of a ship. Best known, Whitehead t., of steel, is 14½ to 18½ ft. long, cigar-shaped; driven by air-engine and propeller, it is automatically steered by a gyroscope. T's are either dropped into the water or discharged by a small charge of powder from a 'tube.' Dirigible t's may be guided by electric or mechanical wires, or by 'wireless.' The Brennen t., in which two reels of piano wire were unrolled by an engine on shore, has been abandoned by Brit. Admiralty. The latest (1913) t., if it misses, returns upon the mark aimed at and keeps circling around it. Modern t's are fitted with appliances for cutting through t. nets hung round a warship.

TORQUAY (50° 28′ N., 3° 31′ W.), seaport, watering-place, on Tor Bay, Devonshire, England; has remains of Tor abbey (XII.-XIV. cent's); manufactures terra-cotta ware. Pop. (1911) 38,772.

TORQUEMADA, THOMAS (1420-98), inquisitor-gen. of Spain; b. Valladolid; became prior of Dominican monastery; persuaded Ferdinand and Isabella to reorganise Inquisition; and on this being authorised by papal bull, he became head of the new tribunal, beginning his work in 1481. His methods of enforcing Catholic religion have left his name a by-word for fanaticism and intolerance. Torture was used as in other royal courts to induce confession; fines and confiscations brought large sums to the Inquisition; and at least 2000 persons were burnt in eighteen years. T. was also largely instrumental in causing the expulsion of the Moors and Jews from Spain.

TORRE ANNUNZIATA (40° 46′ N., 14° 28′ E.), seaport, at S. foot of Vesuvius, Naples, Italy; iron-works; manufactures macaroni. Pop. 29,000.

TORRE DEL GRECO (40° 48′ N., 14° 20′ E.), seaport, at S.W. foot of Vesuvius, Naples, Italy; coral industry. Pop. 36,000.

TORRES NOVAS (39° 30′ N., 8° 13′ W.), town, Estremadura, Portugal; manufactures textiles. Pop. 11,500.

TORRES VEDRAS (39° 3′ N., 9° 17′ W.), town, Estremadura, Portugal; noted for lines of fortifications constructed by Wellington in 1810. Pop. 7200.

TORREVIEJA (38° N., 0° 37′ W.), seaport, Alicante, Spain; salt mines; active trade. Pop. 8300.

TORRICELLI, EVANGELISTA (1608-47), celebrated Ital. mathematician and physicist; b. Piancaldoli; Galileo's successor as prof. at Florence; discovered value of atmospheric pressure.

TORRIDONIAN, pre-Cambrian arenaceous sedimentary rocks, well seen in neighbourhood of Loch Torridon, Scotland.

TORRIGIANO, PIETRO (1472-1522), Florentine sculptor; d. in the prisons of the Span. Inquisition. He was in England for some time, and executed the tomb of Henry VII. at Westminster. Cellini says it was he who broke Michelangelo's nose.

TORRINGTON (41° 15′ N., 73° 14′ W.), town, Litchfield County, Connecticut, U.S.A.; manufactures woollens, machinery. Pop. (1910) 15,483.

TORRINGTON, GREAT (50° 57′ N., 4° 8′ W.), town, on Torridge, Devonshire, England; manufactures gloves. Pop. (1911) 3041.

TORRINGTON, ARTHUR HERBERT, EARL OF (1647-1716), Eng. admiral; assisted William of Orange, subsequently obtaining command of fleet at home.

TORRINGTON, GEORGE BYNG, VISCOUNT (1663-1733), Eng. admiral; defeated Spaniards off Cape Passaro, 1718; instrumental in subduing Sicily, 1719.

TORSION, strain of a wire when one end is fixed and the other rotated; *torque* or torsional stress is the moment of forces acting; torsion pendulums are used in 365-day clocks.

TORSTENSSON, LENNART, COUNT (1603-51), Swed. soldier; won battles of Schweidnitz, Breitenfeld, and Jankau; ruled western provinces of Sweden, 1648-51.

TORT.—In contradistinction to a crime, which is the commission of an unlawful act, so fixed by law, a t. may be defined as a wrong which arises from (1) an act not justified by law, and intended to cause harm, and which actually does harm; (2) an act contrary to law which causes harm not intended by the doer; (3) an act or omission which causes harm not intended, but which should have been foreseen and prevented; (4) failure to prevent harm when bound, within certain limits, to prevent it. A t. may relate either to persons or property; may be breach of duty fixed by law, and for which redress can be obtained by a lawsuit, or wrong independent of contract.

TORTICOLLIS, see RHEUMATISM.

TORTOISES AND TURTLES. — The order CHELONIA, comprising the Tortoises and Turtles, forms one of the most distinct orders of Reptiles. While neither Tortoises nor Turtles are natives of Great Britain, they are fully represented in N. America, and are widely distributed in Europe and Asia. They may be distinguished from all other Reptiles by the 'shell' or *carapace* comprising a dorsal and ventral shield, formed of bones firmly cemented together, and enclosing the body as in a box, from which only head, limbs, and tail protrude. The horny scales overlapping the upper shield form the *tortoiseshell* of commerce. Chelonian limbs resemble those of Lizards, but the toes are shorter and blunter. The neck is extremely flexible, and is curiously long in the Snake-Necked Tortoises. The strong, hard, and horny jaws are without teeth, but possess great powers of mastication.

The term 'tortoise' is confined to the truly terrestrial species of Chelonia, while 'turtle' is usually applied to marine or aquatic members of the group. The Amer. term 'terrapin' has been used somewhat indiscriminately, but usually indicates the freshwater, hard-shelled edible species.

The members of the group, while generally sluggish in their mode of life, vary greatly in habits. Some are vegetable feeders, others are solely carnivorous. All are oviparous, the limy-shelled eggs being generally laid in hollows or furrows in sand. Amongst the best known may be mentioned the LAND TORTOISES, found in Asia, America, and Africa, comprising many marsh-loving web-footed species, as well as others, which, like the BURROWING GOPHER TORTOISE, inhabit arid and desert places. Others again are the well-known common EUROPEAN TORTOISE (*Testuda græca*), with olive-coloured and black-bordered shield; and the gigantic Tortoises, inhabiting the small islands of the Pacific and Indian Oceans, call for remark not only on account of their colossal proportions—for they weigh sometimes over 300 lb.—but also of the great age—in some instances over 150 years—which they may attain.

The aquatic Turtles include the SNAPPING TURTLE, common in N. and Central America—a very vicious species which lives on water-fowl and fish, which it crushes and eats with its powerful hooked jaws; the SOFT-SHELLED TURTLES, entirely lacking in horny scales, are known both in the Old and New Worlds, and are adapted for their aquatic life by the possession of broadly webbed feet; and *Sphargis*, the LEATHERY TURTLE, with flexible carapace, sometimes reaches a length of 6 ft.

TORTOISESHELL, see under TORTOISES.

TORTOLI (39° 54′ N., 9° 40′ E.), small seaport, on E. coast, Sardinia.

TORTONA (45° 53′ N., 8° 52′ E.) (Rom. *Dertona*), town, Alessandria, Italy; cathedral; manufactures silk. Pop. 17,600.

TORTOSA (40° 50′ N., 0° 30′ E.) (Rom. *Dertosa*), fortified town, on Ebro, Tarragona, Spain; cathedral (XIV. cent.); manufactures paper; fisheries; ex-

ports corn, wine; was an important Moorish stronghold; taken by the French, 1708 and 1811. Pop. (1910) 28,019.

TORTURE.—Torture has been used from earliest times either as punishment or to extract a confession in judicial proceedings from unwilling witnesses or accused persons. In Athens and under Rom. Republic only slaves could be tortured, but under the Empire it was extended to freemen, on the prerogative of the emperor, to obtain evidence of *læsa majestas*. Not recognised by the canon law of the Church till the XIII. cent., when sanction was given by Pope Innocent IV. (1282 A.D.) to civil magistrates to put persons accused of heresy to the torture, on the principle of Rom. treason law. Adopted by Ital. municipalities, and France in XIV. cent., then by Germany, XV. cent., and by every European government, except Sweden and England.

Although it had no place in the common law of England, t. was frequently employed by royal prerogative of the Eng. Crown both in State trials and ordinary crimes, under the Tudors (especially against religious offenders) and Stewarts. The first recorded case was in 1310, against the Templars, by reluctant consent of Edward II. The last case was in 1640 (Charles I.), in order to extract a confession of treason. Abolished in France, 1789, in Russia, 1801, in Württemberg, 1806, Bavaria, 1807, Hanover, 1822, and Baden, 1831. Prohibited by papal bull in all Catholic countries, 1816. Never legal in Eng. colonies, or in America. (Flogging, since it ordinarily causes neither mutilation nor permanent injury to the human body, is not held to be torture.) Leaving aside the cruelty and degradation involved, the unreliability of torture as a means of discovering the truth was long evident, since innocent persons in weakness and exhaustion would plead guilty and accuse other innocent persons, in order to obtain relief. Of course when evidence was wanted, and not truth, the use of torture was a valuable asset to base governments.

The chief instruments of torture were the rack, an oblong horizontal frame, on which the accused was stretched while cords, attached to his legs and arms, were gradually strained by a lever until in extreme severity the joints were dislocated; the thumb-screws; the boot; and the pincers. The scourge, and mutilation by hooks and torture by fire, were employed by the Romans. Perverted and diabolical ingenuity also devised many other means for the torture of human beings and animals.

Jardine, *Use of Torture in Criminal Law of England*; Stephen, *History of the Criminal Law*.

TORY, originally an Irish R.C. robber; term applied to Royalist party at time of Popish Plot, then superseded by 'Conservative,' c. 1830. See CONSERVATIVE PARTY.

TORZHOK (57° 6′ N., 35° E.), town, on Tvertsa, Tver, Russia; produces embroidered goods. Pop. 16,000.

TOSCANELLA (42° 20′ N., 11° 54′ E.) (ancient *Tuscania*), town, on Marta, Rome, Italy. Pop. 5000.

TOTANA (37° 46′ N., 1° 30′ W.), town, Murcia, Spain; agricultural district; manufactures linen. Pop. 14,000.

TOTANUS, a genus of PLOVERS (*q.v.*).

TOTEMISM, the superstitious veneration paid by savages to certain material objects, with which they believe their tribe has some peculiar relation, and which are called totems. Some tribes, indeed, believe themselves to be descended from their totem. It seems that at first only the ties of the clan were recognised as binding or even as existent among men. To kill a member of another clan was not murder; moral obligations, even of the most rudimentary sort, only bound those who were of one kin. If blood relationships could be extended, the sphere of moral obligation was correspondingly enlarged; commonly done by making a blood-covenant between different clans, which so became united—thus paving the way for the replacement of clans by nations. For the blood-covenant it was sufficient if a few drops of blood were mutually exchanged between the members of the different clans—a ceremony which is still practised in some parts of Africa.

The objects of the natural world were seen to fall into genera and species, much as the human race into clans and families. So was suggested the idea of forming a blood alliance with one or other of such species, which was deemed to possess supernatural power, and therefore meet to be conciliated. First, the animal species would be chosen, and the animal thus selected would become the totem (family mark), or kin to the human clan; afterwards the analogy would be extended to include plants and other natural objects. A moral obligation was thus established; the life of the animal or plant must be cherished equally as the life of one's brother-clansman; and so developed the domestication of certain animals, and the preservation and cultivation of certain plants.

Then imagination came into play, and the relationship between the clan and its totem was explained as not being artificial, but natural. A myth would be invented to explain that the kinship was real, and either the totem would be taken as being the ancestor of the clan (as in the earlier myths), or it would be shown how the man had at one period or another assumed the totem form (as in later rationalising myths). So arose the numerous myths of transformation into or from animals which have prevailed almost universally.

Essentially, the totem was an object of worship, for it was the abode of supernatural power. To procure the presence of this supernatural ally when needed, the blood-covenant must be renewed, the blood of the totem animal must be shed. This shedding of blood was next interpreted as the offering of the animal to the god. Finally, it was felt that the presence of the god, and communion with him, could best be secured by the worshippers consuming the totem in whole or in part, and so the sacrifice to the god became a meal in which the worshipper symbolised and realised his unity with the god.

But the blood must not be shed on the ground and so dissipated; that would be taboo; so a heap of stones was raised, or a simple stone pillar, on which the sacrifice was made. Thus an altar was originated; and again, by association of ideas, it became sufficient to procure the god's presence if the pillar was smeared with the blood. Then the pillar became the symbol and instrument of the god's presence, and was often carved into some resemblance of the god or the totem; and so, whether marble monolith or wooden asherah (the 'groves' of our Old Testament), the pillar became an idol, to which in turn sacrifices were often offered.

Totemism has not the same significance for Australian aborigines as it has for African tribes. Its connection with primitive marriage laws is also a field of wide conjecture.

J. G. Frazer, *Totemism*; A. Lang, *Secret of the Totem*.

TOTNES (50° 26′ N., 3° 41′ W.), town, on Dart, Devonshire, England; contains many antique buildings and a ruined Norman castle; exports cider, grain. Pop. (1911) 4128.

TOTONICAPAM, TOTONICAPAN (15° 9′ N., 91° 22′ W.), town, Guatemala. Pop. 31,000.

TOTTENHAM (51° 37′ N., 0° 4′ W.), N.E. suburb of London, in Middlesex, England. Pop. (1911) 137,457.

TOTTENVILLE, former village, Richmond County, New York, U.S.A., on Staten Island, now part of New York city.

TOUCANS (*Rhamphastidæ*), a family of brightly coloured Picarian Birds with about 60 species, found in the forests of Central and S. America. Their brilliant plumage—black and green, red, orange, and blue—and their enormously large saw-edged bills combine to give them an odd appearance of ungainly beauty. They live in societies and are said to resemble magpies

in their habits. By the natives they are much esteemed as food.

TOUCH, the sense of the perception of pressure on the surface of the body, often associated with the perception of heat and cold, with which the sensation is more or less combined. The organs of t. in man are of three different kinds, the *End Bulbs*, the *T. Corpuscles*, and the *Pacinian Corpuscles*, in all of which are the terminations of nerve filaments which join togother to compose the peripheral nerve trunks and carry sensations eventually to the brain. The *end-bulbs* are minute rounded bodies found in the conjunctiva, the lips, and the mucous membrane of the mouth, genital organs, and elsewhere. The *t. corpuscles* are oval bodies, rather smaller than the end-bulbs, situated usually in the papillæ of the dermis or true skin (*q.v.*), and most common in the palms of the hands and the soles of the feet. The *Pacinian corpuscles* are larger than the two former, being oval bodies, up to $\frac{1}{16}$th of an inch in length and about half that in breadth, situated in the subcutaneous tissue, and most common on the under surface of the hands and feet, near joints, and associated with the sympathetic nerves of the abdomen.

The purpose of these special organs of t. is that very slight variations of pressure may be rendered more perceptible by the peripheral nerve endings. It has not yet been definitely found whether there are separate nerve fibres for the perception of different temperatures, but it has been shown that there are different small areas on the skin where sensations of heat or cold are more keenly perceived than elsewhere, *cold spots* being more numerous than *hot spots*.

TOUL (48° 40′ N., 5° 53′ E.), town, fortress, on E. frontier, Meurthe-et-Moselle, France; manufactures porcelain; trade in wine; chief edifices are the former cathedral of St. Etienne and church of St. Gengoult; besieged by Germans, capitulated, 1870. Pop. 13,700.

TOULON (Gk. *Telonion*, Rom. *Telo Martius*) (43° 7′ N., 5° 56′ E.), first-class fortress and naval station (headquarters of Mediterranean fleet) in Var department, France; church of St. Marie Majeure, town hall, arsenal, Musée, large safe harbour, naval shipbuilding yards; trades in oil, wine, salt, etc.; British defeated by Span. and Fr. fleets, 1744; taken by Republicans from Royalists and British, 1793. Pop. (1911) 104,582.

TOULOUSE (43° 36′ N., 1° 27′ E.), town, on Garonne and Canal du Midi, France; capital of Haute-Garonne; numerous narrow streets and old houses in Renaissance style; fine church of St. Sernin (XI.–XIV. cent's), cathedral (XI. cent. onwards), capitole (town hall), palace of justice, museums, univ., art academy, XVI.-cent. bridge; large industrial and commercial centre; iron and copper foundries, cannon-making, powder factory, wire-drawing, stained glass, carriages, leather, paper, tobacco, brandy, famous liver and truffle pies. Ancient *Tolosa*, city of Rom. Gaul, became Visigoths' capital, 419 A.D.; rule of famous Counts of T. began *c.* 852; all-powerful in S. France XI. cent.; extinct, 1271, when T. was united to France; English under Wellington here defeated French, 1814; T. lies at gateway to Provence, and in Middle Ages was a centre of Provençal poetry and festivals. Pop. (1911) 149,576.

TOUNGOO, TAUNG-NGU (18° 55′ N., 96° 31′ E.), district, Tenasserim division, Lower Burma. Pop. 285,000. Chief town, Toungoo; formerly capital of an independent kingdom. Pop. 17,500.

TOUPÉE, see HAIR.

TOURACOUS, see TURACOS.

TOURAINE (47° 15′ N., 1° 20′ E.), ancient province, France; capital, Tours; now mainly included in Indre-et-Loire.

TOURMALINE, a mineral harder than quartz, composed chiefly of silica and alumina, found in granite, gneiss, and mica-slate, and sometimes in river sands and alluvial deposits of Ceylon, Burma, Brazil, and Siberia; of vitreous lustre, varying from transparent to opaque; black (see SCHORL), brown, blue-black, blue-green, and red.

TOURNAI, DOORNIK (50° 37′ N., 3° 25′ E.) (Rom. *Turnacum*), town, on Scheldt, Hainault, Belgium; has a fine cathedral containing paintings by Flemish masters; manufactures carpets, hosiery; was capital of the Nervii and an early residence of the Merovingian kings. Pop. (1910) 36,982.

TOURNAMENT, TOURNEY, a mediæval form of mimic warfare indulged in by nobles from XI. to XVI. cent. Combatants were drawn up at either end of a field (*the lists*), and at a signal dashed, with lance in rest, against their opponents. Weapons used in tournaments were generally blunted. T's gradually disappeared after the advent of firearms.

TOURNEUR, CYRIL (*c.* 1575–1626), Eng. playwright; won fame by the *Atheist's Tragedy* and the *Revenger's Tragedy*, a play which in tragic intensity is equal to Webster and second only to Shakespeare.

TOURNIQUET, instrument for stopping arterial blood flow in cases of limb accidents, snake-bites, etc.; in 'first aid' a cord or handkerchief tightened by screwing with a lead pencil makes an efficient t.

TOURNON (45° 5′ N., 4° 45′ E.), town, on Rhône, Ardèche, France. Pop. 5100.

TOURNUS (46° 35′ N., 4° 51′ E.), town, on Saône, Saône-et-Loire, France; XI.-cent. abbey church; trade in wine. Pop. 4000.

TOURS (47° 23′ N., 0° 42′ E.), town, on Loire, France; capital of Indre-et-Loire; magnificent Gothic cathedral (XII.–XVI. cent's), church of St. Julien, abp.'s palace, museum, library, palace of justice, art school, and ruined Château Plessis-les-Tours in vicinity; iron and steel industries, chemicals, leather, wine, woollens, silks, printing; ancient capital of the Turones, later of Touraine (*q.v.*); here Charles Martel defeated Saracens, 732; taken by Germans, 1870. Pop. (1911) 73,398.

TOURVILLE, ANNE HILARION DE COTENTIN, COMTE DE (1642–1701), Fr. admiral; distinguished himself at Palermo, 1677; rear-admiral (*chef d'escadre*), 1683; made successful attacks on Algerine pirates, 1682-88; was defeated by Dutch and English off La Hogue, 1692, but captured their Smyrna convoy, 1693.

TOWANDA (41° 46′ N., 76° 25′ W.), town, on Susquehanna, capital, Bradford County, Pennsylvania, U.S.A.; manufactures furniture. Pop. (1910) 4281.

TOWCESTER (52° 8′ N., 1° W.), town, on Tove, Northamptonshire, England; boots and shoes.

TOWER, ROUND, form of military arch. found VIII.–XIII. cent's; slopes inwards from base to apex; ladder entrance at first floor only; three or four one-roomed storeys; earliest had rubble walls; windows narrow slits.

TOWNELEY, CHARLES (1737–1805), Eng. archæologist; collector of marbles; Brit. Museum bought collection for £28,000.

TOWNSHEND, MARQUESSATE OF.—George, 4th viscount (1724–1807), Brit. commander in Canada after Wolfe's death (1759); Lord-Lieut. of Ireland (1764); cr. marquess (1787); succ. by s. **George** (1755–1811), a prominent politician and archæologist. The latter's notorious heir, George Ferrers (1778–1855), was succ. as marquess by his cousin, John T. (1798–1863), whose grandson, the 6th marquess, John James Dudley Stuart (1866–), was in 1906, declared incapable of controlling his estates.

TOWNSHEND, CHARLES (1725–67), Eng. statesman; M.P. for Great Yarmouth, 1747; Lord of Admiralty, 1754; Sec. for War, 1761; resigned, 1762, and opposed Grenville's administration; Chancellor of Exchequer under Pitt, 1766; taxed imports from America, which subsequently caused revolt of colonies.

TOWNSHEND, CHARLES TOWNSHEND, 2ND VISCOUNT (1674–1738), Brit. statesman; ambassador to States-gen., 1709; app. Sec. of State for northern department by George I., 1714; concluded

alliances with Emperor and France; pioneer of scientific agriculture.

TOWNSVILLE (19° 10′ S., 146° 58′ E.), town, port, on Cleveland Bay, Queensland, Australia; gold-mining and pastoral district. Pop. 17,000.

TOWTON, village, 2½ miles S. of Tadcaster, W. Riding, Yorkshire, England; scene of battle between Yorkists and Lancastrians, 1461.

TOXICOLOGY, term applied to that branch of science which deals with poisons, their nature, effects, treatment, detection, and laws relating to them. See POISON.

TOXINS, see BACTERIOLOGY.

TOYNBEE, ARNOLD (1852–83), Brit. social worker; Eng. social reformer; tutor at Balliol Coll., Oxford; lectured to working-class audiences on economics and industrial questions; Toynbee Hall, Whitechapel, erected to his memory.

TRACERY, see under ARCHITECTURE.

TRACHEA, see RESPIRATORY SYSTEM.

TRACHEOTOMY, term applied to the operation of making an incision into the trachea (windpipe) and inserting a tube to facilitate breathing when the normal air-passages are obstructed, as, for instance, in advanced cases of diphtheria.

TRACHIS, HERACLEA (38° 45′ N., 22° 20′ E.), ancient city, at foot of Mount Œta, Greece; strategic point; associated with Heracles.

TRACHOMA, granular form of inflammation of the conjunctiva of the eye (*q.v.*), to which unhealthy and dirty conditions predispose, common in the Near East (known as Egyptian ophthalmia) and the continent of Europe.

TRACHYMEDUSÆ, see under HYDROMEDUSÆ.

TRACHYPTERIDÆ, see RIBBON FISHES.

TRACHYTE, grey, yellow, brown, green, and red volcanic rock, often containing crystals of glassy felspar, mica, or hornblende; occurs in lava, intrusive sheets, and dykes from early Tertiary times.

TRACT (derived from Lat. *tractare*, to deal with), short argumentative treatise; a species of literature employed and developed by Luther (*q.v.*), whose tract on the captivity of Babylon has been followed by a continuous stream of similar lit. In the XIX. cent. a movement was started by Newman, Keble, and Pusey, whose leading principles they voiced in the famous *Tracts for the Times*. This was the Tractarian or High Church movement. The leading T. Societies are the Society for Promoting Christian Knowledge and the Religious Tract Society. In addition to religious t's there have been many of a political or otherwise controversial nature; more frequently known as Pamphlets (*q.v.*).

TRACTION, the transport of goods in wheeled vehicles.

ANIMAL TRACTION.—The animals used are chiefly horses, mules, donkeys, and oxen, camels and elephants. On the Continent dogs are sometimes harnessed to light carts, but their use in Britain is prohibited by Cruelty to Animals Act, 1854.

MECHANICAL TRACTION is generally accomplished by steam tractors or petrol wagons, may be used on railways (*q.v.*), tramways (*q.v.*), or roads. A road t. engine has four road wheels, having wide rims to prevent their sinking in loose roads. Various devices are in use to prevent skidding. The average speed of such machines loaded and with trailer, varies from 4 to 8 miles per hour. T. engines driven by compressed air are rare.

Cable t. is used on some mountain railways and on a few tramway systems, as New York, Edinburgh, etc. A moving steel cable is placed in a conduit below the level of the roadway, and is gripped by a device which hangs through a slot in the road.

Gasolene or petrol is used principally on road machines.

Electric Traction, haulage of goods or passengers by cars fitted with e. motors.

The first known e. motor, invented by the Abbé Salvatore dal Negro, 1830, carried 40–100 batteries. The question of power-supply, independent of overhead or underground wires, is still unsolved. The first e. railway of commercial value was erected at Lichterfelde (Germany), 1881, and was followed by Cleveland (Ohio), U.S.A., 1884, Richmond, Virginia (U.S.A.), 1887. The tunnel under Baltimore, on the Baltimore-Ohio Railway, was badly ventilated for steam locomotion, and the e. railway was installed.

TRACY, COMTE DE, ANTOINE LOUIS CLAUDE DESTUTT (1754–1836), Fr. philosopher and revolutionist; adhered to Condillac, whose doctrine of origin of ideas he termed 'ideology.'

TRADE.—The relation between the entrance into and exit from a country of money is expressed by the economic term, BALANCE OF TRADE. The theory—known as the 'Mercantile Theory'—that exports should exceed imports or at least 'balance' them, is the pretext for *protection*, and was acquiesced in until early XIX. cent., when Adam Smith, in *The Wealth of Nations*, showed that it was as advantageous to possess commodities as specie. See COMMERCE.

Trade, Board of, Brit. Department of State (dating from XVII. cent.) concerned with trade statistics, trade disputes (through Industrial Council, established 1911), Trade Boards, Labour Exchanges, Commercial Intelligence, Exhibitions, issue of Patents, registration and winding-up of companies, Bankruptcy, Standards of Weights and Measures, inspection of railways, harbours, merchant shipping, etc. The B. of T. has a large permanent staff, and its 'President' has usually a seat in the Cabinet.

Trade Mark, a mark used in connection with goods to indicate that they are the goods of a proprietor 'by virtue of manufacture, selection, certification, dealing with or offering for sale.' By the T. M's Act, 1905, a t. m. must consist of at least one of the following: (1) name of a company, individual, or firm, represented in a special or particular manner; (2) signature of applicant for registration, or some predecessor in his business; (3) an invented word or words; (4) a word, or words, having no direct reference to the character or quality of the goods, and not being according to its ordinary signification a geographical name or surname; (5) any other distinctive mark; but a name, signature, or word, or words, other than such as fall within the descriptions in the above, will not, except by order of the Board of Trade, or the Court, be deemed a distinctive word.

No infringement of a t. m. can be restrained unless it has been registered. An application form can be obtained at a post office for 10s. On this form a representation of the mark should be mounted, and particulars of the t. m. be set out. The applicant must state under which of the 50 classes of goods fixed by the Board of Trade he desires to register the mark. If the Comptroller of the Patent Office accepts the t. m., it is advertised in the official *T. M. Journal*, the applicant pays £1, and the certificate of registration is issued. The period of protection for a registered t. m. lasts 14 years. At the end of that time the registration may be renewed for another 14 years on payment of £1, and so on at the end of every 14 years.

A person entitled to a t. m. cannot transfer it except in connection with the goodwill of a business. Nor can he grant licences to others to use it, without forfeiting his claim to it. If a business is assigned with a t. m. the assignee should apply to the Comptroller to alter the register.

Special provision is made by the Act of 1905 for registration at Sheffield of t. m's on metal goods, and at Manchester for registration of cotton marks.

Trade Unions, combinations of wage-earners engaged in the same trade for purposes expressed in the registered rules and objects of the association. A modern t. u. is an organisation to secure for all its members the fair reward of their labour; to provide for the settlement of disputes between employer

and employed, so that a stoppage of work may be avoided; to secure the enforcement of Factory Acts, and other legislative enactments for the protection of labour; to afford pecuniary assistance to any member victimised or left without employment in consequence of a dispute or lock-out, or when disabled by accident. Stated objects of t. u's are: the abolition of piece-work, equal pay for equal work irrespective of sex, a control over the number of apprentices employed, provision of sick and burial funds, the establishment of healthy workshops, and the return to Parliament and to local governing bodies of working-class representatives. A decision in the law courts—THE OSBORNE JUDGMENT (1909)—makes it illegal for a t. u. to levy its members for political purposes.

T. u's are not derived from trade guilds of the Middle Ages; not till early XVIII. cent. are combinations of wage-earning workmen found, and not till the XIX. cent. have t. u's any character of endurance. From 1799 till 1824 all trade combinations of workmen were illegal associations; and after the Combination Acts had been repealed it was still doubtful in law whether workmen had the right to form t. u's for the purpose of raising wages or resisting a decrease. The T. U. Act of 1871 finally gave t. u's official existence. This Act requires the registration of all t. u's, and only such unions as are registered have any legal existence. Any persons can apply for registration as a union. The application must be made to the Registrar of Friendly Societies, upon a form to be obtained from the Registrar. This form must be signed by seven members of the union, and be accompanied by a copy of the rules, the names and titles of the officers, and the registered address of the union. The objects of the society must be clearly stated, and no disbursement of union funds may be made except in furtherance of such objects. The conditions under which members become entitled to benefit, and the method of appointing officers, committees, and trustees, and of effecting any alteration in the rules, the investment of funds—all these must be laid down in the rules.

When the certificate of registry is issued, the t. u. has been legally registered. So long as that certificate is not withdrawn, any court is bound to recognise it as a society amenable to the law. Every year the Registrar must be furnished with an annual report from each t. u., and this report must specify (1) assets and liabilities; (2) total receipts and expenditure; (3) expenditure on several branches of union work. Failure to make this return renders the responsible officer liable to a fine of £5.

Membership in t. u's in this country increased from a million and a half (1892) to over two millions (1911). The feeling is so strong against non-unionist labour in certain trades and in certain localities that trade unionists have refused to work in association with non-unionists, and have thereby compelled employers to discharge the latter or to face a strike. The strong t. u., however, generally relies rather on arbitration than on the strike for obtaining the conditions it seeks for its members. The formation of national t. u. federations (*e.g.* the Miners' Federation, covering all the miners' associations in Great Britain; the Transport Workers' Federation, covering the unions of dockers, stevedores, seamen and firemen, and carters; and of local federations such as the Building Trades Federation, covering bricklayers, carpenters, labourers, etc.) has been well marked in later t. u. history. America has proved a far more congenial soil than Great Britain for industrial unionists and universal federationists. Germany has *c.* 3,050,000 t. u. members; France *c.* 1,030,000, many of them Syndicalists; Italy *c.* 850,000. Other European countries are gradually developing trade unionism; Russia, where growth is hampered by autocracy, is least advanced. Australia has *c.* 240,000 members, Canada *c.* 134,000, New Zealand *c.* 55,000.

See STRIKES, SYNDICALISM.

Webb, *History of Trade Unionism*; *Industrial Democracy*.

TRADUCIANISM, see CREATIONISM.

TRAFALGAR, BATTLE OF (1805), victory gained by Brit. fleet under Nelson over Fr. and Span. fleets under Villeneuve. Brit. fleet included 27 sail of the line and the allies' 33. Fr. admiral having drawn up his fleet in a double line, Eng. attack was made in two lines, Collingwood heading for the centre with one squadron, while Nelson, on the *Victory*, headed his division to cut between enemy's van and centre. Battle began at noon and ended about five. Nelson, mortally wounded, lived long enough to know the day was won. Eighteen ships were captured by British.

TRAFFIC, see ROADS.

TRAGEDY, see DRAMA, GREECE (LITERATURE).

TRAIL, HENRY DUFF (1842-1900), Eng. writer; works include lives of Sterne, Coleridge, William III., Lord Salisbury, Lord Cromer, Shaftesbury, Franklin.

TRAJAN (53-117 A.D.), Rom. emperor; b. Italica, Spain; became prætor, 85 A.D.; consul, 91; subsequently consular legate of Upper Germany under Nerva, who in 97 adopted him as his son. The Senate acknowledged him as Nerva's successor, and he received titles of Imperator, Cæsar, and Germanicus. Became emperor, 98; reign marked by wars. First and second Dacian wars (101-2, 105-6) ended in victory for T., Dacia becoming a Rom. province. In 113 he waged war on Parthia, annexing various provinces in first campaign, and taking Ctesiphon, capital of Parthia, in second. His eastern campaigns ended in failure, and he had to withdraw from Hatra. In his absence, the Jews had seized the opportunity to revolt, and committed many massacres, which were punished by the Romans with great severity. T., who was seized by illness, took ship for Italy and d. on the way home at Selinus in Cilicia. He was a just and careful ruler, gaining name of Optimus. He lessened power of Senate and improved agriculture. He was opposed to Christianity, but a rescript in answer to a letter of Pliny the younger (*q.v.*) shows his moderation.

TRALEE (52° 17′ N., 9° 43′ W.), county town, seaport, on Lee, County Kerry, Ireland.

TRALLES (37° 48′ N., 27° 48′ E.), ancient town, near Mæander, Caria, Asia Minor.

TRAMINEÆ, see GRASS.

TRAMORE (52° 10′ N., 7° 9′ W.), town, seaside resort, on Tramore Bay, Waterford, Ireland.

TRAMP, see VAGRANCY.

TRAMWAY.—The word tram is of uncertain origin, but probably comes from the Old Swedish *tram*, a beam of wood, the earliest t's, used for coal haulage in the Tyne district, having a track of wooden beams (see RAILWAYS). It has no connection with Outram, the name of a tramway engineer. The first passenger t. was laid down in New York, 1832, but was abandoned. Another attempt in 1852 was more successful, and in 1855 a t. was opened in Philadelphia. The first passenger t. in England, 1860, was like that in Philadelphia, the rails being of wrought-iron, gauge 4 ft. 8½ in. In these t's a raised step-rail was used, and as this was found dangerous to other traffic the English t's were relaid with grooved rails, which, however, had the drawback of offering more resistance and of collecting dirt. The rails rested on timbers laid on a concrete foundation, side flanges and cast-iron chairs to carry the rails being added later. Steam traction was introduced about 1880, and the greater weight and higher speeds caused built-up rails to be superseded by solid girder rails. Cable t's were first used at San Francisco, 1873, and in England, 1884. They fell into disuse because of their great cost of construction and slow speed. The working cost is low and they are safe on steep inclines, but heavy traffic is required to recoup the initial outlay. Cable cars are still used in Edinburgh and Birmingham. The cable is sunk below the track and gripped by an arm carried by the car. Electricity is now almost

universally used. Accumulator cars were tried in Birmingham, 1890, but the cost of maintenance was found prohibitive. There are three electrical systems now in use: the overhead or trolley, the conduit, and the surface contact. In the overhead system, current is taken from a cable by a trolley-wheel fixed to an arm above the car. This system is rapidly superseding the others on account of its lower cost of construction and maintenance, greater reliability, and ease of repair. In the conduit system conductors carrying the current are placed in an underground conduit having a narrow slot at the top through which passes the current collector of the car. This has two slippers which make contact with the conductors and thus take current. This system is the most costly in construction and upkeep. The surface contact system has underground conductors, but contact is made by metal studs. When a car passes over a stud, magnets fixed beneath it operate a switch below the stud, connecting the latter to the conductors. The stud is then alive, and current is collected from it by sliding brushes carried by the car.

TRANCE, CATALEPSY, profound abnormal sleep, resembling hypnosis, except that it comes on spontaneously instead of being induced by another person; it may follow hysteria, exaltation, or mental or physical exhaustion, lasting for several hours or even, sometimes, days or weeks. There is complete loss of consciousness, the reflexes are lost or diminished, there is muscular relaxation and extreme pallor. Sometimes, however, the affected person knows what is happening around him but is quite unable to show that he is conscious, while the reflexes, instead of being lost, may be exaggerated. The action of the heart and the breathing are usually feeble, and the pulse and respiratory movements may be so slight that it seems that the person is dead. An attack ends gradually or suddenly, but may recur. See HYPNOTISM, HALLUCINATION.

TRANENT (55° 57′ N., 2° 57′ W.), town, Haddingtonshire, Scotland; collieries; quarries. Pop. (1911) 4369.

TRANI (41° 18′ N., 16° 25′ E.) (ancient *Turenum*), seaport, on Adriatic, Bari, Italy; cathedral; trade in wine, fruits. Pop. 33,000.

TRANQUEBAR (11° 1′ N., 79° 54′ E.), seaport, on Coromandel coast, Tanjore district, Madras, Brit. India. Pop. 13,300.

TRANSBAIKALIA (c. 53° N., 114° E.), province, Siberia; bounded N. by Yakutsk, W. by Irkutsk and Lake Baikal, S. by Mongolia, E. by Manchuria and Amur; area, 229,520 sq. miles. Surface is mountainous, crossed by Yablonoi Range; drained by Amur and its tributaries and by Vitim, Selenga, and other streams; capital, Tchita. Produces gold, tobacco, cereals; camels and other live stock reared. Pop. (1910) 833,400.

TRANSCASPIAN TERRITORY (35° to 45° N., 50° 30′ to 65° E.), region, Asiatic Russia; bounded N. by Uralsk, E. by Sea of Aral, Khiva, and Bokhara, S. by Afghanistan and Persia, W. by Caspian Sea; area, 213,855 sq. miles. Surface generally consists of desert and steppe-lands, with high plateaux in N., and Kopet-Dagh Mts. along the S. boundary; drained by Murghab, Atrek, and other rivers; chief town, Askhabad. Products include salt, gypsum, naphtha; cereals and cotton are grown and live stock reared; region is crossed by Transcaspian railway. The climate is subject to great extremes of heat and cold. Pop. (1910) 440,800.

TRANSCAUCASIA (41° N., 45° E.), division of the general government of the Caucasus, Russia; comprises the governments of Baku, Elisavetpol, Erivan, Kutais, Tiflis, and provinces of Daghistan, Kars, and Black Sea territory.

TRANSCENDENTALISM, explains possibility of *à priori* knowledge through certain fundamental concepts. See KANT.

TRANSEPT, in arch., transverse part of cruciform church; the arm of that part.

TRANSFORMER, any arrangement which produces by one electric current another different in form is called a transformer. The various devices are widely used in the transmission of electrical power. Generally a t. which raises voltage is called a *step-up*, one which lowers voltage a *step-down t.* Energy is always lost in the translation process—from 25 % downwards. An alternating current or *static t.* produces by one alternating current another alternating current of any magnitude or voltage and the same frequency. The arrangement consists of two insulated concentric cylindrical circuits, called the *primary* and *secondary*, wound on a closed iron core, formed of stampings *c.* ·015-inch thick, and varnished or covered with thin paper on one side to prevent eddy currents. The current passing in the primary induces a current in the secondary, the voltage of which depends on the relative number of turns in the two circuits. The whole is usually surrounded by a heavy insulating oil or other dielectric.

A *phase t.* is an arrangement of static or rotary t's so as to produce, *e.g.*, a polyphase alternating current from a 1-phase, a 3-phase from a 2-phase, etc. Again, a *continuous current t.* may consist of a motor and dynamo coupled together, *e.g.* a motor fed at 150 volts driving a dynamo which delivers at 10 volts (a motor-dynamo set). Clearly the same result is got from one machine with two commutators and two interwoven armature circuits (a rotary transformer). In the same way one machine may be constructed to create by a continuous current an alternating current 1-, 2-, or 3-phase, or *vice versa.*

Rectifiers, translating alternating current into continuous but varying current, fall under two heads: (i.) mechanical, (ii.) electrolytic. An example of the first is the *Ferranti Rectifier,* used in arc-lighting. An alternating current motor runs in step with the alternator supplying the current, and drives a commutator, the segments of which are joined alternately to two insulated rings. The brushes bringing the current to be rectified make contact with two adjacent segments of the commutator. Two other brushes collect the current from the slip-rings. An instance of the second class is two series of cells, with carbon and aluminium electrodes in alum solution, joined in parallel but in opposite senses. Each series passes a current in *one* direction only, and they therefore halve the alternating current. The *Nodon Valve* and *Mercury Vapour* rectifiers depend on the same property. See DYNAMO.

TRANSIT INSTRUMENT, a telescope, mounted on a horizontal axis, and free to move in the plane of the observer's meridian, across which it is desired to note the transit of any object. It is almost superseded now by the **Transit** or **Meridian Circle,** which, combining the functions of the t. i. and the mural circle, gives the declination of a star at the same time as its right ascension. It carries on its axis two graduated circles, 2 or 3 feet in diameter, one on each side and revolving with the telescope. Two other circles, firmly fixed to the piers, carry the reading microscopes and a pointer microscope, which replaces the metal pointer of the mural. The adjustments and corrections are the same as for the transit instrument.

TRANSKEIAN TERRITORIES, KAFFRARIA (c. 31° S., 29° E.), name applied to region, inhabited chiefly by Kaffirs, north of the Kei River, Cape Province, S. Africa; includes Griqualand East, Tembuland, Transkei, Pondoland, of which chief towns respectively are Kokstad, Umtata, Butterworth, Port St. John; total area, 18,181 sq. miles. Surface is level near coast, mountainous farther inland; watered by St. John's and other rivers; produces timber, cereals, bananas, oranges, lemons; cattle, sheep, and horses raised. Local government is in hands of a General Council (native chiefs, white officials, etc.). It was annexed to Cape Colony between 1879 and 1894. Pop. (1911) 888,460 (19,666 whites).

TRANSLATION is the turning of what is written

(or spoken) in one language into another. The translator's first commandment is 'Be faithful.' To understand the original and reproduce its sense exactly is what is required of the ordinary translator. But to rank as lit., t. must be more than a correct rendering of the sense; it must also show style. To translate plain straightforward prose may be easy; to translate a poem or an author with an individualistic style is quite another thing. Something of the original—rhythm, beauty of diction, or what not—is invariably lost in the process. T. when too literal is patently t. and not lit.; when too free it may be lit. (*e.g.* Pope's Homer) but it ceases to be t. The true course lies between; the spirit, form, style, as well as the meaning of the original must be preserved as far as possible; ideal t. should read like an original work (*e.g.* the Bible). Most men of letters since the time of Alfred the Great have attempted t's, but have too often taken liberties with the original. One of the most brilliant classical t's of modern times is Butcher and Lang's *Odyssey*, being at the same time faithful and artistic.

TRANSMIGRATION OF SOULS, see METEMPSYCHOSIS.

TRANSMISSION, POWER, see POWER TRANSMISSION.

TRANSPADANE REPUBLIC, see ITALY (HISTORY).

TRANSPORT AND SUPPLY.—An army cannot keep the field without food, and even when food can be collected in the theatre of operations, it must be distributed over a large area in which the bodies of troops are dispersed. The term 'supply' embraces not merely food but ammunition and bedding, cooking utensils, oil for lamps, and shoes for horses. The means of conveying supplies to the troops is known as 'transport,' whether vehicles, pack horses, or native carriers are employed. Until recently the organisation of wagons allotted to each division of the Brit. army was called a transport and supply column, but in future is to be known as the Divisional Train; the Train is replenished by another organisation called the Supply Park, and in countries where good roads exist mechanical traction will be employed. The Army Service Corps is enlisted and trained in all the duties appertaining to the collection and delivery of food and other necessaries, except ammunition; the supply of ammunition is entrusted to the Royal Artillery, who organise what are called ammunition columns for the purpose. Thus an infantry battalion needing a fresh supply of cartridges would indent upon the nearest brigade of artillery.

TRANSPORTATION, the act of sending criminals overseas to convict establishments, appears to have been first employed in James I.'s reign, but was in most active use under Charles II. and later rulers. Offenders were handed over to contractors, who shipped them to the Amer. plantations, and maintained a property in their labour. The system led to much abuse, for wholesale kidnapping and selling into slavery of innocent persons in all seaports became common, and continued into the XVIII. cent.

After the Amer. War of Independence (1776), Eng. convicts were sent out in large numbers to Botany Bay (New South Wales), and the neighbouring district, where they were drafted into one of three divisions: (1) road-making parties—from which they often escaped; (2) the chain-gangs; and (3) the isolated penal settlement, where the brutalising system was unspeakable. The root idea in sending convicts to Australia was to settle the continent, but strong protests were raised by the Colonial Government. The result was that from 1840 t. was diverted to Van Diemen's Land, where trouble arose, and the system was finally abandoned in 1846. Cayenne (Guiana) and New Caledonia have for years served as Fr. convict settlements, and Russ. prisoners are sent to Siberia.

TRANSUBSTANTIATION, R.C. doctrine, formulated at Lateran Council, 1215; belief that the substance of the sacred elements is transformed into the substance of the actual body and blood of Christ.

TRANSVAAL (22° 27′ S., 25° 32′ E.), inland province of Union of South Africa, between Vaal and Limpopo Rivers; bounded N. by Rhodesia, E. by Portug. East Africa and Swaziland, S. by Orange Free State, Natal, and Zululand, W. by Cape Province and Bechuanaland; length from N. to S., *c.* 400 miles; breadth, *c.* 700 miles; area, 110,426 sq. miles. The surface is an undulating plateau from 1000 to 7000 ft., traversed by mountain ranges and isolated hills known as *kopjes*; in E. are Drakensberg or Quathlamba Mountains, with Mauchberg, *c.* 8700 ft.; Waterberg and Zoutpansberg in N.; Libombo Mountains, forming boundary between T. and Portug. East Africa; Magaliesberg, W. of Pretoria, and Witwatersrand, *c.* 6000 ft., N.W. of Johannesburg. Large part of plateau, known as High Veldt, is generally covered with good pasture grass, but treeless; the Bush Veldt in N. and on E. border lies low, and is fairly well wooded.

Principal rivers are Limpopo (northern boundary), Vaal (southern boundary), Olefant, Komati, Usutu, Pongola, Great Marico, Great Letaba; none navigable; some shallow lakes. Climate is generally healthy, though hot and dry, and subject to numerous dust storms; Bush Veldt district in N. and E. is tropical; unhealthy during rainy season when malaria is very prevalent; mean maximum temperature of Pretoria during summer months, 89°; summer (Oct.–March) is rainy season, winter is dry; average annual rainfall *c.* 25 to 30 inches, greatest in E. Forests are only found in Bush Veldt and mountainous regions; trees include stinkwood, yellow-wood, iron-wood, Cape beech, mimosa, euphorbia, eucalpytus. Big game, such as elephant, lion, giraffe, rhinoceros, buffalo, are almost extinct, except in Reserve on Portug. border; but kudu, springbok, hartebeeste, waterbuck, jackal, hyena, aard-wolf, wild cat, ant-bear, wart-hog, etc., are still numerous; crocodiles and hippopotami abound in Limpopo and other streams; locusts and ants are very destructive, but former are being exterminated.

History.—Mosilikatze and his warriors, fleeing from Zululand, 1817, invaded T. and settled in W. region. A small party of Boers crossed Vaal, 1835, but were murdered by natives; another party, under Potgieter, dissatisfied with Brit. rule, left Cape Colony (the *Great Trek*) and settled on Vet River, 1836; several parties of whites were massacred by natives, which led to the complete defeat of Matabeles under Mosilikatze by Boers under Potgieter, 1837; the former fled across Limpopo, and Boers claimed abandoned country as their own; first permanent settlement made on Mooie River and Potchefstroom founded, 1838; later Potgieter and several Boer families trekked towards Delagoa Bay, seeking a non-Brit. outlet, and eventually some settled in Zoutpansberg, others in the E., founding the town of Leydenburg. Pretorius became commandant of the S. settlements, 1848, and by Sand River Convention, 1852, Britain recognised independence of Boer Republic. Pretorius and Potgieter died, 1853; the former's son, Marthinus Pretorius, united the several districts, 1856 (with exception of Leydenburg and Zoutpansberg, which refused to join), forming the SOUTH AFRICAN REPUBLIC, with President, *Volksraad* (Parliament) elected for two years, and Executive Council, Pretorius becoming first president. During the following years there ensued continuous internal quarrels and petty jealousies. Pretorius made several unsuccessful attempts at union with Orange Free State, and eventually tried to force matters by crossing the Vaal with a small commando, 1857, but was met by a large number of Free State burghers at Rhenoster River and forced to withdraw. Zoutpansberg and Leydenburg united with Republic, 1860, and Pretoria was founded and made capital; the same year Pretorius again visited Bloemfontein, making another effort for union; on his return, serious party quarrels having taken place, he resigned, and Grobelaar became president.

In 1864 Pretorius was again elected president, and Paul Kruger made commandant-general. E. boundary was fixed by Britain, 1869, which finally ended T.'s chance of securing a port. After discovery of Tati gold-fields western boundary was fixed by Keate Award, 1871. Burgers was elected president, 1872. During the past years the country had serious native troubles and great financial difficulties, and in 1877 the Republic was annexed to Britain by Sir Theophilus Shepstone with a virtual promise of home rule. Blundering by the Brit. Government, and Boer impatience for independence, inevitably led to trouble; two deputations headed by Kruger visited England unsuccessfully; the BOER WAR broke out, 1880, and British were defeated at *Bronkhorst Spruit, Laing's Neck* (Jan. 28, 1881), *Ingogo* (Feb. 7), and *Majuba* (Feb. 27), after which peace was made. The Pretoria Convention, 1881, gave Boers republican rights, under Brit. suzerainty as regards boundaries, native affairs, and foreign relations; the London Convention (1884) recognised the independence of the Republic, but Britain retained control of foreign relations. Kruger was elected president, 1882; after discovery of Witwatersrand gold mines, 1884, thousands of foreigners flocked to the country, and within ten years they vastly outnumbered the Boer population, which caused the Republic to exclude 'Uitlanders' from political rights; government monopolies and various internal abuses increased discontent; agitation was organised by mine-owners and Reform Committee, and in 1895 Dr. Jameson, with some 500 men in service of Brit. South African Co., invaded Transvaal, but were defeated by Boers, and Jameson was forced to surrender; leaders sentenced to various terms of imprisonment (afterwards commuted). The Uitlander question remained a bone of contention between Boers and Britons; eventually an abortive conference was held at Bloemfontein, May 31, 1899, between Sir Alfred Milner, Imperial High Commissioner, and Pres. Kruger, to consider franchise proposals. Transvaal suggested arbitration, which Brit. Government refused, insisting on her suzerainty and right of interference; mutual distrust and dissatisfaction grew rapidly, and war broke out, Oct. 11, 1899 (see SOUTH AFRICA); Johannesburg and Pretoria occupied by British, 1900; peace was signed at Vereeniging, 1902, and T. became a Crown colony. Chinese labour and Indian immigration questions were amongst chief problems prior to Union; responsible government granted, 1906; joined Union of South Africa, 1910; Swaziland was under T.'s administration, 1894–1900, since when it has been a Brit. Protectorate under High Commissioner.

Government.—The province is divided into 23 districts, administered by Administrator, Provincial Council (36 members elected for 3 years), Executive Committee (4 members). Principal towns are Johannesburg, Pretoria (provincial capital and administrative seat of Union), Potchefstroom, Heidelberg, Middleburg, Barberton. Dutch Reformed Church predominates; then Anglican, Presbyterian, Methodist, Jewish, and R.C. **Education** is generally compulsory for white children between 7–14; T. has Univ. College at Pretoria, College of Agriculture and School of Mines at Johannesburg. Railways radiate from Johannesburg and Pretoria, connecting Cape ports, Durban, Delagoa Bay, and Bulawayo (see SOUTH AFRICA).

T. is mainly a mining country, and is rich in gold, diamonds, iron ore, coal, silver, copper, lead, etc. The largest gold-fields are the Witwatersrand, around Johannesburg; other gold mines are De Kaap (Barberton Fields), Klerksdorp and Potchefstroom gold-fields, etc.; Premier Mine, near Pretoria, is the chief diamond mine; coal is mined at Middleburg, Boksburg (near Johannesburg), Vereeniging, etc.; other industries are engineering, brewing, pottery, tobacco, soap, candles, wagons, and important cattle-rearing; principal products are maize, wheat, oats, hay, Kaffir corn, tobacco; chief exports, minerals, ostrich feathers, cattle, hides, wool. Gold output (1910), 7,527,107 oz.; coal (1910), 3,974,376 tons; value of diamonds (1910), £1,328,630. Pop. (1911) 29,660 whites, 18,949 coloured.

Hatch and Chalmers, *The Gold Mines of the Rand* (1895); J. Bryce, *Impressions of South Africa* (1897); Theal, *History of South Africa* (1908).

TRANSYLVANIA (*c.* 46° 35′ N., 24° 30′ E.), region, Hungary; area, *c.* 21,500 sq. miles; surface is generally covered by spurs of Carpathians, densely forested; drained by Szamos, Maros, Kokils, Aluta; soil fertile; produces cereals, pulse, tobacco, fruits; cattle, horses, sheep, and pigs raised; minerals include gold, silver, salt, coal, iron, lead, copper. T. was principality under Turk. suzerainty, XVI. and XVII. cent's; whole has belonged to Hungary (*q.v.*) since 1867. Pop. 2,622,000.

TRANSYLVANIAN ALPS (45° 35′ N., 24° 30′ E.), range of the Carpathians on S. border of Transylvania and on frontier of Rumania.

TRAP, apparatus for ensnaring animals; earliest form, earth-covered hole in ground; lobster-pot is a similar device; spring-t. consists of jaws with centre-plate, pressure on plate snaps jaws together; in point-t's weights or spikes descend on victim, used for wild beasts; snare made of wire looped to catch animal's head.

TRAPA, genus of plants, order Onagrariaceæ; Singhara Nut (*T. bispinosa*) is common as food in Kashmir.

TRAPANI (38° 3′ N., 12° 32′ E.) (ancient *Drepanum*), city, seaport, Sicily; bp.'s see; exports salt, wine; was a Carthaginian stronghold; scene of naval victory over the Romans, 249 B.C. Pop. (1911) 59,365; (province) 275,967.

TRAPEZIUM, in geometry, figure bounded by four straight lines no two of which are parallel; **Trapezoid** has two parallel sides. See MENSURATION.

TRAPPISTS, brotherhood of Cistercian monks, so called after abbey of La Trappe (founded, 1140); founded by Armand de Rancé, 1664; the distinguishing feature of their rule is its severity; the name is the unofficial description of the Reformed Cistercians.

TRASIMENO, LAKE (43° 8′ N., 12° 5′ E.) (ancient *Trasimenus Lacus*), lake, Perugia, Italy; length, 10 miles; scene of victory of Hannibal over Romans, 217 B.C.

TRAÙ (43° 34′ N., 16° 12′ E.) (ancient *Tragurium*), seaport, on Adriatic, Dalmatia, Austria; cathedral (XIII.-cent.). Pop. 17,500.

TRAUN, OTTO FERDINAND (1677–1748), Austrian soldier; served in Wars of Span. and Austrian Succession.

TRAUNSTEIN (47° 50′ N., 12° 40′ E.), town, health-resort, Bavaria; saline springs. Pop. 7690.

TRAUTENAU (50° 35′ N., 15° 47′ E.), town, on Aupa, Bohemia; linen-weaving centre; scene of two battles between Austrians and Prussians, 1866. Pop. 16,100.

TRAVANCORE (10° N., 77° E.), native state, Madras, S. India. Pop. 3,000,000. Capital, Trivandrum.

TRAVE (53° 57′ N., 10° 43′ E.), river, Holstein and Lübeck, Germany; enters Baltic at Travemünde; length, 70 miles.

TRAVELLER'S JOY, see CLEMATIS.

TRAVELLER'S TREE (*Ravenala madagascariensis*), Madagascar tree, order Scitaminеæ; huge leaves arranged fan-wise; water is obtained by tapping sheaths of leaf-stalks, hence name.

TRAVEMÜNDE (53° 57′ N., 10° 51′ E.), seaport, watering-place, at mouth of Trave, Germany; herring fisheries.

TRAVERSE CITY (44° 45′ N., 85° 40′ W.), city, summer resort, on Boardman River, capital, Grand Traverse County, Michigan, U.S.A.; fruit-growing region; various manufactures. Pop. (1910) 12,115.

TRAVNIK (44° 10′ N., 17° 42′ E.), town, on Lasva, Bosnia. Pop. 6660.

TRAWLING, the process of dragging the sea-bottom for fish by a flat conical-shaped net. The beam-trawl was formerly the common form of net, and

it was worked by a small steam capstan, or even by a hand windlass. The deep-sea fishing in the distant waters of the North Sea, the Atlantic, and to the north of Russia is practically all done by steam t., Grimsby, Hull, Aberdeen, and Milford being the chief ports. Sailing-smacks, however, still trawl in the near home waters, especially in the North Sea, but near the land. It is customary for fleets of 50 or 60 boats, under the guidance of an 'admiral,' to fish together, 'carriers' being employed to take the catch to land.

Holdsworth, *Deep-Sea Fishing and Fishing-Boats* (1874).

TRAZ-OS-MONTES (41° 35′ N., 7° W.), province, N.E. Portugal; mountainous; comprises districts Villa Real and Braganza. Pop. 435,000. Capital, Braganza.

TREACLE, name for MOLASSES. See SUGAR.

TREAD-MILL, obsolete instrument of prison discipline, consisting of revolving wooden drum provided with steps; the weight of prisoners produced revolutions; sometimes utilised for industrial purposes.

TREASON, treachery against the State. In the early history of England, treachery was adjudged to be a crime against the sovereign, as representative of the State. In past Acts, t. was divided into high t. and petty t., but in 1828 the latter term was abolished. Petty t. embraced such offences as the killing of a superior—offences then punished with the rigour of the t. law, but now treated as ordinary murder. The basis of our criminal code in regard to t. is the Statute of T. of 1352, of which the following enactments are still in force as defining t's—compassing or imagining the death of the king, the queen, or their eldest son; seducing the queen, the king's eldest unmarried daughter, or the wife of the king's eldest son; levying war against the king in his realm; being adherent to the king's enemies in his realm; giving them aid and comfort in his realm or elsewhere; killing the chancellor, the treasurer, or judges in the execution of their offices. 'Levying war' embraces an attempt by force to overawe the sovereign or to overawe either House of Parliament. 'Imagining the king's death' must be proved by such overt acts as written counsels or commands. Additional laws on the subject have since been frequently made and annulled. In 1848 it was enacted that those who are guilty of the treason-felony of attempting to deprive the sovereign of any of his dominions shall suffer a maximum punishment of penal servitude for life. The punishment for high t. has always been death. In early times hanging was accompanied by drawing and quartering and other extreme refinements of punishment—a code to which Scots law in some respects still adheres. The punishment is now execution by hanging. The trial for t. must be prosecuted within three years after the offence, except in the case of attempted assassination of the sovereign, in which case the crime is treated as murder. The accused is furnished before the trial with a copy of the indictment and the names of the witnesses. Accessories before the fact in cases of t. are adjudged principal traitors. Accessories after the fact are liable to two years' imprisonment.

TREASURE-TROVE, money, coins, gold, silver, plate, or bullion found hidden in the earth, or in other private place (the owner being unknown), belongs to the Crown, as treasure-trove. Concealing it is punishable by fine or imprisonment.

TREASURY, state revenue department, administered by commissioners who have taken the place of the old Lord High Treasurer. The First Lord of the Treasury is by custom the Prime Minister, the second lord is the Chancellor of the Exchequer.

TREATIES, to be valid, must be made between sovereign states, and agreement must be expressed. There are no set forms, and the agreement may be verbal, and is sometimes accompanied by oaths and guarantees. In Britain, as in most monarchies, power of making treaties rests with the sovereign, who acts on advice of ministers. In republics it is generally vested in the executive council or the pres. Negotiations may be carried out by ambassadors, who must be fully empowered; and the agreement should be confirmed by the government.

Treaties may be of various kinds: political, such as treaties of peace, alliance, neutrality; commercial, concerning trade; and those referring to international postal arrangements, extradition, international law, etc. A transitory agreement differs from other treaties in that it takes effect at once, leaving no further obligations. A treaty for an indefinite time may be ended by public repudiation; and in war both definite and indefinite treaties are suspended, though such treaties as extradition and copyright would probably revive automatically on its cessation.

Hall, *International Law* (1905).

TREBBIA (45° N., 9° 40′ E.) (ancient *Trebia*), river, N. Italy; joins Po near Piacenza; length, 60 miles; scene of victory of Hannibal over Romans, 218 B.C.

TREBINJE (42° 43′ N., 18° 26′ E.) (ancient *Tribulium*), town, on Trebinjcica, Herzegovina.

TREBIZOND (41° N., 39° 45′ E.), port of Turkey, on Black Sea, in N.E. of Asia Minor; built on small elevated plateau, and encircled by old walls; has ancient castle and some old Byzantine churches, now used as mosques; moderate anchorage; exports nuts, carpets, cattle, hides, silks, tobacco, raisins, beans, maize; chief bazaars are in the Christian suburbs. Originally founded by Greeks; cap. of empire of T. from 1204–1461. Pop. *c.* 35,000.

TREBULA.—(1) (41° 14′ N., 14° 21′ E.) ancient town, Samnium. (2) **T. Mutusca** (42° 18′ N., 12° 50′ E.), ancient town of the Sabines. (3) **T. Suffena** (42° 35′ N., 12° 57′ E.), ancient town of the Sabines.

TREDEGAR (51° 46′ N., 3° 16′ W.), town, on Sirhowy, Monmouthshire, England; ironworks. Pop. (1911) 23,604.

TREE, see FORESTRY.

TREE-CREEPER (*Certhia familiaris*), a minute bird with strong tail-feathers which aid it in climbing trees in search of its insect food. Common in Britain, Europe, Asia, and N. America.

TREE-FERN, tropical *Filicineæ*, with stout, erect stems, clothed with adventitious roots, and bearing a crown of leaves apically. *Cyathea* and *Dicksonia* are typical.

TREE-WORSHIP has been common all over the world. It was a feature of primitive religion to put men, animals, and trees in the same or similar categories; trees, like other objects, seemed to be alive or possessed of spirits. A close connection was thought to exist between a person and a tree, and illness might be transferred to a tree and so got rid of. Another sacred association of trees is with oracles, *e.g.* the famous oak at Dodona. Some deities were specially connected with trees, *e.g.* Jupiter with the oak. Sacred groves existed in various places, and, as in ancient Canaan, were the scene of strange rites. Sacred trees existed, too, among the northern races before their conversion to Christianity, *e.g.* Prussians and Lithuanians.

Robertson Smith, *Religion of the Semites*; Philpot, *The Sacred Tree*.

TREFOIL, see CLOVER.

TREGELLES, SAMUEL PRIDEAUX (1813–75), Eng. Biblical scholar; did important work on text of New Testament.

TRÉGUIER (48° 49′ N., 3° 13′ W.), town, port, at junction of Guindy and Jaudy, Côtes-du-Nord, France; cathedral; birthplace of Renan. Pop. 3400.

TREITSCHKE, HEINRICH VON (1834–96), Ger. historian and politician; b. Dresden; ed. Leipzig and Bonn; wrote *Deutsche Geschichte in XIX. Jahrhundert, Historische und Politische Aufsätze, Politik*, etc.

TRELAWNEY, EDWARD JOHN (1792–1881), Eng. adventurer; deserted from navy and lived life of privateer in Malay Straits; met Shelley in Italy, 1822, and arranged for burning of his body; went to

Greece with Byron and fought in War of Independence; wrote *Adventures of a Younger Son* (1830), *Records of Shelley, Byron, and the Author* (1858).

TRELAWNY, SIR JONATHAN (1650–1721), Anglican divine; bp. of Bristol, 1685, of Winchester, 1707; one of 'Seven Bishops.'

TREMADOC SLATES, see CAMBRIAN SYSTEM.

TREMATODE WORMS (FLUKES, LIVER-FLUKES, etc.), generally of leaf-like shape, but rarely cylindrical, all of which live either as external or internal parasites. The group assumes considerable economic interest, since it includes one of the most destructive parasites of domestic animals—the Liver-Fluke—which, producing the disease 'liver-rot,' used to account for the loss of a million sheep a year in England. To the parasitic habit most of the characteristic structures of Trematodes are due. They have no external coat of cilia, as have the closely related Turbellarians, but all possess suckers or hooks for adhesion. Sense organs are rarely present, and the internal parasites have a thick 'cuticle' to resist the digestive juices of the animal in the food tract of which they live.

Trematodes fall into two main groups—the external and the internal parasites. The former, which occur on Crustacea, Fishes, Amphibia, and Reptiles, are furnished with strong hooks or suckers, and their life-history is simple, their development being direct and concerned with one host only, hence the group name—MONOGENEA.

The internally parasitic Trematodes, or *Digenea*, are most interesting on account of the complexity of their development, which exhibits an alternation of generations (*q.v.*). The sexual adult is parasitic in Vertebrates, the asexual forms occur in Molluscs and the encysted larva in various Invertebrates and Vertebrates. The destructive Liver-Fluke (*Distomum hepaticum*) belongs to this category.

Trematodes form one of the classes (*Trematoda*) of Flat Worms or Platyhelminthes (*q.v.*).

TREMOLITE, see AMPHIBOLE.

TRENCH, see FORTIFICATION.

TRENCH, RICHARD CHEVENIX (1807–86), Anglican divine; dean of Westminster, 1856; abp. of Dublin, 1864–84; wrote *Notes on the Parables*, *Notes on the Miracles*, and works on philology.

TRENCK, FRANZ (1711–49), Austrian soldier; b. Calabria; cavalry officer at seventeen, but compelled to leave Austrian army for duelling; settled in Russia, and with 1000 of his tenants (Pandours) routed Turk. frontier robbers; assisted Austria in Silesian wars, 1741–45; committed suicide in prison.

TRENDELENBURG, FRIEDRICH ADOLF (1802–72), Ger. philosopher; b. near Lubeck; prof. at Berlin; influenced by teleology of Aristotle; affirms motion the common essence of thought and thing, whence thought produces *à priori*, but agreeing with objective reality, space, time, the categories.

TRENT.—(1) TENTRO, TRIENT (46° 4′ N., 11° 7′ E.) (ancient *Tridentum*), fortified town, on Adige, capital of S. Tyrol, Austria; bp.'s see; cathedral; the church of Santo Maggiore was the meeting-place of the famous Council of Trent (1545–63). Pop. (1910) 30,049. (2) (53° 35′ N., 0° 44′ W.) river, England; rises N. Staffordshire; flows through Staffordshire, Derbyshire, Nottinghamshire, Lincolnshire; unites with Ouse to form Humber; length, 170 miles.

TRENT, COUNCIL OF (1545–63).—As a cure for the evils and abuses prevalent in the Church during the XV. cent., churchmen and laymen alike looked to the assembling of a General Council. The Councils at Basel (*q.v.*) and Constance (*q.v.*) had not only been irregular but abortive. The C. of T., considered by Roman Catholics the 19th œcumenical council of Church, sat intermittently from Dec. 13, 1545, to Dec. 4, 1563. Lutherans desired council of all Christians, laying stress on acceptance of Scriptures; emperor and some Catholic rulers aimed at reforming abuses in Church government; pope and court of Rome, while acknowledging necessity for reform, wished to strengthen power of Papacy and condemn new heresies, hence at first resisted formation of council lest these ends should be defeated. Finally convened by Paul III., 1536; and after many delays, met at Trent, 1545, under presidency of Del Monte, Corvinus, and Pole, papal legates. Temporarily removed to Bologna, 1547, it reopened at Trent, 1551; suspended in 1552. After this, was not revived until 1560, under Pius IV., who brought it to successful conclusion. Reforms were carried out, discipline enforced, and decrees concerning religious orders and education of priests were passed. Old doctrines concerning sacraments, purgatory, indulgences, etc., were reaffirmed.

J. Waterworth, *The Council of Trent* (Lond. 1848).

TRENTE ET QUARANTE, ROUGE ET NOIR, card game; six packs used; cards laid out till pips total 30 or over, similarly second row; row nearest 30 wins; played at Monte Carlo.

TRENTON.—(1) (40° 13′ N., 74° 15′ W.) city, capital of New Jersey, U.S.A.; Prot. and R.C. episcopal see; public buildings include city hall and state capitol; manufactures earthenware and pottery, iron and steel, woollens, etc.; rolling mills. Here British were defeated by Washington, 1776. Pop. (1910) 96,815. (2) (40° 4′ N., 93° 41′ W.) city, on Grand River, capital, Grundy County, Missouri, U.S.A.; flour-mills; railroad shops. Pop. (1910) 5636.

TREPANG, see under ECHINODERMATA.

TRES TABERNÆ (Three Taverns) (41° 35′ N., 12° 52′ E.), ancient village, on Via Appia, Latium; referred to in *Acts* 28[15] in connection with St. Paul's journey to Rome.

TRESHAM, FRANCIS (1568 ?–1605), last Gunpowder Plot conspirator to be initiated; is thought to have betrayed plot to Mounteagle; d. in prison, but was attainted, and corpse decapitated.

TRESPASS is an unauthorised entry on another man's ground, thereby doing damage. The owner must bring the action. A trespasser may be ejected, but, if unnecessary force is used, an action for assault against the ejectors may be brought.

TREVELYAN, SIR GEORGE OTTO, Bart. (1838–), Brit. author and nephew of Lord Macaulay. In 1862 he entered the Indian Civil Service. His great work is the *History of the American Revolution*.

TREVES, see TRIER.

TREVI (42° 50′ N., 12° 45′ E.) (ancient *Trebiæ*), town, Perugia, Italy. Pop. 5900.

TREVIGLIO (45° 31′ N., 9° 38′ E.), town, Bergamo, Italy; manufactures silk and wool. Pop. 15,300.

TREVISO (45° 40′ N., 12° 13′ E.) (ancient *Tarvisium*), town, Italy; manufactures iron, pottery; the cathedral contains Titian's *Annunciation*. Pop. (1911) 41,027; (province) 491,561.

TREVITHICK, RICHARD (1771–1833), Eng. engineer; b. Illogan, Cornwall; inventor of high-pressure steam engine; first applied iron to shipbuilding and used steam-power for agricultural implements.

TREVOR, BARONY OF.—Thomas T. (1658–1730), s. of Sir John T., kt. (1626–72), a prominent statesman under the Commonwealth, and Ruth, dau. of John Hampden, was made Chief Justice (1701), baron (1712), and Privy Seal (1726–30).

TREVOUX (45° 56′ N., 4° 46′ E.), town, on Saône, Ain, France; manufactures gold and silver wire.

TRIAL.—In all civil cases of slander, libel, false imprisonment, malicious prosecution, seduction, and breach of promise, either plaintiff or defendant may demand trial by judge and jury. In all criminal cases, where the magistrates do not convict summarily, the prisoner must be sent to trial before judge and jury at the next quarter sessions or assizes.

TRIANGLE, figure bounded by three lines. If a plane figure, lines are straight, three angles together equal two right angles, and area equals half-product of base and height. If figure is on surface of sphere, lines are arcs of great circles, and t. is called *spherical*.

TRIANGULATION, see PARALLAX.

TRIASSIC SYSTEM, lowest strata of the Second-

ary or Mesozoic system, rests on the Permian rocks and older Palæozoic strata, and is beneath the Jurassic (oolites and lias); well developed in central England, extends across Severn Valley into Devonshire. Also in central Europe, Vosges Mountains, Sweden, and North America. Generally classified—

KEUPER or	RHÆTIC.	Black shales, marls, and sandstones.
	UPPER TRIAS.	Marls, slates, sandstones (red and grey), and salines.
MIDDLE TRIAS or MUSCHELKALK.		Limestones, dolomites, and salines.
LOWER TRIAS or BUNTER.		Mottled sandstones, marls, and conglomerates.

Life of the period: plants (ferns, conifers, etc.). Reptiles, foraminifera, gasteropods, ammonites. Fishes (ganoids and placoids) and early mammalia. See also GEOLOGY.

TRIBE, originally group of individuals claiming descent from one male ancestor. See FAMILY, CLAN.

TRIBERG (48° 10′ N., 8° 12′ E.), town, health-resort, in Black Forest, Baden; clock-making centre. Pop. 3800.

TRIBONIAN, Rom. magistrate (fl. 530); held offices of quæstor, master of offices, and consul under Justinian; app. one of ten commissioners to draw up Codex of Imperial Constitutions, 528. Pres. of commission who compiled Pandects or Digesta (extracts from early law writings), 530. Head of commission which drew up Novellæ (changes in law).

TRIBUNE, a Rom. magistrate.—(1) Most important tribunes in Rome were t's of the plebs; originated in struggles between patricians and plebeians; first app. in 494 B.C., with object of protecting the latter against the former, which, however, they could only do within the city. At first two in number, they increased by 449 B.C. to ten. Their power was chiefly negative, consisting in the right of veto (*intercessio*), by which they could stop all business and prevent the magistrates carrying out decrees of Senate. The acts of all magistrates except dictators were liable thus to be vetoed. Gradually they acquired right to attend Senate, and soon after 367 B.C., to summon it. On the fall of the republic the tribunician became one of the chief powers attached to the emperor. (2) Military tribunes with consular power were sometimes app. by Senate (444–367 B.C.) instead of consuls.

TRICHINA, see under NEMATODA.

TRICHINOPOLY (10° 50′ N., 78° 44′ E.), district, Madras, Brit. India; seat of a R.C. college; noted for its cigars and cheroots. Pop. 1,445,000.

TRICHINOSIS, TRICHINIASIS, disease caused by parasitic worm, *Trichina spiralis*, conveyed to man by eating insufficiently cooked 'measly' pork; the larvæ, found in the diseased flesh, consist of capsules, translucent or with lime salts deposited in them, each containing one or two worms; when swallowed the capsules become digested in the intestine, and the embryos are set free, rapidly become mature, penetrate the intestinal walls, and then produce hundreds of embryos, which are carried to the muscles by the blood; there they become encapsulated, and may give rise to no further trouble. The earlier symptoms of the disease are diarrhœa and other gastro-intestinal disturbances when the parasites are in the intestine, and fever, pain, and swelling while the migration to the muscles is proceeding; there is a leucocytosis with great increase of eosinophil cells, which is a valuable aid to diagnosis. The treatment consists of calomel or filix mas or santonin to clear out the intestines, and opium for the muscular pain. The thorough cooking of pork kills the parasites and prevents the disease. See BLOOD.

TRICHOCEPHALUS, see under NEMATODA.

TRICLADIDA, a group of TURBELLARIAN WORMS (*q.v.*).

TRICOLEUR, see under FLAG.

TRICOUPIS, CHARILAOS (1832–96), Gk. statesman; attaché in London, 1852; Minister of Foreign Affairs, 1866; Prime Minister, 1875; retired, 1895.

TRICUSPID, see HEART.

TRICYCLE, three-wheeled development of bicycle, popular for short time before bicycles were improved; chief drawback is its weight; now ridden only by children and old men.

TRIDACNA, see under LAMELLIBRANCHIATA.

TRIDENT, three-pronged spear; emblem of Poseidon (Neptune); borne by Britannia on Brit. coinage.

TRIENNIAL ACT, see PARLIAMENT.

TRIER, TRÈVES (49° 44′ N., 6° 38′ E.), city of Rhenish Prussia, on Moselle; claims to be the oldest town in Germany; interesting Rom. remains, such as amphitheatre, Porta Nigra (III.-cent. town gate, 118 ft. long, 93 ft. high), brick basilica (IV. cent., now Prot. church), ruins of Rom. palace and baths, Igel column (75 ft. high; II.-cent. bas-reliefs), cathedral (XI.–XIII. cent's; contains 'Holy Coat'), Liebfrauenkirche, St. Matthias, Rathaus, museum, library. T. has manufactures of linen, cottons, woollens, leather, iron foundries, machinery, dyeing, stained glass, etc.; capital of Celtic *Treviri*, then Rom. *Augusta Trevirorum*, T. became residence of Rom. emperors, III.–IV. cent's; archbishopric established, 814; as Electors, abp's possessed great temporal power, XIV.-XVIII. cent's; annexed by France, 1801; Prussian since 1814. Pop. (1910) 54,836.

TRIESTE (45° 39′ N., 13° 47′ E.) (Rom. *Tergeste*), chief seaport and large trading centre of Austria, on Gulf of T., at head of Adriatic; consists of old and new town (Theresienstadt), separated by Corso (principal street); cathedral (XIV. cent.), San Niccola, Santa Maria Maggiore, Arco di Riccardo (Roman gate), Revoltella Miramar Castle, town hall, museums, Tergesteo; fine harbour; chief industries, shipbuilding, ironfounding, rope-making, tanning, rosoglio; naval arsenal, headquarters of Austrian-Lloyd line; taken by Venice, 1203; under Austrian rule, 1382; free port, 1719 till 1891. Pop. (1910) 229,510.

TRIFOLIUM, see CLOVER.

TRIFORIUM, in arch., the gallery of a church aisle, an arcade between the pier arches and clerestory.

TRIGGER FISHES (*Balistidæ*), laterally flattened bony fishes, mostly poisonous, with large, regularly placed scales. The name is due to the fact that the third spine of the dorsal fin on being touched sets upright or lowers the first. The species of Balistes are known as the Leather Jacket, the Old Wife, or Old Wench. Found in tropical and sub-tropical seas.

TRIGONOMETRY, primarily, the science dealing with methods of solving *triangles*; more generally includes investigation of all properties of circular functions (see FUNCTION), and their application to other branches of analysis.

I. **Plane Trigonometry.**—Consider origin O and fixed direction OA to right of O. A line OP, initially coincident with OA, turns about O in a counter-clockwise sense, which is regarded as *positive* direction of rotation. Angle POA may be of any magnitude, each complete rotation adding 360 *degrees* (360°); 1°=60 minutes (60′)=3600 seconds (3600″). For theoretical purposes the unit angle is the *radian*, the angle subtended at the centre of a circle by an arc equal in length to the radius. Hence 2π radians=360° where $\pi = 3{\cdot}1415926\ldots$.

The *circular functions* of an angle θ are defined thus:—

Let $\angle POA=\theta$. Take P any point in OP, and draw perpendicular PM to OA. Then we have—

$\sin\theta=MP/OP$, $\cos\theta=OM/OP$, $\tan\theta=MP/OM$, $\operatorname{cosec}\theta=OP/MP$, $\sec\theta=OP/OM$, $\operatorname{cotan}\theta=OM/MP$.

Taking usual notation for positive and negative directions horizontally and vertically, and regarding OP as always positive, the various functions have signs depending on the quadrant in which the angle lies. The

functions are connected by the relations $\sin\theta/\cos\theta = \tan\theta$; $\cos\theta = 1/\sec\theta$; $\sin^2\theta + \cos^2\theta = 1$, etc.

ADDITION FORMULÆ.—From the fundamental theorem of projections (that the sum of the projections on any straight line, of the sides, taken in order, of any closed polygon, is zero) we derive

$$\left.\begin{aligned}\sin(\alpha \pm \beta) &= \sin\alpha\cos\beta \pm \cos\alpha\sin\beta\\ \cos(\alpha \pm \beta) &= \cos\alpha\cos\beta \mp \sin\alpha\sin\beta\end{aligned}\right\} \quad \text{(i.)}$$

Hence by addition and subtraction, putting $(\alpha+\beta)=A$, $(\alpha-\beta)=B$.

$$\left.\begin{aligned}\sin A + \sin B &= 2\sin\tfrac{1}{2}(A+B)\cos\tfrac{1}{2}(A-B)\\ \sin A - \sin B &= 2\cos\tfrac{1}{2}(A+B)\sin\tfrac{1}{2}(A-B)\\ \cos A + \cos B &= 2\cos\tfrac{1}{2}(A+B)\cos\tfrac{1}{2}(A-B)\\ \cos B - \cos A &= 2\sin\tfrac{1}{2}(A+B)\sin\tfrac{1}{2}(A-B)\end{aligned}\right\} \quad \text{(ii.)}$$

Formulæ (i.) admit of extension for any number of angles.

TRIANGLES.—For a triangle ABC, sides a, b, c, from the definitions of sine and cosine we easily prove $a = b\cos C + c\cos B$, with two corresponding formulæ, $a/\sin A = b/\sin B = c/\sin C$. Hence we obtain $a^2 = b^2 + c^2 - 2bc\cos A$, with two similar formulæ. Then we have $\sin^2\frac{A}{2} = \frac{1-\cos A}{2}$, and hence by substitution for $\cos A$ we get $\sin^2\frac{A}{2} = \frac{(s-b)(s-c)}{bc}$ where $2s = a+b+c$. Similarly $\cos^2\frac{A}{2} = \frac{s(s-a)}{bc}$.

Again, $\sin A = 2\sin\frac{A}{2}\cos\frac{A}{2} = \frac{2}{bc}\sqrt{s(s-a)(s-b)(s-c)}$.

$\therefore$ Area of triangle $= \frac{1}{2}bc\sin A = \sqrt{s(s-a)(s-b)(s-c)}$.

From $\frac{\sin B}{b} = \frac{\sin C}{c} = \frac{\sin A}{a}$ we can derive the result $\tan\frac{B-C}{2} = \frac{b-c}{b+c}\cot\frac{A}{2}$, giving the values of B and C when the two sides b and c and the included angle A are known; for $B+C = 180° - A$. All the formulæ given above are used in the *solution* of triangles, *i.e.* given three parts, one of which must be a side, to find the remaining three parts. For the radii of the (i.) circumscribed, (ii.) inscribed, and (iii.) escribed circles of a triangle we easily find the following formulæ by drawing figures for the different cases: (i.) $R = \frac{1}{a}\operatorname{cosec}\frac{A}{2} = \frac{abc}{4S}$, where $S = \sqrt{s(s-a)(s-b)(s-c)}$; (ii.) $r = S/s$; (iii.) $r_a = S/(s-a)$, etc., where r_a is the radius of the circle touching side a externally.

II. **Spherical Trigonometry** deals with triangles on a spherical surface bounded by arcs of great circles; the angles between the tangent lines to the arcs where they meet are the angles of the triangle, the arcs themselves are the sides of the triangle. In the formulæ used it is understood that each side is restricted to be less than a semicircle, and hence any angle of a spherical triangle is less than two right angles. For the solution of spherical triangles the formulæ are more complicated than for plane triangles, since the sides are measured by the angles they subtend at the centre of the sphere. The following are a few of the simpler results, many of which, as will be seen, have analogous formulæ in plane trigonometry which may be easily derived from them:

$$\cos A = \frac{\cos a - \cos b\cos c}{\sin b\sin c}; \quad \frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c};$$

$\cot a\sin b = \cot A\sin C + \cos b\cos C$, with five others similar; $\sin^2\frac{A}{2} = \frac{\sin(s-b)\sin(s-c)}{\sin b\sin c}$, etc. Other formulæ may be obtained from these by changing the angles into the supplements of the corresponding sides, and at the same time the sides into the supplements of the corresponding angles, utilising the properties of the polar triangle. The results,

$\tan\frac{1}{2}(A+B) = \frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}(a+b)}\cot\frac{1}{2}C$ and $\tan\frac{1}{2}(A-B) = \frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}(a+b)}\cot\frac{1}{2}C$, with the two corresponding polar formulæ are known as *Napier's Analogies*. *Delambre Analogies* are—

$$\frac{\sin\frac{1}{2}(A+B)}{\cos\frac{1}{2}C} = \frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}c},$$

$$\frac{\sin\frac{1}{2}(A-B)}{\cos\frac{1}{2}C} = \frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}c},$$

with two others deducible from the polar triangle.

Hobson, *Plane Trigonometry*; Hall and Knight, *Plane Trigonometry*; Todhunter and Leathem, *Spherical Trigonometry*.

TRIKKALA (39° 33′ N., 21° 48′ E.) (ancient *Trika*), town, Greece; centre of trade in wheat. Pop. 18,100.

TRILEMMA, argument offering three alternatives, one of which must be accepted, yet all lead to results disagreeable to an opponent. See LOGIC.

TRILOBITES, fossil animals related to primitive Crustacea; vary from almost a pin's head in size to 2 ft. in length; range from the Lower Cambrian to the Carboniferous period when, except for one species, they died out.

TRIM (53° 33′ N., 6° 47′ W.), county town, on Boyne, County Meath; has a ruined castle (XII. cent.).

TRIMONTIUM (55° 34′ N., 2° 42′ W.), Rom. fort, at Newstead, near Melrose, Scotland; site of recent important excavations.

TRINCOMALEE (8° 34′ N., 81° 12′ E.), seaport, former naval station, Ceylon; fine harbour; taken by British from Dutch, 1795. Pop. 13,300.

TRING (50° 48′ N., 0° 40′ W.), market town, Hertfordshire, England; straw-plaiting industry. Pop. (1911) 4481.

TRINIDAD.—(1) (10° 30′ N., 61° 20′ W.) one of Brit. W. Indian Islands, at extreme S. of Windward group; area, 1754 sq. miles. Surface is hilly; extreme height of c. 3000 ft.; soil is fertile; climate healthy; large crops of sugar and cacao; exports sugar, cocoa, asphalt, rum, bitters, etc. Chief town, Port of Spain. Administration carried on by governor and executive and legislative councils; chief religions are Anglican and R.C. Pop. (1911—excluding Tobago (*q.v.*)) 309,331. (2) (37° 8′ N., 104° 30′ W.) city, on Las Animas, capital, Las Animas County, Colorado, U.S.A.; agricultural region; coal-mines. Pop. (1910) 10,204. (3) (21° 44′ N., 80° 2′ W.) seaport, Santa Clara, Cuba; exports sugar. Pop. 12,500. (4) (20° 30′ S., 29° 50′ W.) uninhabited island in S. Atlantic, claimed by Brazil.

TRINITARIANS, monastic order (now small), existing since 1198.

TRINITY HOUSE, corporation with considerable control over the mercantile marine of the U.K. by charter of 1514; quarters, T. H., Tower Hill, London.

TRINITY SUNDAY, the one succeeding Whitsunday.

TRIOLET, a form of verse invented by mediæval Fr. poets, the formula is—a b a a b a b a. The first line is identical with the fourth, and the last two lines repeat the opening couplet.

TRIPLE ALLIANCE, see ALLIANCE.

TRIPOLI.—(1) (*c.* 25° to 34° N., 11° 45′ to 25° 10′ E.) country, N. Africa; bounded by Mediterranean, Egypt, Sahara, Algeria, Tunis. Area, *c.* 398,900 sq. miles. Surface is mountainous, reaching an extreme height of 4000 ft.; in E. is sandy district, with plateau of Barca to N. No important rivers. Chief towns, Tripoli (capital), Benghazi, Derna. Climate varies; great heat in summer, little rain. T. belonged in turn to Carthaginians, Romans, Vandals, Berbers, Tunisians; independent in XIV. cent.; conquered by Spain, 1509; subsequently given to Knights Hospitallers, from whom it was taken by Turks in 1551. Home of pirates for about three cent's. Became Turk. vilayet, 1835, since when various unsuccessful risings against Turks have occurred. Invaded in Sept. 1911 by Italy, by whom decree of annexation was issued in Nov. 1911.

Turkey refused to recognise this annexation, and war resulted. By Treaty of Lausanne, Oct. 1912, Turkey granted full autonomy to T., and tacitly ignored, without recognising officially, Ital. sovereignty; Italy took over T.'s debt; Turkey, while retaining certain religious rights, ceased to have any political influence in T. Inhabitants chiefly Berbers; some Jews and negroes. Religion, Muhammadanism. Agriculture is principal industry; produces esparto grass, fruits, cotton, cereals; sheep and cattle raised; trades in ostrich feathers, ivory, gold dust. Pop. *c.* 1,000,000. (2) TARABULUS-EL-GHARB (32° 54′ N., 13° 11′ E.), seaport, on Mediterranean, capital of above; starting-point of caravans for interior; manufactures carpets. Pop. *c.* 29,000. (3) TARABULUS (34° 27′ N., 35° 50′ E.), town, vilayet Beirut, Syria; some trade with interior, exports silk; ancient Phœnician city *Tripolis*; besieged by Crusaders, 1104; taken, 1109. Pop. 32,000.

TRIPOLISTA, TRIPOLIS (37° 30′ N., 22° 22′ E.), town, capital, monarchy of Arcadia, Greece, near ancient Mantineia, Tegea, and Pallantium. Pop. 10,800.

TRIPTYCH, tablet of 3 painted leaves, which when folded present a new picture; term also applied to pictures in 3 parts, *e.g.* Rubens' *Descent from the Cross.*

TRIREME, galley with three banks of oars, one above another; superseded at time of Punic Wars by quinqueremes; rowers numbered *c.* 180.

TRISMEGISTUS, see HERMES TRISMEGISTUS.

TRISTAN, TRISTREM, famous hero of mediæval romance, in origin Cornish or Breton, but adopted by nearly every literature in W. Europe. It has been attached to the legend of Theseus, and become somewhat inexplicably involved in the Round Table legend. The chief older poems in which T. figures are *Béroul* (Fr., 1160, fragmentary), Gottfried von Strassburg's *Tristan und Isolde* (Germ., XIII. cent.), *Sir Tristrem* (Eng., XIII. cent.), *Don Tristan de Leonis* (Span., 1528). In modern times, either in its original or in its later, Round Table, setting, it has been used by Wagner, Matthew Arnold, Tennyson, and Swinburne. Its literary history is fully treated in Golther's *Die Sage von Tristan und Isolde.*

TRISTAN DA CUNHA (37° 6′ S., 12° 1′ W.), largest of group of islands, of volcanic formation, in S. Atlantic, the others being Nightingale and Inaccessible Islands and several small islets and rocks; area, *c.* 43 sq. miles; surface mountainous; produce potatoes and apples; cattle and sheep are raised. The islands have no form of government and crime is unknown. First discovered by Portug. admiral, from whom they take their name, 1506; annexed by Great Britain, 1816; garrisoned by Brit. force during Napoleon's exile in St. Helena.

TRITON (classical myth.), s. of Poseidon and Amphitrite; dwelt in golden palace at sea-bottom; quelled waves with a trumpet.

TRIUMPH, honour awarded to victor in ancient Rome by senate, who marched first, followed by spoils and distinguished captives, oxen for sacrifice, and the victor. Under the Empire, only the emperor could enjoy a triumph; last, Diocletian, 302 A.D. A general received an *Ovation* or lesser triumph.

TRIUMPHAL ARCH, structure erected to commemorate some victory. Temporary structures of this description seem to be common to all peoples, but the Romans were the first to make such structures permanent. Famous Rom. arches are those of Titus, Septimius Severus, and Constantine. Modern arches are represented by the Arc de l'Etoile in the Champs Élysées, Paris (1830), the Brandenburger Thor at Berlin, the Siegesthor of Münich, and the Marble and Wellington Arches in London.

TRIUMVIRATE, coalition of three magistrates to superintend foundation of colonies or the coinage; applied to control of state by Cæsar, Pompey, and Crassus; and, later, Antony, Octavius, and Lepidus.

TRIVANDRUM; TREVANDRUM (8° 29′ N., 76° 59′ E.), city, pilgrim resort, capital, Travancore, Madras, India; educational centre. Pop. 60,000.

TRIVIUM, scholastic term for the three arts, grammar, logic, rhetoric.

TRNOVO, TIRNOVO (43° 7′ N., 25° 28′ E.), city, on Yantra, Bulgaria; manufactures copper-ware. Pop. (1910) 12,649; (department) 448,197.

TROCHILIDÆ, see HUMMING-BIRD.

TROCHU, LOUIS JULES (1815-96), Fr. soldier; served in Algeria, Crimea, Lombardy; defended Paris when besieged by Germans, 1870.

TROGEN (47° 24′ N., 9° 27′ E.), town, canton Appenzell, Switzerland; manufactures muslins.

TROGLODYTIDÆ, WRENS (*q.v.*).

TROGONS (*Trogonidæ*), a family of Picarian Birds, with 55 species confined to the tropics of the Old and New Worlds; brightly coloured arboreal birds which feed on fruits and insects. They are the only birds in which the first and second toes are turned backwards, the third and fourth forwards. The LONG-TAILED TROGON or QUEZAL (*Pharomacrus*), with its metallic green and deep red plumage, excessively long tail-covert feathers, which trail far behind it in flight, and crested head, is a strikingly beautiful and shy inhabitant of Central American forests.

TROGUS, GNÆUS POMPEIUS, Rom. historian in Augustan age; principal work, *Historiæ Philippicæ,* an important authority on Eastern history.

TROIA (41° 20′ N., 15° 14′ E.) (ancient *Æcæ*), **town,** Foggia, **Italy.** Pop. 6750.

TROILUS AND CRESSIDA (classical myth.).—T. was s. of Priam of Troy, and Hecuba; his lover C. was dau. of Calchas the Soothsayer; legend used by Chaucer, Shakespeare, and others came from mediæval romances.

TROITSK (54° 1′ N., 61° 41′ E.), town, Orenburg, Russia; gold-mining district; manufactures iron; active trade. Pop. 26,000.

TROLLE, HERLUF (1516-65), Dan. naval hero; gained great victory over Swed. fleet off isle of Öland, 1563.

TROLLHÄTTAN (58° 16′ N., 12° 12′ E.), town, capital, län of Elfsborg, Sweden, on Göta, at falls of Trollhätten. Pop. 7920.

TROLLOPE, ANTHONY (1815-82), Eng. novelist; 3rd s. of Mrs. Francis T.; ed. Winchester and Harrow; post office clerk, 1834; post office surveyor in Ireland, 1841. First novels, *e.g. The Kellys and the O'Kellys* (1848), were unsuccessful financially; *The Warden* (1855) brought him fame, which increased when he pub. *Barchester Towers* (1857). Other novels are *Orley Farm, The Last Chronicle of Barset, Can You Forgive Her? Phineas Finn, An Old Man's Love.* He wrote too much to write excellently, but he had great power of character-drawing and society painting, *Autobiography* (1883).

TROMBONE, a brass musical instrument, the tube of which is capable of being lengthened by player so as to produce sounds of different pitch. Three varieties are used in modern orchestras—alto, tenor (most important of the three), and bass. The tone is grand and noble, especially rich and full in soft passages, and exceedingly effective in intensifying solemn situations. The older composers, like Bach and Handel, employed the trombone very sparingly, but since Weber's and Schubert's time it has been a constituent part of the ordinary full orchestra. It is seldom heard as a solo instrument, though Mozart provides a fine instance in his celebrated *Requiem.*

TROMP, famous Dutch admirals.—MARTIN HARPERTZOON T. (1597-1653), fought against England, 1652-53; fell at Scheveningen. CORNELIUS VAN T. (1629-91), fought against England and France, 1673.

TROMSO (69° 50′ N., 18° 32′ E.), seaport, on island of Tromso, Norway; exports furs, whale- and seal-oil. Pop. 7100; (amt, 1910) 82,193.

TRONDHJEM (63° 25′ N., 10° 23′ E.), city, seaport, on Trondhjem Fjord, Norway; exports lumber, fish; shipbuilding; the cathedral, dating from XI. cent., is place of coronation of the kings of Norway. Pop. (1910) 45,335; (amt) N. 84,948, S. 148,306.

TROON (55° 33′ N., 4° 40′ W.), seaport, watering-place, Ayrshire, Scotland; fine harbour; shipbuilding. Pop. (1911) 6628.

TROPÆOLUM, see NASTURTIUM.

TROPIC BIRDS, or BOATSWAIN BIRDS (*Phæthon*), form a genus and family of six Swimming Birds with four webbed toes; found on all the great oceans, often far from land; feed on fish.

TROPINE ($C_8H_{15}NO$), produced with tropic acid from atropine by alkali hydrolysis; M.P. 62°; B.P. 233°; forms esters with organic acids called tropeines, *e.g.* atropine (*q.v.*), possessing mydriatic action.

TROPPAU (49° 56′ N., 17° 55′ E.), town, on Oppa, capital, Austrian Silesia; manufactures machinery, woollen fabrics. Pop. (1910) 30,762.

TROPPAU, CONGRESS OF, 1820, Austria, Prussia, Russia, England, France, met to discuss Neapolitan revolution. First three decided on intervention, England protesting.

TROSSACHS (56° 13′ N., 4° 25′ W.), beautiful wooded pass, Perthshire Highlands, Scotland, between Lochs Achray and Katrine.

TROUBADOURS, poets of Spain, Italy, and S. France, who flourished from the XII. to the XIV. cent's. The ranks of this order of poets were chiefly recruited from the noble classes, and even kings turned t., *e.g.* Richard Cœur-de-Lion and Alfonso II. of Aragon, but there was also a professional class of lower caste. The t. poet was inspired by the sentiments of chivalry and love, and in many ways had a refining influence on mediæval society. T's for the most part led a wandering life, passing from country to country and from court to court. Sometimes they became attached as retainers to a house. In the XII. cent. there were no t. schools of poetry, but the poets became efficient in the art by attaching themselves to some skilled minstrel. The latter half of the XII. cent. and the beginning of the XIII. is the golden era of Provençal lyric. Among famous t's of this period may be mentioned Arnaut de Maruelh, Folquet, bishop of Marseilles, Arnaut Daniel, and Giraut de Bornelh. In the XIII. cent. may be mentioned Guiraut Riquier, the 'last of the t's.' The poetry of the t's was artificial in character. It was sometimes sung by the composer, but mostly by a professional accompanist, called a 'joglar' or 'jongleur.'

TROUSERS, see COSTUME.

TROUT, see under SALMON FAMILY.

TROUVÈRE, name applied to the mediæval poets of N. France and corresponding to the Troubadour of S. The t's were court poets who furnished the nobles of France with a species of artificial and sentimental poetry. During the first half of the XIII. cent. this type of poetry was most in vogue. The nobles themselves delighted in the pastime, and Thibaut IV. of Navarre, Louis of Blois, and John of Jerusalem were enrolled among the early t's. The theme was invariably the poet's love of some lady married and beyond his reach, but to whom he swore lifelong devotion.

TROUVILLE (49° 20′ N., 0° 7′ E.), seaport, seaside resort, on English Channel, Calvados, France. Pop. 6500.

TROWBRIDGE (51° 19′ N., 2° 12′ W.), market town, Wiltshire, England; manufactures woollen cloths. Pop. (1911) 11,822.

TROY.—(1) (39° 52′ N., 26° 17′ E.) famous city of legendary Gk. history, situated in the Troad, the name applied in ancient times to a district occupying N.W. of Asia Minor; archæologists differed as to its exact locality until Schliemann produced strong evidence that this was the site. Schliemann's excavations at Hissarlik, which were continued by Dörpfeld, showed that nine different towns or villages had been built here, one above the other; and of these the sixth, which obviously flourished in the Mycenæan age, is now generally acknowledged to be the Troy of Homer's epic; this town was surrounded by a great wall, the gates of which were defended by towers. The last or ninth city on this site was ruined by the Turks in 1306.

The 10 years' siege of Troy, in the reign of its last and greatest king, Priam, by an alliance of Gk. chieftains under Agamemnon, is the theme of Homer's *Iliad*; war was entered on by the Greeks on behalf of Menelaus, king of Sparta, whose wife, Helen, had been abducted by Paris, son of Priam. The city was finally taken by a ruse suggested by Ulysses. The Greeks, as if in despair, took to their ships, leaving behind a wooden horse in which Gk. heroes were concealed; the Trojans dragged this horse into the city, and at night the hidden men emerged and opened the city gates to their comrades, who had returned under cover of darkness. City was burned and Priam killed.

Schuchhardt, *Schliemann's Excavations* (trans. by Sellers, 1891).

(2) (42° 43′ N., 72° 42′ W.) city, capital, Rensselaer County, New York, U.S.A., on Hudson River; manufactures collars and cuffs, shirts, iron and steel goods; agricultural products; seat of Rensselaer Polytechnic Institute. Pop. (1910) 76,813.

(3) (40° 3′ N., 84° 14′ W.) city, on Great Miami, capital, Miami County, Ohio, U.S.A.; manufactures machinery, tobacco. Pop. (1910) 6122.

TROYES (48° 19′ N., 4° 6′ E.), town, on Seine, Aube, France; has cathedral dating in part from XIII. cent., and many interesting old churches; public buildings include town hall, library, museum, prefecture; manufactures hosiery, cotton and woollen textiles, yarn. Was important town under Counts of Champagne. Here was signed the treaty conferring succession to Fr. crown on Henry V. of England, 1420. Pop. (1911) 55,486.

TROY WEIGHT, see WEIGHTS AND MEASURES.

TRUCE OF GOD, name given to ecclesiastical efforts to reduce the misery of war, from X. cent. onwards. It began by forbidding attacks on certain persons, *e.g.* women and priests, and on ecclesiastical buildings. Then warfare was forbidden on festivals; spiritual penalties were pronounced against those who transgressed it. It was never much observed in England, where feudal evils were not so rampant, but was gradually enforced in France.

TRUCK ACTS (1831, 1874, 1887, 1896) compel employers to pay workmen in current coin of the realm, not in goods, and to put no restrictions on workmen's manner of expenditure; do not apply to domestic servants and menials.

TRUFFLE, the edible 'fruit bodies' of *Tuber*, a subterranean ascomycetous fungus; found under trees, the best coming from France and Italy, where they are searched for with specially trained dogs or pigs.

TRUJILLO.—(1) (39° 28′ N., 5° 54′ W.) town, Caceres, Spain; birthplace of Pizarro. Pop. 12,800. (2) TRUXILLO (8° 3′ S., 79° W.) city, Libertad, Peru; seat of univ.; manufactures cigars; formerly important commerce. Pop. 6600. (3) TRUXILLO (15° 55′ N., 80° 5′ W.) seaport, on N. coast, Honduras; exports dyewoods. Pop. 4200.

TRUMBULL, JOHN (1756–1843), artist; s. of the Amer. patriot, Jonathan T. His best pictures are connected with Washington and the War of Independence.

TRUMPET (Fr. *trompette, clarion*; Ger. *trompete*; Ital. *tromba*).—(1) brass wind-instrument used in ancient mediæval and modern times, consisting of a cup-shaped mouthpiece and a long narrow tube bent twice on itself and terminating in a bell. The tube is mostly cylindrical, but widens and becomes conical towards the bell. T. is a transposing instrument with brilliant, penetrating tone. The *natural t.*, without valves, side-holes, or slides, is generally used for military purposes and only gives the harmonic scale. In the XVII. cent. the *slide t.* was invented and improved so as to secure a chromatic compass. The modern *valve t.* (with three valves), which has almost entirely taken the place of the natural t., can play more or less perfectly the complete scale; it is made in F, sometimes in high B♭ and A♮, and worked like other valve instruments. In band and orchestra the t. has always had its place.

(2) metal or vulcanite tube with funnel-shaped end for collecting, directing, or intensifying sounds; with attachment for ear or mouth; first hearing trumpet said to have been made in Holland, XVI. cent.

TRUMPETERS (*Psophiidæ*), so called on account of their deep-toned cry; a family of Quail-like birds, found in flocks in the forests of South America; nest on ground; trained to protect domestic fowls.

TRUNK-FISHES, Cuckolds (*Ostraciidæ*), peculiar fishes with body enclosed in a bony box; inhabit shallow water of tropical seas.

TRURO.—(1) (50° 16′ N., 5° 3′ W.) seaport, on tidal Truro River, Cornwall, England; bp.'s see (1876); cathedral (1880); tin mines in neighbourhood. Pop. (1911) 11,325. (2) (45° 21′ N., 63° 18′ W.) town, on Cobequid Bay, Colchester County, Nova Scotia; engineering-works. Pop. 6500.

TRUSS, see Hernia.

TRUSTS.—Trusts may be created either expressly or by implication, and there is a third kind—the constructive trust—created by Courts of Equity to meet the justice of particular cases. The person who carries out a trust is called a *trustee*. T's of personal property may be created by word of mouth, but t's of land or of interests in land must be created by writing unless they are constructive t's. No particular form is required by law, but it should be stated clearly in writing who the trustees are, what property they are to deal with, how they are to deal with it, and for whose benefit they are to act. *Cy près* is an equitable doctrine by which Courts of Chancery, where it is impossible to carry out terms of a t., make an order whereby it is to be carried out as nearly as possible.

T's which in their carrying out involve any breach of the law, or tend to promote immorality, are void in law. By the Bankruptcy Act, 1883, voluntary settlements are void against the trustee in Bankruptcy if made less than 2 years before the Bankruptcy, and even within 10 years of the making, unless the parties claiming under it can prove that the settlor was solvent at the date of the settlement without the aid of the property comprised in the settlement, and had no pecuniary interest in the property. A t. for saying masses for the dead is also void in Britain.

Trustees are usually appointed by the instrument which creates the t., but when there has been an omission the Court of Chancery will always appoint them. The court may also appoint a 'judicial trustee' to act either as sole trustee or jointly with existing trustees.

Commercial trusts are formed by a number of firms or trading corporations, in the same kind of business, combining for the purpose of getting rid of competition amongst themselves, and thereby getting control of the market. Apart from the obvious saving in expenses of management by doing away with the trade rivalry, a successful t. can also dictate what price it will for the commodity it sells or for the means of transit it owns. The usual method of combining is for the various firms interested to be valued, and then their property and goodwill are transferred to the trustees appointed to govern the combination. In return, each firm that joins the amalgamation has a right to a share of the total earnings of the combine, in proportion to the value of the business which it brought. Where the t. is strong enough, it speedily wipes out its rivals; for it can afford to undersell them in the market. Then, all rivals having been driven out of the market, the t. promptly raises its prices without fear of competition, and so makes an enormous profit out of the community. In U.S.A., where the t. has grown more rapidly than elsewhere, legislation has been framed to check such concentration of capital. But the process is at work throughout the world (*e.g.* Amer. Meat T. obtained a footing in Australia, 1913), and on all sides the small industry is being absorbed by the larger. Some Socialists welcome the process as a step to nationalisation of industry; they hold that the State will be an ideal t. which will give the workers the profits now drawn by t. magnates.

J. P. Davis, *Corporations* (1905); F. W. Hirst, *Monopolies, Trusts, and Kartels* (1905); H. W. Macrosty, *Trust Movement in Brit. Industry* (1905).

TRYGON, see under Rays.

TRYON, SIR GEORGE (1832–93), Brit. admiral; commanded Mediterranean Fleet, 1891; gave mistaken order which led to sinking of the *Victoria* with himself on board.

TRYPANOSOMES, minute blood or body-fluid parasites belonging to the Flagellata or Mastigophora group of the Protozoa. To man they are of great importance, for although many harmless forms are known—parasitic in Fishes, Amphibia, Mammals, and other Vertebrates—there are others which cause serious or fatal diseases (trypanosomiases) to man and to his domesticated stock.

T's (genus *Trypanosoma*) are elongated transparent Protozoa, which exhibit, when suitably stained, a somewhat cylindrical body, pointed at the ends, with a large nucleus (*trophonucleus*), a single long flagellum attached along the body by an undulating membrane, but free at one end and sinking into the body at the other end in a small nucleus-like blepharoplast or kinetonucleus. They move in the blood-fluid with a forward, wriggling motion, generally with the free flagellum in front. Some idea of their minuteness may be gathered from the fact that the body of *T. gambiense*, the cause of sleeping-sickness, is only about $\frac{1}{1500}$th inch long.

T's occur in the blood or body-fluids in varying numbers at different times, owing usually to their cycles of reproduction by simple division or fission. From one land vertebrate to another they are borne by insects, such as Tse-tse flies, mosquitoes, fleas, lice, bugs, etc., or by ticks, whereas leeches act as intermediaries where aquatic vertebrates are concerned. In the 'carrier' distinct developmental stages sometimes occur.

The t's which occur in wild animals in nature appear to be harmless, and it is usually only where man or domesticated animals cross the path, as it were, of such species that disease conditions become possible. The t's in an unnatural host, be they few or many, set up processes of poisoning with which the host cannot cope, and the result is fever and often death. Some well-known types of trypanosomiasis are the fatal sleeping-sickness of the natives of Africa caused by *T. gambiense* and carried by a Tse-tse fly, *Glossina palpalis*; nagana or 'Tse-tse fly' disease, which renders great tracts of land in Africa impassible to cattle, caused by *T. brucii*, and carried by *Glossina morsitans*; 'surra' in horses, mules, and elephants in India, the Philippines, and West Indies; durine in horses; and 'mal de caderas' in South American horses, transmitted by a fly, *Stomoxys*.

TRYPSIN, see under Digestion.

TSAD, see Chad.

TSAIDAM, Tsädum (37° N., 95° E.), elevated region, Tibet; of a desert nature; inhabited by Mongols.

TSANA, Dembea (12° N., 37° 25′ E.), lake, Abyssinia; length, 45 miles; altitude, 5700 ft.; the Abai or Blue Nile issues from its S. extremity.

TSAR (less correctly Czar), Russ. form of Cæsar. Ivan III. called himself *Hospodar* (lord) of all Russia; his s., Vassili III. (1505–33), was the first Russian prince to assume the royal title of T.

TSARITSYN (49° N., 44° 30′ E.), town, river port, on Volga, Saratov, Russia; railway junction; important transit trade. Pop. (1910) 74,230.

TSARSKOYE SELO (59° 45′ N., 30° 23′ E.), town, summer resort, St. Petersburg, Russia; contains an Imperial residence. Pop. 24,000.

TSCHAÏKOWSKY, PETER ILJITSCH (1840–93), Russ. composer; studied under Anton Rubinstein at the Petersburg Conservatoire, where he was subsequently (1866–77) teacher of harmony. Then, devoting himself entirely to composition, he wrote operas, the best known of which is *Eugen Onegin*;

symphonics, including the famous *Pathetic*; and many other works. His style inclined towards the dark and melancholy.

TSCHETCHEN, KHISTS, Muhammadan people dwelling in the E. Caucasus, now subject to Russia.

TSCHUDI, GILES, SCHUDY (ÆGIDIUS) (1502–72), Swiss historian; b. Glarus; of distinguished family dating from XII. cent.; strong supporter of Counter-Reformation. **Johann Jakob T.** (1818–89), a naturalist and diplomatist, and **Friedrich** (1820–86), a scholar, were of the same family.

TSENG KUO-FAN (1811–72), Chin. soldier; put down several rebellions; became war commissioner, 1860; captured Nanking, 1864; retired in 1870.

TSE-TSE FLY, see under HOUSE-FLY.

TSE-TSE FLY DISEASE, see under TRYPANOSOMES.

TSU-SHIMA (34° N., 129° E.), island of Japan, in Strait of Korea. Pop. 45,000. In the strait of T. the Japanese, under Togo, crushed the Russ. Baltic fleet, under Rozhdestvensky, 1905.

TUAM (53° 32′ N., 8° 51′ W.), town, Galway, Ireland; seat of Anglican bp. and R.C. abp.

TUAREGS, TUARIKS, nomadic Berber race, living in Sahara, estimated at 300,000; perhaps descendants of ancient Gætulians; tall and long-lived; monogamist before Muhammadan invasion. The women go unveiled, and take part freely in public affairs.

TUAT, fertile district, Algerian Sahara, Africa; called T. Archipelago by French, and now administrative area consisting of T., Gurara, and Tidikelt. Taken by France, 1901. Pop. 134 Europeans and 49,873 natives, *c.* 20,000 of whom are Arabs.

TUATARA, see SPHENODON.

TUBA, a brass wind-instrument with valves, conical tube, and cup-funnel-shaped mouthpiece, forming the tenor and bass of the brass-winds in orchestras; Euphonium (tenor t.), Bombardon, and Helicon (bass t.) used in military bands.

TUBERCULOSIS, chronic infective disease, caused by a micro-organism, the *Bacillus tuberculosis*, the lesions in which are nodules (tubercles) or diffuse infiltrations which undergo a characteristic cascation. In addition to man, all domesticated animals may be attacked; it is particularly widespread among bovines, an important fact because their milk and flesh are so largely used as food. In Britain *c.* 10 % of the deaths per annum are due to t., but there is a progressive decrease in mortality. The discovery of the bacillus was announced by Koch in 1882, since when there has been little added to the facts regarding it, and it is found in all tuberculous lesions.

Badly drained and overcrowded districts predispose to t., while sunlight and fresh air are powerful preventive agents; damp, dark, ill-ventilated houses and workshops, built closely together, greatly increase the liability of their inhabitants to the disease. Delicate constitutions, debilitated conditions from any cause, irregular modes of life, indoor or unhealthy occupations, are all predisposing causes of t.; and chronic catarrh, measles, whooping-cough, influenza, typhoid fever, diabetes, pleurisy, chronic heart disease or kidney disease, injury to the chest, joints, or other part of the body, all predispose.

The bacillus may gain an entrance to the body in several different ways: (1) by way of the respiratory tract, moist particles of sputum from an infected person or dust containing bacilli being inhaled, and thus carried directly to the lungs; (2) being in the air or in food, by the tonsils or other lymphatic tissue in the neighbourhood of the pharynx, and carried by the lymphatics to the lymphatic glands in the neighbourhood, or even to those of the lungs; (3) by the alimentary canal, particularly the lower part of the ileum, being contained in milk or other articles of diet, infection of the intestine being particularly common in children. The bacillus once having entered the body, infection may spread along the air-passages or alimentary canal, along the lymphatic vessels, or by way of the blood vessels, chiefly by the veins.

T. of the *lungs* may take the form of *miliary t.*, in which infection is spread from a primary focus by way of the blood vessels or the lymphatics, or *broncho-pneumonic t.*, in which infection is spread along the air passages; t. is rarely primary in the pleura, or lining membrane of the lungs, extension usually taking place from diseased areas of the lungs, the pleura becoming thickened, with tuberculous points in it. The *lymphatic glands* may be affected in various regions: in the neck infection is conveyed by the lymphatics from the tonsils and other pharyngeal lymphatic structures; the bronchial lymphatic glands and those at the root of the lungs may become infected in the same way, or by extension from the lungs; the mesenteric glands, in the structures supporting the intestines, become infected by bacilli which have entered with the food and have been carried to them by the lymphatics. In the *alimentary canal* the most common tuberculous lesion is ulceration of Peyer's patches, which are masses of lymphatic tissue found chiefly in the lower part of the ileum, infection having come through the food; t. of the pharynx, œsophagus, stomach, and upper part of the small intestine is rare, and occurs usually only secondarily in advanced cases. T. of the *liver* and of the *spleen* is usually secondary to lesions elsewhere, particularly in connection with the alimentary canal and mesenteric glands. T. of the *kidney* is also usually secondary, infection being believed to be carried by the blood stream, while from the kidney infection may spread to other parts of the genito-urinary system; the disease may also originate in other parts of the genito-urinary system.

T. is a common disease of *bone*, injury predisposing to the disease, and infection being usually conveyed by the blood stream; t. of *joints* is usually secondary to lesions in bones. In the *brain* and *spinal cord* t. may occur, infection usually spreading from another tuberculous lesion in the body, *e.g.* a lymph gland or bone, or by extension from the bones of the skull; the disease usually occurs as an inflammation of the meninges or membranous coverings of the brain and spinal cord.

The diagnosis of t. depends largely on the naked eye and microscopical appearance of the lesion, and on the discovery of the specific bacilli, *e.g.* in the sputum, in t. of the lung; in addition, however, inoculation with Koch's tuberculin (made from filtered cultures of bacilli) produces a characteristic reaction, showing that t. is present somewhere in the body.

Treatment consists in enabling the patient to have as much sunlight and fresh air as possible. As long as fever continues he must be confined to bed, and must be exposed to the fresh air, suitably wrapped up. Residence in various favourable localities, cold and dry, at a high altitude, *e.g.* Davos Platz; warm and moist, *e.g.* Bournemouth; warm and dry, *e.g.* Egypt, as well as in sanatoria in bracing and healthy localities, is of much benefit; but efficient treatment can also be carried out at home. Suitable nourishment is as important as fresh air, and loss of appetite and gastro-intestinal troubles are very serious obstacles to recovery; milk, eggs, meat juice, and raw meat are among the most valuable articles of diet, and cod-liver oil or, where the stomach is unable to bear it, malt extract or cream, is very beneficial, less so, perhaps, in pulmonary cases than in others. Arsenic and the hypophosphites are the best tonics. Carefully regulated injections of tuberculin have proved beneficial in certain types of cases. The fever, sweating, cough, and other troublesome symptoms are treated as they arise.

TUBEROSE (*Polianthes tuberosa*), plant often grown for its highly scented flowers.

TÜBINGEN (48° 31′ N., 9° 3′ E.), town, on Neckar, Württemberg, Germany; with Stiftskirche, town hall (XV. cent.), Castle of Hohen-Tübingen, museum, famous univ. (1477); chemicals, scientific instruments, gloves, dyeing, etc. Pop. (1910) 19,075.

TUBUAI ISLANDS, AUSTRAL ISLANDS (23° 30′ S.,

149° 30′ W.), group in S. Pacific belonging to France.

TUBULARIA, see under HYDROMEDUSÆ.

TUCKER, ABRAHAM (1705-74), Eng. philosopher. His *Light of Nature Pursued* contains much sound psychological observation.

TUCSON (32° 12′ N., 110° 54′ W.), city, on Santa Cruz, capital, Pima County, Arizona, U.S.A.; seat of univ. of Arizona (1901); cathedral (R.C.); botanical observatory; mining industries. Pop. (1910) 13,193.

TUCUMAN (27° S., 66° W.), province, Argentina; mountainous; chief product, sugar. Pop. 310,000. Capital, **Tucuman**, SAN MIGUEL DE TUCUMAN (26° 50 S., 66° 2′ W.); cathedral and college; trade in oxen and mules. Pop. (1910) 66,000.

TUDELA (42° 7′ N., 1° 39′ W.) (Rom. *Tutela*), town, on Ebro, Navarre, Spain; scene of victory of French over Spanish, 1808. Pop. 9400.

TUDOR, a Welsh family, whose pedigree has been traced to Ednyfed Vychan, steward to Welsh prince Llewelyn, 1232; more immediate ancestor of Tudor sovereigns was Owen Tudor, a Welsh squire, whose s. by Catharine, widow of Henry V., m. Margaret Beaufort, their s. being Henry VII.

TUDOR PERIOD, see ARCHITECTURE.

TUFF, rock débris consisting of volcanic ashes and igneous rocks of fine-grained material; varieties: *Trachyte-tuff*, débris of trachyte or basalt, contains orthoclase, biotite, augite, and hornblende; *Basalt-tuff*, composed of basalt and found in Skye and Mull; *Pumice-tuff*, glassy fragments and pumiceous matter; *Rhyolite-tuff*, composed chiefly of rhyolite.

TUGELA (29° S., 31° 13′ E.), river, Natal; rises in Mont Aux Sources; flows with an E.S.E. course of 300 miles to Indian Ocean.

TUGGURT (33° 13′ N., 5° 53′ E.), town, oasis, Algerian Sahara.

TUG-OF-WAR, trial of strength; opposing teams stand on opposite sides of mark with rope in their hands, object of each being to drag other across mark; game popular in Scotland and navy; forms one of contests of the Olympic games.

TUGUEGARAO (17° 35′ N., 121° 40′ E.), town, capital, Cagayán province, Luzon, Philippine Islands. Pop. 16,500.

TUKE, WILLIAM (1732-1822), his s. **Henry** (1755-1814) and grandson **Samuel** (1784-1857) were members of a Yorkshire family, who devoted themselves to the treatment of insanity, William founding the York Retreat for lunatics. **Daniel Hack T.** (1827-95), a great-grandson, also made contributions to the study of insanity.

TULA (54° N., 37° 40′ E.), government, Central Russia; undulating; chief occupation, agriculture. Pop. (1910) 1,773,700. Capital, **Tula** (54° 11′ N., 37° 41′ E.), on Upa; manufactures rifles. Pop. (1910) 133,700.

TULARE LAKE, see CALIFORNIA.

TULCEA, TULTCHA (45° 12′ N., 28° 48′ E.), town, on arm of Danube, Dobrudja, Rumania. Pop. (1910) 21,411.

TULIP (*Tulipa*), a genus of Liliaceæ extensively cultivated in gardens, especially in Holland, where, at one period, fabulous sums were spent in its propagation. Some species are natives of Central Asia, and grow wild on the steppes. The cultivated form is usually grown from bulbs, and has a typical liliaceous flower of extremely variable colour. The fruit is a capsule, and the seeds, which are flattened, are only scattered by the agitation of the whole structure.

TULIP TREE (*Liriodendron tulipifera*), N. Amer. tree, order Magnoliaceæ; often over 100 ft. high; flowers are solitary and fragrant.

TULLAMORE (53° 17′ N., 7° 29′ W.), county town, King's County, Ireland.

TULLE (45° 16′ N., 1° 46′ E.) (Rom. *Tutela Lemovicum*), town, on Corrèze, capital, Corrèze, France; bp.'s see; manufactures firearms. Pop. 17,100.

TULLOCH, JOHN (1823-86), Scot. divine; moderator of Assembly of Church of Scotland, 1878; theologian of Liberal school.

TULSA (36° N., 96° W.), city, on Arkansas, capital, Tulsa County, Oklahoma, U.S.A.; coal, oil, and gas region; manufactures glass. Pop. (1910) 18,182.

TULSI DÁS (1532-1623), the greatest Hindu poet; noted also both in his own day and down to the present time as a deep religious thinker. His chief work is the poem *Rám-charit-mánas*, generally known as *Tulsi-Krit-Rámáyan*. So far as the Brahmins are concerned, at all events, it plays much the same rôle as the Bible in this country. It is universally quoted throughout India, and hundreds of his sayings have passed into the common speech of the people. It is based on the great Sanskrit epic of *Válmiki*, but differs greatly from it in treatment and in spirit. He produced eleven other works, most of which are fully extant.

TUMKUR (13° 17′ N., 77° 8′ E.), town, Mysore, India. Pop. 10,500; (district) 680,000.

TUMMEL (56° 42′ N., 3° 55′ W.), river, Perthshire, Scotland; joins the Tay.

TUMOUR, an abnormal swelling in the body, composed of new tissue and having no physiological function; it must be distinguished from increase in size due to simple hypertrophy, such as the heart undergoes to compensate for defective valves; from inflammatory swellings, due to a micro-organism (*e.g.* swollen tuberculous glands of the neck); and from cysts, swellings due to dilatation with fluid of a space already existing. It has been suggested that t's are the result of irritation or injury, and certain t's may follow such a condition, *e.g.* cancer of the tongue after constant irritation of a short clay pipe, but this certainly cannot be the cause in all cases; the theory of Connheim is that t's develop from embryonic cells or 'rests' within the tissues rendered active by some form of stimulus; another theory is that t. growth is due to a micro-organism which stimulates the cells of a tissue to abnormal proliferation.

T's may be classed, for convenience, under the headings of *innocent* and *malignant*; the former, having a local effect, are dangerous only because of the neighbourhood in which they grow, while the latter, in addition to their local effects, have serious results on the general condition of the affected person, and, unless efficient treatment is forthcoming, eventually cause his death. Innocent t's grow slowly; they are usually surrounded by a capsule of fibrous tissue from which they can be easily separated; and in structure they resemble the normal tissues of the body. Malignant t's, on the other hand, grow more rapidly, they possess no capsule and have an irregular margin more or less indefinitely marked off from the surrounding tissues, and in structure they differ from the normal tissues, being of a less highly developed and more embryonic nature. They have a tendency to invade the overlying tissues and thus ultimately to present an ulcerating surface; an affected person becomes sallow, wasted, and in a low condition of health.

Innocent t's may be further considered, according to the tissues in which they originate, as *connective-tissue t's* and *epithelial t's*. The former include the *lipoma*, a t. composed of fatty tissue, resembling the normal fatty tissues of the body, lobulated in structure, and most commonly situated about the shoulders, back, or buttocks. The *chondroma* is a t. composed of cartilage, firm and elastic, and found growing from bone; it may undergo calcification or ossification, or myxomatous degeneration, becoming soft and perhaps semiliquid, or it may develop a malignant tendency, being then classed as a *chondro-sarcoma*. The *osteoma* is a t. composed of bony tissue, and grows from the bones of the skeleton, being either of spongy or of compact bony tissue; it grows very slowly and does not usually cause any untoward symptoms; bony t's may also arise in the muscles, being ascribed to injury, *e.g.* ossification of the adductor longus muscle ('rider's bone'), caused by bruising of that muscle in

riding. The *odontoma* is a t. composed of one or more of the tissues taking part in the formation of the teeth, *e.g.* the enamel organ, developing in the early stages of the growth of a tooth. The *fibroma* is a t. composed of fibrous tissue, the fibres of which may be either loose in structure or arranged in close bundles, and t's of this type most frequently grow in the subcutaneous tissue or in the skin, particularly of the back and buttocks. The *myxoma* is a tumour composed of gelatinous, embryonic tissue, resembling the so-called 'Wharton's jelly' of the umbilical cord, and may be the degenerated condition of a t. of another kind; *e.g.* a chondroma may undergo myscomatous degeneration. The *angioma* is a t. composed of a dilated and tortuous blood vessel or blood vessels—capillary, venous, or arterial—or of a series of blood spaces developed usually from dilated capillaries; the most common situations of the angiomata are the skin and subcutaneous tissues, but the cavernous type may be situated in an internal organ. The *lymphangioma* is a t. consisting of a series of cavities and channels communicating with one another and filled with lymph, resulting from the dilatation of lymph channels; by further breaking down of the meshwork of channels, one or more cysts may be formed, the t. being then termed a cystic lymphangioma. The *myoma* is a t. composed of non-striped muscle fibres with a greater or less admixture of fibrous tissue, the most common situation being the uterus. The *neuroma* is a t. growing in nerves, the term being applied either to a t. growing from the fibrous nerve-sheath, from the connective tissue in the interior of the nerve, or it may be a plexiform arrangement of tortuous nerve cords. The *glioma* is a t. composed of neuroglia, the connective tissue of nervous structures, being found only in the central nervous system.

The innocent forms of epithelial t's include the *papilloma*, which is a projecting t. consisting of an outer covering of the epithelial cells of the skin or mucous membrane and an inner core supplied by blood-vessels; the ordinary *wart* is a common type of papilloma. The *adenoma* is a t. developing from a gland, *e.g.* the mammary gland or a salivary gland, and composed of glandular tissue with a greater or smaller admixture of fibrous tissue; the gland spaces of an adenoma may become greatly distended with fluid, the t. being then termed a cystic adenoma, examples of large size of this type being frequently found in connection with t's of the ovary.

Malignant t's may also be considered, according to the tissues in which they originate, as *connective-tissue t's* and *epithelial t's*. The term *sarcoma* is applied to t's of the former type, the structure of which is remarkable for the preponderance of the cellular over the intercellular elements, in which it resembles the structure of embryonic connective tissue. Sarcomata grow from any of the connective tissues, but are most commonly found growing from fascia, intermuscular tissue, periosteum, and skin. The blood vessels of sarcomata have no definite walls, being practically blood spaces among the cells, while such t's have no lymphatics. Parts of the t. may grow into the veins of the neighbourhood, and then, carried away to other parts of the body, become arrested in the smaller vessels again, and give rise to secondary growths. There are many different varieties of sarcomata, which may be classed according to the size and character of the cells, *small* and *large round-celled*, *small* and *large spindle-celled*, *mixed-celled*; a *lympho-sarcoma* has a structure like that of lymphatic tissue, and a *fibro-sarcoma* has a considerable admixture of fibrous tissue in it; *chondro-sarcoma*, *mysco-sarcoma*, *glio-sarcoma*, *osteo-sarcoma* are terms applied to sarcomata developing in innocent t's of those characters; *melanotic sarcoma* is the term applied to an extremely malignant type in which the cells are pigmented.

The term *carcinoma* (cancer) is applied to t's originating in epithelial tissue, and consisting of columns of cells, which originate from the proliferation of existing epithelial cells, varying with the character of the cells from which they arise, enclosed in alveolar spaces. Carcinomata are most commonly situated in the skin, in certain parts of the alimentary canal, in the breast, and in the uterus. In addition to invading the surrounding tissues, carcinomata have a tendency to give rise to secondary growths, usually in neighbouring lymphatic glands, to which infection is carried by the lymphatic vessels, while secondary growths may also arise in such organs as the liver, to which infection is carried by the blood stream. Of numerous varieties, the most important are *squamous epithelioma*, arising from the squamous epithelial cells of, for instance, the skin, or the mucous membranes of the mouth, lips, or gullet; *columnar epithelioma*, originating in the columnar epithelial cells of, for instance, the stomach and intestines; *glandular carcinoma*, originating in glands, *e.g.* the mammary gland, or the glands of the skin; *encephaloid* and *scirrhus carcinomata* are different types of glandular carcinoma, the former being soft, with large, scattered cells, the latter hard, with much fibrous tissue; *colloid carcinoma* is one which has undergone colloid degeneration; and *rodent carcinoma* arises from the sebaceous glands in the skin, and has a tendency to break down and ulcerate, being popularly termed 'rodent ulcer.' See CANCER.

TUN (33° 52′ N., 57° 27′ E.), town, Khorasan, Persia; produces cotton, opium. Pop. 8000.

TUNBRIDGE, see TONBRIDGE.

TUNBRIDGE WELLS (51° 8′ N., 0° 16′ E.), town, watering-place, Kent and Sussex, England; mineral springs; manufactures wooden (inlaid) wares; public school. Pop. (1911) 35,703.

TUNGABHADRA, TUMBUDRA (15° N., 76° E.), river, S. India; joins the Kistna.

TUNG-CHOW (39° 50′ N., 116° 40′ E.), city, on Peiho, Chi-li, China. Pop. *c.* 51,000.

TUNGSTEN (W=184·0), metallic element in chromium group; occurs in wolfram $(Fe,Mn)WO_4$; obtained by reduction of oxide with hydrogen or carbon; hard, grey; S.G. about 19; M.P. about 2800°; may be drawn into fine wire for metallic filament lamps. T. steel is used for cutting tools and magnets. Chief oxide: WO_3, forming *tungstates*.

TUNGUSES, Asiatic Ural-Altaic or Sibiric people, consisting of *northern Tungus* (on the Amur, and island of Saghalien), *southern Tungus*, *Golds* of the Amur, *Lamuts* of the Sea of Okhotsk, and *Manchus*.

TUNIC, term used of some kinds of short garment, and, ecclesiastically, of a Mass vestment.

TUNICATA, UROCHORDA (TUNICATES, ASCIDIANS, or SEA SQUIRTS), sessile, vegetative-looking, marine animals mostly to be found immovably fixed to rocks or weeds in shallow water; the majority are sac-shaped, although some colonial forms spread in a layer over the substratum, and all are characterised by the presence of a semitransparent, insensible test or tunic (hence 'Tunicate'), which covers the whole body and is composed of a material similar to the cellulose of plants. To look at the adult creatures one can scarcely believe that their development resembles that of the Lancelet (*Amphioxus*), and that they are lowly Chordate animals, but these truths the larva reveals.

An adult Sea Squirt of the simple fixed form has been compared to a leather bottle with two openings. At one of these, the mouth, or inhalent aperture, water enters, bearing with it its hordes of microscopic inhabitants. The water itself passes into and out through innumerable slits in a large sac-like pharynx or branchial chamber, whose walls are traversed by blood spaces. Thus it purifies the blood as it passes to a collecting or atrial chamber and hence to the exterior through the second or exhalent aperture, from which it spurts with such force, when the creature is touched, as to justify the name of Sea Squirt. But in the meantime the inhabitants of the water have been entangled in a mass of slime, swirled along a ciliated runnel within the pharynx, and hurried into the food

canal proper. So that the water which passes through the Sea Squirt serves at once as a respiratory agent and as a food provider. Apart from this complicated branchial and alimentary system, adult sessile Sea Squirts are simple animals. They have no eyes, sense organs, or limbs, the brain is represented by a single nerve ganglion between the two apertures, and the 'heart' is a mere dilated tube interesting only on account of its reversible action, for it drives the blood upwards for a period, then downwards, then upwards again, and so on. All sexual Tunicates are hermaphrodite.

Sea Squirts were not at all stages of life so simple as the adult form. The eggs are probably fertilised within the body, and passing out soon develop into a tadpole-like larva, which, besides possessing in rudiment the organs of its parent, has a strong swimming tail, a median eye and balancing otocyst, a brain and dorsal nerve cord, and a notochord which supports the tail. The two last structures in particular point to the relationship between Tunicates and Vertebrates. Only for a few hours, however, does the larva flaunt its pedigree: it gives up swimming and ordinarily fixes itself to rock or seaweed, soon to degenerate into an immobile Sea Squirt.

It must not be understood that all Tunicates are sessile when adult, for a comparatively small number of free-swimming forms exist, to be now mentioned below in a note on classification.

The Phylum TUNICATA or UROCHORDA (Gr. *oura*, tail; signifying the possession of a notochord in the tail) falls into three Orders, some of which are subdivided:—

Order I. ASCIDIACEA, solitary or colonial, fixed or free-swimming Tunicates, with neither tail nor notochord in adult, and with inhalent and exhalent apertures usually approaching each other.

Sub-Order I. MONASCIDIA or ASCIDIÆ SIMPLICES, solitary forms, which may be sessile (*Ascidia, Ciona*), stalked (*Boltenia*), or free (*Molgula*).

Sub-Order II. SYNASCIDIA or ASCIDIÆ COMPOSITÆ, fixed forms fused into colonies, which are encrusting (*Botryllus*) or stalked (*Colella*).

Sub-Order III. ASCIDIÆ LUCIÆ or ASCIDIÆ SALPÆFORMES, free-swimming, open-sea forms, in thimble-shaped colonies; strongly phosphorescent, e.g. *Pyrosoma*.

Order II. THALIACEA, solitary or social free-swimming Tunicates, with neither tail nor notochord in adult, and with inhalent and exhalent apertures at opposite ends of body. They have transparent tunics, are roughly barrel-shaped, with internal muscles girdling them like hoops, and have alternate sexual and asexual phases in their life histories, e.g. *Salpa, Doliolum*.

Order III. APPENDICULARIÆ, LARVACEA, or PERENNICHORDATA, minute, solitary, free-swimming forms, with tail and notochord in adult. They secrete gelatinous 'houses' which filter their microscopic food from the waters, e.g. *Appendicularia, Oikopleura*.

TUNIS (36° 50′ N., 10° 10′ E.), chief town, Tunisia, N. Africa; connected with sea by canal; encircled by walls; has an old citadel and is defended by several forts; seat of Muhammadan Univ.; contains Bey's palace and fine mosques; important trading centre; manufactures silk and woollen textiles, pottery, leather; exports olive oil, cereals, cattle and hides, ores, dates, morocco, fezes, gems, etc. Originally founded by Carthaginians; subsequently held in turn by Romans, Vandals, Byzantines, Arabs, Turks, and native rulers; taken by French in 1881. Pop. *c.* 170,000.

TUNISIA, LA TUNISIE (35° N., 9° E.), Fr. protectorate, North Africa; bounded N. by Mediterranean, W. by Algeria, S. by Sahara, E. by Tripoli and Mediterranean; length, *c.* 440 miles; breadth, 150 miles; area, *c.* 50,000 sq. miles; coastline over 500 miles, with several excellent harbours. Largest indentations are Gulfs of Hammamet and Gabes (E.), Bay of Tunis (N.). Cape Blanco (Ras-el-Abiad), in N., is most northerly point of African Continent. T. consists of four regions: (1) Tell, mountainous region N. of Majerda River; (2) Sahel, eastern coast region between Cape Bon and Tripoli; (3) central tableland (average elevation *c.* 2000 ft.); (4) Sahara in S., containing famous dried-up salt lakes (largest, Shott Kebir); country around the lakes is known as Belad-el-Geriad (land of dates). Surface generally is mountainous; ranges in N. and N.W. are continuations of Atlas Mountains of Algeria; highest peak in central plateau, Mount Sidi Ali bu Musine (*c.* 5700 ft.); Zaghuan (*c.* 4000 ft.). Flora and fauna are akin to Algeria. Soil is fertile and well watered in N.; large forests (chiefly cork-oak) and beautiful wild flowers; steppe-like vegetation in central region; many fine oases. Climate is hot, but healthy; annual temperature from 60° to 90° F.; rainfall from 10 to 50 in., heaviest in N. The only important perennial river is the Majerda. Principal towns are Tunis (capital), Sfax, Bizerta (large military port), Kairwan, Susa, Porto Farina.

Earliest history of T. coincides with that of Carthage (*q.v.*), which lay not far from Tunis. After the Punic Wars T. formed Rom. province *Africa* (native name is still *Ifrigiyah*); successively under Vandals, V. cent., Byzantine Empire, VI. cent., Saracens, VII. cent.; unsuccessfully attacked by Louis IX., 1270; independent state, XIV.–XVI. cent's; taken by Charles V., 1535; recovered by Turks, 1575. T. was long a stronghold of Corsairs (crushed by Blake, 1655). Beys owed allegiance to Sultan of Turkey, XVII. and XVIII. cent's; Husseim dynasty (still ruling), established 1705; Tunisian incursions into Algeria led to Fr. occupation, protectorate being proclaimed, 1881; now governed by Resident General under Fr. Foreign Office. Interesting Rom. remains survive at Dugga Ferina, Sbreitla, Gafsa, El Djem, etc.

Muhammadans predominate, then R.C's. There are public and private schools, several lycées and colleges, and a Muhammadan univ. at Tunis. Chief industry is agriculture; principal products and exports, cereals, olives, dates, wines, esparto grass, henna, cork, fruits, tobacco; manufactures of Morocco leather, pottery, carpets, rugs, and woollen fabrics; extensive fisheries (tunny, sardines, sponges); copper, lead, zinc mined; valuable phosphates; numerous hot springs. Pop. consists mainly of Bedouin Arabs, Kabyles, and Jews (65,000); European pop. *c.* 120,000; Italians, 103,000; Fr. civilians, 39,000; Maltese, 12,000.

Loth, *La Tunisie* (1907); Vivian, *Tunisia and the Modern Barbary Pirates* (1899).

TUNKERS, GERMAN BRETHREN (*q.v.*).

TUNNEL.—Probably the earliest-known t's are those under the pyramids, but t's proper date from the advent of modern engineering. In railway construction the t. is resorted to where obstacles present too steep an incline to be climbed by ordinary locomotives, or under rivers which are too wide, or otherwise unsuitable for bridging. T's through soft strata have to be lined with brick or masonry. The t's through the Alps are triumphs of engineering, and are: Mont Cenis (France and Italy), 8 miles, cost £226 per yard; St. Gothard (Switzerland), 9¼ miles, £243; Simplon (Italy and Switzerland), 12¼ miles, £148; Arlberg (Tirol), 6½ miles, £108. Both the Mont Cenis and St. Gothard t's took eight years to complete; the Simplon (finished, 1905) is a double t.

The longest t's in Great Britain are railway t's. The *Severn* (completed, 1886), beneath the River Severn, is 7665 yards in length; a t. under the *Mersey* connects Birkenhead with Liverpool. In America the *Hoosac* t., penetrating the Cascade Range, is important. Projects have been on foot at various times for tunnelling the Eng. Channel and also the River Humber. The longest canal t. is that of the Leeds and Liverpool Canal at Marsden near Huddersfield (3 miles).

In boring a t. the engineers commence operations at opposite ends, and boring and drilling machines—operated by compressed air—are used. Blasting is resorted to if necessary. The ventilating of t's,

both during and after construction, is one of the most difficult problems. Under great cities, like London, where the traffic is often very congested, it has been found practicable to bore t's, or *Tubes*, in which electric trains carry passenger traffic. Natural t's are sometimes formed by underground rivers boring their way through rock and other strata.

TUNNY (*Thynnus*), fish of mackerel family; may weigh 1000 lbs.; chief source is Mediterranean.

TUNSTALL (53° 3′ N., 2° 13′ W.), town, Staffordshire, England; ironworks, collieries, potteries; incorporated (1910) with Stoke-on-Trent (*q.v.*).

TUPELO (*Nyssa*), genus of N. Amer. trees, order Cornaceæ; includes Large T. (*N. tomentosa*), which bears a fruit like olives.

TUPPER, SIR CHARLES, Bart. (1821–), Brit. colonial statesman; held various offices of state in Canada; Sec. of State, and Prime Minister of Canada, 1896.

TURACOS, Touracous, Louris, Plantain-Eaters (*Musophagidæ*), a family of Picarian Birds related to Cuckoos, and comprising 35 species confined to the forests of Africa, where they live solely on fruits. The bright red of their plumage is a copper compound which is said to wash out when the birds immerse themselves in water.

TURBELLARIAN WORMS (Leaf Worms, Planarian Worms, etc.).—These are flattened, leaf-like worms, often beautiful in colour, and often, like the 'living film' (*Leptoplana*), to be seen gliding over rock surfaces on Brit. shores, so thin and delicate as to seem a transparent film of jelly. They frequent exceedingly diverse habitations. Some live in the sea, where they feed on molluscs and sea-worms, and these are usually broad and leaf-like, and may reach a length of 6 in. (e.g. *Leptoplana* and *Thysanozoon*). They swim or creep with easy graceful motion controlled by well-developed muscles, and by the coat of short fine filaments (*cilia*) which covers their bodies. Smaller forms (Planarians, e.g. *Planaria* and *Polycelis*), only half an inch in length, but narrower than the marine species in proportion to their length, and more 'worm'-like, live in freshwater ponds and streams. They are commonly to be seen gliding on the leaves of water plants or on the under-surfaces of stones, feeding on earthworms, snails, water-beetles, and such like. Some long worm-like forms (Land Planarians, e.g. *Geodesmus* and *Bipalium*), up to a foot in length, are terrestrial, living in moist places, where they lie concealed during the day under leaves or loose vegetation, whence they issue at night in search of worms, wood-lice, or slaters, and such small organisms for food. The tints of Land Planarians are brighter, and their colour patterns more pronounced, than those of aquatic forms, but their movements are less graceful. Nevertheless, they progress with an easy wavy motion due to the propelling power of strong cilia fringing a groove on the under-surface of the body. Turbellaria are carnivorous, and disable their prey, often much larger than themselves, by peculiar offensive rod-like weapons (*rhabdites*), which are shot in abundance from the skin.

Turbellarians lack any special respiratory or excretory organs, and have at best simple sense organs and nervous system; but even these are further reduced in some forms which are parasitic in the Shore Crab, in various Molluscs, and in Sea Cucumbers (e.g. *Anoplodium* and *Graffilla*).

From other types of Flat Worms (Platyhelminthes) (*q.v.*) Turbellarians may be distinguished by their free-living habit and by their delicate soft bodies, which are coated with short active filaments or cilia, and are furnished with microscopic rod-like offensive weapons (*rhabdites*, and sometimes *nematocysts*) on the surface, and with a muscular protrusible pharynx.

Amongst themselves, Turbellaria fall into three orders: 1. Small marine and freshwater forms, with a straight or slightly branched food canal—*Rhabdocœlida*, e.g. *Convoluta paradoxa*, common on seaweed off Brit. coasts. 2. Marine, freshwater, or land 'Planarians,' with long, flattened body, and food canal having three main branches—*Tricladida*, e.g. *Planaria lactea*, found in Brit. streams and ponds, or *Bipalium kewense*, native in the forests of Samoa, but occurring as an introduction in Brit. hothouses. 3. Large, marine, leaf-like Planarians, with many branches from the food canal—*Polycladida*, e.g. *Leptoplana teremellaris*, common on Brit. shore rocks.

TURBET I HAIDARI (35° 20′ N., 59° 10′ E.), town, Khorasan, Persia; commercial centre. Pop. *c.* 35,000.

TURBINE, see Engine.

TURBO, a Mollusc, see under Gasteropoda.

TURBOT (*Rhombus maximus*), a flat-fish (*q.v.*) found chiefly in N. Sea; eggs are buoyant.

TURCOMANS, see Turks.

TURDIDÆ, Thrush Family (*q.v.*).

TURENNE, VICOMTE DE, Henri de la Tour d'Auvergne (1611–75), marshal of France (1644); b. at Sedan; gained several brilliant victories in Thirty Years War; sided with rebels of the Fronde, 1650; but on being restored to favour in 1651, assumed command against them and their Span. allies under Condé; practically ended Civil War in 1652, defeated Condé at *Arras*, 1654, and won *Battle of the Dunes* against the Spanish, 1657. In the Dutch War which broke out in 1672, he was left in command by Louis XIV.; failed to outmanœuvre Montecuculi in 1673, but won battle of *Sinzheim*, 1674; again opposed to Montecuculi in 1675, but was killed at beginning of engagement. A great strategist, T. reformed the Fr. army.

TURGAI (49° N., 61° E.), province, general-government of the Steppes, Asiatic Russia; formerly part of Kirghiz Steppes; extends from Sea of Aral and Syr-Darya on S., to Orenburg on N.; consists largely of arid steppes studded with lakes; chief occupation, live-stock rearing; population mostly Kirghiz. Pop. (1910) 617,200. Capital, Turgai.

TURGOT, Anne Robert Jacques, Baron de l'Aulne (1727–81), Fr. statesman and economist; b. Paris; intendant of Limoges, 1761–74; pub. *Réflexions sur la formation et la distribution des richesses*; became Minister of Marine and Comptroller-General, 1774; established free trade in corn, and quelled bread riots, 1775; attempted reforms in royal household; abolished *corvée* system of enforced labour, and put down *jurandes* or *maitrises* (trade corporations), revised government contracts, and attacked privileges of nobles. T.'s aim was to restore finances of government by taxing all classes. His reforms made him unpopular with nobles, whose privileges he attacked, with clergy, who disliked his toleration of Protestants, and with merchants, whose trade he injured. Dismissed in 1776, he spent rest of life in study; belonged to physiocratic school of economists; man of high integrity; failed to avert or postpone Fr. Revolution.

Stephens, *Life and Writings* (1895).

TURGUENIEV, IVAN (1818–83), Russ. novelist; b. Orel; ed. Moscow, St. Petersburg, Berlin; wrote excellent stories, *A Nest of Nobles*, *Fathers and Children*, *Virgin Soil*, etc.

TURIN, Torino (45° 3′ N., 7° 41′ E.), city, northern Italy; capital of T. province, in Piedmont (*q.v.*); near junction of Po and Doria Riparia; has churches of San Giovanni Battista (XV. cent.), San Filippo, La Consolata, Corpus Domini, Superga (royal mausoleum) · Madama, Carignano, and royal palaces; Pinacoteca (picture-gallery), museums, library, univ.; ancient capital of the Taurini; then Rom. colony *Augusta Taurinorum*; under house of Savoy (*q.v.*) from XI. cent.; here Prince Eugene defeated French, 1706; large industrial centre—silks, cottons, woollens, carpets, gloves, machinery, glass, paper, furniture, pianos, tobacco. Pop. (1911) 427,733; (province) 1,215,844.

TURKESTAN (*c.* 36° to 54° N., 53° to 102° E.), general name for an extensive tract of Central Asia stretching from Caspian Sea to Gobi Desert and from Siberia to Persia, Afghanistan, Kashmir, and Tibet;

naturally divided into Eastern and Western T. by Pamir.

Eastern T., also called CHINESE T., is bounded by Tianshan Mts., Pamir, Kuenlun Mts., Kansu, and Gobi Desert. Most of this district belonged to China in II. cent. B.C.; it was under control of Tibet in VIII. cent. A.D., and at a later date was partly held by Turks; conquered by Mongols under Jenghiz Khan, *c.* 1219; formed part of Tamerlane's empire in XIV. cent.; has belonged to China, with some short interruptions, since 1758. The area is *c.* 432,000 sq. miles. Much of surface occupied by Takla Makan Desert in W., to N. of which flows the Tarim, ending in Lob Nor, a large marsh or lake. In S.E. the Altyn-Tagh Mts. stretch between Takla-Makan Desert and Kansu. Besides Tarim, chief rivers are Khotan Darya, Cherchen Darya, Keriya Darya, Kashgar Darya in W. and S.W. There are three passes into Western T. and two into India, trade with India being chiefly by way of Karakoran Pass. Climate has great extremes of heat and cold. Cereals, fruits, vegetables, wool, silk, are produced and exported. Indigenous animals include the yak, camel, wild ass. Population, including Mongols, Tartars, Chinese, Arabs, *c.* 2,000,000.

Western T., also called RUSSIAN T., is bounded by Caspian, Siberia, Pamir, Afghanistan, Persia. This district was partially overrun by Mongols in XI. cent., and in XIV. cent. formed part of Tamerlane's empire; it was afterwards divided into a number of independent states. In the XIX. cent. it came by degrees under Russ. control. It includes Turgai, Akmolinsk, Semipolatinsk, Trans-Caspian Province, Bokhara, Khiva, and the provinces of Samarkand, Ferghana, Syr Darya, and Semiryechensk, which are officially known as the governor-generalship of T. Area is *c.* 1,300,000 sq. miles. Surface is mountainous in S. and E.; W. and N. largely composed of desert. Sea of Aral is in W. between Syr Darya, Turgai, and Trans-Caspia, and in the E. is Lake Balkash. Chief rivers are Amu Darya, Syr Darya, Zarafshan, Murghab. Climate is hot and dry. There is great mineral wealth —gold, silver, lead, copper, iron, coal, salt. Wild animals include bears, foxes, tigers. Inhabitants are Uzbegs, Russians, Turks, Mongols, Persians; religion, Muhammadanism. Pop. *c.* 9,000,000.

Curtis, *Turkestan* (1911); Skrine and Ross, *The Heart of Asia* (1899).

TURKESTAN, HAZRET (31° 30′ N., 69° 20′ E.), town, pilgrim resort, on Syr Darya, Russ. Turkestan. Pop. 11,900.

TURKEY, THE OTTOMAN EMPIRE, an empire partly in Europe, partly in Asia, and partly in Africa; area, *c.* 1,600,000 sq. miles.

European T. (see separate headings, ASIA MINOR, TRIPOLI, etc.) lies between 26° 6′ and 29° 20′ E. and 39° and 41° 50′ N., and is bounded N. and W. by Bulgaria, the boundary line starting from Enos, following the Maritza to Adrianople, leaving this on S. crosses to Kirk-Kilisse which it also includes, and then runs to Midia. It is impossible as yet to compute the area; but it can hardly be less than 6000 or more than 10,000 sq. miles; E. by the Black Sea and the Bosporus; S. by the Sea of Marmora, the Dardanelles, and the Ægean Sea. There is low ground in the E. along the Ægean, but elsewhere the surface is mountainous. The Maritza alone is of importance for irrigation and navigable for small boats as far as Adrianople. The climate in the higher and more exposed districts is one of extremes, but in sheltered parts of E. and S. delightful. The rainfall varies between 25 in. in the E. and 28 in the S.

History.—According to tradition SULIMAN and his hordes of Turk. nomads, under pressure of Mongols, moved W. from Khorassan to Armenia in the early XIII. cent. His son Ertoghrul (d. 1288) assisted the Seljuk sultan of Iconium against the Mongols and received territory in Bithynia. His son OTHMAN or OSMAN I. (1288–1326), from whom the name *Ottoman* is derived, established his independence, taking the title sultan (1299). Othman's son ORKHAN (1326–59) won N.W. Asia Minor as far as the Sea of Marmora, divided his territory into the administrative districts called *sanjaks*, organised a standing army, and in particular established the Janissaries ('new corps'),

one of the most famous fighting bodies in the world's history. The Turks had already become the militant leaders of the Muhammadan world in the Arab decline, and were more brutal and less tolerant than the Arabs had ever been.

MURAD or AMURATH I. (1359–89) made the first permanent encroachment of the Turks on Europe; he made Adrianople the capital of European T. (1361). BAJAZET I. (1389–1403) established his authority over the rest of Asia Minor, Walachia, etc., and defeated a vast Christian host at *Nicopolis* (1396), but was captured by Tamerlane at *Ancyra*. MUHAMMAD I. (1403–21) was succeeded by MURAD II. (1421–51), who forced the Byzantine emperor to increase his tribute, and won several victories over the Hungarian confederacy. MUHAMMAD II. (1451–81) captured Constantinople in 1453, thus putting an end to the Byzantine empire and establishing the Turks in command of the Bosphorus. Hungary and Servia made heroic resistance against further advance, but Greece fell 1456–60, and Otranto 1480. BAJAZET II. (1481–1512) was deposed and poisoned by the Janissaries in favour of his son SELIM I. (1512–20), who overran Persia (1514), Syria (1515), and Egypt (1516); after defeating the last Abbasid caliph at Cairo, Selim assumed the title of *caliph*, which has since descended with T., the sultans being henceforth leaders of the Faithful.

The state came to its apogee under his son SULIMAN II. (1520–66), *the Magnificent*. He took Belgrade, 1521, Rhodes, 1522, and after defeating the Hungarians at *Mohacs Field* (1526) made Hungary into a Turk. province under the rule of his nominee, while Austria was forced to pay tribute. The Most Christian King, Francis I., eagerly courted the alliance of Suliman. He was the last of a long series of great Turk. leaders, and the Turks, unless driven to bay, can do nothing without a leader; Turk. statesmen and generals of talent have ever since had to contend with a slothful, suspicious despot. Under SELIM II. (1566–74) the Turks for the last time alarmed Europe by conquering Cyprus (1571). In the same year the fleet was destroyed by Don John of Austria before *Lepanto*. Under MURAD III. (1574–95) and MUHAMMAD III. (1595–1603) the Turks were expelled from Persia. AHMED I. (1603–17) resigned much of Hungary to Austria. MUSTAFA I. (1617–18) was deposed, OSMAN II. (1618–22) murdered by the Janissaries.

MURAD IV. (1623–40) revived the glories of T., again capturing Bagdad (1638). IBRAHIM I. (1640–48) was murdered by the Janissaries. Under MUHAMMAD IV. (1648–87) Muhammad Köprili and his son Ahmed restored internal order, and, though suffering early defeats at the hands of Venetians and Austrians, subdued Crete (1669) and Podolia. Kara Mustafa's invasion of Austria ended with the signal Turk. defeat before *Vienna* (1683); the Venetian conquest of Greece and the overthrow of Turk. rule in Hungary followed. Muhammad was then deposed in favour of SULIMAN III. (1687–91). AHMED II. (1691–95) and MUSTAFA II. (1695–1703) were defeated by the Austrians, and the latter, after ceding Transylvania and Hungary to Austria and other territories to Venice, Russia, and Poland, was deposed by the Janissaries.

AHMED III. recovered the Morea and, from Russia, the Azof district, but lost Belgrade (1718). MAHMUD I. (1730–54) recovered at the Treaty of Belgrade, after fresh wars with Russia and Austria, Belgrade, Servia, and Walachia. OSMAN III. (1754–57) was succeeded by MUSTAFA III. (1757–73) under whom the Russians inflicted a severe defeat on the Turk. fleet, and invaded Moldavia and the Crimea. They advanced farther under Abdul Hamid I. (1773–89), and, despite the Treaty of Kuchuk Kainardji of 1774, annexed the Crimea in 1783 and in 1788 invaded Georgia. SELIM III. (1789–1807) lost further territory to Russia, was deposed by the Janissaries, and murdered by MUSTAFA IV. (1807–8), deposed in favour of his bro. MAHMUD II. (1808–39), who abolished the Janissaries in 1826, and carried out various reforms. A new Russ. war (1806–12) led to further circumscription of territory, and after the War of Gk. Independence (1828–29) Greece was lost, while troubles with Egypt (see MEHEMET ALI) began.

ABDUL MEJID (1839–61), however, succeeded in opening the eyes of the Powers to the importance of T. as standing in the way of Russ. progress S., and in return for their support made a show of internal reform. Thus she received aid in the CRIMEAN WAR, 1853–55, and by the Treaty of Paris (1856) was admitted into the European concert. Her internal condition, however, went from bad to worse, and more and more the Powers saw their interest in interfering. ABDUL ASIS (1861–76), a wasteful despot, allowed the pasha of Egypt to become khedive, and sought Russ. friendship, but was murdered by the war party. His nephew, MURAD V. (1876), was deposed in favour of his bro., ABDUL HAMID II., who defeated the Servians and Montenegrins.

As T. rejected the decisions of the Conference of Constantinople of 6 Great Powers, Russia proceeded to a new war (1877–78), which would have seriously diminished Turk. territory but for the intervention of Britain at the *Berlin Congress* of 1878. T. recovered Rumelia, but was obliged to allow Austria to occupy Bosnia and Herzegovina and Britain to occupy Cyprus. In 1882 T. permitted the occupation of Egypt by Britain, and in 1885 E. Rumelia was united to Bulgaria. The Armenian 'atrocities' of 1895–96 led to fresh intervention of the Powers. In 1897 the Greeks vainly invaded Macedonia and T. occupied Thessaly, but was compelled by the Powers to receive a war-indemnity in exchange. Further wars of liberation now commenced on behalf of alien nationalities within the Turk. rule (see BALKANS).

A constitution was granted in 1876, suspended in 1878, but Abdul Hamid was forced by the Turk. army to promulgate it anew in 1908. Bosnia and Herzegovina were definitely annexed by Austria in 1908, when Bulgaria finally broke away; the independence of the latter was recognised in 1909. A change of ministry in 1909 followed a short passage of civil war; after the restoration of order Abdul Hamid was deposed in favour of his bro., MUHAMMAD V. (1909). The 'Young Turk' movement has acquired great importance. On the whole, the new parliament is considered extremely capable, but hampered not only by the revolts of its provinces, but by the ill-will of the sultans.

In August 1912 a massacre at Kotchana drew from Bulgaria a strong protest, and at the same time Montenegro raised trouble by a territorial dispute. The Balkan States had formed themselves into a definite league and demanded that Turkey should carry out reforms in Macedonia. In spite of European diplomacy war broke out, Oct. 8, on the refusal of Turkey to accede to the Allies' demands. For details of the struggle, see TURKO-BALKAN WAR.

The collapse of Turk. troops led to serious riots in Constantinople at the beginning of 1913. Nizam Pasha was assassinated and a new government formed.

Literature.—Like the Persians, the Turks sing of wine and roses, and sometimes of the deeds of Persian heroes like Bahram, Rustum, and Jamshid. The XVI. cent. was the great age of Turk. lit. as of Turk. history; among famous poets of this time are FUZULI, BAKI, and LAMI. NEDIM and SHEIK GHALIB are foremost poets of the XVIII. cent. Modern authors are SHINASI, HAMID BEY, EKREM, and RIF'AT BEY.

The **Government** is by a hereditary, absolute sultan or *padishah*, who is also the head of the Muhammadan world; he is controlled, like the Shah of Persia (*q.v.*), by the laws of Muhammad and also by the Hatt-i-Sherif, codes of law compiled in 1839. In 1876 T. received a Constitution; a Parliament was established with Senate and House of Representatives, the Senate to be replenished by the Sultan from public servants. The Prime Minister is known as the Grand Vizier. The empire is divided into governments (*vilayets*) under

governors-general (*valis*), and subdivided into provinces (*sanjaks*) which are divided into districts (*kazas*).

Army and Navy.—Many districts of the empire are exempt, but in most military service is compulsory (on Christians also since 1909). The peace strength of the army is estimated at 375,000. T. has about 42,000 *gendarmerie*, of whom about 16,000 are mounted. The navy is partly raised by conscription; there are about 30,000 sailors under command, and about 9000 marines. The chief fortresses are Constantinople, Erzerum, Adrianople, Kirk-Kilisse, and Smyrna. The chief towns are Constantinople (the capital, pop. *c.* 1,200,000), Damascus (350,000), Smyrna (350,000), Aleppo (210,000), Bagdad (200,000), Beirût (150,000), Brûssa (110,000). The total mileage of RAILWAYS is *c.* 3000, of which about 1300 miles are in the European part. The properly made ROADS (*c.* 1000 miles) are utterly inadequate for the needs of the country.

Products and Industries.—The soil is fertile, but Turk. implements and methods are primitive, and the present output of wheat, maize, rice, rye, oats, barley, sesame, fruits (apple, pear, apricot, peach, orange, lemon, olive, fig, vine, chestnut, walnut, almond), oil-seed plants, millet, opium, mulberry, roses, tobacco, madder, and cotton, might be largely increased. The considerable mineral wealth is little developed. Chrome, silver-lead, zinc, manganese, antimony, copper, borax, meerschaum, coal, and lignite, are worked on a small scale; iron, emery, asphalt, quicksilver, arsenic, and sulphur are known to exist. There are important coast fisheries and a sponge fishery on the Mediterranean. There are hand-loom manufactures of carpets, light dress materials, coarse cloth, laces, and trimmings; leather, saddlery, and other leather goods; filigree, brass, and copper work; manufacture of tobacco, and spinning of silk, cotton, and wool. The exports are valued at over £13,000,000; Great Britain takes 40 %, France over 29, and Austria-Hungary over 9. The exports received by Great Britain are chiefly mohair, wool, wheat, oats, barley, maize, linseed, and other seeds, olive oil, tobacco, manganese and other ores. The mercantile marine has a tonnage of some 200,000.

MUHAMMADANISM is the religion of nearly all the inhabitants of Asiatic T. and of half the population of T. in Europe; in the latter district there is a large proportion of Christians (mostly Gk. Orthodox or Rom. Catholics or Armenians), and a large number of Jews. Attached to nearly every mosque is an elementary school of which there are 1780 in the empire; education is free and compulsory for boys from 6 to 11, for girls from 6 to 10. The univ., founded at Constantinople (1900), exists as yet on paper only. There are an ancient Gk. National School and an imperial Art School and Medical School. The population of the empire is estimated at 35,400,000, that of European T. at 6,130,000.

Creasy, *Hist. of the Ottoman Turks* (1882); Curtis, *The Turk and his Lost Provinces* (1903); Freeman, *The Ottoman Power in Europe* (1877), *History and Conquests of the Saracens* (3rd ed., 1877); Lane-Poole, *Turkey* (1889, 'Story of the Nations' Series); Macdonald, *Turkey and the Eastern Question*.

TURKEYS (*Meleagridæ*), family of game-birds, comprising five species, confined to the table-lands and cañons of N. and Central America. From one of these, *Meleagris gallopavo*, found wild in the highlands of Mexico and the southern Amer. States, the domesticated T. is descended.

TURKO-BALKAN WAR (1912–13).—In spite of the declaration of the Great Powers that they would agree to no change of the *status quo* in S.E. Europe, the allied Balkan States (Bulgaria, Servia, Greece, and Montenegro) took opportunity afforded by Turko-Italian war and issued mobilisation orders. The immediate reason was the refusal of Turks to punish perpetrators of Kotchana massacre (Aug. 1912) and proposal to hold Turkish manœuvres near Bulgarian frontier.

Montenegro precipitated matters by declaring war, Oct. 8. Turkey declared war against Bulgaria and Servia, Oct. 17. The same day Servia, and the next day Bulgaria and Greece, declared war. Six days later KIRK-KILISSE fell to the Bulgarians, and KUMANOVO and Novibazar to the Servians. USKUB, the chief Servian ojective, fell two days later (Oct. 26); Adrianople, the chief Bulgarian objective, was shut in and the Turkish Macedonian forces were in full flight before Servians and Greeks to Monastir and Salonika The Turks were defeated at LULE BURGAS on Nov. 1, and the bombardment of Adrianople began. SALONIKA was invested by Greeks on Nov. 5, and fell three days later. MONASTIR fell to Servia on Nov. 15.

Macedonia had been taken as well as the whole of Thrace except Adrianople and a fragment 25 miles square, and most of the Ægean Islands had been seized by the Greeks. If the Bulgarians had followed up their victories of Lule Burgas and CHORLU (Nov. 6), it is almost impossible that Constantinople, but 25 miles distant, could have held out. But the outbreak of cholera in the troops made the victors pause. The assault on the CHATALJA LINES began Nov. 17.

Overtures for peace had been in the air since the beginning of November, and a first meeting of peace envoys was held at Chatalja on Nov, 25, and on Dec. 3

an armistice was signed by Bulgaria, Servia, Montenegro, and Turkey—Greece refused. A conference of delegates from the warring states was opened at St. James's Palace, London, on Dec. 16, and the next day a conference of foreign ambassadors met at the Foreign office to discuss the problem of Albania. Owing to Turkey's refusal to cede Adrianople, the peace conference was suspended Jan. 6, peace negotiations between the Allies and Turkey were formally broken off Jan. 29, and hostilities were resumed Feb. 3.

Turkey appealed to the Powers March 1, Adrianople fell March 26, and Turkey unconditionally accepted the Powers' suggestions as a basis for concluding peace April 1. Bulgaria signed a truce with Turkey April 14, and the Powers' terms for mediation were conditionally accepted by the Allies April 21. SCUTARI surrendered to Montenegro April 22. The peace conference was reopened, and the Allies, under pressure from the Powers, signed the TREATY OF LONDON May 30.

War between Allies.—By the treaty between Bulgaria and Servia, concluded before the war, Bulgaria was to have the bulk of N. Macedonia, and Servia the Sanjak of Novibazar and N. Albania. Early in the war the Powers of the Triple Alliance set themselves against Servia having a port on the Adriatic, and Austria supported the scheme for an autonomous Albania. Servia was thus to lose a

great part of her share of the spoil, while Bulgaria had gained what she had not expected, Thrace. Servia asked Bulgaria for a revision of the terms of distribution, proposing (May 26) a conference for that purpose or submission of the questions at issue to the Triple Entente. Friction between the armies of the Greeks and Bulgarians and the Servians and Bulgarians had been in evidence for some time, and at times small bodies of the troops were involved in skirmishes. Rumania, which had preserved neutrality, became now another disturbing factor. Her demands for compensation were not fully agreed to by Bulgaria, and the Rumanian army mobilised July 4.

Throughout June minor skirmishes took place between the Allies. Bulgaria invaded Servia (July 7), but by July 10 she was so far defeated by the Greeks and Servians that she appealed to Russia to stop the war. The same day Rumania invaded Bulgaria, but the latter attempted no resistance. The Bulgarian frontier was crossed by Servia and Greece, and on July 16 Turkey crossed the Enos-Midia line (fixed by the Powers), reaching Lule Burgas, six days later re-occupied Adrianople, and invaded Bulgaria. The Allies met at Bukharest (July 30), and the Treaty of Bukharest was signed on August 10, redistributing the Balkan peninsula as shown in the map. Turkey, however, refused to relinquish Adrianople; Bulgaria appealed to the Powers on Aug. 17, but entered into negotiations with Turkey on Sept. 4, and the protocol leaving Adrianople and Kirk-Kilisse to Turkey was signed Sept. 27. Meanwhile the Albanians had invaded Servia, and the latter retaliated but was peremptorily ordered by Austria to evacuate Albania.

TURKS, a general term for Tatars, Turcomans, and Ottomans. The last named, under the rule of the Sultan, are the most important branch of Tatar origin and Muhammadan faith. The Turks had a powerful empire in Western Asia, including Persia and Syria in the XI. cent. Osman, or Othman, a Turkish chieftain, added to this territory in 1299. In 1355 the Turks invaded Europe, conquered Macedonia, Albania, and Servia, captured Adrianople and made it their capital. Constantinople fell in 1453, and has remained to this day the capital of the Ottoman Empire. Under Sultan Suliman I. (1502–56) the Ottomans reached the height of their power. Belgrade, the great bulwark of the West, was captured by Suliman, Hungary was invaded and Buda taken, Rhodes and the finest islands of the Archipelago were added to the Ottoman Empire. On the death of Suliman corruption set in, and the Turks began to lose ground. It was not till the latter years of the XIX. cent. that Rumania, Servia, Bulgaria, and Montenegro were released from Turkish rule and the Ottoman Empire in Europe reduced to very small dimensions. In Africa, Tunis and Algiers have gone to France, Italy has annexed Tripoli, and Great Britain has established its authority over Egypt. In Europe the people of Albania and Macedonia have now obtained freedom from Turkish rule. While the Turks themselves are industrious, sober, and brave, the rule of the Sultans has everywhere been destructive of decency and civilisation, and corrupt and cruel. The Turks do not change. Never has Turkish conquest been followed by an improvement in social life, but always by barbaric massacre and general misery. For the last 300 years Europe has been slowly driving back the Turkish invaders.

TURK'S AND CAICOS ISLANDS (21° 26′ N., 71° 10′ W.), group, in Bahamas, Brit. W. Indies; salt. Pop. (1911) 5656.

TURMERIC, yellow dye obtained from dried and ground rhizome of *Curcuma longa* (*Zingiberaceæ*).

TURNER, JOSEPH MALLORD WILLIAM (1775–1851), most distinguished of English landscape painters; at first studied architecture, but became a pupil of the Royal Academy, and began exhibiting when only 15. By the age of 21 he had fully established himself as an artist; at 24 was elected Associate of the Royal Academy; at 28, Academician; at 33, professor of Perspective. His life remained somewhat obscure: his manners were eccentric; he was miserly to a degree, and when he died it was in a lodging at Chelsea under an assumed name. He travelled a good deal, both at home and abroad, generally in a furtive way; and altogether, as a man, had very little that was attractive in his character. As a landscape painter, he shares the foremost position with Claude and Corot. Ruskin, who greatly increased his reputation among the reading public, described him as 'the greatest painter of all time,' but that is an exaggeration. His knowledge of nature was certainly unrivalled, but though his water-colours are superb for delicacy and brilliant execution, his oils are not technically supreme. The main characteristic of all his work is an idealising of things, an overmastering faculty of realising the beautiful, the mysterious, and the sublime, in greater measure than they really exist. Hence his pictures, beautiful as they are, cannot be depended on for accuracy. He worked also in black and white, and as an etcher is well represented by the 71 plates of his *Liber Studiorum*.

Life, by P. G. Hamerton and by Cosmo Monkhouse.

TURNHOUT (51° 19′ N., 4° 57′ E.), town, Antwerp, Belgium; cloth. Pop. 24,000.

TURNIP (*Brassica campestris*), a biennial member of the Cruciferæ, which during its first year stores a reserve of food in the thickened tap-root, this being utilised during the following year for flowering.

TURNSTONES, see under PLOVER FAMILY.

TURNU MAGURELE (43° 40′ N., 24° 55′ E.), town, river port, on Aluta, Teleorman, Rumania; exports grain. Pop. 9000.

TURNU SEVERIN, TURNU SEVERNU (43° 44′ N., 24° 52′ E.), town, river port, on Danube, Rumania; shipbuilding-yards; Rom. antiquities. Pop. (1910) 20,506.

TURPENTINE, an essential oil or oleo-resin, occurring in stems of conifers; varieties: American (kind used in England), French (resembles American), Venetian (larch), Russian (used for making 'Sanitas' disinfectant), 'Canada balsam.' See also TERPENES.

TURPIN (d. 800 ?), abp. of Reims; long regarded as writer of *Historia Caroli Magni*.

TURPIN, DICK, see THEFT (HIGHWAYMEN).

TURQUOISE, TURKIS, TURQUEIS, gem stone of opaque greenish-blue colour; composed of phosphate of aluminium, iron oxide, and copper oxide; occurs in thin veins in slaty rock. *Oriental t.* is found only at Nish Apur, in Persia.

TURRETED-SHELLS, see under GASTEROPODA.

TURRIFF (57° 32′ N., 2° 27′ W.), town, Aberdeenshire, Scotland. Pop. of parish (1911) 4128.

TURRIS (40° 50′ N., 8° 30′ E.) (modern **PORTO TORRES**), ancient seaport town, Sardinia, on N. coast.

TURSHIZ (25° 10′ N., 58° 30′ E.), town, Khorasan, Persia. Pop. *c.* 22,000.

TURTLE, see under TORTOISES.

TURTON (53° 38′ N., 2° 24′ W.), town, Lancashire, England. Pop. (1911) 12,651.

TUSCALOOSA (33° 7′ N., 87° 39′ W.), city, capital, Tuscaloosa County, Alabama, U.S.A.; seat of Alabama Univ. (1831); coal, iron, and cotton. Pop. 8407.

TUSCANIA, TOSCANELLA (42° 40′ N., 11° 52′ E.), ancient town, Etruria, Italy.

TUSCANY, TOSCANA, W. central division of Italy, comprising eight provinces—Arezzo, Florence, Leghorn, Grosseto, Lucca, Massa-Carrara, Pisa, and Siena; Apennines to N. and E.; rivers Arno, Ombrone, Cecino, Serchio; area, 9287 sq. miles; principal towns, Florence, Siena, Pisa, Leghorn, Pistoja, Perugia, Lucca (*qq.v.*). In ancient times T. formed part of ETRURIA (*q.v.*); province of *Tuscia* under later empire, then Frankish county; divided up into separate city-states, 1115; Pisa first predominant, then Florence; Cosimo de Medici made Grand-Duke of T., 1569; T. conferred (1737) by Emperor of Austria on Francis of Lorraine (afterwards Francis I. of Austria); made appanage of second sons of Austrian emperor, 1763; republic, then kingdom of *Etruria*, created under

Louis de Bourbon, 1803; Austrian line restored, 1814; annexed to Italy, 1859; cradle of Ital. language and lit. Chief products are maize, wheat, wine, oil, chestnuts; rich in copper, lead, iron ore, mercury, marble, salt, lignite, Sienese earth; mineral and hot springs.

TUSCULUM (near modern Frascati) (41° 48′ N., 12° 44′ E.), ancient city, in Alban Mountains, Latium; said to have been founded by Telegonus, s. of Ulysses; on defeat of its chief, Mamilius (497 B.C.), became an ally of Rome; favourite residence of wealthy Romans (Cicero among others); birthplace of Cato; destroyed by Rome, 1191; has remains of Rom. amphitheatre.

TUSKEGEE (32° 25′ N., 85° 40′ W.), town, capital, Macon County, Alabama, U.S.A.; contains T. Normal and Industrial Institute (founded for the free industrial education of negroes; besides mechanical industries, agriculture, fruit-farming, and baking are taught; and there are some 1500 students in day and night schools, over 300 being women) and Alabama Conference Female College (Methodist-Episcopal). Pop. (1910) 2803.

TUSSAUD, MADAME, MARIE GROSHOLTZ (1760–1850), foundress of famous WAX-work, Baker Street, London.

TUSSER, THOMAS (*c.* 1515–80), Eng. versifier; wrote *Five Hundred Points of Good Husbandrie.*

TUSSILAGO, see COLT'S-FOOT.

TUTBURY (52° 52′ N., 1° 42′ W.), town, Staffordshire, England; manufactures glass; its ruined castle was twice the prison of Mary, Queen of Scots.

TUTICORIN (8° 48′ N., 78° 11′ E.), seaport, on Gulf of Manaar, Madras, Brit. India. Pop. 30,000.

TUTTLINGEN (47° 59′ N., 8° 49′ E.), town, on Danube, Württemberg; manufactures shoes; scene of defeat of French by Austrians and Bavarians, 1643. Pop. (1910) 15,862.

TUXEDO PARK (41° 15′ N., 74° 15′ W.), fashionable settlement, Orange County, New York, U.S.A.

TUY (42° 5′ N., 8° 35′ W.), city, on Miño, Pontevedra, Spain; cathedral; manufactures leather, liqueurs. Pop. 11,500.

TVER, government of European Russia; area, 24,975 sq. miles. Pop. (1910) 2,177,200. Its capital, **Tver** (pop. 60,900), manufactures cottons, woollens, and hardware.

TWAIN, MARK, pseudonym of S. L. CLEMENS (1835–1910), Amer. author; b. Florida, Missouri. His first important work was *The Innocents Abroad,* a description of a voyage to the Mediterranean ports. This was followed by numerous other volumes descriptive of Amer. life and full of Amer. humour.

TWEED (55° 47′ N., 2° W.), river, Scotland; rises in Peeblesshire, passes Abbotsford, Melrose, Dryburgh, etc.,—the land of Scott,—and enters Ger. Ocean at Berwick; length, 97 miles; tributaries, Gala, Ettrick, Leader, Teviot, Till, Whiteadder; salmon fisheries.

TWEED, WILLIAM MARCZ (1823–78), Amer. politician of the most corrupt type; first Tammany boss.

TWEEDDALE, MARQUESSATE OF, title held by HAY family since 1694, when William of Orange cr. 1st marquess; 2nd marquess, prominent in Scots politics; 4th, Sec. of State for Scotland; 8th, fought in Peninsular War.

TWELFTH DAY, see EPIPHANY, FEAST OF.

TWELVE TABLES, see ROME (LAW).

TWICKENHAM (51° 27′ N., 0° 20′ W.), residential town, on Thames, Middlesex, England; associated with Pope, Horace Walpole, and other celebrities; its manor is a Crown possession. Pop. (1911) 29,374.

TWILIGHT is due to reflection of sunlight from vapours, etc., in higher regions of atmosphere. In low latitudes there is little t.

TWILL, a woven cloth in double thread, giving appearance of diagonal ridges or ribs on the surface.

TWISS, SIR TRAVERS (1809–97), Eng. lawyer; draughted constitution of Congo Free State (1884); wrote valuable works on international law.

TYBURN, Eng. stream which once flowed to the Thames at Westminster; T. gallows stood near the present Marble Arch.

TYCHO'S STAR, see CASSIOPEIA.

TYLDESLEY WITH SHAKERLEY (53° 31′ N., 2° 28′ W.), town, Lancashire, England; cotton mills; collieries. Pop. (1911) 15,582.

TYLER (32° 20′ N., 95° 10′ W.), city, capital, Smith County, Texas, U.S.A.; cotton industries. Pop. (1910) 10,400.

TYLER, JOHN (1790–1862), 10th Pres., U.S.A.; b. Greenway, Virginia; originally Democratic, afterwards joined Whigs; Vice-Pres., 1841; Pres., 1841; vetoed National Bank Bill, 1841, causing cabinet to resign. Annexation of Texas occurred during his administration. T. was pres. of Peace Convention at Washington, 1861; sided with South in Civil War, and was member of Confederate Congress, 1861, till death.

TYLER, WAT (d. 1381), leader in Eng. rising of 1381; marched with insurgents to Smithfield, was met by Richard II., and demanded abolition of serfdom and free pardon for the rebels; slain by lord mayor.

TYLOPODA, a group of Even-Toed (*Artiodactyle*) Ungulates, comprising *Camelidæ* or CAMEL FAMILY.

TYMPANIC MEMBRANE, see EAR.

TYNDALE, WILLIAM (1492–1536), Eng. Prot. divine; translator of New Testament into English; persecuted and obliged to flee abroad; captured near Brussels and executed. His version formed the basis for subsequent work. See BIBLE, THE ENGLISH.

TYNDALL, JOHN (1820–93), Irish physicist; commenced life in Irish Ordnance Survey; master at Queenwood Coll., Hampshire; took his doctorate at Marburg Univ.; became prof. (1854) and director (1867) of Royal Institution; most lasting work was done in Heat; wrote *Heat as a Mode of Motion* (1863), pres. Brit. Association, 1874; friend of Huxley from 1850; had extraordinary power of popularising physics, and lectured much.

TYNDARIS (38° N., 15° E.), ancient city, Sicily, on N. coast; founded, 396 B.C.

TYNE (55° 1′ N., 1° 26′ W.), river, England; flows E. to North Sea at Tynemouth; length, 80 miles.

TYNEMOUTH (55° 1′ N., 1° 26′ W.), seaport, watering-place, at mouth of Tyne, Northumberland, England; contains ruins of a VII.-cent. priory and a castle (XI. cent.); shipbuilding; fisheries; manufactures ropes and sails. Pop. (1911) 58,822.

TYPE, see PRINTING (LETTERPRESS PRINTING).

TYPEMETAL, see ANTIMONY.

TYPEWRITER, writing-machine producing characters similar to printing. In 1714 Brit. patent was granted Miller; in America to Burt, 1829. In 1875 Sholes & Glidden brought out first practical machine, which was manufactured by Remington & Sons, gunsmiths, of New York. T. consists of keyboard, and pressure of keys causes corresponding types (carried at end of levers) to strike paper. Types are inked by pad, or more often strike inked ribbon, pressing it against the paper. The Elliott-Fisher machine is unique, for it writes in a book or ledger.

TYPHLOPIDÆ, a family of SNAKES (*q.v.*).

TYPHOID FEVER, ENTERIC, a specific infectious fever, characterised by an eruption on the skin, swelling of the spleen and lymph glands of the abdomen, and particularly by lesions in the intestine. The disease is caused by *Bacillus typhosus,* a short, thick rod, with rounded ends and numerous flagella, infection being most usually conveyed by water which has been contaminated by sewage, as the bacillus is present in the fæces of affected persons. Milk and shell-fish are other common carriers of infection. The incubation period of the disease is about 12–14 days, and the onset is gradual, the first symptoms being headache, shiverings, a feeling of tiredness and of abdominal discomfort, and, later, a gradual rise of temperature accompanied by diarrhœa. By the end of a week the temperature is high, the pulse is weak and rapid, the abdomen is distended, there may be diarrhœa or constipation, and the spleen and abdominal lymphatic glands are enlarged.

The rash appears on the 7th day in the form of

rose-coloured spots on the trunk, coming out in successive crops. By the 2nd and 3rd week the symptoms are more pronounced, the patient is flushed, wasted, the vitality feeble, there is severe diarrhœa, and there may be delirium. In the intestine there is at first inflammation of the lymphatic patches and follioles, then necrosis, and sloughing of the parts, leaving ulcers which eventually heal. At the end of 3 weeks, however, the temperature begins to go down, becoming normal in a week, and the other symptoms lessen in severity. Relapses, due to new infections of the intestine, and sometimes 2 or 3 in number, may occur. Hæmorrhage in the intestine is the most common and most serious complication, usually occurring about the 3rd or 4th week, when sloughs are coming away, and it may be so severe as to cause death immediately; perforation, followed by peritonitis, is another very serious complication, usually ending fatally; pneumonia, bronchitis, and thrombosis also frequently complicate the disease.

One of the most important aids to the diagnosis is *Widal's reaction*, the inoculating of diluted blood serum obtained from the patient with a typhoid bacillus culture, and if clumping or 'agglutination' of the bacilli takes place when a drop of the fluid is examined under the microscope, the case is one of t. f. The dilution of the serum must be at least 1 in 40.

The treatment consists of isolation, complete confinement to bed, liquid, nourishing food, with plenty of water to drink, and stimulants may be necessary. Opium is given with lead acetate for intestinal hæmorrhage and for severe diarrhœa, and severe constipation is treated with enemata, purgatives being harmful. Cooling baths or, when baths are impossible, ice-packs are employed to relieve high temperatures. The period of isolation is 4 weeks. In regard to preventive measures, a vaccine has been prepared from killed typhoid bacilli, inoculation by which diminishes susceptibility to disease, and experiments are being carried out, with considerable success, with an anti-typhoid serum. The urine and fæces of a person who is convalescent from typhoid fever must be carefully disinfected by a 1 in 20 solution of carbolic acid for some weeks after the period of isolation is over, as a preventive measure, as the bacillus may be present for some time in the excreta.

TYPHON, see EGYPT (RELIGION).

TYPHOON, see CYCLONE.

TYPHUS FEVER, a specific infectious fever, characterised by an eruption on the skin and nervous prostration, caused by a micro-organism which has not yet been discovered, infection being conveyed by contact with affected persons, and, it is believed, by fleas and similar parasites, while filth and unhealthy conditions are predisposing causes. The incubation period is about 12 days, and an attack comes on suddenly, with headache, pains in the back, shiverings, prostration, often vomiting and constipation. The temperature rises sharply, and the characteristic 'mulberry' rash appears about the 5th day, chiefly on the back of the trunk and limbs, and minute hæmorrhages develop at the spots. The pulse becomes weaker and more rapid, and by the 2nd week there is delirium, while prostration is intense. About the 14th day, however, the temperature usually falls by crisis, the pulse becomes stronger and slower, the patient perspires, sleeps easily, and generally improves. Serious complications may arise, *e.g.* pneumonia, pleurisy, thrombosis, or paralysis.

The treatment consists of isolation, careful and constant nursing, and the administration of nourishing fluid foods. Stimulants are usually required at one stage or another, ice is applied for headache and delirium, and complications are treated as they arise. The period of isolation is 5 weeks.

TYPOGRAPHY, see under PRINTING.

TYRANNUS, KING BIRD (*q.v.*).

TYRAS (46° 12′ N., 30° 20′ E.) (modern AKKERMAN), a Milesian colony, near mouth of Tyras (Dniester).

TYRCONNELL, ancient kingdom of Ireland, corresponding generally to the modern Donegal (*q.v.*).

TYRCONNELL, RICHARD TALBOT, EARL OF (1630–91), Irish Jacobite; representative of Roman Catholics in Ireland; became viceroy, 1678.

TYRE, TIRE, outer rim of wheel; iron band shrunk on a cart-wheel; steel rim of railway carriage wheels. Term usually applied to **pneumatic t.** of cycles and motor-cars; a tube containing compressed air forms a cushion on uneven road surfaces. The outer cover is made of woven canvas coated with para rubber; the inner tube is fitted with a valve which allows air, forced in by a hand- or foot-pump, to enter but not to escape. Outer covers have various devices—ribs, steel or rubber studs, chains, etc.—to prevent skidding.

The first cycle t's were thin and 'solid'; later 'cushion' t's were thick tubes of small bore.

A PUNCTURE is a hole made by glass, etc., in a pneumatic t. It is repaired by cementing a piece of rubber sheeting on the inner tube by a solution of india-rubber in naphtha or bisulphide of carbon. Motor-car t's are best repaired by vulcanising (see RUBBER), as friction with the road tends to loosen cemented patches.

TYRE (33° 17′ N., 35° 17′ E.) (modern SUR), ancient city, on coast of Phœnicia; one of the most flourishing maritime cities of ancient times; famous in Biblical history; fell to Alexander after a siege in 332 B.C.; occupied by the Crusaders, 1124–1291; finally destroyed by the Turks.

TYREE (56° 30′ N., 6° 56′ W.), island, Inner Hebrides, Argyllshire, Scotland; length, 12 miles; greatest breadth, 6 miles.

TYRNAU, see NAGY-SZOMBAT.

TYROL, TIROL (46° 50′ N., 7° 20′ E.), crown-land, Austria, between Bavaria, Salzburg, Carinthia, Italy, Switzerland, Vorarlberg; area, 10,300 sq. miles; magnificent Alpine scenery (Oezthaler, Zillerthal, Dolomites, and other chains), with perpetual glaciers; highest peak, Ortler, 12,800 ft.; immense forests; metal industries, cotton, silks, leather, wine, fruit, salines, sulphur, etc.; capital, Innsbruck; Trent and Bozen also on Brenner-pass route; chief rivers, Inn, Drave, Adige; health and sporting resort. T. was originally part of Rhætia; taken by Romans, 15 B.C.; passed to Austria, 1363; famous rising of Hofer (*q.v.*), 1809; reunited to Austria, 1815. Pop. (1910) 946,613.

TYRONE.—(1) (54° 37′ N., 7° 15′ W.) inland county, Ulster, Ireland; surface mostly hilly, rising into mountains in N. and S.; fertile and well-cultivated in low-lying districts; watered by branches of Foyle and Blackwater; chief pursuits, agriculture and cattle-rearing; linens and coarse woollens manufactured. Pop. (1911) 142,437. Capital, Omagh. (2) (40° 40′ N., 78° 14′ W.) town, on Little Juniata, Pennsylvania, U.S.A.; shipping station for an agricultural and lumber region. Pop. (1910) 7176.

TYRONE, LORDS OF, see O'NEILL.

TYRRELL, GEORGE (1861–1909), Irish theologian, became R.C., 1879; entered Soc. of Jesus, 1880; sympathetic with modernism; expelled from order, and suspended, 1906; wrote *Mediævalism*, *Lex Orandi, Lex Credendi, Christianity at the Cross Roads*.

TYRTÆUS (VII. cent. B.C.), Gk. elegiac poet who inspired with his war songs the Spartans so that they defeated the Messenians.

TYRWHITT, THOMAS (1730–86), Eng. editor of *Chaucer* and classics (Aristotle's *Poetics*, etc.); refuted Chatterton's 'Rowley' poems.

TYTLER, WILLIAM (1711–92), Scot. historian; b. Edinburgh; pub. *Inquiry, Historical and Critical*. His s. Alexander (1747–1813) wrote *Outlines* or *Elements of General History*.

TYUMEN, TIUMEN (56° 55′ N., 60° E.), town, on Tura, Tobolsk, Siberia; terminus of a railway from Perm; manufactures leather, carpets; active trade. Pop. (1910) 34,400.

TZETZES, JOHN (XII. cent.), Byzantine writer of *Iliaca*, a poem, and *Chiliades*, a collection of legends.

U, 21st letter of alphabet; Greeks developed *upsilon* from Phœnician equivalent of *f*; Rom. alphabet took *v*, from which *u* came (cf. M.E. *haue* = have).

UBANJI (1° N., 19° E.), river, Africa; formed by union of Mbomu and Welle; joins Congo; length, 1500 miles.

ÚBEDA (37° 1′ N., 3° 27′ W.), town, Jaen, Spain; trade in wine, agricultural produce. Pop. (1910) 23,394.

UDAIPUR (24° 35′ N., 73° 43′ E.), native state, Rajputana, India. Pop. (1911) 1,276,472. Capital, **Udaipur**. Pop. 47,000.

UDAL, allodial tenure. See ALLODIUM.

UDAL, NICHOLAS (1504–56), Eng. playwright; b. Hampshire; ed. Oxford; was headmaster of Eton, then of Westminster. He is notable for one work, *Ralph Roister Doister*, a great advance on the Interlude, for the author has combined the Interlude tradition with classical correctness. The 'Vice' of the Interlude, the gull, the braggart, the witty maids are all there, and their fun is delightful. The play is elementary, the vehicle—rhymed doggerel—is poor, but in the history of drama *Ralph Roister Doister* is of high importance.

UDINE (46° 10′ N., 12° 50′ E.) (ancient *Vedinum* or *Utinum*), town, Italy; manufactures silks; formerly capital of Friuli. Pop. (1911) 17,626; (province) 628,330.

UELZEN (53° N., 10° 31′ E.), town, on Ilmenau, Hanover, Prussia; manufactures sugar, flax. Pop. 9500.

UFA (55° N., 56° E.), government, E. Russia; traversed in E. part by chains of the Urals; drained chiefly by the Byelaya; minerals include iron, copper, coal; excellent pastures; produces large crops of cereals. Pop. (1910) 2,890,700. Capital, **Ufa** (54° 46′ N., 56° 8′ E.), at junction of Ufa and Byelaya; manufactures iron. Pop. (1910) 66,430.

UGANDA (in Bantu, BUGANDA), Brit. protectorate in E. Africa; bounded N. by line of 5° N. lat.; E. by line through middle of Lake Rudolf, N. boundary of E. African Protectorate, to shore of Victoria Nyanza; S. by line of 1° S. lat.; W. by north line from Mt. Sabyino to Mt. Nkabwe, river Ishasha to Lake Edward, across lake to Margherita Peak, Lamia River to Semliki River, Semliki to Albert Nyanza, middle of Albert Nyanza to Mahagi, and thence to 5° N. lat. by Congo-Indian boundary. Captain Speke was first European to visit Buganda (1862); welcomed by King Mutesa. Stanley, also well received (1875), was invited to send missionaries. These came, 1877, 1879, but Mwanga, Mutesa's successor, becoming suspicious, Christian massacres took place in 1885. U. was assigned to Great Britain by Anglo-German treaty (1890), and protectorate proclaimed, 1894. Mwanga rebelled, 1877, but was soon put down, and mutiny of Sudanese troops in same year quelled after some months' fighting. Sir H. Johnston, sent as Commissioner, 1899, reorganised protectorate.

U. is divided into five provinces: (1) Kingdom of Buganda, on W. shores of Victoria Nyanza; (2) W. province, on W. boundary; (3) N. province, along W. to N. boundary; (4) Rudolf province, from N. boundary down E. to (5) E. province, lying E. of Buganda and N. province.

U. contains head-waters of Nile, interference with which might greatly injure irrigation of Egypt. Surface is plateau, over 3000 ft., with mountains in S. and W. rising to height of 14,000 to 20,000. N. is forested; climate mild; rainfall, 47 inches. The Governor administers justice, raises revenue, and controls native chiefs, who, however, govern their own subjects. Europeans are tried in Brit. courts; there is a High and an Appeal Court (of judges from neighbouring protectorates). Islands in Victoria Nyanza are home of sleeping-sickness, and are now abandoned.

Several steamers of Uganda railway (584 miles, completed, 1902, at cost of over £5,000,000) ply on lakes; mail service by runners is in vogue, and telephones and telegraphs are being extended. Iron, china-clay, and copper abound; cotton and coffee grow wild; rubber, gum-plants, cocoa, sugar, vanilla, tea, and grain are among industries. Chief exports (amounting in 1911–12 to £392,591) are ivory, timber, cattle, gum, and hides; imports (1911–12, £624,537), provisions, textiles, machinery.

Chief native stock is Bantu (about ⅘th of total); nearly half are intelligent Buganda, and there are Sudanese and Masai. In 1909 over 36,000 scholars were in Anglican and 11,000 in R.C. schools. Brit. capital is Entebbe; native, Kampala. Area, 171,681 sq. miles. Pop. (1911) 2,843,325 natives, with 500 Europeans.

Lugard, *Rise of our E. African Empire*; Johnston, *The Uganda Protectorate*.

UGLICH (57° 33′ N., 38° 23′ E.), town, on Upper Volga, Yaroslavl, Russia; cathedral (XIII. cent.); paper- and flour-mills. Pop. 9800.

UGOLINO DELLA GHERARDESCA (c. 1220–89), count of Donoratico; Pisan noble active for Guelph faction; placed by Dante among traitors in lowest circle of *Inferno*.

UHLAND, JOHANN LUDWIG (1787–1862), Ger. poet and politician; b. Tübingen; wrote excellent volkslieder and ballads; also lyrics, and *Life of Walther von der Vogelwaide, Der Minnesang*, etc.

UIST, NORTH AND SOUTH (57° 35′ N., 7° 20′ W.) (57° 15′ N., 7° 20′ W.), two islands, Outer Hebrides, Inverness-shire, Scotland. Pops. (1911) 3677; 5383.

UITENHAGE (33° 46′ S., 25° 27′ E.), town, Cape Colony; railway-works; wool-washing industry. Pop. (1911) 11,574.

UJIJI (4° 50′ S., 29° 40′ E.), town, on Lake Tanganyika, Ger. E. Africa; trading centre; here Stanley found Livingstone, Oct. 28, 1871. Pop. 15,000.

UJJAIN (23° 11′ N., 75° 52′ E.), town, native state Gwalior, India; exports opium; was capital of ancient Malwa. Pop. 43,000.

UKASE, an edict from Tsar or Senate of Russia (*q.v.*).

UKRAINE (49° 40′ N., 30° 20′ E.), region, formerly on frontier between Russia and Poland; now included in Russian governments Kiev, Podolia, Poltava, and Kharkov.

ULCER, term applied to an open sore formed by a gradual breaking down of tissue in skin or mucous membrane; chief varieties are *simple*, due to gradual death of the tissue cells through lack of nutrition, or to traumatism; *specific*, due to the action of a specific micro-organism, *e.g.* of tuberculosis or syphilis; *malignant*, due to the replacement of the skin or mucous membrane by a malignant growth, *e.g.* epithelioma.

Treatment consists of rest, cleansing of the u. with mild antiseptic lotions, *e.g.* boracic lotion, and the application of antiseptic dressings, the part affected being raised to aid the return of venous blood; in chronic ulcer the pressure exerted by an india-rubber bandage is very advantageous; in malignant u. operative treatment is, of course, necessary at once.

ULEÅBORG (Finnish OULU) (67° N., 27° 30′ E.), län of N. Finland, including part of Lapland; largely

forest-covered. Pop. (1910) 328,311. Capital, **Uleåborg** (64° 57′ N., 25° 42′ E.), on Gulf of Bothnia; trade in timber. Pop. (1910) 16,114.

ULFILAS (311–83) (Little Wolf), Arian bp., called apostle of the Goths; his mission to the Goths has been called the noblest side of Arianism, and U. is its greatest name. He came to Constantinople to support the Arians; translated Bible into Gothic — earliest Teutonic version, and portions, of greatest importance to Teutonic philology, survive.

ULLATHORNE, WILLIAM BERNARD (1806–89), R.C. bp. of Birmingham, 1850–88.

ULLESWATER, see LAKE DISTRICT.

ULLMANN, KARL (1796–1865), Prot. divine; prof. at Halle (1829), Heidelburg (1836).

ULM (48° 24′ N., 9° 59′ E.), city, Württemberg, Germany; first-class fortress; magnificent Gothic cathedral (1377–1494), famous spire, Neu Bau (containing government offices), town hall; cottons, woollens, leather, flour-milling, distilling; here General Mack, with 28,000 Austrians, surrendered to Napoleon, 1805. Pop. (1910) 56,019.

ULRICH, DUKE OF WÜRTTEMBERG (1487–1550), driven from Württemberg, 1519; his attempt to recover duchy, on outbreak of Peasants' War, failed, 1525; restored by aid of Hesse, 1534; promoted Reformation, destroying monasteries and seizing Church property.

ULSTER (54° 40′ N., 7° 20′ W.), province, in N. of Ireland; contains counties of Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone. Manufactures textiles and iron goods; bricks; shipbuilding and distilling are important. Pop. (1911) 1,587,572. U. as a whole is Protestant, and strenuously opposed to the Home Rule Bill, and threatens to resist by arms any attempt to enforce it. Her champion is Sir Edward Carson. See IRELAND, HISTORY.

ULSTER, EARLDOM OF, Irish honour, first held by Hugh de Lacy, 1205; successively held by De Burgh, Plantagenet, and Mortimer families, coming in 1425 to Richard, Duke of York, whose s. became Edward IV., 1461, since when held by royal family.

ULTIMATUM, final propositions presented by one side in an international dispute. If these are not accepted, diplomatic negotiations are broken off. Wars sometimes begin without formal submission and rejection of u.

ULTRAMARINE, a silicate of aluminium and sodium containing sulphur; is a blue pigment, natural form lapis lazuli; used for blueing clothes and paper.

ULTRAMONTANISM, school, party, tendency, and policy in R.C. Church, its existence as distinct from Catholicism being denied by Catholics as a whole. It is the inheritor of the mediæval opposition to secularism and is largely equivalent to the modern opposition to liberalism or 'modernism' of any kind. It really sums up the dominant tendencies in the R.C. Church and the policy of the Curia, is certainly opposed to secularism, rationalism, and nationalism, but tends to be a vague term flung at certain R.C. tendencies by those who do not agree with them. The formulation of the doctrine of Papal Infallibility at the Vatican Council of 1870 was certainly a triumph of U., and likewise later pronouncements against modernism.

Acton, Lord, *History of Freedom*.

ULVERSTON (54° 12′ N., 3° 5′ W.), town, on Morecambe Bay, Lancashire, England; ironworks; ships' iron, slates. Pop. (1911) 9552.

ULYSSES, see ODYSSEUS.

UMAN (48° 43′ N., 30° 20′ E.), town, Kiev, Russia; export trade in corn. Pop. (1910) 37,200.

UMARKOT (25° 21′ N., 69° 46′ E.), town, Thar and Parker, Sind, Brit. India. Pop. 5100.

UMBALLA, AMBALA (30° 21′ N., 76° 52′ E.), city, military station, Punjab, Brit. India. Pop. (1911) 18,131.

UMBELLIFERÆ, herbaceous dicotyledons, possessing stout, hollow stems, and sheathing, much divided leaves; inflorescence, cymose umbel, usually compound, though simple in *Astrantia*, *Bupleura*, and some others. Carrot, celery, caraway, and parsley are economically important.

UMBILICUS, see NAVEL.

UMBRELLA, used by women in Britain from XVII. cent.; first Englishman to use it habitually, Joseph Hancock, *c.* 1750; used by ancients; ceremonial significance in East.

UMBRIA, district in central Italy; ancient U. at one time embraced almost whole of central and N. Italy, but varied greatly in extent at different periods; was Sixth Region of Italy under Empire. Modern U., comprising province of Perugia, is bounded by Tuscany, Abruzzi, and Rome; capital, Perugia; region mountainous, but very fertile; contains many objects of artistic and architectural interest; until 1860 U. formed part of Papal States.

UMLAUT, word invented by Jacob Grimm (*q.v.*) to denote vowel change caused by the following vowel *i* (or *e*). *e.g.* Ger. *Mann* gives *Männlich*. In English the following vowel may have disappeared, cf. *Frank*, *French=Frankish*; man, men; fall, fell; mouse, mice.

UNALASKA, see ALEUTIAN ISLANDS.

UNAO (26° 32′ N., 80° 32′ E.), town, United Province, British India. Pop. 13,700.

UNCIAL, see PALÆOGRAPHY.

UNDERWRITER, see INSURANCE.

UNDULATORY THEORY, see LIGHT.

UNEMPLOYMENT.—Every fresh piece of labour-saving machinery invented necessitates at least temporary unemployment for displaced labour. Changes of fashion, and mistakes on the part of the employer causing loss of business are also regular causes. Some persons, through want of will, strength, or health, are permanently unemployable. Others dissatisfied with the conditions of labour are unemployed by choice. Legislation has been framed to mitigate the evil. The Insurance Act (1911) provides for u. in certain trades.

UNGAVA (56° N., 71° W.), unorganised territory, Canada, occupying N.W. side of Labrador peninsula.

UNGULATA, a great order of mammals comprising the HOOFED ANIMALS. Their main characteristic is the presence of hard blunt nails, or hoofs, encasing the toes, and fitting the animals especially for running. They include Hyrax, Elephants,—the PERISSODACTYLA,—Tapirs, Rhinoceroses, Horses,—the ARTIODACTYLA,—Pigs, and the RUMINANTS, all of which are discussed separately; but here we may mention an extinct group of gigantic forms—*Titanotherium* (*Brontotherium*) and its allies, which were apparently common in America in later Tertiary times. They were scarcely less than Elephants in size, and had a rhinoceros-like skull, with complex molar teeth (*brachydont*).

UNGULATE, see HORSE FAMILY.

UNGVAR (48° 38′ N., 22° 20′ E.), town, on Ung, Hungary; pottery, wine; health-resort. Pop. 15,200.

UNICORN, a fabulous animal mentioned by classical authors as existing in India and as having a long, single horn on the forehead. The animal was supposed to resemble the horse in build and swiftness, though the origin of the fable is probably the rhinoceros. James I. adopted the unicorn as the sinister supporter of royal arms at Union of the Crowns.

UNIFORMITY, ACT OF, see ENGLAND (HISTORY).

UNIFORMS.—Until the XVI. cent. soldiers were distinguished only by wearing the badges of their leaders. In 1707 the first *Clothing Regulations* for the Brit. army appeared. Scores of valuable works record the results of special study by artists of the professional dress of soldiers and sailors.

In 1742 an official *Representation of the Clothing of H.M. Household and of all the Forces upon the Establishments of Great Britain and Ireland* was issued. The typical military dress of the XVIII. cent. was a loose scarlet coat with skirts, looped up at the sides

to give freedom to the legs, a close-buttoned cloth waistcoat coming down to the thighs, breeches of red or blue nearly concealed by long white gaiters fastened at the knee by a black strap and reaching half-way up the thigh. The conical head-dress of cloth with brass insignia was replaced by a three-cornered hat. The coat was open at the collar and chest to display a white cravat and a shirt, and the cuffs were turned up to leave the wrists free; a broad buff belt hanging from left to right suspended a pouch, and a belt round the waist supported a bayonet and a small basket-hilted sword. The following dates mark important changes: 1800, a cylindrical shako with peak replaced the cocked hat; 1801, greatcoats issued; 1802, chevrons for N.C.O's introduced; 1808, queues dispensed with; 1811, trousers worn; 1833, narrow welt of red cloth placed down the outer seams of trousers; 1845, the Albert shako; 1855, tunic replaced coatee; 1871, glengarry forage cap; 1878, cork helmet replaced shako. In 1881 the distinctive facings for collars and cuffs of the tunic were abolished, and uniformity was gained by adopting white facings, except for 'royal' regiments, which retained blue facings.

In Trafalgar days the Brit. seamen wore pig-tails and the cocked hats of officers were often worn 'fore and aft.' Of the Fr. sailors of the period some were in blue jackets, white trousers, and red caps or straw hats, and of the Span. some wore brown and yellow jackets and caps. The dress of the Span. marines was light blue, with red cuffs and collars; the Fr. marines were dressed in dark, with red cuffs and collars and epaulettes. Both wore caps with brass plates denoting the number of the regiment.

The use of smokeless powder in South Africa, 1899–1902, caused the most violent change ever known in military costume, for smart uniforms (no longer screened by clouds of powder smoke) presented a favourable target. Hence the introduction of a 'service dress,' comfortable, durable, and invisible. As early as 1878 'Khaki' (dust-colour) clothing was adopted for service in Afghanistan.

The active service kit of the Brit. infantry soldier is as follows: *Ankle boots, *braces, water-bottle, *drawers, identity disc, helmet, jacket (service dress), *puttees, shirt, *trousers (service dress), waistcoat (cardigan), clasp knife. [Kilted rogiments substitute for articles marked *: Apron (kilt), gaiters (Highland), shoes (Highland), garters and rosettes, hose-tops.]

The haversack (weight 3 lb.) contains: (*a*) Rations; (*b*) knife, fork, and spoon. The pack (weight 12½ lb.) contains: Pay-book, mess tin and cover, cap (comforter), greatcoat, holdall (with razor, brushes, soap, etc.), housewife, socks, towel.

The French army is about to adopt a grey-blue cloth for greatcoat and tunic and kepi, but will retain the red trousers. Holland adopted 'grey-green' service dress for the manœuvres of 1913.

Ackermann's *Costumes of the Brit. and Ind. Armies, 1840–60*; Cannon's *Historical Records of the Brit. Army, 1834–53*; Spooner's *Costumes of the Brit. Army, 1840–44*, and *Military and Naval Uniforms, 1833–40*; Luard's *History of the Dress of the Brit. Soldier* (1852).

UNIO, Freshwater Mussel, see under LAMELLIBRANCHIATA.

UNION.—(1) (40° 45′ N., 74° 3′ W.) town, on Hudson River, Hudson County, New Jersey, U.S.A.; manufactures silk goods. Pop. (1910) 21,023. (2) (34° 43′ N., 81° 40′ W.) city, capital, Union County, S. Carolina, U.S.A.; cotton industries. Pop. (1910) 5623.

UNION JACK, see FLAG.

UNION LEAGUE OF AMERICA, THE, political organisation which existed 1862–70; caused permanent political opposition of blacks and whites.

UNIONTOWN (39° 53′ N., 79° 42′ W.), town, capital, Fayette County, Pennsylvania, U.S.A.; glass- and ironworks. Pop. (1910) 13,344.

UNIT CHARACTER, see MENDELISM.

UNITARIANISM, see under FREE CHURCHES.

UNITED BRETHREN IN CHRIST, Amer. denomination founded by Philip William Otterbein, 1726–1813; theologically they are Evangelical Protestants; a small conservative minority seceded, 1889.

UNITED FREE CHURCH OF SCOTLAND, Church formed by union of Free Church of Scotland and United Presbyterian Church. A Free Church minority refused to consent, and though the Court of Session upheld the majority, on appeal to House of Lords (1904) the Free Church minority obtained possession of all property. An Act of Parliament had to settle differences, as owing to its small numbers the Free Church was unable to retain and administer efficiently all the property.

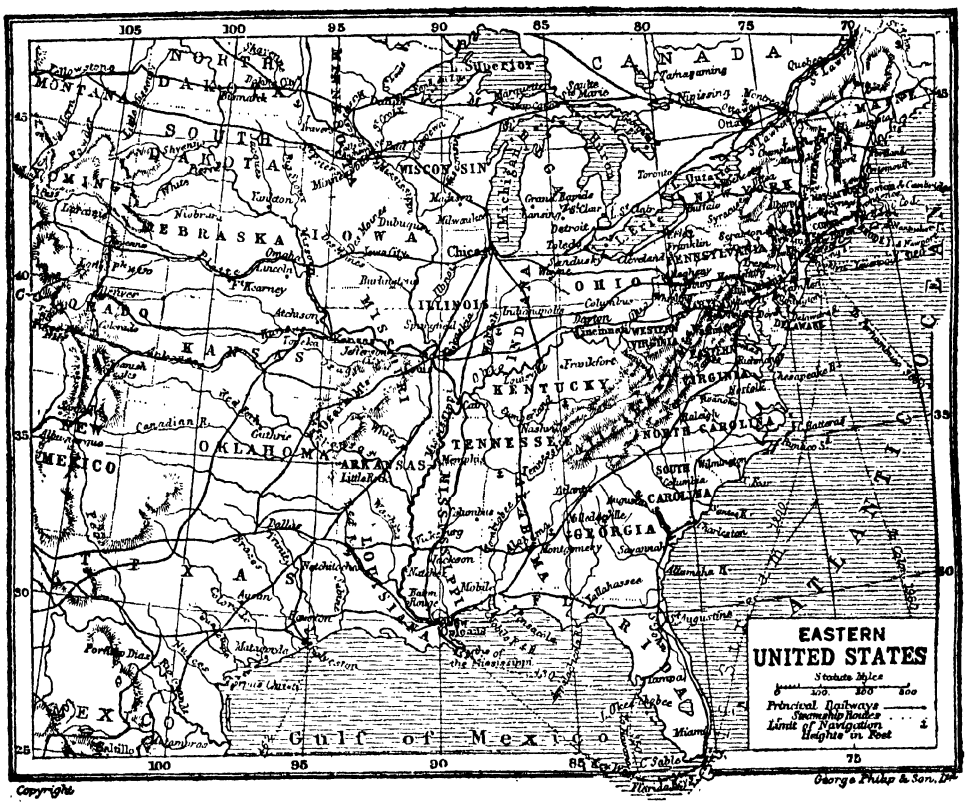
UNITED KINGDOM OF GREAT BRITAIN AND IRELAND (50° to 70° 30′ N., 1° 44′ E. to 10° 30′ W.), includes England, Scotland, Ireland, and Wales (for geography, see these headings); total area, including Isle of Man and Channel Islands, 121,391 sq. miles. Pop. (1911) 45,365,599.

The ruling monarch is George V., whose right rests on the Act of Settlement (1701), by which succession was settled on Princess Sophia of Hanover and her heirs.

Government is a limited monarchy; executive power though nominally vested in sovereign is in reality held by the Cabinet, a council of Ministers of State, who hold office as a result of their party's having a majority in Lower House; at present the Cabinet consists of Premier, Chancellor of Exchequer, Lord President of Council, Lord High Chancellor, Foreign Secretary, Home Secretary, Colonial Secretary, War Secretary, Indian Secretary and Privy Seal, Secretary for Ireland, Secretary for Scotland, First Lord of Admiralty, Pres. of Board of Trade, Pres. of Local Government Board, Pres. of Board of Education, Pres. of Board of Agriculture and Fisheries, Postmaster-General, Chancellor of Duchy of Lancaster, First Commissioner of Works, and (as personal honour) Attorney-General. Legislative power is vested in a parliament of two Houses; HOUSE OF LORDS includes all English peers, who hold their seats by hereditary right or by creation of the Sovereign, archbishops and bishops of Church of England, and a number of elected Scots and Irish peers, the former being elected for each parliament, while the latter hold their seats for life. The HOUSE OF COMMONS consists of members elected by the various county, borough, and University constituencies throughout the kingdom. In 1911 changes in the Constitution came into force with the PARLIAMENT ACT; the duration of Parliament was limited to five years; money bills may become law without consent of Upper House, and other bills may also be passed without consent of the Lords if they are passed in the Lower House in three sessions in succession.

In 1911 also the payment of members of Lower House came into force. A bill for Home Rule in Ireland is at present (1913) under discussion. (For local government, justice, education, religion, etc., see articles on England, Scotland, and Ireland.)

The **revenue** of the U.K. in 1911 was £203,850,588, and the expenditure was £171,995,667; principal sources of national revenue are income-tax, customs duties, estate duties, post-office; and chief items of expenditure are charges on national debt, and the upkeep of army, navy, and civil services. The army, including regular forces, militia, territorials, reserve forces, and colonial and native Indian troops, numbers in all (1912) 735,767; and the navy in 1912 numbered in all 134,000. For naval figures, see under NAVY.



Industries, commerce, etc.—Agriculture is carried on; chief crops are, in Great Britain, oats, wheat, barley, potatoes; in Ireland, oats, potatoes, barley; live stock raised (in order of numerical importance); in Great Britain, sheep, cattle, pigs, horses; in Ireland, cattle, sheep, pigs, horses. Minerals include coal, iron, tin, lead, zinc, wolfram, copper, besides limestone, sandstone, oil shale, and gypsum. The principal manufactures are iron and steel goods, and cotton, woollen, and linen textiles. The foreign countries with which trade is most extensively carried on are

Germany, United States, France, and Russia; large trade is also carried on with India, Australia, Canada, and other British colonies. Value of exports (1911), £464,119,000; imports (1911), £680,157,000. Chief imports are cereals, live stock, food-stuffs, raw materials, including cotton, timber, wool, etc., and iron and steel goods; and the chief exports are coal, cotton goods, linen and woollen goods, iron and steel goods, fish. Shipping is one of most important industries; total net tonnage of British steam and sailing vessels engaged in foreign and home trade in 1911 was 18,213,620, and in same year the foreign vessels cleared at British ports had a tonnage of 28,636,846. Railway lines open in 1910 had mileage of 23,387.

Annual Register; Whittaker's *Almanac*; *Statesman's Year Book*; Welton, *England's Recent Progress* (1911).

Punjab; area, 107,164 sq. miles. Surface generally is a wide plain, with Himalayas on N. boundary; watered by Ganges, with Jumna and other affluents; chief towns are Allahabad (capital), Lucknow, Benares, Cawnpore, Agra, Meerut. Administration is carried out by a lieutenant-governor, who is assisted by a legislative council. Agriculture is extensively carried on; chief crops are wheat, rice, millet, barley, maize, and pulse, while cotton, sugar-cane, and oil-seeds are also cultivated. Climate in many parts is unhealthy. Principal religions, in order of numerical importance, are Hindu, Muhammadan, Christian, Jain, and Sikh. Pop. (1911) 47,182,044.

UNITED STATES.—Geography.—The U.S. is a federal republic, extending across N. America from E. to W., and is bounded N. by Canada, E. by the Atlantic, S. by the Gulf of Mexico and Mexico (Rio Grande del Norte, etc.), and W. by the Pacific (see

UNITED METHODIST CHURCH, body composed by amalgamation in 1907 of Methodist New Connexion, Bible Christians, and United Methodist Free Church.

UNITED METHODIST FREE CHURCHES, body formally begun in 1857, now amalgamated in United Methodist Church.

UNITED PRESBYTERIAN CHURCH, Scot. religious body existing under that name, 1847–1900. The **United Secession Church** had arisen, 1732, the occasion for schism being disputes over patronage. In 1847 they had 400 churches, when they united into the *Relief Church* (existing since 1761) to form the U.P. Church. After various abortive efforts this Church united with the Free Church to form the United Free Church (*q.v.*).

UNITED PROVINCES OF AGRA AND OUDH (*c.* 24° to 31° 30′ N., 77° to 84° 30′ E.), province, Brit. India; bounded N. by Punjab, Tibet, E. by Nepal, Bengal, S. by Bengal, Central India Agency, W. by Rajputana,

article on detached territory of ALASKA). The main portion lies between 25° (a few small islands are farther S.) and 49° N., and between 67° and 124° 30′ W. The extreme length N. to S. is *c.* 1660 miles, the mean breadth, *c.* 2700, the area (excluding Alaska), 3,000,000, the coastline over 13,000 sq. miles. The surface outlines are simple. Inland from the E. coast is the Atlantic Plain with average width of 200 miles and rising to the ridges of the Appalachians. W. of these the ground sinks to the great Central Plain with prairies rising W. into the Great Plains, a low plateau E. of the Rocky Mountains. W. follow the Rocky Mountains, succeeded by mountainous plateau, then by the Cascade Range and the Sierra Nevada (extreme height, 14,900 ft.) and the Coast Range and Sierra Madre, from which there is abrupt fall to the Pacific.

The larger proportion of the country W. of 98° W. is over 2000 ft. above sea-level, E. more than half is under 600 ft. The Central Plain is broken by the Ozark Mountains (extreme height, *c.* 2000 ft.), which curve

through S. Missouri, Arkansas, and the eastern part of Oklahoma; and across its N. by the rising ground known on the S. slope as the Great Divide, on the N. as the Height of Land. The latter has no great elevation, and so the cold N. winds and warm, moist S. winds are able to pass up the central hollow of the whole continent. The N.E. is drained by streams flowing to the Great Lakes and the St. Lawrence; the coastal strip by the Penobscot, Connecticut, Hudson, Delaware, Susquehanna, Potomac, James, Roanoke, Savannah, and smaller streams; the Central Plain by the Mississippi-Missouri system, the Alabama, Sabine, Trinity, and smaller streams flowing direct to the Gulf of Mexico; the S.W. by the Rio Grande del Norte (flowing into the Gulf of Mexico) and the Colorado (Gulf of California); the N.W. by the Columbia, which breaks across the coast mountains; short rivers run down to the Pacific from the W. coast mountains.

The great rivers of the Central Plain are navigable for long distances; the Hudson is navigable, but other E. rivers are chiefly important for manufacturing and harbour purposes; W. rivers mostly flow through deep gorges, and, except the Columbia, are of no commercial importance. The E. coast as far S. as Long Island is rocky and has many good harbours; farther S. it is low and sandy, and broken only by the great openings of the Delaware and Chesapeake; along the Gulf of Mexico it is low and swampy, fringed in places with shallow lagoons, with muddy bars at the river mouths, while near the middle the Mississippi delta projects some 50 miles out to sea. The long line of W. cliffs is broken only in extreme N. (between the boundary at Juan de Fuca Strait and the mouth of the Columbia River) and near centre of S. (at the Golden Gate at San Francisco).

Geology.—Rocks of every geological age are to be found. Archæan rocks appear in the W. hills, in New England, the Piedmont plateau, etc. Proterozoic and Palæozoic rocks are found near the Great Lakes, and the Lower Silurian system of Palæzoic soils appears in the Appalachian Mountains, while coal-measures are found in Pennsylvania, other parts of the E. states, the middle states, and occasionally in the W. Large tracts of Cretaceous rocks extend W. of the Great Lakes, and go S. at the E. foot of the W. hills to the S. boundary. E. follow Tertiary rocks, which also surround the Gulf of Mexico and occupy Florida and the S.E. coast. Volcanic rocks appear all along the W. coast.

Climate varies from the winter snows and cold of the N.E. to the mildness of the Pacific slopes and subtropical conditions of the S. and S.E. The lowest mean temperature in Jan., at ordinary heights, is at Duluth, c. 12° F., with a minimum range of 40°; at Chicago it is 26°, at New York, 30°; at San Francisco, 50°; in Florida, 70°. The means for July are: Duluth, 66°; Chicago, 73°; New York, 73°; San Francisco, 59°; Florida, 83°. The minimum in Jan. at New York often falls below zero, and the July maximum, all over the country, at ordinary heights reaches over 100°. Rainfall E. of 98° long. varies from over 60 to 25 inches; along the Pacific coast strip it ranges to nearly 90 inches; among W. hills and on W. plateau it is only 2 inches in some places.

History.—The U.S. were the first Eng. colonies. John Cabot departed from Bristol, 1497, with the charter of Henry VII. and planted the Eng. flag in Newfoundland, an incident on which England's claim to N. America was based; not until the close of Elizabeth's reign was Spain's power sufficiently curtailed to allow of Eng. colonisation.

VIRGINIA.—In 1584 Raleigh sent out colonists, who occupied the region named by Elizabeth, Virginia. Raleigh received proprietary rights and the power to make laws, but in 1603 Virginia was made a Crown colony. All the colonists had disappeared, and in 1606 the Virginia Co. was formed to make a fresh settlement; its charter gave it control of territory between 34° and 45° N. lat., and it was subdivided, the London Co. undertaking the S., a Plymouth Co. the N. The band of settlers sent out in Dec. 1606 finally founded Virginia (1607). The new settlers were nearly all unfit and were almost exterminated by Indians, but sufficient interest was taken in the colony in England to ensure its continuance; the Company, however, lost its charter in 1623.

A system of government by governor and council (app. by the proprietor, now the Crown) and House of Representatives had already been established, and was followed in the succeeding colonies. Long before the colonies became self-supporting, the Houses of Representatives made efforts to obtain the control of taxation, and harassed the governor by insisting on the privileges of the Eng. House of Commons. Almost from the first England obtained enormous profits from the tobacco trade, and stringent navigation laws to prevent foreign participation were from early days a grievance of the planter. Another important element in Amer. history, negro slavery, was introduced in 1619. The working out of social and political problems under entirely different conditions is chiefly responsible for the differentiation of Amer. from Eng. character, but the stream of religious and political recusants into N. America amounted to a selection of Eng. types. The South was far from being the aristocratic settlement formerly represented, but the North was the pre-eminently republican district.

NEW ENGLAND.—The Pilgrim Fathers landed from the *Mayflower* in 1620 and built New Plymouth, and in 1629 the Puritan colony of Massachusetts was incorporated. Different sects of Puritans founded New Haven, Connecticut (which received charter, 1662), Providence, Rhode Island (incorporated 1663), New Hampshire, Maine, and Vermont. Some of these were annexed to others, and in 1643 the four colonies of Massachusetts, Connecticut, New Haven, and Plymouth united in the confederation of New England.

MARYLAND was formed from Virginia in 1634, as a proprietary colony of the Calverts, Lords Baltimore, Rom. Catholics, to whom a patent was granted for the purpose in 1632.

Sir Robert Heath received in 1629 a large tract of land S. of Virginia, and called it CAROLINA, after Charles I.; it was divided between eight proprietors in 1663, and received a constitution, ascribed to Locke, which never came into force; the colony was divided into N. and S. in 1663. Disputes between the colonists and proprietors ended with the great rebellion of 1719 in the S., and in 1729 the proprietors surrendered their rights to the Crown.

The Dutch W. India Co. had in 1626 established the New NETHERLANDS round the Hudson valley; in 1664 England declared war on the United Provinces and seized this colony, ceded at Breda (1667); it was reoccupied by the Dutch in 1673, but finally ceded by the Treaty of Westminster (1674); it had already been granted to James, Duke of York, after whom it was named NEW YORK. James granted the territory out to proprietors, one of whom, Carteret, who held Jersey for the Crown during the Civil War, had called his portion NEW JERSEY (1665).

William Penn received land on S. bank of the Delaware, originally settled by Swedes, and established colony of PENNSYLVANIA, 1682. He gave it a curious constitution which never worked, but showed a statesman's gifts in the founding of Philadelphia. The Dutch settlements on the S. bank of the Delaware, now the state of DELAWARE, were also granted to Penn.

The 13th colony, GEORGIA, was founded in 1732 by James Oglethorpe, between Virginia and Florida; it was a philanthropic effort to find a sphere for destitute Englishmen, and it provided a buffer state between Brit. and Span. territories. After a brave struggle against Spain, the proprietors surrendered their charter to the Crown in 1752. Various attempts at federating the 13 colonies failed.

The long struggle of Britain and France in N. America ended in 1763 with the *Treaty of Paris*, by which France ceded Canada to Britain, and France and

Spain confirmed Brit. possessions E. of the Mississippi and N. of Florida.

American War of Independence (1775–83), definitely severed Britain from her colonies in N. America (except Canada). Since the middle of the XVIII. cent. relations had been strained owing to the policy of Grenville's ministry, supported by George III., in rigidly enforcing the laws which gave Britain a monopoly of Amer. trade. Smuggling was circumvented, and resentment led to political resistance to taxation by Britain. Rockingham in 1766 repealed Grenville's Stamp Act of 1765, but in 1767 some new duties were imposed. These were met with resistance, the Americans denying the right of the Eng. Parliament, in which they were not represented, to tax them, and declaring that they owed allegiance to the Crown alone. In 1773 Lord North repealed all duties except that on tea, which the India Company could send to America from England without Eng. duty so that the price in America was low. But the Americans were concerned with the principle, and the tea ships were boarded in Boston Harbour and their cargoes thrown overboard, Dec. 16, 1773. Boston was deprived of its charter and a volunteer Amer. army was raised.

On April 19, 1775, a body of Eng. troops on their way back to Boston after destroying some magazines at Concord were attacked at Lexington by the colonial volunteers; the local militia had the advantage, and Boston was blockaded. On June 17, General Gage dislodged the colonists from the neighbouring hills in the battle of Bunker's Hill. Washington was now app. general of the Amer. army by a Congress at Philadelphia, which issued on July 4, 1776, the famous DECLARATION OF INDEPENDENCE of the U.S.A. All the advantages were with the Americans owing to the smallness of the Eng. armies and the incompetence of their commanders. But at first the English had some success. Sir William Howe, successor to Gage, won the battle of Long Island, August 1776, the first fight in the open field, and New York became the Eng. headquarters. He won in 1777 the battles of Brandywine and Germantown, but neglected to attack Washington with his half-starved army in winter quarters at Valley Forge, and he did not co-operate with General Burgoyne, an equally indifferent commander, who, marching from Canada down Hudson Valley, surrendered to the Americans at Saratoga in October 1777. France now recognised Amer. independence, 1778, and sent help. Spain joined her in 1779. Paul Jones, an Amer. captain, plundered the Brit. coasts. Clinton, Howe's successor, conquered South Carolina in 1780; but Lord Cornwallis, the best of the Eng. generals who fought in this war, was forced to surrender to superior forces at Yorktown, October 17, 1781. This virtually ended the war, though Charleston held out for some time, and New York only surrendered when the Independence of America was recognised as the basis of the peace negotiations resulting in the *Treaty of Versailles*, 1783.

During the war the various states had accepted 'Articles of Confederation and Perpetual Union'; these were superseded by the national constitution drawn up by the Convention at Philadelphia in 1787; this constitution, with 15 amendments, remains, but the power of the nation has since grown considerably at the expense of the states. The question of 'states' rights' agitated the country until the Civil War. George Washington, the late commander-in-chief, became the first Pres. (1789), and showed remarkable ability in walking 'on untrodden ground.' He and his successor, John Adams, evaded, with difficulty, foreign war. There had already sprung up parties of Federalists and Republicans, the latter headed by Thomas Jefferson, for a time Washington's Sec. of State, and full of the individualistic ideas of the Fr. Revolution. Jefferson was a thorn in Washington's flesh, but as Pres. (1801–9) used his friendship with France to secure Louisiana (1803), admitted to the Union in 1812. The U.S. remained firmly neutral in the war against Napoleon until irritation at the restrictions on her carrying trade led to war with Britain, 1812. Britain, distracted by the Napoleonic struggle, had not desired war, suffered considerable naval damage, and was glad to make Treaty of Ghent (1814). This second war with Britain slew all lingering loyalism in the U.S., and gave the latter definite status as a Power.

The Federalist party disappeared, and an 'Era of Good Feeling' lasted throughout the administration of MONROE, whose name is associated with financial prosperity, the regulation of the currency, exploration and settlement in the west, the consequent admission into the Union of the five new states of Indiana, Illinois, Alabama, Mississippi, and Missouri (Kentucky had been admitted, 1791, Tennessee, 1796, and Ohio, 1802), the acquisition of the Floridas (1819), and the enunciation of the 'Monroe Doctrine' (*q.v.*).

Civil War.—The great struggle between N. and S. commenced with Adams's administration (1825). The S. planting states considered that their prosperity depended on negro slavery, while the manufacturing states of the N. did not require slaves, and determined to end the system throughout the Union; the question took political form as a struggle as to the amount of control possessed by the Union over the separate states. The first great flare was over the 'Tariff of Abominations' of 1828, passed entirely in the interests of the N. The 'South Carolina Exposition' declared the new Act unconstitutional, and proposed that the separate states should declare it null and void in their territories. A large party of Nullifiers (or States' Rights Party) was formed, and in 1832 S. Carolina nullified the Act. Pres. Jackson replied by the 'Force Act,' which empowered him to collect the revenues in question, and was in its turn nullified in S. Carolina. Jackson's treatment of the U.S. Bank led to the formation of a new party of Whigs pledged to resist despotism. Democracy first showed its strength in the west, and won a great triumph in the 'Log-Cabin' election of 1840.

SLAVERY was in 1787 prohibited in the N.W. Territory, and had died out in the E. and central states; importation of slaves into the U.S. was forbidden in 1808. It was necessary to admit Louisiana in 1812 as a slave state, but when Missouri was admitted in 1820 a compromise was made by which Missouri was admitted as a slave state, but all land N. of 36° 30′ declared free for ever. At this time there were 12 free, 12 slave, states. Numerous abolitionist societies were formed in the N. The annexation of Texas (admitted as a state) in 1845 brought about war with Mexico. After inflicting many defeats on the Mexicans and capturing their capital the U.S. dictated terms at Guadalupe Hidalgo (1848), acquiring New Mexico, California, and Texas. After a warm dispute as to the question of slavery in the newly acquired territories, it was prohibited in Oregon but left to the decision of the Territorial courts of California and New Mexico, a privilege thenceforth known by its opponents as 'squatter sovereignty.' In 1850 California was admitted to the Union as a free state. Gold was first discovered there in 1848; it was already thronged by miners, and the decision as to its constitution was a burning question. To appease the S. it was found necessary after the decision to make the 'Compromise of 1850,' which provided for the return of runaway slaves. In 1854 the Missouri Compromise was set aside by the KANSAS-NEBRASKA ACT for the creation of the territories of Kansas and Nebraska, the principle of squatter sovereignty being again recognised; the slave-states rejoiced, but after a fierce fight the free-states secured Kansas, which was admitted to the Union in 1861. A notable episode of the struggle was the DRED SCOTT CASE (1857) in which the question of slaves being carried by their masters into free territory was decided in favour of the slave-owner. Abraham Lincoln, head of the anti-slavery party, which

had now adopted the designation Republican, skilfully attacked this decision. The states' rights party had become the Democratic; it was a fatal blow to it that Lincoln was elected pres., 1860, and Republican power was to last without a break until 1885. The pitch of feeling in the N. against slavery is to be judged by Mrs. Stowe's *Uncle Tom's Cabin* (1852). Lincoln's election meant Abolitionist victory and the S. states at once seceded, adopting in 1861 the title of Confederate States of America. The S. had less than half population of N. and considerably fewer resources.

War commenced with the capture of Fort Sumter by the secessionists in April 1861. Lincoln immediately proclaimed the blockade of the Confederate ports (a deed which alienated foreign powers, especially Britain, which depended on the slave-states for cotton) and sent M'Clellan south. The latter recovered W. Virginia by the middle of June; a series of Federal reverses culminated at Bull Run in July. The appointment of M'Clellan as U.S. General-in-Chief and commander of the army of the Potomac bitterly disappointed Federal hopes, and at the close of 1862 he was directed to resign. He had succeeded, however, in driving Lee, the Confederate general, back from Maryland into Virginia. His successor Burnside advanced on Richmond, but was defeated at Fredericksburg, Dec. 1862. Lincoln proclaimed the emancipation of slaves in the rebel states except in parts occupied by federal forces from Jan. 1, 1863. Burnside was superseded by Hooker, defeated by Lee at Chancellorsville (May). Lee's second invasion of Maryland and Pennsylvania entirely failed, and after the terrible battle of Gettysburg (July) he was driven back by Meade over the Potomac; on the same day Vicksburg fell before the Federal troops. From this time the Confederate cause declined; the lack of supplies and soldiers made itself felt and the Federal officers had now gained experience.

Grant, now General-in-Chief of the Federals, won the battle of Chattanooga (Nov.), and, retaining Meade as commander of the army of the Potomac, gave Sherman the command in Tennessee and Georgia. In May, 1864, Grant advanced against Lee, who was moving towards Richmond, fought the bloody, indecisive battles of the Wilderness, Spottsylvania, and Cold Harbor, crossed the river James, and commenced the siege of Petersburg. Sheridan was operating in the Shenandoah Valley (*q.v.*), while Sherman occupied Atlanta in Sept., and, after destroying Atlanta in Nov., made his famous march through Georgia to Savannah where he re-established communications with the Federal fleet. Hood's army was destroyed at Nashville by the Federal general, Thomas (Dec.). The Confederates evacuated Charleston in Feb. 1865. Grant was still besieging Petersburg, and in April the Confederates made a desperate, successful sortie, but were stopped by Sheridan. Richmond also was evacuated. On April 9 Lee surrendered at Appomattox Court House to Grant. Johnston surrendered and the S. Pres., Jefferson Davis, was captured in May in Georgia. President Lincoln was assassinated by a Southern sympathiser, April 15. Throughout the war naval operations were of the greatest importance, and the Confederates considered the loss of Wilmington in 1865 a greater blow than the fall of Charleston. Warships were procured by the Confederates from Britain, a fact which caused considerable unfriendliness between the latter and the U.S. (see ALABAMA).

Reconstruction of the Union.—The 13th amendment to the constitution was proclaimed in Dec. 1865; it abolished slavery in the U.S. and places under their jurisdiction. Lincoln had wished that compensation should be given to the slave owners, but had been forced to give way. There was now a bitter dispute as to further punishment of the S. states. A still more difficult problem was that of dealing with the emancipated negroes, unused to practise personal liberty, and yet, according to a large northern party, rightful claimants of votes. Early in 1866 the Pres. vetoed a Freedman's Bureau bill and Enfranchisement bill, but the latter was nevertheless passed. The rebellion was formally declared in April 1866 to be at an end, all the states but Mississippi having accepted the 13th amendment and been received back into the Union. Johnson, Lincoln's successor, ultimately persuaded Congress that no unnecessary harshness should be shown to the S., utterly ruined by the war and the loss of their slaves, but was first forced to veto a bill for disfranchising those who had fought against the Union, and to carry out a political campaign in which he made a very bad impression by the violence of his attacks on Congress. The Radicals proposed a 14th amendment by which ex-Confederate officials were to be disfranchised, the Confederate debt repudiated, the equality of negroes universally recognised. The Reconstruction bills of 1867, passed by the requisite majority of Congress, but vetoed by Johnson, divided the S. into 5 military districts and embodied the 14th amendment. Johnson strove to upset these acts, and in 1868 the Lower House impeached him; he was saved by a majority of only 1 vote in the Senate, and was not re-elected, but had successfully accomplished his task.

General Grant now became pres., and Republicans were returned all along the line, the negro vote, already exercised in all the states except Mississippi, Texas, and Virginia, being Republican. Grant remained in office until 1877. The 15th amendment, passed in 1869, forbade disfranchisement on account of race, colour, or antecedent servitude; it was accepted by the 3 recalcitrant states, who were readmitted to the Union in 1870. The Alabama question (*q.v.*) was settled, Britain in 1872 agreeing to pay $15,500,000 compensation.

Alaska was purchased from Russia in 1867, but Congress showed itself for a long time averse to large schemes and fearful of war. Internal development during this period was extraordinary; railway speculation first appeared and corruption in public life became a scandal. Meanwhile in the S. the 4 million enfranchised negroes controlled political life; these people, without political or moral sense, were reducing the S. to anarchy, while N. officials, the notorious 'carpet-baggers,' inspired their votes and protected them from their previous masters. Under these conditions there was formed in S. Carolina the secret society known as the Ku Klux Klan, which performed illegal police duty in chastising and often murdering negroes and carpet-baggers, and practically brought to an end the farce of negro equality. Grant was, it is believed, personally incorrupt, but did nothing to prevent Republican outrages in the S., nor could redress be obtained by petition to Congress. Dissatisfaction in the Republican ranks led to the formation of a Liberal Republican party in 1872, under Brown, Schurz, Trumbull, Sumner, and others. It was short-lived, and Grant was re-elected in 1872, but in 1876 the Republican Hayes became pres. Hayes formed a cabinet of moderate Republicans and Democrats, proclaimed the reform of abuses, and sought to mitigate party strife, but the opposition of Congress proved too much for him. He successfully quashed 7 bills of Congress, but failed to cure the disease of Amer. politics. Trade and agriculture, however, improved, and in 1879 specie payments were resumed, a fact which did much to restore Republican credit.

The Republican Garfield became pres., 1881; a few months later, after some civil service reforms and reduction of the public debt, he was assassinated. His successor, Arthur, a Stalwart, did much to assuage party strife, though his name is connected with no great measure and he more or less connived at Republican corruption. The Democratic victory in the Congress election of 1882 led the Republicans to effect some reform in the Civil Service and pass a Tariff Act to reduce the surplus, but they fell in 1884 before a union of Democrats and Independents (Mugwumps). The Republican candidate was beaten by the Democratic

Cleveland. Cleveland was almost purely the candidate of the S. and had practically no supporters to commence with in the Congress, but, like Arthur, he was practical, moderate, and conciliatory, and gradually won over the Houses. The question to which he devoted his chief attention was Tariff Reform. Despite enormous pensions and expensive public works, the surplus revenue remained immense, and Cleveland pressed for reduction of taxes, urging the increase of national prosperity which would ensue. This was the issue at the election of 1888 when the Republican candidate Harrison was returned over Cleveland.

In 1890 the M'Kinley Act (named after the chairman of the Committee on Ways and Means) was passed, increasing the duties on foreign articles, especially those of Europe, while Amer. sugar-planters received a bounty. At the same time expenditure was increased, the 51st Congress obtaining the nickname of 'the Billion Dollars Congress' from the amount of its appropriations. The only result of restored Republicanism seemed to be increase of price of necessities of life. Nor did the ambitious Pan-Amer. Congress of 1889 bear much more fruit. Blaine, Sec. of State, organised this Congress at Washington as a means towards establishing the U.S. hegemony over the 'Three Americas.' The republic of Hawaii was annexed by the U.S. in 1892, and a treaty was made with Britain in that year for Bering Sea (*q.v.*) arbitration. The Democratic party obtained a large majority for Cleveland's re-election, and he returned to office in 1893. He had at once to face a great financial crisis, largely due to the Sherman Act of 1890, which obliged the Sec. of the Treasury to pay notes for silver up to the amount of 4,500,000 ounces of silver monthly, if offered, these notes to be redeemable, on demand, in gold or silver. Cleveland denounced this Act, which had dangerously lowered the gold reserve of the Treasury and the price of silver, and reformed both the currency and the tariff, and succeeded first in reducing the surplus and at last in producing a deficiency of revenue. The Sherman Act was repealed in 1894.

A commercial crisis, in which numerous railway companies and banks failed, led to the Chicago Riots and a march of the unemployed on Washington. Abroad, the dispute between Venezuela (*q.v.*) and Britain as to boundary led to U.S. intervention, Olney, Sec. of State, enunciating the old Monroe Doctrine. Cleveland recommended a Commission, strongly stating that if decision was given for Venezuela it would be the duty of the U.S. to support her claims to the uttermost. He voiced the wish for a more adventurous foreign policy, increasing the fleet, and pushing on the construction of the Nicaragua Canal, which he wished to be non-national, the gift of America to the world; at home he sought to strengthen Union control of the states. The currency was the question at issue in the presidential election of 1896; the Democratic party by adhering to silver had lost many of its members, and the gold standard Republicans succeeded in returning M'Kinley; Sherman became Sec. of State, and the Republican programme of activity abroad and increase of protective duties was carried out, the 'Populist' party (the extreme left of the Democrats and bigotedly silverite) resisting step by step. In 1899 the gold dollar was made the unit of value, and the banking laws were reformed.

The CUBAN QUESTION meant foreign war and extra-Amer. expansion (see SPANISH-AMERICAN WAR). M'Kinley was fortunate in the fact that the gold mines of Alaska were discovered at this time, and in the new methods of mining by means of which gold became plentiful, and in the new commercial and agricultural prosperity which put an end to labour unrest; the exploitation of the non-political poor remains, like the multi-millionaire, a characteristic of Amer. life. The great oil, railway, and banking trusts were built up at this time, and combinations of capitalists began to control production.

The Democrats opposed M'Kinley in 1900, and used as electioneering material the old silver question, the new trusts, and what they called the new 'imperialism,' but they were divided, and the Republicans again won. M'Kinley, however, was assassinated in 1901, and Vice-Pres. Roosevelt succeeded. Roosevelt continued the imperialistic policy, asserting in 1904 the right of the U.S. to 'international police power' in the W. hemisphere, and establishing U.S. control over San Domingo. He also participated with European Powers in interference in E. politics. His great aim, however, was international peace. He acquired from a Fr. company the right to construct the Panama Canal, and crushed the resistance of Colombia by aiding the republic of Panama to obtain its independence (1903). The canal, guaranteed neutral, was commenced in 1907. Roosevelt legislated against capitalistic combinations, and exposed Civil Service frauds, and yet kept his popularity with Republicans, while he won over Democrats. The result was his enormous majority in 1904. He afterwards lost Republican confidence, especially after the fall of the Knickerbocker Trust Co. (1907), although he showed great energy in the alarming financial panic. Reform of the tariff and many extreme Radical measures were on the Democratic programme of 1908, but the Republicans returned Taft by a large majority. Roosevelt's influence, however, had brought about the formation of a party of 'Progressive' Republicans, a fact which greatly weakened Taft. He was succeeded in March 1913 by Woodrow Wilson (Democratic). Taft's administration was marked by conferences at Ottawa (1910) and Washington (1911) of U.S. and Canada to discuss reciprocity in trade. The Arbitration Treaty with Britain desired by Cleveland was made in 1911, but has since been considerably modified. The chief events of 1911 were the dissolution of the Standard Oil and Amer. Tobacco Companies, and the bringing of a suit against the U.S. Steel Corporation Co.

Government.—The main portion of the republic consists of a federal district and 48 states. They were added to the original 13 in the following order: District of Columbia (1790–91), Vermont (1791), Kentucky (1792), Tennessee (1796), Ohio (1803), Louisiana (1812), Indiana (1816), Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820), Missouri (1821), Arkansas (1836), Michigan (1837), Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1848), California (1850), Minnesota (1858; territory, 1849), Oregon (1859; territory, 1850), Kansas (1861; territory, 1854), West Virginia (1863), Nevada (1864; territory, 1861), Nebraska (1867; territory, 1854), Colorado (1876; territory, 1861), Dakota, N. and S. (1889; territory, 1861), Washington (1889; territory, 1853), Montana (1889; territory, 1864), Idaho (1890; territory, 1863), Wyoming (1890; territory, 1868), Utah (1896; territory, 1850), Oklahoma including Indian Territory (federal state, 1907), Arizona (1912), New Mexico (1912). The constitution of 1787, with 15 amendments, is in force. By it, executive, legislative, and judicial bodies were instituted. Executive power lies with a President, chosen for 4 years by votes of electors appointed by direct vote of citizens of each state; the number of electors equals the number of senators and representatives which each state is entitled to return to Congress (this depending on the population). The Pres., elected in Nov. of every 4th year, enters office on Mar. 4 following; he may veto any bill passed by less than two-thirds majority in both houses of Congress, and is commander-in-chief of army, navy, and federal militia. The President's salary is $75,000, and $25,000 for expenses. On his death the Vice-Pres. succeeds for remainder of term. The legislative power lies with Congress, which consists of a Senate (two members from each state, chosen by the state legislatures for 6 years) and House of Representatives (elected for 2 years; the electoral unit is about 174,000).

The salary of senators and representatives is $7500

yearly, with travelling expenses of 20 cents per mile. The Supreme Court, appointed by the constitution of 1787, consists of a Chief Justice and 8 justices appointed by the Pres. with advice and consent of the Senate, to hold office during good behaviour. There are 33 Circuit judges, and 91 judges of District Courts. Each state has a governor, senate, and house of representatives. There are 10 women-suffrage states—Wyoming (1869), Colorado (1893), Idaho (1896), Utah (1896), Washington (1910), California (1912), Arizona (1912), Kansas (1912), Oregon (1912), and Illinois (1913). In Iowa and Louisiana women have a tax-paying suffrage, while in New York, Delaware, Michigan, and Montana they have both tax-paying and school suffrage; 17 other states have school suffrage. Each state has sovereign power over its own local bodies, and the counties (parishes in Louisiana) into which the S. and W. states are divided have usually independent control of local affairs; the counties are divided into townships or 'precincts.' Counties are to be found in the N., but there the local unit is usually the township or municipality. The townships are symmetrical in size—about 6 sq. miles in area; their officers are known as trustees or supervisors; the school district is not always coincident with the township. Boroughs appear only in Connecticut, Rhode Island, and Vermont; the town of New England has town meeting and board ('select men'), of whom chief officers are the 'moderator' and town clerk; these towns are rapidly becoming split up for local government into 'urban centres.' Democratic opposition to ward representation was strong at Boston as it is at New York; numerous cities have recently adopted Commission Government, a system by which local government is scientifically simplified.

Law.—The law of U.S.A. is English in origin and nearly all technical terms and forms of procedure; Eng. decisions are quoted, and Eng. legislation is sometimes copied, *e.g.* Lord Campbell's Act and the Employers' Liability Act. Each state has its own laws, but certain subjects, *e.g.* disputes between states and residents of different states and offences against the coinage and the revenue laws, are dealt with by the federal courts. Progress in America has been principally in the direction of sweeping away complexities of the Eng. land laws and removing the disabilities of women. No state gives preference to males over females or to eldest sons. The landlord's right of distraint has been abolished in many states; and other states never recognised it. The entailing of land is made impossible in some states. Generally a wife is in the position of a spinster as regards property, and nearly everywhere a married woman has full power of contract.

Criminal law was always milder than in Britain. Some of the states have abolished capital punishment, and America was long before England in allowing criminal appeal. The criminal law of the U.S. and of most of the states has been codified, and there are several state civil codes.

Literature.—With the settlement of the Puritans there came into existence a class of lit. suited to their peculiar needs, and the earliest example was *The Bay Psalm Book* (1640), supposed to have been the first book printed in America. In another class was Mather's *Magnalia Christi Americana*, or *The Ecclesiastical History of New England from its First Planting in the Year 1620, unto the Year of our Lord 1698* (1702). During the XVIII. cent. there was a moderate amount of fiction and minor verse, now mostly forgotten; but it may be noted that the national hymn, *Hail, Columbia*, was written by Joseph Hopkinson in 1798; and the earliest Amer. play, Thomas Godfrey's tragedy, *The Prince of Parthia*, was produced at Philadelphia in 1767. Not until the early part of the XIX. cent. did America begin to develop a lit. of her own. Two examples of this new development are Washington Irving's *Sketch Book* (1819) and James Fenimore Cooper's *The Spy* (1821). To this period also belongs the poetry of William Cullen Bryant—*Thanatopsis* (1807) and *Poems* (1832)—the prose and verse of Nathaniel Parker Willis (1806–67), and the poetry and tales of EDGAR ALLAN POE (1809–49). The later writings both of Irving and Cooper added to their fame. Poe's short stories have never been surpassed in their kind, and his poems have secured a lasting place in lit.

Amer. romanticism was developed in the poetry of HENRY WADSWORTH LONGFELLOW (1807–82), and the New England stories of NATHANIEL HAWTHORNE (1804–64). Longfellow, whose first volume of verse, *Voices of the Night*, appeared in 1839, later produced lengthy poems upon national subjects (*Hiawatha, Evangeline, The Courtship of Miles Standish*). Another writer of influence was the Transcendentalist, RALPH WALDO EMERSON (1803–82), whose first book, *Nature*, was published in 1836. WALT WHITMAN (1819–92), author of *Leaves of Grass* (1855), is perhaps the most dominant figure in XIX.-cent. Amer. lit., and, though his formlessness repels many readers, his optimism has largely influenced thought.

Other writers are John Greenleaf Whittier, the Quaker poet (1807–92); Oliver Wendell Holmes, author of the 'Breakfast Table' Series (1809–94); James Russell Lowell (1819–91); Henry David Thoreau, nature-writer (1817–62); Mrs. H. B. Stowe (1811–96), author of *Uncle Tom's Cabin*; Francis Bret Harte, novelist and poet (1839–1902); Col. John Hay, author of *Pike Country Ballads* (1838–1905); and the great Amer. humorist, Samuel Langhorne Clemens ('Mark Twain') (1835–1910).

Amer. writers of history have been: George Bancroft (1800–91), author of *History of the United States*; William Hickling Prescott (1796–1859), author of *Conquest of Mexico, Conquest of Peru, Ferdinand and Isabella*; and John Lothrop Motley (1814–77), author of *Rise of the Dutch Republic*.

Bates, *Amer. Lit.* (1898); Brownell, *Amer. Prose Masters* (1910); Stedman, *Poets of America* (1885); Wendell, *A Literary History of America* (1901); Trent, *History of Amer. Lit.* (1903).

Finance.—The revenue in 1912 was *c.* $691,778,000, the expenditure, $654,554,000; the Public Debt amounted to $1,027,575,000 in 1912.

Army and Navy.—$94,210,000 was appropriated to the U.S. army and military schools for year 1911–12, but nearly twice that was spent; $120,000,000 was spent on the navy. The services are recruited by voluntary enlistment; the army, which may not number over 100,000, was composed in 1911 of 4281 officers, 73,454 men, while the Philippine Scouts amounted to 179 officers, 5401 men, and the State Militias mustered about 85,000. Besides 29 battleships, 15 armoured cruisers, and 19 protected cruisers (a large number on the new Dreadnought plan), torpedo-boat destroyers are being built at the rate of 20 per annum, and 20 submarines have already been constructed. In warship tonnage the U.S., it is estimated, comes next to Britain. A school for officers of U.S. navy was founded at Annapolis, 1845. The ages of candidates range from 15 to 20. The course lasts for four years, following two years' experience at sea. Little interest is taken in airships, although in 1912 Congress appropriated $125,000 for military aviation.

The NATIONAL PARKS of the U.S. have been formed by Congress with the idea of preserving remarkable natural sites for public use. The first and largest, Yellowstone Park, formed from Wyoming, Montana, and Idaho in 1872, is 2,142,720 acres in extent. Others of great size are Glacier in Montana, Yosemite, Sequoia, and General Grant (California), Mt. Ranier (Washington), Crater Lake (Oregon).

About 38 % of the population is actively employed; of this class nearly 40 % are engaged in agriculture, fishing, and mining, 22½ in manufacturing and mechanical industries, over 19 in domestic service, over 14 in trade and commerce. Over 25 % are gathered in

the 159 towns with more than 25,000 inhabitants. The capital is Washington. New York, Chicago, and Philadelphia are the largest cities, having in 1910 populations of 4,767,000, 2,185,000, and 1,549,000 respectively. The next in order of population are St. Louis (687,000), Boston (670,000), Cleveland (561,000), Baltimore (558,000), Pittsburg (534,000), Detroit (460,000), Buffalo (424,000), San Francisco (417,000), Milwaukee (374,000), Cincinnati (364,000), Newark (347,000), New Orleans (339,000), Washington (331,000), Los Angeles (319,000), and Minneapolis (301,000). Jersey City, Kansas City, Seattle, Indianapolis, Providence, Louisville, Rochester, St. Paul, Denver, and Portland (Ore.) have all a population over 200,000; Columbus, Toledo, Atlanta, Oakland, Worcester, Syracuse, New Haven, Birmingham, Memphis, Scranton, Richmond, Paterson, Omaha, Fall River, Dayton, Grand Rapids, Nashville, Lowell, Cambridge, Spokane, Bridgeport, and Albany contain over 100,000 inhabitants.

Railways.—The densely populated states have a network of convenient railway communications, being rapidly extended; in 1910 about 240,000 miles were worked. The chief lines are the New York Central, the Atlantic Coast Line, the Chicago, Burlington, and Quincy, the Pennsylvania, the Pacific Lines, the Southern, the Illinois Central, and the Rock Island.

Water Communication.—There is an enormous amount of water traffic on the Great Lakes (which have one-third of whole shipping trade of country) and on the canals connected with them—Sault Ste Marie, Erie, Hudson R., Hudson and St. Lawrence, Ohio to Susquehanna, and Lake Michigan to the Mississippi, etc., with total length of about 4000 miles. The Mississippi-Missouri system has one-sixth of total traffic, and is navigable for nearly 14,000 miles. The streams flowing into the Atlantic are navigable for over 5000 miles, those flowing into the Gulf for over 5000 miles, and those flowing into the Pacific for nearly 2000 miles. The length of public roads was in 1909 2,199,000 miles.

Resources and Industries.—The products of U.S.A. are so varied that the nation might easily be self-supporting and yet enjoy the luxuries of life. Agriculture is still of chief importance, but the importance of industries is multiplied every few years. Of a total of about 6,340,000 farms, some 45 % are (1910) between 100 and 500 acres, 26 between 50 and 100, 20 between 20 and 50, the bulk of the remainder still smaller. Of the country E. of 98° long. nearly two-thirds is under crop—the N. districts producing crops of the ordinary grains and green crops, the centre maize and tobacco, the S. cotton, with rice and sugar-cane in much smaller proportion. The chief grain crops are wheat and oats, the former covering an area of about 49,000,000 acres, the second over 35,000,000 acres; barley, flax, rye, buckwheat, and rice are also important crops. The chief wheat-growing states are Minnesota, Kansas, N. and S. Dakota, California, Nebraska, Missouri, Pennsylvania, Iowa, Illinois, Texas, Oregon, Washington, Indiana, and Ohio. Nebraska, Iowa, Kansas, Missouri, Illinois, Indiana, and Ohio chiefly grow the variety known as maize, the specialty of the U.S. The oats area is in the N.E. The grain surplus for export in 1910–11 was valued at $22,000,000, that of wheat flour, $49,000,000; this amounts to 38 % of the surplus supply of all the exporting countries in the world, and double that of the next in order, Russia.

In 1910 the U.S. produced 60 % of the cotton of the world. The great cotton states are Texas, Georgia, Mississippi, Alabama, N. and S. Carolina, Louisiana, and Arkansas, the most valuable area being the islands along the coast of S. Carolina, the long-stapled Sea Island fibre of which is very valuable. The area under cotton is over 28,000,000 acres; 1½ million acres were under tobacco in 1910, and the crop was over 984,000,000 lb. The chief tobacco states are Virginia, Kentucky, Maryland, N. Carolina, and Tennessee. Sugar-cane is grown in Louisiana, Texas, and Florida; the area has been greatly restricted since the abolition of slavery, the place of the cane product being taken by the beet-sugar of Nebraska, Kansas, New Jersey, Illinois, California, Colorado, and Utah; by the maple sugar of Vermont, New Hampshire, and other N.E. states; and by the sorghum sugar of Kansas. Sorghum is also grown for feeding cattle. In 1910, 723,000 acres were under rice; this is chiefly in S. Carolina, but rice is produced in N. Carolina, Georgia, Mississippi, and Louisiania.

Hops are grown in New York, Wisconsin, Washington, Oregon, and California; hemp, flax, and jute in Kentucky, Tennessee, and Missouri; flax for seed in Minnesota, Kansas, Nebraska, Iowa, and Missouri; the vine in California, New York, Ohio, and Missouri, but chiefly in California; apples, peaches, plums, pears, and other fruits of N. Europe in Pennsylvania and Delaware. The cultivation of many tropical and subtropical fruits is carried on in California and several S. states. W. of 98° long. stock is widely reared, the climate, soil, and grasses being specially suitable; crops produced are chiefly for feeding. The area of the ranching districts is estimated at over 1,350,000 miles, the value of the stock at nearly £640,000,000; Iowa comes first, Texas second in value of production. Cows are most plentiful in Vermont, Pennsylvania, New York, and Ohio, where there is considerable production of butter and cheese.

About 25 % of the U.S. is still under timber, but reckless clearing led to the Weeks Law of 1911, which aims at forest reservation and nationalisation. The largest tract (over 350,000,000 acres) is on the Atlantic side; the other great districts (each about 50,000,000 acres) are the Pacific coast, the Rocky Mountains, and the central W. states; varieties are pine (including redwood sequoia and giant big-trees), cedar, laurel, oak, and aspen in the W.; cactus, yuccas, mesquites, creosote bush, and sage brush in W. plateau; in the E., ordinary European trees, hemlock, cedar, cypress and hickory, chestnut oak and dyer's oak, valuable for tanning and dyeing purposes.

The salmon fishing of the W., the fishery of Great Bank of Newfoundland, and whale and seal fishing are valuable.

About two-thirds of the world's petroleum is produced in the U.S., which is very rich in all sorts of minerals. It was chief gold country until distanced by the Transvaal in 1898. Over $96,000,000 in value of gold was produced in 1911, over $30,000,000 silver; copper $142,000,000, lead $30,000,000, zinc $25,000,000, aluminium $7,000,000, white lead $18,000,000. Pig-iron is valued at $419,000,000, bituminous coal at $405,000,000, anthracite at $149,000,000, coke at $90,000,000. Brick-clay, salt, phosphates, limestone (for flux), gypsum, quicksilver, and pyrites are also found in large quantities. It is considered that the high protective duties have caused the sudden growth in importance of U.S. manufactures in N.E., especially in states of New York and Pennsylvania; while the cotton factories of S. are obtaining great success; in cottons the U.S. is second to Great Britain, but the industry is chiefly carried on in the N.E. states. Woollens, silks, leather, clothing, and iron and steel goods of all kinds are manufactured.

Commerce.—The leading exports are raw cotton, bread-stuffs, meat, and dairy products, iron and steel ore and goods, mineral oils, wood and its manufactures, copper, tobacco, and leather; but many other exports are of value. The chief imports are sugar, coffee, chemicals, manufactured goods.

Interstate Commerce is trade between members of different states, which, according to an article of the constitution, is under federal control. An Act called the I. C. Act was passed by Congress in 1887 for the regulation of trade between the states when carried on entirely or in part by rail; according to this Act, all common carriers engaged in interstate traffic are liable to regulation, and their charges must not be excessive; while preferences, rebates,

special rates, etc., are expressly forbidden. By this Act also an *I. C. Commission* was established; this consists of seven (originally five) members, who are nominated by the Pres. and are authorised to prosecute any one who violates the provisions of the Act, and to obtain all necessary information from the carriers; the commissioners are also empowered by the Act of 1906 to fix the rates of carriage when unjust charges are complained of. I. C. is considered to begin with the actual motion of the goods from one state to another. Before the year 1868 the imported goods were taxable only after the distribution or sale of the original cases in which they were delivered; but in that year it was decided that the state's power of taxation should begin with the delivery of the goods at their destination.

Judson, *Law of Interstate Commerce* (1905).

Education is free and compulsory from 6 to 14 in most states, and in all there are public elementary schools; in some, free education for those over 14 is provided. Where the state makes insufficient provision for education in any grade, the Union makes grants of land appropriated for that purpose; co-education is a great feature. The secondary schools are noted for excellence; univ's were established in the old colonial days, and the present bodies are excellently endowed.

Religion.—As far as exact details have been obtained, three-fifths of the population is Prot., the chief sects being Methodist and Baptist; Lutherans and Presbyterians (much less widely spread) following. The remaining two-fifths is nearly all R.C. Pop. (1910) 91,972,266.

Garner and Lodge, *History of the United States* (1906); Andrews, *History of the U.S.* (1895); Fiske, *The Amer. Revolution* (1891); Larned, *Literature of American History* (1902).

UNITS, PHYSICAL.—The magnitude of any measurable quantity is always expressed in terms of some definite quantity of the same kind, known as a *unit*, and the expression gives the number of times the unit is contained in the given quantity. The pure number so used is termed the *numeric* of the quantity. In the physical world we have to deal with three essentially different kinds of quantity, viz. length, mass, time. Each is independent of the other two, but any other physical quantity can be expressed in terms of one or more of them. Hence the units of these quantities are termed *fundamental*, while the unit of any other quantity expressed in terms of them is known as a *derived* unit. For example, a point moving uniformly over 10 centimetres in 2 seconds is said to have a velocity of 5 centimetres per second, and 1 centimetre per second is therefore a derived unit of velocity. This introduces the idea of *dimensions* in units. Thus the unit of area is the square of the unit of length, and the unit of volume is its cube. If L is the unit of length, the units of area and volume can be represented by L^2 and L^3 respectively. Or, we may say that area is of two, and volume of three, dimensions in length. Since the unit of velocity is a length divided by a time, it can be said to be of one dimension in length and *minus* one (-1) dimension in time, *i.e.* LT^{-1} $\left(\text{or } \frac{L}{T}\right)$. Similarly, acceleration is LT^{-2} $\left(\text{or } \frac{L}{T\times T}=\frac{L}{T^2}\right)$, force MLT^{-2}, energy ML^2T^{-2}, and so on. With regard to the choice of three quantities which shall serve as units of length, mass, and time respectively, we have chiefly to consider their convenience. But it is obvious that any standard must satisfy two conditions: (1) that the quantity chosen must be of unvarying value; (2) that its direct comparison with other quantities of the same kind is practicable at all times and places. In most scientific work the centimetre is chosen as the unit of length, the gramme as the unit of mass, and the second as the unit of time, and these form the centimetre-gramme-second, or C.G.S., system of units. The centimetre is one-hundredth part of the metre, which is defined as the length of a platinum bar, preserved in Paris, when it is at a temperature of 0° C. Originally the metre was intended to be one ten-millionth part of the distance from the North Pole to the Equator along the meridian through Paris. Later geodetic measurements have shown that the metre is not exactly this length, but the standard remains the same and the measurements referred to are expressed in terms of it. The gramme is one-thousandth part of the mass of platinum known as the 'Kilogramme des Archives,' which was intended to represent the mass of 1 cubic decimetre of water at 4° C. The second is the mean solar second, of which there are 86,400 in each mean solar day. It will be seen that none of these units are natural constants: all are arbitrary. It has been found possible, however, to find the length of the standard metre with great accuracy in terms of the wave-length of cadmium light, and this is as constant as any known quantity. The mean solar second is by no means an invariable interval of time, for the rate of the earth's axial rotation must be slowly changing so as to lengthen the second. It is, however, sufficiently constant for all practical purposes over long periods of time. For the definitions of British units see WEIGHTS AND MEASURES.

Everett, *Units and Physical Constants*.

Units, Dimensions of, powers in which fundamental units of length, mass, and time are involved in any unit of a physical quantity. The unit of area involves the product of two lengths; its *dimensions* are therefore 2 in length, 0 in mass, 0 in time—written $[L^2M^0T^0]$. Dimensions of other physical quantities are: Volume $[L^3M^0T^0]$; velocity $[L^1M^0T^{-1}]$; acceleration $[L^1M^0T^{-2}]$; force $[L^1M^1T^{-2}]$; work or energy $[L^2M^1T^{-2}]$; momentum $[L^1M^1T^{-1}]$. Two systems of units—the Eng. foot, pound, and second (F.P.S. system); the Continental centimetre, gramme, and second (C.G.S. system).

UNIVALVE MOLLUSCS, see GASTEROPODA.

UNIVERSAL LANGUAGES, the only approximately universal language there has ever been is Latin, the common educated and learned speech of Rom. and mediæval times. It was partly replaced by French for diplomatic and literary purposes. Nearest approach to-day is English for commercial and maritime use. From end of XVIII. cent. onwards efforts have been made to found an artificial universal language. Two chief attempts are *Volapük*, by M. Schleyer (1886), from Romanic and Germanic roots, rather like shortened English. *Esperanto* has been most successful. Invented, 1887, by Dr. Zamenhof, mainly Romanic, but also from Slav, Germanic, and Hellenic roots; has alphabet of 28 letters; simple to pronounce and construct. It is widely prevalent, with about 1900 groups for propagation and several journals, *e.g. British Esperantist*. Its practical use to universal extent has yet to be shown.

UNIVERSALIST CHURCH, Amer. religious denomination, founded 1774; has *c.* 1000 churches; principal doctrine is that good will ultimately triumph over evil, hence Universalists believe in the final salvation of all men; term 'Universalist' applied not only to members of the denomination but to Christians holding similar views, *i.e.* modern liberal religious thinkers and some in early Church, *e.g.* Origen.

UNIVERSITIES.—The four great mother-universities of Europe—*Bologna, Paris, Oxford,* and *Cambridge*—came into existence all about the same time, *c.* 1200. The XIII. cent. sprinkled the Romance countries with u's. The XIV. cent. witnessed the uprising of the old Teutonic u's. In the XV. cent. came Scotland's turn. In the XVI. the Reformation was responsible for a fresh crop of u's in Northern Europe. In the XVII. North America entered the u. field and set burning the Colonial torch of learning. The XVIII. cent. was one of stagnation for most u's and of extinction for many. The XIX. cent. began with the great Ger. revival, continued with Brit.

Colonial activity, and ended with *U. Extension* in many directions, particularly to women and to workingmen. The XX. cent. opened with a great civic u. outburst in England and the promise of u. reform and expansion in many quarters.

Of the mediæval u. little need be said here. Feudalism, the Church, the Crusades, travel, commerce, had widened men's learning and horizon. The Trade Guild must have suggested to scholars the advisability of forming guilds of their own. Masters and pupil could derive mutual profit and protection, associated in corporate life. Papal Bull or Imperial Charter gave them a legal footing as u's. Theology, Jurisprudence, Medicine, were their chief studies. The *Universitas* offered not an all-embracing curriculum, but world-wide citizenship. Each *Studium Generale* was a little cosmopolitan city, nurturing students of many lands, grouped accordingly for administrative purposes in so many 'nations.' Lat. was the academic tongue of all. Students and masters lived together monastic-fashion in boarding-houses. As numbers grew, this system became difficult to maintain, and was abandoned, save at Oxford and Cambridge, where the coll's not only survived as residences, but encroached on the u's' teaching domain. Thus the historic Eng. u's have attained unique social, if not intellectual, distinction. Other survivals of mediæval organisation and customs are to be found in most old u's.

British Universities. — ENGLAND. — *Oxford* and *Cambridge* U's originated in XII. or early XIII. cent., in two little country places, some 70 miles apart. For over 600 years these were the only u's in England. In France, however, u's were founded at *Caen* (1436) and *Bordeaux* (1442) under the Eng. régime. Oxford and Cambridge (*qq.v.*) enjoyed a monopoly for over 600 years. Proposals to establish u's in the North of England and Wales during the Commonwealth proved abortive. *Durham*, England's third u., was not founded till 1832. The U. of *London* followed in 1836. Durham copied the older u's, but London marked a new departure, being a purely examining and degree-conferring body, doing no teaching or research. Aspiring to imperial scope, London U. threw open its examinations and degrees to all comers. Residence was not required. This arrangement was largely due to scarcity of u's in England and Colonies, expensiveness and conservatism of Oxford and Cambridge, and disabilities under which Nonconformists laboured as regards u. titles (only removed by *U. Tests Act*, 1871). London early recognised the importance of modern subjects (science, etc.), and was first to grant degrees to women (1878).

During Queen Victoria's reign only two Eng. u's were founded—the *Victoria* U. (1880; dissolved 1903), a federal non-teaching u., which conferred degrees on students prepared by constituent coll's in Manchester, Liverpool, and Leeds. *Birmingham* (1900) was the first modern City U. in England—the precursor of *Liverpool* (1903), *Manchester* (1903), *Leeds* (1904), *Sheffield* (1905), *Bristol* (1909), and more to follow. It was the first Eng. Single-College, Teaching, 'Day' U. following Scot. and continental patterns. The new city u's, tokens of a municipal and national awakening, all teach, all promote research, all give Science, Pure and Applied, place of honour in their classrooms and try to combine idealism with industrialism. Their advent, coinciding with the partial conversion of the Examining U. of London into a true teaching u. (1900), marks a new era of untold promise in Brit. u. history.

WALES.—National not municipal aspirations called into being the federal U. of *Wales* (1893), an examining body superimposed on coll's at Aberystwyth, Bangor, and Cardiff.

SCOTLAND.—In the XV. cent. Scotland established three u's—*St. Andrews* (1411), *Glasgow* (1453), and *Aberdeen* (King's Coll., 1494). The Reformation added two more—Edinburgh (1582) and Marischal Coll., Aberdeen (1593). *Edinburgh*, the 'Tounis College,' was a municipal enterprise, anticipating modern city u's. Unlike the Early Eng. u's, the Scot. u's were founded in the largest towns. Political and financial reasons caused the adoption of continental models, instead of the Oxford and Cambridge collegiate system. In 1860 the two Aberdeen coll's amalgamated. Despite this decrease and the recent 'epidemic' of u's in England, the proportion of u's to population is still three times as great in Scotland as in England, and Scotland is to-day better provided with u's—quantity, quality, and availability combined—than any other part of the empire.

IRELAND.—In Ireland and Canada racial and religious quarrels have affected u. development. The U. of *Dublin* (founded 1591, largely on Cambridge models, with Trinity as its only coll.) left Catholics and Dissenters unprovided for. Hence *Queen's U.* was established (1850) to examine and confer degrees on students of coll's at Belfast, Cork, and Galway. The *Catholic* U., started in 1854, never got a charter. In 1880 Queen's U. was replaced by the *Royal* U. of Ireland, another examining body, which also failed to satisfy the people of Ireland. The Irish U's Act, 1908, abolished it and set up the *National* U. of Ireland (with constituent coll's at Cork, Galway, and Dublin) and *Queen's U. of Belfast*, a teaching u., intended primarily for Presbyterians and other Protestants, as the National U. is designed mainly for Catholics.

CANADA.—Language differences, disagreements of Catholics and Protestants, rivalries of Prot. sects, the Dominion's vast area, the absence of any Federal (national) authority in educational matters, and the conception (imported from England) of a u. as an examining institution as distinguished from the teaching institution, viz. the College, all combined to scatter broadcast throughout Canada degree-conferring bodies, many of which were—and are—unworthy of the name 'University.' Canada has a score of so-called u's, located as follows: ONTARIO: *Toronto* (with *Trinity* U. and *Victoria* U. affiliated), *Queen's* (Kingston), *M'Master* (Toronto), *Ottawa*, *Western* (London). QUEBEC: *M'Gill* (Montreal), *Laval* (Quebec and Montreal), U. of *Bishop's College* (Lennoxville). NOVA SCOTIA: *Dalhousie* (Halifax), *King's College* (Windsor), *Acadia* (Wolfville), *St. Francis Xavier* (Antigonish). NEW BRUNSWICK: *New Brunswick* (Fredericton), *Mount Allison* (Sackville). WESTERN PROVINCES (all XX.-cent. creations): U's of *Alberta*, *Saskatchewan*, *Manitoba*, *British Columbia*. These include 4 Anglican u's, 3 R.C., 2 Baptist, 2 Methodist, 1 Presbyterian; 7 unsectarian Provincial (*i.e.* State) u's (Toronto, New Brunswick, Dalhousie, Alberta, Saskatchewan, Manitoba, British Columbia; some teaching, some only examining; mostly with affiliated denominational coll's); and M'Gill (Independent; unsectarian but Prot. in atmosphere). The greatest Canadian u's are *Toronto*, *M'Gill*, *Dalhousie*, *Queen's* (Presbyterian), and *Laval* (Fr. R.C.). The oldest u. is *King's College* (N.S.), chartered 1802; the youngest, *British Columbia*, instituted 1912. NEWFOUNDLAND has no u. as yet.

AUSTRALIA.—Each State of the Commonwealth now has one and only one u. The three oldest and biggest bear names of cities—*Sydney* (founded 1850), *Melbourne* (1853), *Adelaide* (1876); the three youngest are called after States—*Tasmania* (1890), *Queensland* (1909), *Western Australia* (1911). All are teaching u's, centralised, State-endowed, non-sectarian (some have denominational residential coll's attached), following continental, Scot., or modern Eng. patterns, rather than Oxford and Cambridge residential collegiate system. Sydney and Melbourne have large teaching staffs, and have made names for themselves in the u. world. Tasmania (191,000 inhabitants) has one u.; so has New South Wales (1,650,000 inhabitants)—a remarkable distribution.

NEW ZEALAND.—The National U. of *New Zealand* is the sole degree-conferring body in that country. It has affiliated coll's in North and South Islands, including the U. of *Otago*, which suspended its degree-confer-

ring powers when the U. of New Zealand was founded (1870), provided the latter remained a purely examining and not a teaching body.

South Africa.—The Union of S. Africa has also only one u.—an examining board—the U. of the *Cape of Good Hope* (founded 1873). Seven or eight coll's in the various provinces prepare students for its examinations. The foundation of a National Central Teaching U. of South Africa at Groote Schuur (near Cape Town) is advocated, and large bequests have already been received (1913).

India.—Three examining u's were founded in 1857 in *Calcutta*, *Bombay*, and *Madras*; *Punjab* (Lahore, 1883) and *Allahabad* (1887) belong to the same type. Under this system Cram reigned supreme in India, non-descript affiliated institutions multiplied amazingly, and Higher Education was almost synonymous with Examination. The Indian U. Act (1904) permitted the u's to assume teaching functions and promote research—permission which is slowly being taken advantage of. A teaching U. at *Dacca* was authorised (1912), and U's at *Benares*, *Aligarh*, and U. of *Burma* at Rangoon are projected. Higher u. ideals seem at last to be gaining ground in India.

China.—A U. of *Hong Kong* was opened in 1912.

Malta.—The oldest u. in the Empire outside the Brit. Isles is the U. of *Malta* (1769), dating from before Brit. occupation.

United States.—North America has *c.* 1000 degree-conferring institutions calling themselves u's or coll's (Amer. 'colleges' are usually a transition stage between school and u.: pupils aged 17–21). Of these, some are great homes of learning, but many are utterly unworthy of their name. The Carnegie Foundation for the Advancement of Teaching is now sifting true from pseudo-u's. *Harvard*, America's *doyen* u., dates from 1636; *William and Mary*, 1693; *Yale*, 1701; *Princeton*, 1746. Unlike Eng. u's, Amer. u's progressed rapidly in XVIII. cent. They helped to found the Republic—'the Colleges united the Colonies.' State u's were established *c.* 1800 onwards; an ordinance of 1787 provided land-grants for u. purposes in N.W. Territory. The Morrill Act (1862) gave 30,000 acres for higher education to each State for each Senator and Representative in Congress. An influx of Ger. scholars (*c.* 1848) and Paris Exhibition (1873) also quickened the u. movement in America. By 1907 there were 39 State u's—democratic institutions, State-controlled, State-maintained. Private u's and coll's are mostly denominational, some aristocratic. Co-education is almost universal. Official statistics (1910) show over 600 u's and coll's, *c.* 80 % being private. States and individuals alike show extraordinary generosity towards u. education. Noted u's, besides aforementioned, are: *Boston*, *Brown* (R.I.), *Chicago*, *Columbia* (N.Y.), *Cornell*, *Johns Hopkins* (q.v.), *Leland Standford Jr.*, *New York*, *North Western* (Ill.), *Pennsylvania*, *Syracuse* (N.Y.), *Western Reserve* (Ohio); *California*, *Illinois*, *Indiana*, *Iowa*, *Kansas*, *Michigan*, *Minnesota*, *Missouri*, *Nebraska*, *Ohio*, *Virginia*, *Wisconsin* (State u's). U. of *State of New York* is purely administrative and non-teaching. Absence of Federal authority has hitherto prevented a National U. being established. Several u's provide for coloured students, e.g. *Howard* U. (District of Columbia).—Philippines: *St. Thomas U.* (Manila).

Germany has 21 u's, viz. *Heidelberg* (founded 1385), *Leipzig* (1409), *Rostock* (1419), *Greifswald* (1456), *Freiburg* (1457), *Tübingen* (1477), *Marburg* (1527), *Königsberg* (1544), *Jena* (1558), *Wurzburg* (1582), *Giessen* (1607), *Strassburg* (1621 and 1872), *Kiel* (1665), *Halle* (1694), *Breslau* (1702, 1811), *Göttingen* (1737), *Erlangen* (1743), *Münster* (1780), *Berlin* (1809), *Bonn* (1818), *Munich* (1826). Germany started later in the u. race than Italy, France, and England. The Renaissance was responsible for the XIV.–XV. cent. u's; Reformation and counter-Reformation account for those of XVI.–XVII. cent's. Halle was Germany's first modern u. Napoleon's wars wiped out almost a score of Ger. u's. Berlin U. marked the dawn of a new era, representing Prussia's determination to counterbalance military and territorial losses by intellectual conquests. In XIX. cent., Germany, so backward in Middle Ages, outstripped all rivals in u. progress. Her u's have greatly promoted Germany's national unity, international prestige, and industrial development.

Ger. u's are State institutions; the examinations for medical degrees, for instance, are State examinations. They enjoy limited autonomy and unlimited intellectual independence; *Lehr-* and *Lern-freheit* are u. watchwords. They are homogeneous; and students migrate freely from u. to u. A spirit of research and scientific investigation dominates every u. They are 'Day' u's—teaching institutions, without residential obligations or facilities, the unit being the faculty, not the coll. This type has been reproduced more or less successfully in Austria, Switzerland, Holland, Scandinavia. Ger. u. achievements have also given a great stimulus to Amer. and modern Eng. u's. The biggest Ger. u's are Berlin, Munich, Leipzig, Bonn.

Austria-Hungary.—*Prague* is the oldest u. in Central Europe, the first Teutonic u.; now a double u., German and Czech. Other famous u's are *Cracow* (Polish, 1349), *Vienna* (1365; great medical school). These are all State-maintained, as are modern *Czernowitz*, *Innsbruck*, *Graz*, *Lemberg*; *Budapest*, *Kolozsvar* (Magyar), *Zagreb* (Croatian).

Netherlands.—*Leyden* (1575) was once among most celebrated European u's; *Groningen* (1614), *Utrecht* (1636), are also State u's; *Amsterdam* has 2 u's, one municipal, one free.

Switzerland.—*Bâle* dates from 1460; *Lausanne*, 1537; *Geneva*, 1559; *Bern*, *Fribourg*, *Neuchâtel*, *Zürich* are modern; Swiss u's are Cantonal.

Scandinavia.—*Upsala* (1477), oldest Scandinavian u., was once most renowned in Europe; *Lund* (1666), *Stockholm* (1878), *Copenhagen* (1478), *Christiania* (1811).

Russia.—Imperial u's of *St. Petersburg* (1819) and *Moscow* (1755) are very large; smaller u's are *Dorpat* (1632), *Charkow*, *Kazan*, *Kiev*, *Odessa*, *Warsaw*, *Saratov*, *Tomsk*, *Shaniaosky* (Moscow). In Finland, u. founded in Abo (1640) was removed to *Helsingfors* (1828).

Belgium.—*Louvain* (1425) is a Catholic u.; *Ghent* and *Liège* (1816, 1817) are State u's, *Brussels* a free u.

France.—In XIII. cent. many coll's (first and foremost, the *Sorbonne*) gathered round the *U. of Paris*, and famous u's arose at *Toulouse*, *Montpellier*, *Orleans*, etc. These and later u's were all swept away by the Revolution. In their place Napoleon created the *U. of France* (1808), embracing all educational institutions of the empire. Thus u. came to mean an administrative system, not a teaching institution (cf. U's of *London* and *State of New York*). Independent u's were re-established, 1897, faculties being grouped again in local u's, instead of being attached to U. of France. Existing State u's are: *Paris*, *Lyons*, *Lille*, *Bordeaux*, *Toulouse*, *Montpellier*, *Nancy*, *Aix-Marseille*, *Caen*, *Dijon*, *Grenoble*, *Besançon*, *Poitiers*, *Rennes*, and *Clermont*; also *Algiers*. There are several free 'Faculties' in certain towns.

Italy in the Middle Ages was famous for its u's, taking the lead in many respects. *Bologna* (XII. cent.) is perhaps the oldest European u.; other State u's are *Padua* (1222), *Naples* (1224; now greatest), *Genoa* (1243), *Macerata* (1290), *Siena* (1300), *Rome* (1303), *Pisa* (1343), *Pavia* (1361), *Turin* (1412), *Catania* (1434), *Parma* (1502), *Messina* (1549), *Cagliari* (1626), *Sassari* (1677), *Modena* (1678), *Palermo* (1779). Free u's are *Perugia* (1308), *Ferrara* (1391), *Urbino* (1564), *Camerino* (1727); *Florence* has an Institute of Higher Studies.

Spain.—*Salamanca* (1243) enjoyed a great reputation in Middle Ages. *Valladolid* dates from 1346; *Barcelona* (1340), *Saragossa* (1474), *Valencia* (1501), *Seville* (1502), *Santiago* (1504), *Granada* (1531), *Oviedo* (1608); Alcala (1499) was removed to *Madrid*, now one of Europe's largest u's.

Portugal has one u.—*Coimbra*, originally founded at Lisbon (1290).

Other European u's are: GREECE—*Athens* (1837). RUMANIA—*Bucharest* (1864), *Jassy* (1860). BULGARIA—*Sofia* (1888). SERVIA—*Belgrade*. TURKEY—*Constantinople* (

Egypt.—*El Azhar* (Cairo: Moslem; 972 A.D.).

Japan.—State u's at *Tokio*, *Kioto*, *Tokohu*.

China.—*Imperial U. of Peking* and *U. of Tientsin*; 'Western' U. projected.

South America.—PERU—The oldest u. in Amer. Continent is *San Marcos* (Lima; 1551); others are *Arequipa*, *Cuzco*, *Trujillo*. ARGENTINE—National u's at *Cordoba*, *Buenos Aires*; Provincial at *La Plata*, *Santa Fé*, *Paraná*. CHILE—*Santiago*. ECUADOR—*Quito*. HONDURAS—*Tegucigalpa*. URUGUAY—*Montevideo*.

Rashdall, *U's of Europe in the Middle Ages* (1895), *Thriving U's of the World* (1911); *Minerva Lexicon* (annual: U. Directory); Eliot, *Univ. Administration*; Curzon, *Principles of Univ. Reform*; Paulsen, *The Ger. U's* (1906).

College Fraternities.—Societies in univ's of U.S.A. and Canada are also termed Gk. Letter Societies (e.g. *Phi-Beta-Kappa*). They are composed of men organised into lodges generally on a basis of common tastes. Members of all the four years of coll. are eligible; the lodges are nominally secret. In 1910 the number of men's general fraternities was 32, with 1068 living chapters and owning much valuable property. The first men's society was founded at the Coll. of William and Mary, at Williamsburg, Virginia, 1776; the first woman's soc. or sorority (*Kappa-Alpha-Theta*) was founded in 1870, at De Pauw Univ., and in 1910 there were 17 general sororities with some 300 active chapters. Their place in Amer. college life is invaluable, and takes the place to a great extent of the Eng. collegiate system.

UNLEAVENED BREAD, see PASSOVER, HOST, EUCHARIST.

UNNA (51° 32′ N., 7° 41′ E.), town, Westphalia, Prussia; iron- and salt-works. Pop. 17,380.

UNST (60° 45′ N., 0° 53′ W.), most northerly of Shetland Islands. Pop. (1911) 2077.

UNTERWALDEN (*c.* 46° 50′ N., 8° 20′ E.), canton, Switzerland; area, 295 sq. miles; comprises the two half-cantons of Obwalden and Nidwalden. Surface is mountainous, reaching extreme height of *c.* 10,600 ft. in Mt. Titlis; drained by Aa. Dairy-farming is carried on; fruit is cultivated and live stock raised. Chief town of Obwalden is Sarnen; of Nidwalden, Stanz. Pop. (1910) 30,919.

UNYAMWEZI, region, Ger. E. Africa, between Lakes Victoria and Tanganyika; inhabited by Bantus.

UNYORO (1° N., 31° E.), territory, Brit. E. Africa, between Uganda and Lake Albert Nyanza.

UPANISHADS, Brahmanical metaphysical treatises, the older forming part of the Vedas. See SANSKRIT LITERATURE.

UPAS TREE (*Antiaris toxicaria*), native to Malay Archipelago, yields a virulent poison (*upas*) used for poisonous arrows; formerly reputed to kill all animal life near it.

UPERNIVIK, see GREENLAND.

UPPER SIND FRONTIER (28° N., 69° E.), district, Sind, Bombay, India. Pop. 240,000. Capital, Jacobabad.

UPPINGHAM (52° 36′ N., 0° 43′ W.), town, Rutlandshire, England; famous public school (1584). Pop. (1911, rural district) 6735.

UPSALA (59° 51′ N., 17° 38′ E.), city, on Fyris, capital, län of Upsala, Sweden; seat of an abp. (Primate of Sweden) and of a univ. (1477); the cathedral (1260) contains monuments of some of the Swed. kings and of the naturalist Linnæus; 2 miles N. is site of the mediæval town of Old U. Pop. (1911) 26,586; (län) 129,404.

UPUPA, HOOPOES (*q.v.*).

UR (UR OF THE CHALDEES) (30° 50′ N., 46° 20′ E.), ancient city, Babylonia, now represented by the ruins of Mughair, on Euphrates; was native place of Abraham and residence of the earliest Babylonian kings; an important maritime and commercial city.

URÆMIA, condition resulting from failure of poisonous matter to pass from blood to urine.

URAL MOUNTAINS (51° to 68° N., 59° to 65° E.), series of ridges running in various directions, which form the physical boundary between European and Asiatic Siberia, with total length of *c.* 1500 miles; height, *c.* 1300 ft., in extreme N.; over 5500 ft. farther S., reaching extreme height of 5530 ft. in Murai-chakkl; 3000 to 5000 ft. in centre, and 3000 to 5400 ft. at S. end. Rich in minerals, gold, copper, iron, platinum, silver, coal, salt, malachite, precious stones. Many large forests on the slopes; crossed by railways from Perm to Ekaterinburg and Tiumen, and by Siberian railway between Samara and Ufa.

URAL-ALTAIC, a group of languages, sometimes called Turanian, of Eastern origin. The present-day languages directly attaching themselves to this group are Turkish, Mongolian, Manchu, Finnish, and Magyar. Theories have been advanced connecting with this group Japanese, old Etruscan, and the philologically mysterious language of the Basques of the Pyrenees. The whole group belongs to that class of languages mentioned under II. in the article on PHILOLOGY (*q.v.*), capable of a small degree of inflection, but in the main agglutinating.

URALSK (51° N., 51° E.), province, Asiatic Russia, in N. of Caspian Sea; belongs to the general-governorship of the Kirghiz Steppes. Pop. (1910) 775,400. Capital, **Uralsk** (51° 12′ N., 51° 24′ E.), on Ural; trade in cattle with the Kirghiz. Pop. (1910) 58,240.

URANIUM (U=238·5), white metal allied to chromium; occurs as U_3O_8 in pitchblende; S.G. 18·7, M.P. very high; radioactive, 'ancestor' of radium. Oxides and derivatives: UO_2, uranous salts, green: UCl_4, $U(SO_4)_2 9H_2O$; UO_3, uranyl salts, yellow, fluorescent: $UO_2(NO_3)_2 6H_2O$; uranates: $Na_2U_2O_7$ (uranium yellow, makes glass yellow, with green fluorescence); $U_3O_8 = UO_2.2UO_3$; UO_4.

URANUS, planet discovered by Sir William Herschel in 1781; distance from sun, 1780 million miles; diameter, about 32,000 miles; period, 84 years; four satellites, with nearly circular orbits, whose plane is inclined 82° to that of the ecliptic: satellites revolve contrary to usual direction in solar system; spectrum shows a dense atmosphere.

URA-TYUBE, ORA-TEPE (39° 50′ N., 68° 50′ E.), town, Syr-Darya, Russ. Turkestan; manufactures cotton goods. Pop. 23,500.

URBAN, name of 8 popes.—**Urban II.**, ODO DE LAGARY, pope, 1088–99; cardinal, 1078; succ. Victor III., and continued work of Gregory VII.; opposed Philip I. of France; presided at Council of Clermont which proposed First Crusade, 1095.—**Urban VI.**, BARTOLOMMEO PRIGNANO, pope, 1378–89; b. 1318; the Great Schism began with his pontificate.—**Urban VIII.**, MAFFEO BARBERINI, pope, 1623–44; b. 1568; a worldly man, suspected for relations with Protestants.

URBANA (40° 5′ N., 83° 42′ W.), city, capital, Champaign County, Ohio, U.S.A.; seat of U. univ. (Swedenborgian); manufactures furniture, agricultural machinery. Pop. (1910) 7739.

URBINO (43° 43′ N., 12° 39′ E.), town, Pesaro e Urbino, Italy; has a modern cathedral, several interesting old churches, and a ducal palace, built in XV. cent., and containing fine art collections; seat of free univ. (1564); birthplace of Raphael (*q.v.*); cheese, silks; formerly celebrated for majolica. Pop. 20,000.

URBS SALVIA (43° 12′ N., 13° 25′ E.), modern *Urbisaglia*, ancient town, Picenum, Italy.

URCHIN, see ECHINODERMATA.

UREA, $CO(NH_2)_2$, a crystalline substance, soluble in water; M.P. 132° C.; occurring in urine of mammals, carnivorous birds, and reptiles; human urine contains about 3 %; produced artificially by Wöhler, in 1828, by evaporating an aqueous solution of ammonium cyanate, which underwent isomeric change,

thus: $NH_4O.C:N \longrightarrow NH_2.CO.NH_2$. This was the first synthesis of an 'organic' compound from inorganic materials. U. is carbamide, *i.e.* amide of carbonic acid, and may be obtained, like other amides, by action of ammonia on chloride of the acid.

UREDINEÆ, see FUNGI.

URETHRA, DISEASES OF, see GYNECOLOGY.

URFA, see EDESSA.

URGA (47° 58′ N., 106° 40′ E.), city, on Tola, Mongolia; religious and commercial centre. Pop. *c.* 27,000.

URI (*c.* 46° 48′ N., 8° 40′ E.), E. central canton, Switzerland; bounded by Schwyz, Glarus, Grisons, Ticino, Valais, Bern, Unterwalden; area, 415 sq. miles. Surface is generally mountainous, except along valley of Reuss; highest points include Gallenstock, Sustenhorn, St. Gothard; chief town, Altdorf. Live stock raised; dairy-farming carried on. Formed league with Schwyz and Unterwalden, 1291, which was beginning of Swiss Federation. Pop. (1910) 22,113.

URIA, GUILLEMOT (*q.v.*).

URICONIUM (52° 41′ N., 2° 39′ W.), modern WROXETER, ancient town, Britain.

URIM AND THUMMIM, in Old Testament, were probably a kind of lot; important decisions were taken by means of them; only used in early times, and in the Priestly Code their precise form seems forgotten.

URINARY SYSTEM, the function of which concerns excretion of waste products from the body contained in the fluid termed the *urine*, comprises the *kidneys*, the *ureters*, the *urinary bladder*, and the *urethra*.

The KIDNEYS are a pair of glands of a characteristic bean-shaped form, having a convex outer border and a concave inner border, with somewhat bulging extremities, while their colour is a deep brownish red. They are about 4 in. long, 2 in. broad, and 1 in. thick, weighing about 4 to 6 oz. They are situated in the upper part of the back of the abdominal cavity, one on each side of the vertebral column, the left kidney placed rather higher than the right. The substance of the kidney consists of a vast number of minute lengthy and complicated tubules, with which are associated numerous small blood vessels. Each tubule begins from a small dilatation called a *Malpighian capsule*, into which a bunch of thin-walled capillary blood vessels projects, and through the walls of this bunch the water and salts of the fluid part of the blood, of which the *urine* is composed, easily pass by filtration into the capsule and proceed down the tubule. The tubules pour the urine into the *pelvis* of the kidney, which is a diluted part of the ureter in the interior of the kidney.

The URETER is a narrow tube, of comparatively thick walls, which conveys the urine from the pelvis of the kidney to the urinary bladder, passing downwards and inwards in the posterior wall of the abdomen, behind the peritoneum.

The URINARY BLADDER is a sac serving as a reservoir for the urine, which it receives from the kidneys by the ureters and expels from the body by the urethra. Its situation and its relations depend upon the amount of its distension; when empty it lies entirely within the pelvis, but when distended it rises up into the abdomen. When empty it is somewhat pyramidally shaped, the apex pointing downwards, where the urethra commences. The bladder is held in position mainly by ligaments attached from the pelvis to the apex or *neck*. The walls of the bladder are composed of an outer coat of peritoneum present, however, only on the upper parts of the organ, a middle coat of three layers of muscular fibres, and an inner coat of mucous membrane, much corrugated when the bladder is empty. As the bladder becomes distended rhythmic contractions of its muscular walls are set up, which increase in strength until the urine is expelled by the urethra.

The URETHRA is the canal by which the urine is conveyed from the bladder to the exterior. In the male it is about 8 or 9 inches in length, and also serves to convey the secretion of the reproductive glands or *testicles*; it passes through the *prostate* gland and through the *corpus spongiorum* of the penis, at the end of which organ it opens. In the female the urethra is about an inch and a half in length, directed downwards and forwards, and opening by a small slit immediately in front of the vagina.

See KIDNEY, BLADDER, BLOOD.

URMIA, URUMIAH.—(1) (37° 35′ N., 45° E.) town, near Lake Urmia, Azerbaijan, Persia; centre of missionary activity; exports dried fruit. Pop. *c.* 90,000. (2) (37° 40′ N., 45° 30′ E.) salt lake, Persia; contains numerous islands; shallow, no outlet; area, 1795 sq. miles.

URN, a vase of marble, glass, or clay, for ashes of the dead. See Sir Thomas Browne's *Urn-Burial*.

UROCHORDA, TUNICATA (*q.v.*).

UROTRICHUS, see under MOLE FAMILY.

UROTROPINE, colourless, granular crystalline substance prepared by the combination of ammonia with formaldehyde, and used medicinally as a urinary antiseptic, especially in cystitis (inflammation of the bladder), and to disinfect the urine in persons convalescent from typhoid fever (*q.v.*).

URQUHART, DAVID (1805–77), Eng. diplomatist; attached to embassy at Constantinople, 1835. Wrote *Turkey and its Resources* and other works. Introduced Turk. baths to England.

URQUHART, SIR THOMAS, of Cromarty (1611–60), Scot. writer and soldier; fought against Covenanters, fled to England, where Charles I. knighted him, 1641, in which year he pub. his *Epigrams*; taken prisoner by Roundheads at *Worcester*; in 1652 he wrote *The Jewel*, an encomium on the Scots, and *The Pedigree*, a history of his family from the creation; he pub. in 1653 an *Introduction to the Universal Language*, and his best work, a translation of *Rabelais*.

URSA MAJOR, THE GREATER BEAR, constellation in N. hemisphere; also called The Plough, Charles's Wain, or The Wagon; the two stars in line with the Pole Star are the Pointers.

Ursa Minor, THE LESSER BEAR, constellation in N. hemisphere, includes the Pole Star (*Ursæ Minoris*); also named Cynosure or Dog's Tail, because of its s.

URSINS, PRINCESS DES, MARIE ANNE DE LA TRÉMOILLE (1642–1722), lady of Span. court; as chief of household to queen of Spain, attained great power which ended on queen's death and king's remarriage.

URSULA, ST. (III. or V. cent.), a mythical saint with attendant maidens, in R.C. calendar; her day is Oct. 21; first mentioned in IX. cent.; associated with Cologne; legend reached most elaborate form in XI. cent. U. was the dau. of a king and was martyred with 11,000 virgin companions—the story probably a Christianised version of a Teutonic myth.

URSULINES, female monastic order, existing since 1535; nurses and teachers.

URTICARIA, see NETTLERASH.

URUGUAY (30° to 35° S., 53° 26′ to 57° 41′ W.), small republic, S. America, to N. of Rio de la Plata; bounded N.E. by Brazil, S.E. by Atlantic, S. by River Plate, W. by Argentina; area, 72,210 sq. miles. Surface is flat with low ridges of hills, reaching an extreme height of *c.* 2000 ft.; drained by Rio Negro and other tributaries of the Uruguay. Climate is healthy; temperature ranges from 35° to 90° F.

U. was discovered by Span. explorers early in XVI. cent.; was included in Span. dominions until 1811, and was subsequently seized by Portuguese; remained a province of Brazil until 1825, when it proclaimed itself an independent republic, being formally recognised as such three years later. Legislative power is vested in a Senate of 19 members and House of Representatives of 75 members. Executive power is held by the president.

Chief towns, Montevideo, Paysandu, Colonia, Minas. Principal industry is rearing of cattle and sheep; extensive exports of meat, wool, and animal pro-

ducts. Wheat and maize are chief crops, and grapes, olives, and tobacco are grown. Minerals include gold, copper, lead, silver, mercury. Education is free and obligatory. State religion, R.C. Pop. 1,178,000.

URUGUAYANA (29° 38′ S., 56° 59′ W.), town, river port, on Uruguay, Rio Grande do Sul, Brazil; trade in cattle. Pop. 15,000.

URUMIAH, see URMIA.

USEDOM (54° N., 14° E.), island, in Baltic, belonging to Pomerania, Prussia. Pop. 39,000.

USELIS (39° 47′ N., 8° 45′ E.) (modern USELLUS), ancient town, Sardinia.

USHAK (38° 40′ N., 29° 30′ E.), town, Asia Minor; manufactures 'Turkey' carpets. Pop. 12,000.

USHANT, OUESSANT (48° 28′ N., 5° 3′ W.), island of France, belonging to Finistère department.

USHER, JAMES (1581 – 1656), Anglican ecclesiastic; ed. Trinity Coll., Dublin; bp. of Meath, 1621; abp. of Armagh, 1625; came to England, 1640, and remained; author of numerous works; formulated chronological scheme often printed in margins of Eng. Authorised Version.

USK.—(1) (51° 42′ N., 2° 55′ W.) town, on Usk, Monmouthshire, England. (2) (51° 39′ N., 2° 54′ W.) river, Wales and England, joins estuary of Severn; length, 60 miles.

USKOKS, Uscocs, Christians of Bosnia and Herzegovina expelled by the Turk. invasion in XVI. cent. From Dalmatia and Croatia they waged war against the Turks and practised piracy; disbanded by Austria and established in interior of Croatia, 1617.

USKUB (42° 1′ N., 21° 45′ E.) (ancient *Scupi*; Servian SKOPLYE), town, on Vardar, capital, vilayet Kossova, Servia; strategic point; commercial centre; dyeing and weaving industries; was once capital of the Servian kings. Captured by Allies in Turko-Balkan War (*q.v.*), 1912. Pop. *c.* 31,000.

USTICA (38° 44′ N., 13° 12′ E.), mountainous island, in Mediterranean, belonging to Italy.

USTILAGINEÆ, see FUNGI.

USTYUG VELIKIY (61° N., 46° E.), town, on Sukhona, Vologda, Russia; manufactures woollens; exports grain. Pop. 12,500.

USURY was always condemned by R.C. Church, and was an offence against the law in England in Middle Ages. Elizabeth fixed the interest at 10 %, and in 1624 it became 8 %. The growth of commerce and the rejection of Catholic authority made the u. laws a dead letter, and in 1854 they were repealed. The distinction between u. and interest is that u. is living by the lending of money, while interest is accepting from another the profit that would

UTAH (37° to 42° N., 109° 2′ to 114° 2′ W.), inland western state, U.S.A., lying among western ridges of

Rocky Mountains; bounded N. by Idaho, Wyoming, E. by Wyoming, Colorado, S. by Arizona, W. by Nevada; area, 84,928 sq. miles; the Wahsatch Mountains, which run roughly N. and S., reach height of *c.* 13,000 ft., and the Uintah range in N.E. rises in highest point to *c.* 14,000 ft.; in N.W. is the Great Salt Lake; watered by Colorado R., with the Green, Grand, Fremont, San Juan and other tributaries, and by the Sevier and other streams. Climate is subject to great extremes in mountainous districts, healthy and temperate in valleys; rainfall very small and irregular; soil fertile wherever irrigation water can be obtained.

U. was transferred from Mexico to the U.S. in 1848, and was settled by the Mormons under Brigham Young; organised as a Territory, 1850; admitted to the Union, 1896. Executive power is vested in a governor who is assisted by 5 officers of state; legislature consists of a Senate of 18 members and House of Representatives of 46 members, elected respectively for 4 and 2 years by popular vote. For purposes of local administration the state is divided into 27 counties.

The chief towns are Salt Lake City (capital) and Ogden. Agriculture is successfully carried on in the fertile regions where water is obtainable; chief crops, wheat, oats, potatoes, hay; maize, barley, and rye are also cultivated, and sugar-beet is an important product. Various fruits and vegetables are grown, and horses, cattle, sheep, and pigs are raised. Minerals include silver, copper, lead, gold, coal, asphalt, salt. Industries of importance are copper-refining, flour-milling, fruit-canning, and the manufacture of boots and shoes, sugar, cheese, and butter. Railway mileage in 1910 was over 2000. Education is free and obligatory for children between the ages of 8 and 16. Salt Lake City is seat of State Univ., and there are Mormon univ's or colleges at Logan, Provo, and Salt Lake City. The principal religion is Mormonism, which is professed by about three-fourths of the entire population; other creeds are R.C., Presbyterian, Methodist. Pop. (1910) 373,351.

UTAKAMAND, see OOTACAMUND.

UTERUS, DISEASES OF, see GYNECOLOGY.

UTGARTH, see ASGARD.

UTICA.—(1) (37° 10′ N., 10° 10′ E.) (modern PORTO FARINA) city, at mouth of Bagradas, ancient Africa; founded by Phœnicians; took part with Rome in third Punic War; on the destruction of Carthage became chief town of the Rom. province of Africa; scene of Cato's death. (2) (43° 5′ N., 75° 16′ W.) city, on Mohawk, capital, Oneida County, New York, U.S.A.; manufactures hosiery, cotton goods; trade in cheese; noted for the number of its charitable institutions. Pop. (1910) 74,419.

UTILITARIANISM, the theory that the moral value of actions depends on their conduciveness to general happiness. See ETHICS.

UTOPIA, see MORE, SIR THOMAS.

UTRAQUISTS, see HUSSITES.

UTRECHT (27° 30′ S., 30° 26′ E.), town, Natal; coal-fields.

UTRECHT (52° 5′ N. 5° 7 E.), city, on Crooked Rhine, Holland; capital of U. province; strong fortress; city intersected by two canals, Oude and Nieuwe Gracht. Outstanding features are St. Martin's Cathedral (1254–67), R.C. cathedral (1524), Janskerk (begun XI. cent.), pope's house (1517), built by Adrian VI., picture-gallery, museums, univ. (1634), library, Maliebaan (fine triple avenue), Hoogeland park. In Middle Ages U. was centre of bp.'s see (see UTRECHT PROVINCE); passed to Spain, 1528; *Union of U.*, 1579, established Dutch independence; *Treaty of U.* (vide infra) signed here, 1713. Chief industries are printing, machinery, chemicals, woollens, silks, velvets, tobacco, cigars, plate-glass. Pop. (1911) 121,317.

Utrecht, Treaty of (1713), name of nine distinct treaties which ended War of Span. Succession. Most important results: England obtained Newfoundland, Nova Scotia, St. Kitts, Hudson's Bay, from France; Gibraltar and Minorca from Spain. Philip was recognised as king of Spain; gave up Sicily to Savoy, Milan, Naples, and Span. Netherlands to emperor. Guarantee given that Fr. and Span. crowns would not be united.

UTRECHT PROVINCE, smallest province of Holland, lies S. of Zuider Zee; watered by several branches of the Rhine delta; area, 534 sq. miles; capital, Utrecht (*q.v.*); agriculture, cheese (Gouda), butter, wheat, fruit, cattle-rearing, etc. U. was governed by bp's, VIII.–XVI. cent's; continual strife with burghers and powerful neighbours; bp.'s temporal power broken, XIV. cent.; sold to Charles V., 1528; rose against Spain, 1579; became centre of Jansenists, *c.* 1720; taken by Prussians, 1787, by French, 1795; restored to Holland, 1814. Pop. 295,000.

UTRERA (37° 10′ N., 5° 49′ W.), town, Seville, Spain. Pop. 15,700.

UTTARPARA (22° 41′ N., 88° 23′ E.), town, on Hugli, Bengal, Brit. India. Pop. 7300.

UTTOXETER (52° 54′ N., 1° 52′ W.), town, Staffordshire, England; manufactures agricultural implements. Pop. (1911) 5719.

UXBRIDGE (51° 34′ N., 0° 26′ W.), town, on Colne, Middlesex, England. Pop. (1911) 10,374.

UXMAL (20° 12′ N., 90° 2′ W.), deserted city, Yucatan, Mexico; remarkable Mayan ruins.

UZÈS (44° N., 4° 20′ E.), town, on Auzon, Gard, France; castle and cathedral; manufactures silk. Pop. 4100.

UZHITSE, UZICE (43° 50′ N., 19° 45′ E.), town, Servia. Pop. 7500.

UZZIAH, king of Judah; s. of Amaziah; in his reign Isaiah began to prophesy; the condition of the country under his rule is described in *Isaiah* 2.

V, the 22nd letter of the alphabet, a differentiated form of U. It was absent from the Anglo-Saxon alphabet, where its place was served by the symbol *f*.

VAAL (26° 30′ S., 24° 30′ E.), river, S. Africa; rises in Mount Klipstapel; flows with a winding S.W. course to the Orange River; length, 700 miles.

VACARIUS (1120–1200 ?), Ital. lawyer; first to teach Rom. law in England; brought to Canterbury to assist Abp. Theobald, 1146; lectured at Oxford; prominent ecclesiastical judge till end of XII. cent.

VACCINATION, the inoculation in human beings of cowpox, a disease of cattle, as a prevention against smallpox (*q.v.*). The practice of inoculation of smallpox in healthy persons, with the purpose of producing a slight attack of the disease with subsequent immunity to it, was introduced from the East into England by Lady Mary Wortley Montagu in 1721. Edward Jenner, a medical practitioner in Gloucestershire, found that there was a current belief in that part of the country that dairymaids and other persons who had contracted cowpox from cows could not take smallpox afterwards. In 1796 he inoculated a boy with cowpox and, some weeks later, inoculated him with smallpox, to find that he did not contract the latter disease. After further experiments, cowpox inoculation became widely practised, taking the place of smallpox inoculation.

The method which was followed for many years was arm-to-arm v., the matter being taken from a vesicle on the arm of one child and inoculated on the arm of another; glycerinated calf lymph is now, however, universally employed in Britain in v. The methods and practice of v. are regulated in Britain by various Acts of Parliament, the chief provisions at present being that every child must be vaccinated before the age of six months unless the parents satisfy a magistrate that they have a conscientious objection, on sufficient grounds, to v., or that a medical man certifies that v. would be prejudicial to the child's health, in which case the age limit may be extended; and v. is carried out at the home of the child.

Since the introduction of v. the case-mortality of smallpox has diminished from 37 % to 5 %, although it has been shown that in epidemics even at the present day the case-mortality among unvaccinated persons still reaches the former figure, this fact disproving the argument that the decreased case-mortality in smallpox is due to improved sanitation and care for the public health. Formerly, also, before the introduction of v., smallpox was a disease mainly of infancy, while to-day it is a disease mainly of adults, the infants being protected by v., the immunising power of which gradually grows less in adult life. In those countries where re-v. is compulsory, and in those particular classes of the community of other countries in which it is made compulsory, *e.g.* civil servants, soldiers, smallpox is practically unknown, and, in the former, when cases do occur they can be treated in the ordinary hospitals. Protection given by v. against smallpox gradually diminishes, from seven to ten years being the period for which it lasts, and re-v. is necessary to secure full protection, the re-v. of children at the age of ten having been shown to confer efficient protection for the remainder of life.

VACUUM TUBE, a glass tube from which the air has been exhausted, used for the study of the electric discharge through a gas at low pressure; inside the ends are sealed metal electrodes, which can be connected to an electric machine, and a spark thus produced in the tube. The exhaustion is carried out either by an air, water, or mercury pump, but the best results are given by Prof. Dewar's method, wherein the tube, after a preliminary exhaustion by pump, is put into connection with carbon, frozen by liquid air; the carbon will absorb air or gas still remaining. Its use has resulted in the discovery of Röntgen or X-rays, and radio-activity.

VACUUM-CLEANER, machine for removing dust by suction; driven by petrol or electricity; portable hand-driven v's common.

VACZ, WAITZEN (47° 47′ N., 19° 7′ E.), town, on Danube, Hungary; bp.'s see; trade in grapes. Pop. 17,200.

VAGINA, DISEASES OF, see GYNECOLOGY.

VAGRANCY, in law, is wandering abroad without visible means of subsistence, and has been a criminal offence from Henry VIII.'s time. Many repressive and penal measures have been passed against v., but no remedial legislation has been enacted. Remedial measures have been left to philanthropic agencies. While the dislocation of trade and other economic changes are responsible for much v., there are always certain persons of nomadic instinct to whom the life appeals.

VAIGACH (70° N., 60° E.), island of Russia, in Arctic Ocean, between mainland and Novaya Zemlya.

VAISON (44° 18′ N., 5° 10′ E.) (ancient *Vasio*), town, on Ouvèze, Vaucluse, France; Rom. remains.

VAISYA, see BRAHMANISM, HINDUISM.

VALAIS (46° 10′ N., 7° 40′ E.), border canton, Switzerland, to N. of Italy; area, 2027 sq. miles. Surface consists of a deep valley about 80 miles long and 2 broad, between Pennine and Bernese Alps; drained by Rhône; there are forests with valuable timber-trees on the mountain slopes, and a considerable area is covered with excellent pasturage; cattle raised; silkworms reared; wine produced. Chief town, Sion. V. is connected with Italy by the Simplon and Great St. Bernard Passes. Has been a member of Swiss confederation since 1815. Pop. (1910) 128,381.

VALDEMAR I. (1131–82), king of Denmark; formed alliance with Henry, Duke of Saxony, and defeated Wends of Baltic, conquering Rügen, 1168–69; with his minister, Absalom, greatly increased Dan. prosperity.

VALDEMAR II. (1170–1241), king of Denmark; acquired Holstein and Ger. territories N. of Elbe; led crusade against, and defeated, Esthonians, 1218; imprisoned by Henry, Count of Schwerin, 1223, and compelled to surrender Northalbingia and other possessions; tried to recover them, but was defeated at Bornhövede, 1227.

VALDEMAR IV., king of Denmark (c. 1320–75), recovered N. Zealand, 1344; sold Esthonia to Livonian order, 1346; regained rest of Zealand and S. islands, 1347. By 1361 had recovered Scania from Sweden, and most of old Dan. possessions; his conquest of Gotland, 1361, caused wars with Hanseatic League: had to make great concessions at Stralsund, 1370, but recovered most of Holstein.

VALDEPEÑAS (38° 50′ N., 3° 27′ W.), town, Ciudad Real, Spain; produces wine; mineral springs. Pop. (1910) 23,580.

VALDES, JUAN DE (1500–41), Span. author; pub. anonymously *Diálogo de Mercurio y Caron*, 1528, against ecclesiastical scandals, hence suspected by Inquisition; translated Scripture into Span.; writings tinged with mystic evangelicalism.

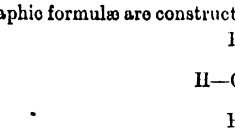
VALDIVIA (40° S., 73° W.), province, S. Chile. Pop. 140,000. Capital, **Valdivia**. Pop. 17,000.

VALDOSTA (30° 38′ N., 83° 18′ E.), town, capital, Lowndes County, Georgia, U.S.A.; manufactures cotton products. Pop. (1910) 7656.

VALENCE (44° 56′ N., 4° 53′ E.), town, France; capital of Drôme, on Rhône; cathedral (XI. cent.), Maison de Têtes (1531); foundries, tanneries, silks. Pop. 24,000.

VALENCIA.—(1) (39° 20′ N., 1° W.) province, Spain, bordering Mediterranean; fertile and well cultivated; chief rivers, Guadalaviar and Jucar; formerly an independent Moorish kingdom; conquered by Aragon, 1238. Pop. (1910) 884,298. (2) (39° 27′ N., 0° 20′ W.) chief town of V. province, Spain, on Guadalaviar; abp.'s see, has cathedral dating from XII. cent. and abp.'s palace; seat of univ.; exports olives and olive oil, various fruits; manufactures silks, tiles, linen, leather, cigars. V. was captured by French, 1812. Formerly fortified. Pop. (1910) 233,348. (3) (10° 9′ N., 68° 12′ W.) city, near Lake Valencia, capital, Carabobo state, Venezuela. Pop. 40,000.

VALENCIA DE ALCÁNTARA (42° 17′ N., 5° 36′ W.), fortified town, Cáceres, Spain; active commerce; Rom. relics. Pop. 9500.



VALENCIENNES (50° 22′ N., 3° 30′ E.) (ancient *Valentianæ*), fortified town, at junction of Rhônelle and Scheldt, Nord, France; coal-mining centre; manufactures iron, sugar; formerly famous for its lace; taken by the Spaniards, 1567; by Louis XIV., 1677. Pop. (1911) 34,766.

VALENCY is the chemical value of an atom for purposes of combination or displacement. Consider the series—

$$HH\ HCl\ H_2O\ H_3N\ H_4C\ Cl_5P\ Cl_6W.$$

The chlorine atom in HCl is chemically equivalent to a hydrogen atom, for it has taken its place; the oxygen atom in H_2O is equivalent to two hydrogen atoms, with which it combines or displaces from two molecules of hydrogen. Similarly the nitrogen atom in H_3N is worth three hydrogen atoms.

Potentially, v. rises from 1 to 8 in the groups of the periodic system; actually it is variable, and often differs by 2 in different compounds of the same element, *e.g.* $SnCl_2$, $SnCl_4$. V. is represented by figures, *e.g.* C^{IV}, or by 'bonds,' *e.g.* —C—, by means of which graphic formulæ are constructed, *e.g.*—

Various theories of v. have been propounded to meet difficulties presented by numerous complex compounds. 'Molecular compounds' and the 'amines' are not explained by the usual conceptions. A theory supposes that units of v. are electrons, which form the bonds of chemical affinity.

VALENS, Byzantine emperor, 364–78 A.D.; reduced taxation, 366; persecuted orthodox Christians; fought against Persia, 373–75; waged war on Goths; was defeated and killed at battle of Adrianople.

VALENTIA, Valencia (51° 54′ N., 10° 25′ E.), island, off W. coast of Kerry, Ireland; terminus of several Atlantic cables.

VALENTIA, SIR FRANCIS ANNESLEY, Viscount (1585–1660), Brit. statesman; accused of corruption by Strafford; Sec. for Ireland during Commonwealth.

VALENTINE'S DAY, Feb. 14, formerly believed to be first day of birds' mating; hence custom of youths and maidens sending each other 'valentines'—usually humorous love-letters, caricatures, etc.; custom is almost dead in Britain; possibly connected with St. Valentine, martyred at Rome, Feb. 14, 271.

VALENTINIAN I., Flavius Gratianus Valentinianus, Rom. emperor, 364–75 A.D.; made his bro. Valens emperor of East, himself ruling West; waged war in Africa, Britain, Germany; defeated barbarian tribes, Alemanni, Saxons, and Burgundians; chief work was fortifying frontiers along Rhine; a Christian.

VALENTINUS is said to have been born in Egypt (Epiphanius), and to have begun his teaching in Cyprus; flourished in Rome during the times of Pius and Anicetus, A.D. 138–60 (Irenæus), and according to Tertullian apostatised on being refused a bishopric.

His disciples, the **Valentinians**, were of two schools: the Oriental, in Egypt and Syria, and the Ital., which spread from Rome to the Rhône; they developed the doctrine exoteric for ordinary church use, and esoteric for the initiated, and it is doubtful how much Valentinus himself taught. It was Platonic in foundation, Docetic and Dualist. The supreme Deity, called the Abyss or Unfathomable One, manifested Himself by sending forth a number of Æons, male and female, 30 in all, who constituted the Pleroma or Fulness of God. Christ was produced by the greatest of the Æons, to illumine the others, and the world was created by the Demiurge, an offspring of the last of the Æons, who also made man in His own image. Men were of three classes: spiritual, animal, and material. The spiritual (of whom the chief was Jesus, into whom Christ had entered at Baptism and departed just before the Crucifixion, and who was only apparently born of the Virgin Mary) were to be united with Christ, no matter what lives they led. The animal could not aspire to this, but might be translated to the regions of the Demiurge. The material, no matter how virtuous, were doomed to annihilation. Jesus was to be to mankind what Christ was to the Æons. Immorality resulted from the doctrine concerning the fate of the spiritual and material of humankind.

Smith and Wace, *Dictionary of Christian Biography.*

VALENZUELA, FERNANDO DE (1630–92), Span. statesman; app. Prime Minister by queen-regent of Spain; afterwards exiled to Philippines.

VALERA Y ALCALÁ GALIANO, JUAN (1824–1905), Span. novelist; b. Cabra; led an active public life, being frequently ambassador and councillor of state, senator, and member of the Spanish Academy, Madrid. Author of several fine romances.

VALERIA, VIA (42° N., 13° 30′ E.), ancient highway, Italy; continued the Via Tiburtina to Lake Fucinus and the country of the Marsi, thence to the Adriatic.

VALERIAN (*Valeriana officinalis*), plant with protandrous, asymmetrical flowers, possessing a nectariferous spur; there are only three stamens, two being suppressed. The fruit is plumed, pappus representing calyx.

VALERIUS, see Flaccus.

VALERIUS MAXIMUS (*fl. c.* 30 A.D.), Rom. author; wrote a collection of historical anecdotes.

VALET, a body-servant; in France word meant a 'youth,' but in later Middle Ages became an attendant who performed personal services of lower kind than the esquire.

VALETTA, Valletta (35° 54′ N., 14° 31′ E.), fortified seaport, capital, island of Malta; naval and coaling station; important transit trade; contains the palace of the old Masters of the Knights of Malta (governor's residence); cathedral (1576). Pop. (1911) 22,882.

VALHALLA (Scandinavian myth.), hall of the gods, and heaven of warriors slain in battle; the latter spent the day fighting.

VALLA, LORENZO (*c.* 1406–57), Ital. scholar of the Renaissance. His services to learning were exceptional; made excellent Lat. renderings of Xenophon, Herodotus, and Thucydides, and his *Elegentiæ* was long a standard text-book.

VALLADOLID.—(1) (40° 30′ N., 4° 40′ W.) province, Old Castile, Spain; traversed by Douro; chief industry, agriculture. Pop. (1910) 285,211. (2) (41° 36° N., 4° 43′ W.) town, at junction of Esgueva and

Pisuergo, capital, V. province, Spain; seat of univ. (1346) and archbishopric; has royal palace and an unfinished cathedral (1585); manufactures cloth; agricultural trade; Columbus died here, 1506, and Philip II. was born, 1527; capital of Spain till 1560. Pop. (1910) 71,066. (3) (20° 37′ N., 88° 18′ W.) town, Yucatan, Mexico; cotton goods. Pop. 14,500.

VALLE, PIETRO DELLA (1586–1652), Rom. noble who travelled in Turkey, Persia, and India, and wrote valuable accounts.

VALLEJO (38° 20′ N., 122° 20′ W.), city, seaport, on San Pablo Bay, Solano County, California, U.S.A.; exports fruit and grain; has a U.S. navy-yard. Pop. (1910) 11,340.

VALLEY FORGE (40° 7′ N., 75° 28′ W.), village, on Schuylkill, Chester County, Pennsylvania, U.S.A.; winter quarters of Washington and Amer. army, 1777–78.

VALLEYFIELD (45° 30′ N., 74° 20′ W.), town, port of entry, on St. Lawrence, Quebec, Canada; cotton- and paper-mills. Pop. 9000.

VALLISNERIA, genus of aquatic plants, order Hydrocharideæ; the only species, *V. spiralis* (Eel Grass), a common aquarium plant, has unisexual flowers; the male flowers follow the female flowers when they rise to surface.

VALLOMBROSA (43° 40′ N., 11° 30′ E.), famous XI.-cent. Benedictine monastery (now School of Forestry), Florence, Italy.

VALLS (41° 16′ N., 1° 8′ E.), town, Tarragona, Spain; textile industries. Pop. 12,900.

VALOIS, HOUSE OF, see FRANCE (HISTORY).

VALPARAISO.—(1) (33° S., 70° W.) province, Chile; mountainous; many fertile valleys; chief river, the Aconcagua. Pop. 310,000. (2) (33° 6′ S., 71° 40′ W.) fortified seaport, on Pacific Ocean, capital, V. province, Chile; chief commercial and manufacturing centre in Chile; most important seaport on Pacific coast of S. America; founded 1536, has several times been destroyed by earthquake; bombarded by Spaniards, 1866. Pop. 162,447. (3) (41° 26′ N., 86° 59′ W.) city, capital, Porter County, Indiana, U.S.A.; contains Valparaiso Univ. (1873). Pop. (1910) 6987.

VALS, VALS-LES-BAINS (44° 40′ N., 4° 20′ E.), watering-place, on Volane, Ardèche, France; mineral springs.

VALTELLINA, region, Italy, consisting of upper valley of Adda, in Sondrio province; enclosed by high ridges of Alps; chief towns, Sondrio, Tirano, Bormio; produces cereals, fruit, wines. Taken by Grisons, 1512, remaining in its possession until 1797 when Napoleon included it in Cisalpine Republic; was subsequently transferred to Austria, and has belonged to Italy since 1859.

VALUE, term in political economy applied to articles of wealth produced by human labour. The laws of supply and demand always affect the v. of commodities. V. is created by labour—the labour of the producer, artisan or agriculturist, and the distributor; and the amount of labour will settle the normal value. But if production is greater than demand, the v. will sink below the cost of production; just as scarcity will create a rise in value.

Utility must be considered. Much labour may be expended on articles of no usefulness to any one, and if this non-usefulness is recognised and there is no demand, there will be no value, however great the labour expended; but political economy is concerned with the transactions of ordinary people. V. may be defined as 'the power which an article confers upon its possessor, of commanding in exchange for itself, the labour, or the products of the labour, of others' (F. A. Walker, *Political Economy*). It is power-in-exchange. It is not the same as price, which expresses the exchange power in terms of one commodity—money. Neither v. nor utility must be confused with goodness. Destructive commodities have an economic value, since they can command a price.

Art works that cannot be reproduced are beyond the laws of supply and demand. V., in the case of a masterpiece of art, is governed by no law, and has no economic existence. Taste, caprice, and capacity to spend in others confer on the owner of a work of art that is demanded by these others the power to fix a price that has no relation to the cost of production, a 'fancy' price. The essence of economic v. is that the cost of production, or reproduction, is known. And the v. of ordinary articles of commerce is fixed by the knowledge of that cost, whether the articles be beneficial to mankind or otherwise.

J. S. Nicholson, *Principles of Political Economy*; C. F. Bastable, *Theory of International Trade*.

VALVE, apparatus designed to prevent back flow of fluid in a pipe (as in human intestine) or to control and regulate motion of fluid.

VALVES, or PISTONS, in music, see PISTONS.

VALYEVO, VALJEVO (44° 25′ N., 19° 50′ E.), town, Servia; plum-growing centre. Pop. 7000.

VÁMBÉRY, ÁRMINIUS (1832–), Hungarian traveller and scholar; b. Szerdahely, near Pressburg; travelled through Armenia and Persia, 1861–64; prof. of Oriental Languages at Budapest till 1905; author of many works on Turk. language, and autobiographical.

VAMPIRE BATS (*Phyllostomatidæ*), a large family of Bats, with about 150 species, distinguished either by a well-developed 'leaf' above the nose, or by skin folds or warts beneath the chin; the middle finger of the wing has three joints; they are confined to the tropical and subtropical regions of the New World, where they inhabit forest areas, the majority feeding on fruits, or on fruits and insects. Two nocturnal species, however (*Desmodus* and *Diphylla*), are blood-suckers.

VAMPYRELLA, an Amœboid Protozoon; see under PROTEOMYXA.

VAN (38° 30′ N., 43° 11′ E.), town, Armenia, Turkey-in-Asia; at S. face of high isolated rock, on which is inscription of Xerxes; has a citadel which probably dates from VIII. cent. B.C.; is encircled by walls. Several mosques and churches; some antiquities ascribed to Semiramis; in neighbourhood are orchards and vineyards; manufactures cottons. Pop. *c.* 30,000.

VAN BUREN, MARTIN (1782–1862), 8th pres. U.S.A.; b. Kinderhook, New York; elected to Senate, 1821; governor of New York State, 1828; vice-pres. of U.S.A., 1832; succ. Jackson as pres., 1837; retained most of his cabinet and continued his financial policy, to which the crisis of 1839, when many banks stopped payment, was attributed; was opposed to annexation of Texas, expressing his views in famous letter, pub. 1844; was defeated for presidency, 1844; stood unsuccessfully for election, 1848.

VAN DIEMEN'S LAND, TASMANIA (*q.v.*).

VAN DYCK, SIR ANTHONY (1599–1641), famous Dutch portrait painter; born at Antwerp. He received his earliest instruction in art under Hendrik van Baler. In 1615 he entered the studio of the great master Rubens, with whom he remained as an assistant till 1620. During this apprenticeship he was set to copy the Italian masters owned by Rubens, and later to transfer to canvas Rubens's designs and the paintings thereon for the master to finish. To such power did the pupil attain, that none can certainly say of many of the works of this time whether they were by Rubens or his pupil. On leaving Rubens, he studied in England under the patronage of James I., and subsequently in Italy. Among his early pictures are the 'Crucifixion' for St. Michael's, Ghent, and the 'St. Augustine' of Antwerp. In 1632 the painter was invited to England by Charles I., and styled 'principal painter in ordinary to their Majesties at St. James's.'

As a painter of historical subjects, he surpassed his master Rubens in the perfection of his detail, the refinement of his figures, and the exquisite purity of his colouring, though he fell far below him in grandeur of conception and fertility of invention. As a portrait painter he ranks next to Titian. V. D. was also a skilled etcher, as his remarkable portraits of Snyders and Vorsterman show. See *Van Dyck* (P. M. Turner).

VAN EYCK, see EYCK.

VAN WERT (40° 50′ N., 84° 40′ W.), city, capital, Van Wert County, Ohio, U.S.A.; railroad- and machine-shops. Pop. (1910) 7157.

VANADIUM (V=51·0), silvery, crystalline, rare metal in nitrogen group, occurring as lead vanadate in vanadinite; obtained by reduction of dichloride in hydrogen; permanent in air; S.G. 5·5; dissolved with difficulty; readily forms nitride VN. Oxides and derivatives: V_2O neutral; V_2O_3, VSO_4 (lavender); V_2O_3, VCl_3, $V_2(SO_4)_3$ and alums (green); V_2O_4, $V_2O_2(SO_4)_2+4H_2O$ (blue); $K_2V_4O_9+7H_2O$ (hypovanadate); V_2O_5, NH_4VO_3 (vanadate — yellow); HVO_4.

VANBRUGH, SIR JOHN (1664–1726), Eng. dramatist and architect; b. London; became soldier, went abroad, and was imprisoned in Bastille as suspected spy (1690); first play, *The Relapse* (1697); *The Provoked Wife* (1698); best work, *Confederacy* (1705); also adaptations of Molière, etc.; app. Clarencieux king-at-arms; knighted, 1714. U. is one of cloverest Restoration dramatists, his plays being marked by sparkling wit and originality, but marred by gross indecency, which occasioned fierce attack by Jeremy Collier (*q.v.*). His great abilities as architect are testified by Blenheim House and Castle Howard.

Works edit. by Ward, 1893.

VANCOUVER.—(1) (49° 30′ N., 123° W.) city, port, on Burrard inlet, Brit. Columbia; terminus of Canadian-Pacific Railway and of several lines of steamers; important lumber industry. Pop. (1911) 123,902. (2) (45° 39′ N., 122° 31′ W.) city, on Columbia, capital, Clarke County, Washington, U.S.A.; lumbering and fruit-packing industries. Pop. (1910) 9300.

VANCOUVER, GEORGE (d. 1798), Eng. sailor; accompanied Captain Cook, 1772–74, 1776–79; explored west coast of N. America. V. Island named after him.

VANCOUVER ISLAND (50° N., 126° W.), island belonging to the Canadian province of British Columbia; separated on E. and N.E. from the mainland by Strait of Georgia and Queen Charlotte Sound, and from United States by Strait of Juan de Fuca; mountainous and forest-clad; coal-fields and fisheries. Pop. 58,000. Capital, Victoria (*q.v.*).

VANDALS, a Teutonic race which played a prominent part in the disruption of the Rom. Empire in V. cent. They overran Gaul and Spain, and, crossing to Africa, established a kingdom there under Genseric, which lasted from 429 till 534 A.D.; wantonly destroyed works of art, monuments, and priceless treasures of lit. during the sack of Rome, 455 A.D., hence term 'vandalism.'

VANDERBILT, CORNELIUS (1794–1877), Amer. capitalist; s. of a small farmer; began business as a boy of sixteen by ferrying passengers and goods between New York and Staten Island; became successful boat-builder and owner of steamships; engaged in railroad ventures, 1863, and was pres. of New York central railroad, 1867; left $11,000,000.

VANDERDECKEN, see FLYING DUTCHMAN.

VANE, SIR HENRY (1589–1654), Eng. statesman; was sent to arrange peace between Spain and Holland, 1629, and to make terms with Gustavus Adolphus of Sweden, 1631; on dismissal from office, 1640, joined opposition.

VANE, SIR HENRY (1613–62), Eng. statesman; s. of above; ed. Westminster school and Oxford; in America two years, 1635–37; elected M.P. for Hull, 1639, and again in Long Parliament; leader of parliamentary party in Commons on Pym's death, 1644, till the Presbyterians, who mistrusted him, were in the majority, 1646. V. took no part in the king's trial and execution, but was an active servant of the Commonwealth; protested against Cromwell's expulsion of Long Parliament, 1653, retired to the country, and in 1656 was imprisoned by Cromwell till the end of the year for refusal to give a bond that he would not act against the Government. At Restoration, 1660, the House of Commons voted V.'s exclusion from Parliament. He was executed for high treason on June 14, on Tower Hill. V. was the author of several controversial, religious, and political pamphlets.

VANELLUS, LAPWING, see PLOVER FAMILY.

VANILLA, a genus of climber included in the Orchidaceæ and possessing aerial roots which have a special absorptive layer or velamen. *V. planifolia* is cultivated for its pods, which yield the aromatic fluid v., used in flavouring chocolate and confectionery.

VANISHING-POINT, see PERSPECTIVE.

VANNES (47° 41′ N., 2° 45′ W.) (ancient *Dariorigum* or *Civitus Venetorum*), seaport, Morbihan, France; cathedral; museum of Celtic and prehistoric antiquities; manufactures leather. Pop. 17,000.

VANSITTART, HENRY (1732–*c.*1771), Anglo-Ind. gov. of Fort William, 1760–64; tried to check corruption among East India Company's servants.

VAN'T HOFF, JACOBUS HENDRICUS (1852–1911), Dutch physical chemist; investigated oceanic salt deposits (Stassfurt), stereoisomerism, mass action; contributed to theory of solution.

VAPORISATION.—When a substance in liquid form is exposed so as to have a free surface above which there is either a vacuous space, or air, or a gas, particles of the substance pass out and constitute the vapour of the liquid. The process by which the vapour is formed is termed v. or evaporation.

Let a large vessel be emptied of air; admit a quantity of liquid, such as water, alcohol, or chloroform: evaporation begins and particles pass out of the liquid into the vacuous space above it. This process goes on until the pressure of the vapour on the interior walls of the vessel reaches a certain amount, which is dependent on two factors, viz. the temperature of the contents of the vessel and the nature of the liquid. Thus, if the temperature were 50° C. the pressure would, if the liquid were water, be equal to that of a column of mercury 9·2 centimetres high; if alcohol, 22 centimetres; if chloroform, 53·5 centimetres. When this maximum pressure has been reached for a given temperature, the vapour is said to be *saturated vapour* at that temperature, and the vapour and liquid are said to be in equilibrium at that temperature when the saturation pressure has been reached. V. does not cease at this stage. The molecules of the liquid are continually moving about through the mass, and are in frequent collision with neighbouring molecules. Each is surrounded by others whose attractions control its motions. In the interior of the liquid mass these attractions will, on the average, be nearly equal in all directions, and the motion of a particular molecule at any given instant will depend on the effect of the immediately preceding collision with a neighbouring molecule. Hence the molecular speed will vary from one molecule to another through a considerable range of speed. Near the surface of the liquid, however, the conditions are different. There the directive action of attraction is, on the whole, downwards, and a molecule will only succeed in passing outwards into the free space beyond if it approaches the surface with a perpendicular speed which is much above the average of other molecules in its neighbourhood. On passing through the surface, it moves about in the free space along with other molecules forming the vapour of the liquid. Some of these molecules will, in the course of their motion, return to the liquid. When the saturation pressure is reached, we have an equality in the rates at which the molecules pass out of, and return to, the liquid. It follows that the rate of evaporation will be increased by any cause which increases the speed of the molecules within the liquid. A rise in temperature has this effect, and hence evaporation takes place more rapidly at higher temperatures.

Now evaporation involves the removal from the liquid of those molecules whose speed is above the average, and this will tend to reduce the temperature.

Heat has therefore to be supplied at a certain rate if the temperature of the liquid is to remain steady. If supplied at a greater rate, the temperature rises, and if this goes on until the vapour pressure is equal to the pressure above the liquid, bubbles of vapour will form and rise to the surface. This stage is known as *ebullition* or boiling, and the temperature at which it takes place is known as the boiling point. The amount of liquid vaporised from a surface at a given temperature depends principally on the length of the perimeter of the surface.

Preston, *Theory of Heat*; Poynting and Thomson, *Heat*.

VAR (43° 25′ N., 6° 20′ E.), department, France; formed from part of ancient Provence; hilly or mountainous; chief river, the Argens; minerals include iron, coal, salt; the vine largely cultivated; capital, Draguignan; a part of V. was transferred to Alpes-Maritimes in 1860. Pop. (1911) 330,755.

VARALLO SESIA (45° 49′ N., 8° 17′ E.), town, on Sesia, Novara, Italy; contains Sacro Monte, a famous place of pilgrimage. Pop. 3300.

VARANGIANS, see VIKINGS.

VARANUS, see under LIZARDS.

VARASD, Ger. name of WARASDIN.

VAREN, BERNHARD (1622–50), Ger. geographer; his *Descriptio Regni Japonici* and *Geographia Generalis* were famous works of scholarship.

VARESE (45° 49′ N., 8° 50′ E.), town, Como, Italy; silk industry. Pop. 7800.

VARIA (42° 20′ N., 2° 20′ W.) (modern VICOVARO), ancient village, on Anio, and on Via Valeria, Italy.

VARIATIONS, in music, consist of transformations of a theme by changes in harmony, melody, rhythm, time, counterpoint; the same theme must persist throughout. An early form of v. merely introduced runs, grace-notes, and similar embellishments without any fundamental alterations; when the rhythm of each v. was systematically divided into quicker notes they were called *Doubles*, e.g. Händel's *Harmonious Blacksmith*. *Ground-bass*, i.e. the placing of a phrase in the bass and continual repetition thereof with new harmonies and ingenious counterpoint, was a form of v. highly developed in the XVII. cent. In his *Goldberg V.*, etc., Bach was unrivalled until Beethoven, Haydn, Mozart, and Brahms practised v.

VARIATIONS, see under EVOLUTION.

VARICOSE VEINS, a permanently dilated and tortuous condition of the veins, rarely occurring except in the lower limbs, the lowest part of the bowel (piles or hæmorrhoids), or the spermatic cord (varicocele); due to causes hindering flow of blood from lower parts of the body to heart, *e.g.* prolonged standing, pregnancy, while congenital deficiency of the valves of the veins is also an important factor; the treatment is to treat any existing cause of venous congestion, to wear a woven silk or worsted stocking, or bandage, put on to support the dilated vessels, while in painful or extreme cases operative treatment is necessary, the affected veins being removed.

VARIOLA, SMALLPOX (*q.v.*).

VARIOLITE, a green, basic, igneous rock having pale coloured spots which give it a pock-marked appearance.

VARLEY, JOHN (1778–1842), Eng. painter; a founder of Water-Colour Soc.; bro. *Cornelius* (1781–1873), water-colour painter, invented graphic telescope.

VARNA (43° 13′ N., 27° 54′ E.) (ancient *Odessos*), fortified seaport, on Black Sea, Bulgaria; export trade in cattle and grain; chief port in Bulgaria. Pop. (1910) 41,419; (department) 329,609.

VARNHAGEN VON ENSE, KARL AUGUST (1785–1858), Ger. biographer; b. Düsseldorf; wrote *Goethe in den Zeugnissen der Mitlebenden*, biographies of General von Seydlitz, Field-Marshal Schwerin, etc.

VARNISH, see PAINTS.

VARRO, MARCUS TERENTIUS (116–27 B.C.), Rom. writer; b. Reate; ed. Rome and Athens; rose to prætorship; saw military service under Pompey; treated kindly by Cæsar after Pharsalia; proscribed by Triumvirs; goods confiscated; compensated by Augustus. Most prolific writer, with vast store of knowledge; credited with over 600 books; his style is certainly vigorous but monotonous and with little elasticity; best-known work, *Antiquitates Rerum Humanarum et Divinarum*, forty-one books of closely packed information, an encyclopædia of Rom. knowledge. V. also wrote several poems which have perished; fragments of *Saturæ Menippeæ* remain; other extant works, *De lingua Latina* (partially), philological and grammatical treatise, and *De re rustica*, series of dialogues on husbandry.

VAS DEFERENS, see REPRODUCTIVE SYSTEM.

VASA, NIKOLAISTAD (63° 10′ N., 21° 45′ E.), seaport town, on Gulf of Bothnia, Finland. Pop. (1910) 21,819; (province) 514,940.

VÁSÁRHELY, see MAROS-VÁSÁRHELY, HÓDMEZŐ-VÁSÁRHELY.

VASARI, GIORGIO (1511–74), Ital. painter and architect; a pupil of Michelangelo. His paintings brought him some contemporary distinction, but he is remembered for his book, *Vite de' più excellenti Pittori, Scultori, e Architetti*, 1550.

VASCO DA GAMA, see DA GAMA, VASCO.

VASCULAR CRYPTOGAMS, see PTERIDOPHYTA.

VASCULAR SYSTEM of the body includes the CIRCULATORY SYSTEM (*q.v.*), which is a system of blood vessels conveying nourishment, by means of the blood, to all parts of the body; and the LYMPHATICS (*q.v.*), which are a system of lymph vessels bringing the lymph, or nutritive fluid derived from the blood, into intimate relation with the cells composing the tissues of the body.

VASELINE, a jelly left on distillation of petroleum; also manufactured from paraffin; semi-solid; insoluble in water, hence used for protecting steel from damp; an ingredient of some ointments.

VASILKOV (50° 13′ N., 30° 22′ E.), town, Kiev, Russia; trade in cattle and corn. Pop. 18,500.

VASLUI (46° 36′ N., 27° 40′ E.), town, at junction of Berlad and Vaslui, Rumania. Pop. 14,000.

VASO-MOTOR FIBRES, see NERVOUS SYSTEM.

VASSAL, in the feudal system, a follower of a lord, from whom he held land and to whom he vowed fidelity.

VASSAR COLLEGE, Poughkeepsie, a New York institution for the higher education of women; founded by Matthew Vassar, a wealthy brewer, 1861.

VASTO (42° 7′ N., 14° 45′ E.) (ancient *Histonium*), fortified town, Chieti, Italy. Pop. 10,200.

VATICAN COUNCIL, THE.—This, according to Roman Catholics the last œcumenical council, was convened by bull, *Æterni Patris*, 1868. When its main object of proclaiming Papal Infallibility became known, agitations broke out in France, Germany, and Italy, and many of higher clergy gave written expression of discontent. Council first met in December 1869. It soon became apparent that doctrine of Infallibility would not be carried without debate; early months of 1870 were devoted to discussion of points of church life and discipline wherein reforms were necessary. Lengthy discussions ensuing, it was found that matters progressed too slowly, and new procedure was decreed, whereby debates could be ended and motions carried if majority so willed it; the end in view was that Infallibility should be accepted by resolution, if not by unanimous consent.

Majority of council was in favour of dogmatising the doctrine; they were the Ultramontane party and numbered 480, while in the opposition were 136 bp's. Ultimately other questions were set aside, and Infallibility alone submitted to council. General debate, during which opposition made clear all their objections, began May 13, and ended June 3; special debate then ensued, and ended July 13, when doctrine was put to the vote, and voted for by 451 members, repudiated by 150. Opposition appealed to pope for modification, without success, and doctrine became dogma, July 18. Bp's who had protested then submitted.

Manning, *The True Story of the Vatican Council* (London).

VAUBAN, see FORTIFICATION.

VAUBAN, SÉBASTIEN LE PRESTRE DE (1633–1707), Fr. soldier; b. St. Léger de Foucher, Burgundy; served under Condé in war of Fronde; taken prisoner by French, and was persuaded by Mazarin to serve Fr. king; life passed chiefly in constructing fortresses and besieging places; his development of existing systems of attack and defence made Fr. school of fortification first in Europe; conducted forty sieges; fortified and reconstructed over 100 places, including Dunkirk, Strassburg. Wrote *Traité de l'attaque des places.*

VAUCLUSE (44° N., 5° 10′ E.), department of S.E. France in Provence, with four arrondissements—Avignon, Apt, Carpentras, and Orange; capital, Avignon; associated with Petrarch (*q.v.*); wine, potatoes, wheat, fruit; area, 1370 sq. miles. Pop. (1911) 238,656.

VAUD (*c.* 46° 35′ N., 6° 30′ E.), canton, in W. Switzerland, N. and E. of Lake of Geneva; area, 1244 sq. miles; surface mountainous, reaching height of over 10,600 ft. in Mt. Diablerets, but an extensive plain slopes down to Lakes of Geneva and Neuchâtel; chief town, Lausanne. Produces white wines; cattle raised; tanning, condensed milk, tobacco, clocks. Entered Swiss Confederation with present name in 1803. Pop. (1910) 317,457.

VAUDOIS, WALDENSES (*q.v.*).

VAUGHAN, HENRY (1622–95), Eng. poet and mystic; b. Newton, Brecknockshire. His poems and prose works are devotional in character. The best are the *Silex Scintillans* ('Sparks from the Flintstone'—a happy title) and *The Mount of Olives.*

VAUGHAN, HERBERT (1832–1903), R.C. cardinal (1893); bp. of Salford, 1872; abp. of Westminster, 1892; of ancient Catholic family.

VAUVENARGUES, LUC DE CLAPIERS, MARQUIS DE (1715–47), Fr. writer; served in army and died young; contrasts with usual writer of XVIII. cent., praising virtue, piety, etc.; his *Réflexions and Maximes* (1746), a foil to La Rochefoucauld's.

VAUXHALL, district in Lambeth, London, on S. bank of Thames; famous pleasure grounds, 1661–1859.

VECTOR.—A v. is a magnitude which has direction, such as a force or velocity, or any line of definite length and definite direction. V's are commonly the latter as representing the former. Many problems of dynamics can be treated simply by vectors; thus, if the line XY represents a force acting from X to Y in magnitude and direction, and the line YZ represents similarly a force, then the line XZ, joining them, represents the resultant in magnitude and direction.

V. Analysis combines most of the advantages of quaternions and Cartesian analysis. By the older methods v's were resolved into three components along three arbitrary axes, and the operations made upon these components. V. a. gives methods of manipulating vectors directly, without having recourse to initial resolution into components. The transformation, however, from vector to Cartesian notation is easy.

Bucherer, *Elemente der Vektor-Analysis*; J. G. Coffin, *Vector Analysis*; Henrici and Turner, *Vectors and Rotors*; Gibbs-Wilson, *Vector Analysis.*

VEDA, see BRAHMANISM.

VEDDAHS, inhabitants of Ceylon; supposed to be Dravidian (*q.v.*), but possibly earlier.

VEDETTE, Fr. mounted sentinel.

VEERE (51° 33′ N., 3° 40′ E.), town, on island of Walcheren, Zeeland, Netherlands.

VEGA CARPIO, LOPE FELIX DE (1562–1635), Span. dramatist and poet; b. Madrid; author of over 1500 plays. These may be divided into contemporary, historical, and legendary. As is to be expected in the case of so prolific a writer, his work is valuable not merely for the intrinsic worth of part at least of it, but for the mine of ideas it provided for others. Thus, his *Azero de Madrid* is obviously the inspirer of Molière's *Médecin malgré lui*, and his *Alcade de Zalamea* is clearly recognisable in one of Calderon's most famous plays. While some of the plays show considerable merit, there is a marked lack of originality about V. C.'s work. He may be termed rather a manufacturer of plays than a literary artist.

VEGA, GARCILASO DE LA (1503–36), Span. soldier; one of chief poets of Renaissance, which he introduced into Spain, writing sonnets in new manner.

VEGETABLE KINGDOM, see PLANTS.

VEGETARIANISM, abstinence from flesh-eating on dietetic or conscientious grounds; supporters affirm that vegetable diet produces highest human development in every way; opinion divided regarding eating of eggs and fish; medical views generally antagonistic to extreme principles of v. V. Society formed, 1847. Vegetarian cafés exist in most cities.

VEGETIUS, FLAVIUS RENATUS (fl. IV. cent.), author of *Epitoma rei militaris*; still used by writers on war.

VEGLIA (45° 5′ N., 14° 35′ E.), island, in Gulf of Quarnero, belonging to Istria, Austria.

VEII (42° N., 12° 25′ E.), ancient city, Etruria; one of the Etruscan League; frequently at war with Rome; taken by Camillus, 396 B.C.

VEINS, the blood vessels which convey the blood from the capillaries to the heart, gradually joining together to form larger vessels as they near that organ. The *pulmonary v's* lead from lung capillaries to the left auricle of the heart, conveying to it purified or 'arterial' blood, while the *portal v.* conveys venous blood from capillaries of the intestine to the liver, where it again breaks up into capillary v's; all the other v's, however, convey venous blood towards the heart, gradually forming larger v's until the ascending and descending *venæ cavæ* pour venous blood into the right auricle of the heart.

The walls of v's are composed of three coats, similar to those of the arteries, but much thinner and weaker—the internal coat, or *intima*, consisting of a layer of flattened cells forming the lining of the blood vessel, the middle coat, or *media*, of muscular and elastic fibres, and the external coat, or *externa*, of fibrous tissue and longitudinal elastic fibres, with, in certain of the larger v's, a network of muscular fibres. There are valves in the v's, most common in the v's of the extremities, composed of fibrous and elastic tissue with a coating of the flat cells of the intima, the purpose of the valves being to allow blood to be forced only towards the heart; there are no valves in the *venæ cavæ*, the pulmonary, portal, and certain other large v's.

See PHLEBITIS, VARICOSE VEINS, VASCULAR SYSTEM.

VEINS, cracks in rocks filled with substance different to that of rock in which they occur. Regular and irregular v's branch off into many smaller shoots and may be either metallic or non-metallic. They may be many yards wide and miles in length, and are caused by contraction of the rock during consolidation or cooling. They may also be caused by earth movements. V's occupied by ores are called lodes (see MINING), while some are of intrusive masses of igneous rock.

VEJÉR DE LA FRONTERA (36° 13′ N., 5° 55′ W.), town, on Barbate, Cadiz, Spain. Pop. 11,400.

VELA, see ARGO.

VELASQUEZ, DIEGO RODRIGUEZ DE SILVA (1599–1660), Span. painter; studied under Herrera and Pacheco at Seville, but was practically self-taught. Seville street-studies were among his first pictures, and one of these, the celebrated *Water-Carrier* (now in Apsley House), was presented by Ferdinand VII. to the Duke of Wellington. Introduced to Philip IV., he was commissioned to paint his portrait, and this was followed by some forty other portraits of the king. For many years he had a studio near the royal apartments, and Philip often

came to watch him at work. Charles, Prince of Wales, sat to him for his portrait in 1623; and in 1627 he was appointed Usher of the Chamber as the prize in a competition with other artists, for his picture, *The Expulsion of the Moriscos*. He made two visits to Italy—the first in 1629 to study Ital. art, the second (1648) on a commission to purchase works of art for the king. On his return in 1651 he was made Marshal of the Palace, and in this character superintended the arrangements connected with the marriage of Maria Teresa to Louis XIV. in 1659, the year before his death. The larger number of V.'s pictures remained royal property until transferred to the Prado Gallery at Madrid, where he can best be studied in all his varieties as a master of portrait, genre, landscape, and animal painting. His pictures are estimated to number 274, of which 121 are in Great Britain. One of the most famous is the so-called 'Rokeby' Venus, sold some years ago for £45,000.

VELEIA (44° 55′ N., 9° 42′ E.), ancient town, Liguria, Italy.

VELELLA, see under HYDROMEDUSÆ.

VÉLEZ-MÁLAGA (36° 46′ N., 4° 10′ W.), town, near mouth of Vélez, Málaga, Spain; produces fruit. Pop. (1910) 24,140.

VELIA (40° 15′ N., 15° 10′ E.) (modern CASTELLAMARE DELLA BRUCCA), ancient Gk. town, on Tyrrhenian Sea, Lucania, Italy.

VELLEIUS PATERCULUS, MARCUS (*c.* 19 B.C.–*c.* 31 A.D.), Rom. historian; his history begins with the myths, and is of little value until his own period, of which the account is over ornate, but often picturesque.

VELLETRI (41° 41′ N., 1 2° 47′ E.) (ancient *Velitræ*), town, Rome, Italy; cathedral; produces wine. Pop. 14,500.

VELLORE (12° 55′ N., 79° 10′ E.), town, military station, on Palar, N. Arcot, Madras, Brit. India. Pop. 46,000.

VELLOZIA, genus of plants, order Velloziaceæ; native of Brazil, Africa, Madagascar; best-known species are TREE LILIES, cultivated for their bell-shaped flowers.

VELLUM, see PALÆOGRAPHY.

VELOCIPEDE, vehicle propelled by rider, *e.g.* bicycle or tricycle.

VELOCITY is sometimes taken to mean *speed*, i.e. rate of change of position, or more strictly as speed in a constant and determined direction, viz. a straight line. Any other v. is variable, even with a constant speed.

VELVET, textile fabric formed by interweaving of silk threads to form nap or pile; first manufactured, XIV. cent.; introduced into England by Huguenots, 1536; **Velveteen** is similarly manufactured from cotton.

VENAFRUM (41° 30′ N., 14° E.) (modern VENAFRO), ancient town, Campania, Italy.

VENDACE, see under SALMON FAMILY.

VENDÉE (46° 40′ N., 1° 20′ W.), maritime department, France, formed from ancient Bas-Poitou; is divided into woodland ('Bocage') in the E., plain in the S., and marsh in the W.; chief products, grain and wine. Pop. (1911) 438,520. Capital, La Roche-sur-Yon.

Vendéan peasants during Fr. Revolution were greatly influenced by priests, who accused Republicans of heresy; and on introduction of conscription they rose in insurrection. Massacred Republicans at St. Florent and other places. Joined by Royalist nobles. Government sent three armies to Vendée. Vendéans at first successful, but afterwards defeated, and ultimately were utterly routed at Savenay, 1793.

VENDETTA, private vengeance for bloodshed; survives in Corsica, Sardinia, and in parts of U.S.A.

VENDÔME (47° 47′ N., 1° 1′ E.) (Rom. *Vindocinium*), town, on Loir, Loir-et-Cher, France; contains fine abbey church and the ruined castle (XI. cent.) of Dukes of V.; manufactures gloves. Pop. 7400.

VENEER, thin layer of expensive wood, glued to cheaper wood.

VENER (59° N., 13° E.), largest lake, Sweden; drained by the Göta to the Cattegat; area, 2150 sq. miles.

VENEREAL DISEASES, term applied to certain diseases which result most commonly, although not invariably, from impure sexual intercourse; they are three in number — gonorrhœa (*q.v.*), soft chancre, and syphilis (*q.v.*).

VENESECTION, opening a vein by operation; usually performed on a vein of arm, where pressure can be applied easily when stoppage of bleeding is required. See BLOOD-LETTING.

VENETI.—(1) a Celtic seafaring people, dwelling in Gallia, Celtica, and trading with Britain. Waging war against the Romans, 57 B.C., they were utterly defeated the following year. The town of Vannes, in the department of Morbihan, preserves their name. (2) a people of N. Italy inhabiting the territory called Venetia under the Rom. Empire; peaceful and commercial; famous horse breeders. On the fall of the Empire the inhabitants of some of the many towns destroyed by Attila fled to the islands of the lagoons, and thus Venice came into existence early in the IX. cent.

VENETIA (*c.* 45° to 46° 40′ N., 10° 40′ to 13° 30′ E.), division of N.E. Italy between Alps and Adriatic; divided into eight provinces, Verona, Vicenza, Venice, Padua, Belluna, Rovigo, Treviso, Udine; capital, Venice (*q.v.*); area, 9475 sq. miles; named after ancient *Veneti*.

VENEZUELA (1° 42′ to 12° 25′ N., 59° 40′ to 73° 30′ W.), republic, S. America; is bounded N. by Caribbean Sea and Atlantic, E. by Brit. Guiana, S. by Brazil, W. by Colombia; area, *c.* 393,976 sq. miles. Surface has low ground, partly swamp, partly forest, in N.W. round Lake Maracaibo; mountains (Sierra Nevada de Mérida, spur of E. Andes) running by S.E. to Lake Maracaibo and out to sea at Caracas; llanos between this and Orinoco; mountains to S. of Orinoco. Drained by Orinoco and its tributaries. Chief towns, Caracas, Valencia, Maracaibo, Ciudad Bolivar. Climate generally healthy; temperature varies with elevation, warmest along Orinoco; rainy season, May to Oct. or Nov.

European knowledge of V. dates from 1498 when it was discovered by Columbus. Span. navigators, Vespucci and Ojeda, further explored coast, 1499; country was subsequently annexed by Spain, under whose control it remained until 1810, when it rose in rebellion against mother country. Independence declared, 1811; ten years of war followed, in which Venezuelans were led by Bolivar (*q.v.*); Spain finally defeated, 1821, when V. became part of Colombian republic. This was broken up in 1830, when V. became an independent republic, being recognised as such by Spain in 1845. Its subsequent history is one of revolutions, civil wars, trade disputes with various European nations, and boundary disputes with surrounding countries.

Government is a federal Republic of 20 autonomous states; executive authority vested in pres., who is assisted by cabinet of seven ministers. Legislature consists of Congress of two houses. Senate of 40 members, two chosen by each State legislature, and Chamber of Deputies, members of which are elected by popular vote. State religion is R.C. Education is in backward state. Army numbers 9600 men, and military service is nominally compulsory.

V. is exceedingly rich in natural resources and has good means of developing them. Forests have fibre trees, rubber-plants, balsams, cinchona, gums, vanilla, sarsaparilla, dividivi, furniture- and dye-woods. Llanos provide pasture for large herds of cattle. Soil, extremely fertile, produces wheat, barley, cotton, cacao, indigo, rice, rubber, sugar-cane, coffee, tobacco, fruits. Minerals include gold, silver, copper, iron, coal, salt. Exports coffee, cocoa, hides, rubber, tobacco, etc. Imports provisions, cottons, hardware,

machinery. Railway mileage is over 500. Inhabitants include Spaniards, Indians, half-breeds. Pop. (1911) 2,713,703.

Keane, *Central and South America*, vol. i. (1909).

VENGURLA (15° 51′ N., 73° 40′ E.), seaport town, Ratnagiri, Bombay, India. Pop. 19,700.

VENICE, VENEZIA (45° 26′ N., 12° 18′ E.), fortified seaport, N. Italy; capital of province of V.; situated on 117 islands in the Lagune at head of Adriatic; traversed by *c.* 150 canals crossed by innumerable bridges. The city is divided into two main parts by Grand Canal (2 miles long and *c.* 200 ft. broad); connected with mainland by railway viaduct 2 miles long. The lagoons are protected from the sea by sand-hills and masonry work; shipping enters by several channels; aqueduct carries water-supply from mainland.

V. has numerous narrow, winding lanes, fine squares, mediæval houses (mostly built on piles), and magnificent churches and palaces, rich in painting, sculpture, and architecture (Tintoretto, Titian, Paul Veronese; Palladio, Sansovino, etc.). Notable features are magnificent Cathedral of St. Mark (begun 830; destroyed by fire and rebuilt, 976 onwards), with wonderful mosaics, four ancient bronze horses, fine spiral alabaster columns, etc.; opposite is the famous Campanile (322 ft. high; collapsed, 1902; rebuilt, 1911); Santa Maria dei Frari (1417), with Titian and Canova monuments; Giacomo di Rialto (*c.* 520), V.'s oldest church; San Sebastiano, with tomb of Paul Veronese; Santi Giovanni e Paolo, with tombs of Doges; San Salvatore, with Titian's *Annunciation*, etc.; Madonna dell' Orto (1460); Palace of the Doges (founded *c.* 814; rebuilt after fires, 976, 1105), with magnificent court (1485), Scala dei Giganti, great Council Hall, etc., and Bridge of Sighs connecting palace with prison; Royal Palace (formerly Procuratie Nuove) and Old Library; other fine palaces are Cá d'Oro, Farsetti, Loredan, Foscari, Pisani, Papadopoli, Grimani, Vendramin, Rezzonico, Corner Spinelli, Corner Cá Grande, etc., on Grand Canal; Procuratie Vecchie (palace of '9 procurators'), on Piazza of St. Mark; Academia di Belli Arti, Scuolo di San Rocco, Galleria Internationale d'Arte Moderna, Museo Civico, all rich in art collections; Rialto, fine old bridge across Grand Canal, lined with shops; Merceria (principal business street); Piazza of St. Mark, handsomest square in V., enclosed on three sides by magnificent buildings and arcades with shops and cafés; Zecca or Mint (between library and Royal Palace); Clock Tower (1496–99); Piazetta extending from the S.E. corner of Piazza of St. Mark to the Lagune, with two granite columns from Constantinople (erected XII. cent.; surmounted by Lion of St. Mark and Patron St. Theodore), formerly a place of execution, now a stand for gondolas; Ghetto Vecchio, long the Jewish quarters, with quaint mediæval houses and synagogue of Span. Jews; Lido (bathing-resort) on neighbouring Malamocco Island. Gondolas, the usual means of conveyance, were gorgeously decorated up to XV. cent., after which they were painted black by order of the Great Council.

History.—The Veneti, persecuted by Huns and Lombards, settled on the islands and marshes of the lagoons *c.* 586, and founded townships of Heraclea, Torcello, Burano, Malamocco, Chioggia, etc. The first Venetian Doge (*q.v.*) was elected, 697; seat of government removed from Heraclea to Malamocco, 707, and to Rialto (811), the origin of Venice. V. became a republic, XI. cent., and gradually extended her dominions along the Istrian and Dalmatian coasts, becoming mistress of the Mediterranean. Constantinople and other Byzantine possessions were taken, 1203–4, by famous Doge Enrico Dandolo; fierce wars waged against Genoese, who were finally defeated, 1380; Corfu, Argos, Durazzo, Crete, etc., taken, XIV. cent.; Vicenza, Verona, Padua, Brescia, Bergamo, Ravenna, Zante, and Kephallinia, 1483, Cyprus, 1489,

were added to her already extensive possessions, and V. was now at the zenith of her power.

V.'s mercantile prosperity declined after the discovery of the new sea-route (*via* Cape of Good Hope) to India, 1486. The League of Cambrai, 1508, was a new source of danger to the republic. Fierce and continuous struggles against the Turks ended with the surrender of Cyprus, 1571, Crete, 1666, Morea, 1718, and all her possessions except those of northern Italy. After this V.'s greatness ceased. She was completely crushed by Napoleon, and passed to Austria, 1797. V. declared herself a republic, 1848, but was forced to surrender, 1849; united to Italy, 1866. Before the Tiepoline conspiracy, 1310, the Great Council of nobles (*Maggiore Consiglio*) exercised supreme authority under the Doge; thereafter the oligarchical Council of Ten (*Consiglio dei Dieci*) wielded chief power. V. figured prominently in the history of art, especially in XV. and XVI. cent's (see PAINTING, ARCHITECTURE). From XII. to XVIII. cent. Doges annually threw ring from gorgeous barge *Bucintoro* into Adriatic ('wedding of Adriatic') in token of V.'s dominion of sea.

Chief industries are famous glass-ware and mosaics; gold and silver filigree work, embroidery, lace, damasks, brocades, *objets d'art*, chemicals, leather, cotton and woollen goods, shipbuilding, torpedoes. Pop. (1911) 160,727.

Erichsen, *The Story of Venice* (1905); Hazlitt, *The Venetian Republic: its Rise, its Growth, and its Fall* (1900); Ruskin, *Stones of Venice*.

VENLO (51° 23′ N., 6° 11′ E.), town, Limburg, Netherlands; formerly fortified; breweries, distilleries. Pop. 15,500.

VENN, HENRY (1725–97), Anglican clergyman; of Evangelical sympathy.

VENOSA (40° 58′ N., 15° 49′ E.) (Rom. *Venusia*), town, Potenza, Italy; cathedral and XI.-cent. abbey church. Pop. 8600.

VENTILATION, renewal of air of a room. Human breath and gas or oil lights discharge carbon dioxide (CO_2), which must be driven out and replaced by oxygen. Country air contains 2 to 3½ parts of CO_2 in 10,000; a room should not contain more than 6 in 10,000. Each person should have 3000 cub. ft. of fresh air per hour. In calculating air-space, 12 ft. is the maximum height reckoned; breathed air rises this height, loses its warmth and lightness, and sinks, hence windows should be opened from the top. Simple aids to v. are: *Perforated Bricks*, communicating with room by gratings which break current and prevent draughts; *Boyle's Valve*, in chimney near ceiling, an aperture with 2 talc flaps forming a valve which allows air to enter chimney, but prevents smoke from entering room; *Louvre Panes*, slips of glass placed obliquely in oblong opening in window pane.

The following devices strive to introduce cold air without causing draughts: *Hinckes-Bird's Ventilator*, the lower window sash is raised and blocked with a board, and air enters between the sashes and with an upward current; *Tobin's Tube*, a pipe whose lower end communicates with outside air, whilst upper end opens into room about 6 ft. from floor; *Sheringham Valve*, metal guard on aperture in wall, directs air upwards and can be closed on occasion; *Galton's Grate* has air-space behind chimney communicating below with outside air and above with room, the heat of chimney warming incoming air.

Bad air may be drawn off artificially by Boyle's self-acting air-pump ventilator, by shafts heated with gas jets or steam, or by electric fans.

VENTIMIGLIA (43° 48′ N., 7° 34′ E.), fortified seaport, Porto Maurizio, Italy. Pop. 3600.

VENTNOR (50° 36′ N., 1° 10′ W.), watering-place, Isle of Wight, England. Pop. (1911) 5787.

VENTRILOQUISM, art of producing voice sounds without movement of mouth; Greeks and Romans believed ventriloquist's voice came from the abdomen (Lat. *venter*, the belly).

VENUE, in Eng. law, the place or district where a cause of trial arises, and formerly where it must be tried. No 'local v.' for a trial now exists.

VENUS (classical myth.), see APHRODITE.

VENUS, second planet from sun, 67 million miles distant; diameter, 7700 miles; period, 224·7 days; probably has atmosphere denser than earth's, and spectroscope gives evidence of presence of water vapour; exhibits phases like moon. The transit of V. across the sun is used to compute the sun's distance from the earth.

VENUSIA (40° 58′ N., 15° 50′ E.) (modern VENOSA), ancient city, on Via Appia, Apulia, Italy; birthplace of Horace.

'VENUS'S FLOWER BASKET,' see under SPONGES.

VENUS'S FLY-TRAP (*Dionæa muscipula*), a carnivorous plant growing in the Carolina bogs. The upper parts of the leaves form an interlocking apparatus which catches and digests insects.

VERA CRUZ.—(1) (19° N., 96° 20′ W.) state, Mexico, on the Gulf; interior mountainous and fertile; coast low and sandy; products chiefly agricultural. Pop. (1910) 1,124,368. Capital, Jalapa. (2) (19° 11′ N., 96° 8′ W.) city, seaport, on Gulf of Mexico, Vera Cruz, Mexico; exports tobacco, coffee. Pop. 31,000.

VERBENA, a plant several species of which possess handsome and sweet-scented flowers. *V. officinalis*, the vervain, is indigenous to Britain.

VERCELLI (45° 20′ N., 8° 26′ E.) (ancient *Vercellæ*), town, on Sesia, Novara, Italy; abp.'s see; the cathedral contains a IV.-cent. MS. of the Gospels; Rom. antiquities; manufactures silk; export trade in rice. Pop. 18,500.

VERDEN (52° 56′ N., 9° 12′ E.), town, on Aller, Hanover, Prussia; manufactures agricultural machinery. Pop. 10,000.

VERDI, GIUSEPPE (1813–1901), Ital. composer; known almost solely by his operas; achieved success with *Rigoletto* (1851), *Il Trovatore* (1853), and *La Traviata* (1855). These closed his triumphs until his *Aïda* was produced at Cairo, 1871. His career ended brilliantly with *Othello* and *Falstaff*, the latter written when he was eighty.

VERDIGRIS, mixture of acetates of copper; used in making some green pigments; forms on brass and copper exposed to damp, and is highly poisonous.

VERDUN (49° 10′ N., 5° 22′ E.) (ancient *Verodunum*), fortified town, Meuse, France; XII.-cent. cathedral; bp.'s see; manufactures confectionery, hardware; capitulated to the Prussians, 1870; famous **Treaty of V.** was signed by the sons of Louis I., 843. Pop. 13,000. See GERMAN EMPIRE (HISTORY).

VERDY DU VERNOIS, JULIUS VON (1832–1910), Ger. soldier; lecturer at the Berlin Military Academy and author of masterly treatises on tactics.

VERE, Eng. family name; derived from Ver, near Bayeux; founded in England by Aubrey de V. on vast estates from William the Conqueror; held the Earldom of Oxford in male line for more than 500 years. Aubrey de V., 20th and last Earl of Oxford, died 1703. Also an Irish baronetcy of De V., to which family Aubrey De V., the poet (1814–1902), belonged.

VERE, SIR FRANCIS (1560–1609), Eng. soldier; served with Leicester in Holland, 1585, and was commander, 1589; officer in the Dutch army, 1593–1604, and rendered distinguished services in the war with Spain; negotiated treaty with Elizabeth; governor of Portsmouth, 1606.

VERESHCHAGIN, VASSILI (1842–1904), Russ. painter; began as a naval officer, and many of his pictures deal, very realistically, with fighting subjects.

VERGIL, POLYDORE (*c.* 1470–1555), historian; b. Urbino, Italy; came to England, 1501, and held various ecclesiastical appointments; pub. the first authoritative edit. of Gildas, 1525, and a *History of England*, 27th Book, bringing it down to 1538.

VERGIL, PUBLIUS VERGILIUS MARO (70–19 B.C.),

Rom. poet; b. near Mantua, in district of Andes; ed. Cremona, Milan, Rome, where he studied philosophy under the Epicurean Siron. In the confiscations after *Philippi*, V.'s father lost his farm, but V. succeeded in regaining it, largely by the influence of Asinius Pollio, who extended his patronage to him and introduced him to the literary coterie presided over by Mæcenas, where he was well received and became intimate with Horace, Gallus, and later with Augustus. He withdrew from Rome to S. Italy in 37, journeyed to Athens *c.* 24, and again in 19, but died shortly after returning to Italy with Augustus.

WORKS.—Several poems are ascribed to V.'s youth, but the authenticity of none has been definitely proved, though the *Culex*, written in hexameters, and the *Catelepta*, a collection of short poems, are probably his. His first important work was the *Eclogues*, written between 42 and 37 B.C., ten pastoral pieces in hexameters. They are imitations of the pastorals of Theocritus (*q.v.*), and are Gk. rather than Rom. in sentiment. Incidentally they describe scenes from the poet's early life, and are full of delicate pictures of the country of his boyhood. To the fourth a special significance was attached by the early Christians; in reality it commemorates Pollio's accession to the consulship (40), and tells of the prospective birth of a child (presumably Pollio's) who would attain to the highest honours and inaugurate a new era. This was interpreted to mean the birth of Christ, and is still called the *Messianic Eclogue*.

The *Georgics* (37–30) are four books dealing with husbandry, in imitation of Hesiod's *Works and Days*; they deal with the subject from the idealistic point of view, although the struggle between man and nature, a theme which pervades the whole poem, is realistically portrayed.

V.'s greatest masterpiece is the *Æneid*, which, though practically complete at his death, was never revised, as may be seen from the number of imperfect lines. V. desired to burn it, but the manuscript was happily saved. It is an epic, in twelve books, dealing with the fall of Troy and the wanderings of Æneas, the traditional founder of the Julian line, and contains some truly magnificent passages, such as Dido's speech (iv.). The unfortunate choice of a hero, who is frequently priggish and whose success is solely due to constant divine intervention, does not seriously mar the work. The influence of the *Æneid* on subsequent Rom. writers cannot be overestimated, and although it was inspired by the Homeric poems, was the greatest Rom. epic ever written.

V. is the greatest master of Rom. hexameter; this metre, rough if forceful in Lucretius, became graceful and polished in V.'s hands, capable of expressing every shade of emotion with beauty and yet with strength. He is not a great creative poet; his hero is far inferior to Achilles or Odysseus, but for purity of diction and grace of expression he is absolutely unsurpassed.

Trans., by Connington, Lonsdale and Lee, Mackail; Sidgwick, *Text and Notes*.

VERGNIAUD, PIERRE VICTURNIEN (1753–93), Fr. revolutionary; b. Limoges, France; called to Bar, 1782; represented Gironde in National Legislative Assembly, and became head of Girondist party. Threw himself eagerly into revolutionary movement, and by his orations greatly increased popular antagonism to monarchy. On attaining Louis's downfall, he denounced the massacres which had taken place. He was pres. at king's condemnation and voted for his death. He was afterwards accused of treason by Robespierre; imprisoned in La Force; guillotined, 1793.

VERHAEREN, ÉMILE (1855–), Belg. author; has published several volumes of poetry.

VERKHNE-UDINSK (51° N., 107° 30′ E.), town, at junction of Uda and Selenga, Transbaikalia, Siberia; trade in tea; important annual fair. Pop. 10,500.

VERLAINE, PAUL (1844–97), Fr. poet; leading member of the Symbolists; *Fêtes galantes* and *Sagesse* are among his 20 vol's of strange, original verse.

VERMICELLI, Ital. wheat-paste made up in solid wormlike threads (Lat. *vermis*, a worm); macaroni, of same composition, is in the form of a hollow tube.

VERMIGLI, PIETRO MARTIRE, 'Peter Martyr' (1500–62), Ital. Prot. theologian; Augustinian prior, but joined reformers; regius prof. of Divinity at Oxford, 1548; of Hebrew at Zürich, 1556; wrote several works specially on the Eucharist.

VERMILION, see PIGMENTS.

VERMONT (42° 44′ to 45° 1′ N., 71° 34′ to 73° 30′ W.), one of New England states of U.S.A.; bounded N. by Canada, E. by New Hampshire, S. by Massachusetts, and W. by New York, from which in the N.W. it is separated by Lake Champlain; area, 9565 sq. miles; surface generally undulating and hilly, reaching an extreme height of over 4000 ft.; among highest peaks are Mansfield (4380 ft.) and Camel's Hump (4100 ft.). Watered by Connecticut R., which forms E. boundary, and its tributaries, White, William, West; and by Otter Creek, Missisquoi. Climate is salubrious, but subject to intense cold in winter.

V. was first permanently settled in first half of XVIII. cent. by colonists from Massachusetts; and was admitted as a state to the Union in 1791. The executive is in the hands of a governor, who is assisted by various officers of state. Legislative power is vested in a Senate of 30 members and House of Representatives of 246 members. For local administration the state is divided into 14 counties. Sends two Senators and two Representatives to Federal Congress.

Chief towns are Montpelier (capital), Burlington, Rutland, Barre. Most important industry is agriculture; hay, oats, maize, wheat, and barley are cultivated, and potatoes and fruit are grown. Maple sugar is largely produced, and tobacco is cultivated. Cattle, horses, sheep, and pigs are raised, and dairy-farming is carried on. There are large forests, producing hardwood, and lumbering is an important industry. Woollens and flour are also manufactured. Marble, granite, and limestone are quarried. Railway mileage in 1912, 1071. Education is free and obligatory. Principal religions are R.C., Congregational, Methodist. Pop. (1910) 355,956.

VERNE, JULES (1828–1905), Fr. novelist; wrote a great number of much-read novels, in each of which plot works round scientific or physiological fact; many have forecasted recent developments, *e.g.* gramophone, cinematograph; translated into several languages and some staged; best known, *Round the World in Eighty Days*, *Michael Strogoff*, *Twenty Thousand Leagues under the Sea*, *The Mysterious Island*.

VERNET, three eminent Fr. painters. CLAUDE JOSEPH (1714–89) painted the sixteen chief seaports of France on a royal commission. CARLE (1758–1835) painted chiefly horses and dogs and battle-scenes. EMILE JEAN HORACE, his s. (1789–1863), also excelled with battle-pieces.

VERNEUIL (48° 45′ N., 0° 53′ E.), town, on Avre, Eure, France; manufactures machinery. Pop. 3700.

VERNEY, prominent Buckinghamshire family from time of Elizabeth. Sir Edmund (1590–1642), standard-bearer to Charles I.; slain at Edgehill. Sir Ralph, 1613–66, sat in Long Parliament. Sir Harry, 2nd baronet (1801–94), a Calvert; took name of V. on succeeding to estates.

VERNIER, PIERRE (*c.* 1580–1637), b. Ornans, Burgundy; invented instrument, the *vernier*, for accurately measuring fractions of small-scale divisions.

VERNON (49° 6′ N., 1° 27′ E.), town, on Seine, Eure, France; trade in stone. Pop. 7500.

VERNON, EDWARD (1684–1757), Eng. admiral; obtained command of expedition against Span. S. Amer. possessions, and took Porto Bello with squadron of six ships; attacked Cartagena without success, 1740; admiral, 1745; dismissed service, 1746, for publishing letters of official chiefs.

VEROLI (41° 45′ N., 13° 25′ E.) (ancient *Verulæ*), town, Rome, Italy; bp.'s see.

VERONA (45° 26′ N., 11° E.), city, N. Italy (Venetia),

on Adige, capital of V. province; first-class fortress. Rom. remains include fine amphitheatre (*c.* 290 A.D.), theatre, walls, gateways, etc.; many mediæval churches, palaces, and houses (by Sanmichele and others), with works by Paul Veronese, Titian, Tintoretto, Pisano, Giolfino, etc.; cathedral (XII. cent.); churches—San Zeno Maggiore (Romanesque XI. cent. onwards), Sant' Anastasia (1250–1450), Santa Maria in Organo (*c.* IX. cent.), San Fermo Maggiore (XIV. cent.), San Bernadino (XV. cent.), San Giorgia in Braida (rebuilt XVI. cent.); palaces—Pompei (now Museo Civico, with fine picture-gallery), Ragione (old court of justice), Consiglio, or La Loggia (town hall, 1476–93), with fine staircase; house of Capulets and Juliet's reputed tomb; magnificent tombs of Scaligers; Porta del Palio, etc. Chief industries are cotton, woollen, silk, iron goods, furniture, paper. V. became a Rom. colony, 89 B.C.; taken by Lombards, 568; headed Venetian League against Frederick Barbarossa; fierce struggles between Guelphs (*q.v.*) and Ghibellines; fl. under Scaligers (*q.v.*), XIII. and XIV. cent's; taken by Visconti of Milan, 1387; passed to Venetians, 1405; taken by French, 1796; awarded to Austria, 1814; recovered by Italy, 1866. Pop. (1911) 81,915; (province) 474,846.

Wiel, *Story of Verona* (1902).

Verona, Congress of, 1822.—Austria, Prussia, Russia, Britain, and France met to discuss Span. disorders. Britain protested against armed intervention; other powers decided to demand altered constitution in Spain; if unsatisfactory answer were returned, France was to invade Spain.

VERONAL, $(C_2H_5)_2C[CO{\cdot}NH]_2CO$, white crystalline powder, used medicinally as a hypnotic (10 to 15 grs.), inducing sleep without evil effects.

VERONESE, PAOLO, name by which PAOLO CALIARI or CAGLIARI (1528–88), Ital. painter, is known; was born at Verona (whence title). His f., a sculptor, was his first master, but his tastes inclining to painting, he was sent to study under Antonio Badile. Through Titian's influence he was commissioned to decorate Venetian ducal palace. Most famous painting, *Family of Darius before Alexander* (National Gallery, London).

VERONICA, see SPEEDWELL.

VERRES, GAIUS (d. 43 B.C.), Rom. governor; ruled Sicily, 73–71 B.C., by tyranny and oppression; prosecuted for extortion, 70 B.C.; denounced by Cicero in *Verrines.*

VERROCCHIO, ANDREA DEL (1435–88), Ital. sculptor and painter; started as goldsmith; executed important bronze statues, among which may be named the *David* and the *Unbelieving Thomas* at Florence, and the *Bartolommeo Colleoni* at Venice. A *Baptism of Christ,* in the Florentine Academy, is his only extant canvas.

VERS DE SOCIÉTÉ, light verse written for entertainment, on trifling and topical subjects, or relating to contemporary persons; many writers of it in France in XVIII. cent., and Prior (*q.v.*) is accredited first of Eng. poets in this line.

VERSAILLES (48° 47′ N., 2° 7′ E.), town, near Paris, France; capital of Seine-et-Oise department. Louis XIV., at cost of *c.* £20,000,000, converted (1661 onwards) V. hunting-seat—begun by Louis XIII.—into great palace (chief architect, Hardonin Mansard) with magnificent apartments; beautiful gardens, designed by Le Nôtre (1613–1700); noted fountains; in grounds stand *Grand Trianon* (built for Mme de Maintenon) and *Petit Trianon* (for Mme Du Barry). Treaty of V. ended Amer. War of Independence, 1783; V. witnessed initial scenes of Fr. Revolution (*q.v.*), 1788–89; palace made National Museum, 1833; king of Prussia proclaimed Ger. emperor here, 1871; presidential elections take place at V. Pop. (1911) 60,458.

VERSE, a line of a metrical composition; name used loosely for a stanza; v. may or may not be poetry, *e.g.* a *Limerick* is verse, not poetry. See POETRY, PROSODY, ELEGY, LYRICAL POETRY, SONNET, IAMBIC, ALCAICS, SAPPHIC METRE.

VERSECZ, WERSCHETZ (45° 8′ N., 21° 17′ E.), town, County Temes, Hungary; seat of Gk. bp.; red wine and brandy. Pop. (1910) 27,370.

VERTEBRATA (Lat. *vertebra,* 'joint'), CHORDATA, the great phylum of animals characterised primarily by the presence of a jointed internal axis supporting the body. In some of the less specialised forms, *e.g.* Tunicates and the Lancelet, this backbone or vertebral column is not developed, but in these its place is taken by a supporting unjointed and elastic rod—the notochord—which even in the higher forms precedes in development the backbone (hence the name Chordata). Besides this important feature, Vertebrates possess a nerve-chord embedded in the dorsal portion of the body (a contrast to the ventral nerve-chord of Invertebrates); and a series of openings leading from the fore-part of the food canal to the exterior, which sometimes become functional gill-slits or may remain embryonic vestiges of gill-slits.

The number of described species of Vertebrates falls little short of 40,000, and these form two great groups. The highest group—AMNIOTA—comprises Mammals (including man), Birds, and Reptiles, in all of which the embryo is protected by a 'water-jacket' membrane, the *amnion,* surrounding the embryo and keeping it suspended in a liquid medium. With the amnion is associated a second embryonic membrane—the *allantois* —the main function of which is respiratory. Such structures are absent from embryonic Fishes and Amphibians, which are therefore grouped together as ANAMNIA.

VERTIGO, giddiness, may be due to diseases of eyes or ears, dyspepsia, loss of blood, epilepsy, over-indulgence in alcohol or tobacco.

VERULAM, ST. ALBANS (*q.v.*).

VERVET MONKEY, see under CERCOPITHECIDÆ.

VERVIERS (50° 37′ N., 5° 52′ E.), town, on Vesdre, Liège, Belgium; manufactures woollen cloth. Pop. (1911) 46,948.

VESOUL (47° 37′ N., 6° 9′ E.), town, capital, Haute-Saône, France; manufactures files, tools. Pop. 9000.

VESPASIAN, TITUS FLAVIUS VESPASIANUS (9–79 A.D.), Rom. emperor; commanded legion in Britain and subdued Isle of Wight, 43–44. Consul, 51; governor of Africa, 63; of Judæa, 66; emperor, 69; suppressed Batavians, Gauls, and Jews; restored peace to Rome; continued conquest of Britain; erected new forum, baths, etc.; began Colosseum.

VESPERS, SICILIAN, revolution which broke out at time of vespers, Easter Tuesday, 1282, against tyrannical and oppressive government of Charles I. of Anjou; after riot near Palermo, a massacre of French took place, and republic was proclaimed; subsequently crown was given to Peter of Aragon, by whose aid Charles's attack on Messina was repulsed and his fleet twice destroyed.

VESPIDÆ, see WASPS.

VESPUCCI, AMERIGO (1451–1512), navigator; fitted out Columbus's third fleet; sailed for New World, 1499; explored Venezuelan coast; discovered All Saints' Bay, on Brazilian coast, 1503, afterwards sailing south to Cape Frio; became pilot-major of Spain, 1508; claimed to have reached America (named after him) before Cabot or Columbus.

VESTA, Rom. goddess of the hearth, and akin in attributes to the Gk. Hestia. As fire was symbolical of the permanent abode, V. was worshipped as guardian both of the home and the State, and colonists bore with them a portion of the fire of the State hearth. Thus Æneas brought with him from Troy portion of the sacred fire of V. The fire at Rome was tended by a company of maidens—VESTAL VIRGINS—of good birth and pure morality, and of whom absolute virginity was demanded.

VESTERAALEN, see LOFOTEN.

VESTERÅS, WESTERÅS (59° 36′ N., 16° 32′ E.),

town, on Lake Malär, capital, län of Vestermanland, Sweden; cathedral and castle; active trade; scene of defeat of Danes by Gustavus Vasa, 1521. Pop. (1911) 19,803.

VESTMENTS, ecclesiastical ceremonial robes. Use of special costume in public worship was part of Jewish religion; but clerical v. of R.C. Church are derived, not from Jewish priestly garments, but from ordinary dress of Rom. citizens during Empire, which the ecclesiastics retained unchanged, notwithstanding changes of fashion in outside world. Thus the dalmatic originated in *tunica dalmatica*, worn in Rome in II. cent.; alb, in *tunica alba*, worn until VI. cent.; and chasuble, in an overdress called the *pænula*, which in 382 was ordinary dress of senators. By IV. cent. v. were distinguished and kept apart from ordinary clothes; and about that time appeared a special garment for bp's, which in V. cent. was used by popes and called the *pallium*, while the stole (*orarium*) also became a recognised liturgical v. The institution was mainly developed between VI. and IX. cent's, towards end of which time a pope's v's consisted of the *camisia*, amice, dalmatic, alb, tunicle, stole, chasuble, and pallium. Further developments occurred between IX. and XIII. cent's, when pontifical gloves and shoes, mitres, and the *rationale* (a kind of pallium worn by certain Polish and Ger. bishops, or a jewelled clasp worn on breast) were introduced.

In modern R.C. Church a priest's v's consist of amice, alb, girdle, stole, maniple, and chasuble. A bp. has, in addition, the tunicle, pontifical gloves and shoes, mitre, staff, pectoral cross, and ring. An abp. has a crozier and may wear a pallium; and the pope wears the dalmatic, a *subcinctorum* and the *orale* (a sort of circular amice, with a hole for the head) in addition to bp.'s v's.

In XVI. cent. most of the Reformers set aside the v. as well as the ceremonies of the R.C. Church. The Lutherans retained the alb, but the Calvinists dispensed with all v. They were retained by the Swed. Church. In the Anglican Church their use has been the subject for endless discussion. The Ritualist movement has revived most of the R.C. v's in some places, not invariably without resistance. In 1870 the Privy Council declared them to be illegal, and in 1874 an Act was passed to enforce the decision. Many of the clergy refused to obey, and the Act gradually became ineffective. At the present time each clergyman uses his own discretion.

VESTRY, small building attached to church; used for robing and assembly of clergy, etc.

VESUVIANITE, **VESUVIAN**, **IDOCRASE**, mineral composed of silica, alumina, and lime; first found in dolomite blocks ejected from Vesuvius.

VESUVIUS (40° 48′ N., 14° 25′ E.), active volcano, 4200 ft. in height, situated S.E. of Naples at a distance of 7 miles. Its most destructive eruption (79 A.D.) buried Pompeii in deposit of mud and ashes, and Herculaneum by flow of lava; a great outburst occurred in 1871–72, but owing to fertility of soil the district was soon reoccupied and replanted with vineyards, only to be again devastated by greater eruption in 1906.

VETCH, or **TARE**, *Vicia*, a genus of Leguminosæ, climbing by means of leaf tendrils. *Vicia sativa* is largely cultivated as a fodder plant, and is also ploughed in as a fertiliser. In addition to *V. sativa* the following allied species are Brit.—*V. cracca*, tufted v.; *V. lutea*, yellow v.; and *V. sylvatica*, wood v.

VETERINARY SCIENCE.—V. medicine and surgery has existed from the time of the Egyptians, and there are MSS. in Greek and Latin which show some acquaintance with the main principles. Some progress was made in the Middle Ages, especially in the continental armies. The diseases of the horse very naturally and necessarily were especially studied, and English text-books of XVII. and XVIII. cent's show that efforts were made, and not wholly without success, to improve treatment. But the real study of v. s. is coincident with the rise of v. schools.

The first veterinary school was established a little over two centuries ago at Lyons; but it was not until 1792 that a school was opened in London (the Veterinary College of London, later the Royal Veterinary College) by a student of the Lyons school, and the Royal College of Veterinary Surgeons was not founded until 1844. Now there are schools all over the world, and students must qualify in chemistry, botany, zoology, anatomy, and physiology, stable management and shoeing, pathology, bacteriology, materia medica, hygiene, v. medicine and v. surgery, obstetrics, and meat inspection. Several universities now give the B.Sc. and D.Sc. in v. s.

Certain diseases attack **Horses** analogous to those in man. INFLUENZA is characterised by the suddenness of its onset; there is loss of appetite, quickened breathing, fever, the legs are swollen and stiff, and eyelids are swollen. A clean, loose, well-ventilated box, with water in which are dissolved two drams each of potassium nitrate and potassium chlorate are the only treatment, and in from 10 to 14 days the symptoms abate. But the stall should be thoroughly disinfected, as the disease is infectious.

TETANUS, caused by the bacillus gaining access to the body, usually through a wound, is first noticed by stiffness of muscles round the wound. The stiffness spreads, the animal champs his jaws, grinds his teeth, and at length the jaws become fixed. Injection of a serum, hyposulphite of soda, belladonna, are the best (but not very successful) remedies, and the animal must be kept in a cool, dark, quiet place.

COLIC, arising from indigestion, due to unwholesome food or organic disease. Symptoms: the animal shows signs of pain, paws ground with forefeet, lies down, rolls, gets up again, occasionally looks towards flank. Treated by draught containing chlorodyne, turpentine, spirits of ether nitrate and linseed oil, and enemata if necessary.

STRANGLES, a disease most common in young horses. Symptoms: loss of appetite, cough, difficulty in swallowing and breathing, swelling of glands between lower jaw, fever, discharge from nostrils. Treatment is directed to mature as quickly as possible abscesses likely to form in region of throat; throat is stimulated with embrocation or even blister; head is steamed with boiling water (containing eucalyptus oil) poured over hay or sawdust; feeding is mashes, gruels, carrots, and little hay; drink as in influenza; abscess is cleansed when it bursts.

GLANDERS AND FARCY is a disease under Diseases of Animals Act (see GLANDERS). The treatment of the disease being unsatisfactory, usually a case is at once isolated and the animal destroyed.

One of the most dreaded and infectious diseases of **Cattle** is TUBERCULOSIS, caused by the bacillus. The cow is commonest subject, chest being most frequently attacked, but also commonly the abdomen, udder, whence the bacillus passes to the milk. Koch's tuberculin is used as a diagnostic in cases of doubt, and diseased animals are at once slaughtered. ABORTION, caused by a micro-organism, is another great disease of cattle beasts. When a case occurs, it is advisable to segregate the animal, remove fœtus and membranes, and disinfect the place. In cases of FOOT-AND-MOUTH DISEASE all animals exposed to infection are slaughtered, and there are strict regulations as to moving cattle in affected areas. ANTHRAX, a blood disease caused by anthrax bacillus, is communicable to man. There are few recognisable symptoms, but when an animal is suddenly found dead, anthrax is commonly the cause. Cases have to be reported, and carcases must be buried 6 ft. below ground, or burned.

DISTEMPER is a troublesome disease affecting **Dogs**, most commonly under one year of age. Primary symptoms are those of catarrh; the dog shivers, is dull and restless, with dry nose, inflamed eyes, impaired appetite, thirst, and loss of flesh, and commonly a

skin eruption; a cough is present, at first dry and then moist; breathing is often quickened, and food forced on dog is at once rejected. Complications such as pneumonia may arise. Symptoms are treated as they arise; a vaccine has been advocated, but its curative value has yet to be seen.

RABIES OR MADNESS, a disease of brain and spinal cord, is uncommon in Brit. dogs. Symptoms are dullness, irritability, the animal seeks to be alone, snaps at anything, runs away, and wanders at a peculiar jog that is quite characteristic. Pasteur's vaccine cures people bitten by rabid dogs. Dogs also suffer from gastritis, skin diseases, pneumonia, and pleurisy.

All animals suffer from the effects of parasites, some causing mange and ringworm. Of internal parasites, worms are most troublesome—tape-worm in dogs, round-worm in horses, a liver-fluke in cattle and sheep.

Operations are frequently performed on horses: stripping of the ventricles for roaring, castration, ovariotomy. Local anæsthetics are used extensively in the smaller operations, such as removing tumours.

There are numerous text-books on the various divisions of v. s., as well as on the diseases of various animals.

VETO, any prohibition, especially applied to royal power of refusing assent to a Bill; not used since 1692, and now obsolete; gov. of a Brit. colony has power of v., or may reserve assent till Bill has been considered by the Crown; Pres. of Fr. Republic may refer back Bill passed by the Chambers for further discussion; Pres. of U.S.A. and governors of the different states have suspensory v. over legislation, but a ⅔ majority overrides v. The Brit. House of Lords absolute v. became a suspensory v. by Parliament Act, 1911.

VETTER, WETTER (58° 20′ N., 15° 30′ E.), lake, Sweden; drained by Motala to the Baltic; length, 80 miles.

VETULONIUM, VETULONIA (42° 54′ N., 11° E.), ancient town, Etruria; one of the Confederation.

VEVEY (46° 28′ N., 6° 51′ E.), town, on Lake Geneva, canton Vaud, Switzerland; tourist resort. Pop. (1912) 13,900.

VEXIÖ (56° 50′ N., 14° 52′ E.), town, on Lake Vexiö, län of Kronoberg, Sweden; cathedral; iron foundries. Pop. 8320.

VÉZELAY (47° 28′ N., 3° 43′ E.), small town, France; noted Benedictine abbey, founded IX. cent.

VIANDEN (49° 55′ N., 6° 10′ E.), town, on Our, Luxemburg.

VIANNA DO CASTELLO (41° 41′ N., 8° 43′ W.), seaport, on Atlantic, Portugal. Pop. 11,000.

VIAREGGIO (43° 25′ N., 10° 14′ E.), seaport, watering-place, Lucca, Italy. Pop. 15,500.

VIATICUM, Eucharist administered in Catholic Church when death is imminent.

VIAUD, LOUIS MARIE JULIEN, see LOTI, PIERRE.

VIBORG.—(1) (60° 47′ N., 28° 43′ E.) town, capital, län of Viborg, Finland; iron foundries; exports timber. Pop. (1910) 49,007. (2) (56° 27′ N., 9° 25′ E.) town, capital, Viborg amt, Jutland, Denmark; XII.-cent. cathedral. Pop. (1911) 10,885.

VIBURNUM, dried bark of tree *V. prunifolium* (N. America and India); employed medicinally in menorrhagia and dysmenorrhœa as an antispasmodic.

VICAR, title in Rom. Empire, now only ecclesiastical, meaning 'one who acts for another.' The pope has been called 'V. of Christ' since VIII. cent.; v's apostolic are app. in R.C. Church for certain episcopal functions, generally in missionary countries; in Anglican Church a v. nominally acts for a lay rector.

VICENTE, GIL, see PORTUGAL (LITERATURE).

VICENZA (45° 32′ N., 11° 32′ E.) (ancient *Vicetia*), town, at junction of Bacchiglione and Retrone, Italy; noted for its buildings by Palladio; Gothic cathedral (XIII. cent.); bp.'s see; manufactures silk; in latter part of Middle Ages was independent republic; passed to Venice, 1404; taken by the Austrians, 1848. Pop. (1911) 54,246; (province) 496,052.

VICH (41° 55′ N., 2° 11′ E.) (ancient *Ausa*), town, Barcelona, Spain; cathedral; textiles. Pop. 12,000.

VICHY (46° 7′ N., 3° 25′ E.), town, watering-place, on Allier, Allier, France; mineral springs. Pop. 14,700.

VICKSBURG (32° 21′ N., 90° 47′ W.), town, Warren County, Mississippi; situated on Mississippi R.; has fine public buildings, including town hall, Federal Government building, county court. An important trading centre; manufactures hardware, cotton-seed oil, machinery; exports cotton, lumber, etc. Was an important stronghold of Confederates during Civil War, and was eventually captured by Grant after a prolonged siege on July 4, 1863. Has magnificent park commemorating the V. campaign of 1862–63, and a national cemetery where many thousand Federal soldiers are buried. Pop. (1910) 20,814.

VICO, GIOVANNI BATTISTA (1688–1744), Ital. historian and philosopher; prof. of Rhetoric in Naples; app. historiographer-royal by Charles III. of Naples, 1735; denied hist. reality of characters in Græco-Rom. traditions; investigated problem of differences in legislative codes when the principle of justice is eternal and immutable. Held that God rules the world of nations by natural laws; law proceeds from the human conscience, at first confused and uncertain, embodied in palpable religious forms, then leading to abstract formulæ, and finally to the development of philosophical principles of law.

VICTOR AMEDEUS II. (1666–1732), duke of Savoy and 1st king of Sardinia; s. of Duke Charles Emmanuel II. and Jeanne de Savoie-Nemours; m. Anne, niece of Louis XIV. of France; the greater part of his reign was spent in throwing off the Fr. yoke.

VICTOR EMMANUEL II. (1820–78), succ. his f., Charles Albert, as king of Sardinia, 1849; joined England and France in an anti-Russ. alliance, 1855, and sent troops to the Crimea; joined by Napoleon III. in war against Austria, 1859, and defeated the Austrians; Tuscany, Parma, Modena, and Romagna joined Sardinia, 1860; the same year Garibaldi invaded and conquered Naples, and was joined by V., who accepted sovereignty of S. Italy, and annexed the majority of Papal States; proclaimed king of Italy at the first Ital. Parliament at Turin, 1861.

VICTOR EMMANUEL III. (1869–), King of Italy since assassination of his f., Humbert I., 1900; m. dau. of Nicolas, king of Montenegro.

VICTORIA.—(1) (34 to 39° 6′ S., 141° to 149° 58′ E.) state, S.E. Australia; bounded N. and N.E. by New South Wales, S.E. by Pacific, S. by Indian Ocean, W. by S. Australia; area, 87,884 sq. miles. Surface is generally mountainous, with a level tract in the N.W.; principal mountains are the Great Dividing Range, which crosses the country from E. to W., and reaches an extreme height of over 6500 ft. in Mt. Bogong; drained in N. by Murray, which forms N. boundary, and its tributaries Loddon, Goulburn, Ovens, and Mitta-Mitta; and in S. by Glenelg, Yarra, La Trobe, Michell, Tamba, and Snowy Rivers. There are many lakes, of which most important are Corangamite in S., Tyrrell and Hindmarsh in N.W., Wellington and Victoria in S.E. The region is chiefly of Archæan formation. Climate is healthy and temperate. Flora and fauna are those of Australia.

V. was discovered by Captain Cook, 1770; first permanently colonised by British, 1834; included in New South Wales until 1851, when it was constituted a distinct colony; discovery of gold led to great influx of population, 1851; joined Australian Commonwealth, 1901. V. is administered by a governor, nominated by Brit. Crown, and assisted by a Cabinet of 12 ministers; the Parliament consists of a Legislative Council of 34 members, and a Legislative Assembly of 65 members, elected respectively for 6 and 3 years by popular vote. Votes were given to women by Adult Suffrage Act in 1908. V. sends 21 Representatives to Federal Parliament.

Chief towns are Melbourne (capital), Ballarat, Bendigo, Geelong. Agriculture is an important industry, chief crops being wheat, oats, and barley; potatoes are widely grown; grapes and other fruits and tobacco are extensively cultivated. Horses, cattle, sheep, and pigs raised; dairy-farming carried on. There are large forests, producing valuable timber. Gold mines are an important source of wealth; other minerals are coal, tin, antimony, silver. Manufactures include machinery, hardware, textiles, wine. Chief exports are gold, wool, meat, live animals, cereals. Education is free and obligatory. There is no State religion; principal religions are Anglican, R.C., Presbyterian, Methodist. Pop. (1911) 1,315,551.

Turner, *History of Colony of Victoria* (1904); Gregory, *Geography of Victoria* (1907).

(2) (49° 30′ N., 123° W.) capital, Brit. Columbia, at S.E. end of Vancouver Island; formerly a post of the Hudson's Bay Company; 3 miles W. is Esquimalt, a fortified naval station. Pop. (1911) 31,600.

(3) (20° 15′ S., 49° 15′ W.) seaport, on Bay of Esperito Santo, capital, state Esperito Santo, Brazil; exports coffee. Pop. 10,500.

VICTORIA, see HONG-KONG.

VICTORIA (1819–1901), Queen of Great Britain and Ireland; dau. of the Duke of Kent and niece of William IV. As William IV. died without male issue, Victoria succeeded to the throne in 1837. In 1838 Lord Durham settled the revolt in Upper and Lower Canada and granted a popular constitution. At this time also the great Chartist movement broke out. The Queen m. her cousin Albert, s. of the Duke of Saxe-Coburg, 1840. War broke out in Afghanistan, 1841, and the Sikh War, 1845, resulting in the annexation of the Punjab, 1849. Important home measures were the adoption of penny postage and the institution of an educational department. In England religious unrest expressed itself in the Tractarian movement, and in 1843 the Disruption agitation in Scotland led to the secession of the Free Church. In 1846 Peel repealed the Corn Laws, the famine in Ireland of 1845 having led him to adopt this policy. Peel's ministry fell in 1846, and Lord John Russell's ministry succeeded. Lord Palmerston's sympathy with the European revolutionary movements led to a breach between him and the Sovereign, and he resigned, 1851. The year 1851 also witnessed the Great Exhibition, the outcome of England's industrial activity. Palmerston became Prime Minister, 1855; during his ministry war in the Crimea was brought to a successful issue, 1856. Minor wars were also waged in China and Persia. Palmerston's policy during the Indian Mutiny of 1857 again led to a breach with the Sovereign. In 1858 Palmerston's ministry fell, but he resumed office again, 1859, and continued in power till his death, 1865. The Prince Consort died, 1861. In 1868 Disraeli became Prime Minister, but his ministry was soon superseded by Gladstone's (1868–74), during whose administration important measures were passed. The Irish Church was disestablished, Army Purchase was abolished, and the Ballot and Judicature Acts were passed. The year 1874 marked a change in the political tide. There was a strong Conservative reaction, and Disraeli became Prime Minister. In 1876 the Queen received the additional title of Empress of India. In 1878 Lord Beaconsfield and Lord Salisbury represented Britain at the Berlin Congress. A war with the Zulus led to the annexation of Zululand, 1879. Gladstone again became Prime Minister, 1880. In 1881 the Boers acquired autonomy. The battle of Tel-el-Kebir, 1882, secured Britain's suzerainty in Egypt.

Home Rule agitations in Ireland became serious, and the Irish Land League was formed, 1879. In 1882 the Phœnix Park outrages were committed, in which Cavendish and Burke were murdered. Gladstone resigned (1885), and his resignation was followed by the brief administration of Lord Salisbury. At the close of the year Gladstone again became Prime Minister, but his Home Rule Bill was thrown out by the Lords. In 1892 Gladstone again became Premier, but the defeat of his second Home Rule Bill led to his resignation, 1894. Rosebery's Disestablishment Bill for Wales was defeated, and his ministry was succeeded by that of Lord Salisbury. In 1899 hostilities commenced between Britain and the Transvaal. In 1900 the Australian Commonwealth Bill was passed. Queen Victoria was an extraordinarily able ruler, and her reign was characterised by great colonial expansion and rapid growth of industry and commerce at home.

VICTORIA, genus of aquatic plants, order Nymphæaceæ; *V. regia*, the only species, a S. Amer. water-lily, has leaves 6 ft. in diameter, and white, fragrant flowers.

VICTORIA CROSS, see MEDAL.

VICTORIA FALLS (17° 59′ S., 25° 51′ E.), cataract of the Zambesi; height, 400 ft.; width, about 1 mile; discovered by Livingstone, 1855; is one of the great waterfalls of the world.

VICTORIA NYANZA (0°, 33° 15′ E.), large freshwater lake, Central Africa; northern part lies in Brit. territory, S. part is in Ger. E. Africa; area, *c.* 28,000 sq. miles; entered by the Kagera, Katonga, Rubana, Shimiu, and other rivers, and is the source of the Nile, to which it drains by way of Ripon Falls; first discovered by Speke in 1858. There are many islands, of which the most important are Ukerewe and Sesse. Contains numerous kinds of fish and molluscs, and is frequented by alligators and hippopotami.

VICTORIAHAVN, see NARVIK.

VICTORIAN ORDER, ROYAL, see KNIGHTHOOD.

VICTOR-PERRIN, CLAUDE, DUKE OF BELLUNO (1764–1841), Fr. marshal; b. La Marche; entered army as a private, but rose steadily, and Napoleon created him Marshal for the services at Friedland. After distinguished service in the Pruss. War he became governor of Berlin.

VICUGNA, see CAMEL FAMILY.

VIDIN, WIDIN (43° 59′ N., 22° 52′ E.) (Rom. *Bononia*), fortified town, river port, on Danube, Bulgaria; distilleries; exports cereals; active commerce. Pop. (1910) 16,450; (department) 237,571.

VIEIRA, ANTONIO (1608–97), Portug. Jesuit; won patronage of John IV.; combined the life of preacher with that of statesman, and improved economic condition of Portugal. V.'s ideal was the conversion of Amer. Indians and negro slaves, and from 1653 to 1661 he worked zealously in the cause.

VIENNA, WIEN (48° 14′ N., 16° 20′ E.), capital of Austria, on Danube; one of finest, largest, and most hist. cities of Europe, renowned for art, architecture, learning, industry, music. The Ringstrasse, on site of old fortifications (destroyed, 1858), claims to be the handsomest street in the world. Here are congregated, among other splendid structures, Votive Church (1856–79), univ. (founded, 1237), Rathaus, celebrated Burg Theater and Opera-House (seating 2347), Parliament House, Royal Natural History Museum, Art Gallery (one of the finest in Europe), the new wing of the Imperial Palace (Hofburg), Maria Theresia, Schiller, and Goethe monuments. Owing to stormy history mediæval buildings are rare, but include Stefansdom (completed, XV. cent.), with famous spire. Other notable buildings are Belvedere Castle and Karlskirche (baroque arch.). The Prater is a beautiful natural park. Schönbrunn palace and park lie near the city. V. is centre of Austrian trade and industry; chief manufactures being *objets-d'art*, blouses, hats, clothing, and furniture (including bentwood). In Rom. times V. was *Vindomina*, later *Vindobona*; founded by Claudius, I. cent. A.D., to command Danube; city restored by Leopold the Holy, 1136; flourished under Rudolf IV., 1365, who founded univ. and rebuilt Stefansdom; became permanent residence of Ger. emperors; besieged by Turks, 1529, 1683; absolute government abolished, 1848. V. gained civic autonomy, 1850; since then advanced by leaps and bounds. Pop. (1910) 2,031,498.

Vienna, Congress of (1814–15), attended by the chief powers of Europe, undid Napoleon's work. It restored King of Naples, Duke of Tuscany, Pope, and King of Sardinia to their former territories, and gave Milan and Venice to Austria. A new kingdom of the Netherlands was cr., with the Prince of Orange as king. George III. recovered Hanover. Poland was made a constitutional kingdom, under Russia. A Ger. Confederation was formed; the national feeling which overthrew Napoleon was disregarded, and the arrangements were entirely in the interests of the princes of Europe.

VIENNE.—(1) (46° 30′ N., 0° 30′ E.) department, France, formed chiefly from ancient Poitou; generally level; traversed by Vienne; produces grain, wine. Pop. (1911) 332,276. Capital, Poitiers. (2) (45° 32′ N., 4° 52′ E.) town, on Rhone, Isère, France; formerly abp.'s see; has Romanesque-Gothic cathedral, dating from XII. cent., and other old churches; Rom. remains include temple of Augustus and Livia, theatre, aqueducts. Manufactures textiles, hardware, leather, gloves; large trade in wine. Pop. 25,300. (3) (46° 10′ N., 0° 40′ E.) river, France, rises in department Corrèze, joins Loire; length, 220 miles.

VIENNE, COUNCIL OF, a R.C. synod, Oct. 1311 to May 1312, by which the Order of the Temple was suppressed as conflicting with the general weal.

VIERSEN (51° 17′ N., 6° 24′ E.), town, Rhineland, Prussia; manufactures velvets, silks. Pop. (1910) 30,172.

VIERWALDSTÄTTERSEE, see LUCERNE, LAKE OF.

VIERZON (47° 13′ N., 2° 3′ E.), town, Cher, France; manufactures agricultural machinery. Pop. 12,000.

VIETA, FRANÇOIS (1540–1603), Fr. mathematician; b. Fontenai-le-Comte, near La Rochelle; employed on State matters by Henry III. and IV.; made algebra a symbolic science and discovered trigonometrical relations of multiple angles.

VIEUXTEMPS, HENRI (1820–81), Belg. violinist and composer.

VIGAN (17° 30′ N., 120° 20′ E.), town, Luzon, Philippine Islands; manufactures cotton fabrics; fisheries. Pop. 16,000.

VIGEVANO (45° 18′ N., 8° 52′ E.), town, on Ticino, Pavia, Italy; cathedral; silk manufactures. Pop. (commune) 25,000.

VIGFUSSON, GUDBRAND (1828–89), Scandinavian scholar, for some years lector in Icelandic at Oxford. His works include an Icelandic dictionary and the *Corpus Poeticum Boreale.*

VIGIL, watch kept on eve of a religious feast.

VIGILANTIUS (fl. c. 400), author of a famous work denouncing the worship of martyrs, vows of celibacy and poverty, and many superstitious practices of his time.

VIGNY, ALFRED DE (1797–1863), Fr. poet; served during wars of the Empire; disciple of Romanticism from the beginning, frequenter of Victor Hugo's *salon,* and full of ardour of early movement; chief fame from poems, but novel *Cinq-Mars* (1826), though without interest of form, shows no inferiority of mind, and his dramas, an adaptation of Shakespeare's *Othello* (1829), *Stello* (1832), and *Chatterton* (1835), did great service to Romantic movement. See FRANCE (LITERATURE).

VIGO (42° 12′ N., 8° 43′ W.), seaport, naval station, on Ria de Vigo, Pontevedra, Spain; fisheries; important commerce. Pop. (1910) 41,213.

VIHÂRAS, see ARCHITECTURE, INDIAN.

VIJAYANAGAR, BIJANAGAR (15° 20′ N., 76° 30′ E.), ruined city, Madras, India; ancient capital of the kings of V.

VIKINGS (Icelandic *Vikingr,* sea-rover; not connected with 'king'), Scandinavian pirates who from VIII.–XI. cent. overran large parts of the Brit. Isles and Europe. The Viking Age reached its height in IX.–X. cent. One band of *Northmen* (Varanglans) under Rurik founded the Russian Empire, 862 (see RUSSIA), crossed Europe by the Dnieper valley, and even threatened Constantinople. Still more hist. are the Viking invasions of Britain and the European coast between the Rhine and Loire mouths. Towards end of VIII. cent. the Danes made first appearance on Eng. coast; colonising expeditions followed mere harrying raids; although checked by Alfred (*q.v.*) and Danegeld (*q.v.*), Danes secured permanent footing, Canute (*q.v.*) becoming king of all England, 1018 (see ENGLAND, HISTORY OF).

Northmen invaded N. and W. of Scotland (*q.v.*), IX.–X. cent.; western isles not recovered by Scot. king till 1263. V's landed in Ireland (*q.v.*), 795 onwards, and founded kingdoms of Dublin (852), Waterford, etc. On continent they seized river-mouths (*e.g.* Scheldt, Seine) and thence plundered or conquered surrounding country. In IX. cent. they repeatedly took Paris, ravaged Burgundy and Rhine districts, and even penetrated Mediterranean. Charles the Simple in 912 ceded Normandy (*q.v.*) as a peace-offering to Northmen under Rollo. Like their descendants, the Normans (*q.v.*), the Northmen or V. were able administrators as well as bold adventurers. In their small craft (several examples of which have been discovered) they scoured the seas, reaching Greenland and even N. America (see VINLAND) in X.–XI. cent.

Keary, *Vikings in Western Christendom* (1891).

VILLA DEL PILAR (26° 44′ S., 58° 15′ W.), city, river port, on Paraguay, Paraguay. Pop. 11,000.

VILLA REAL (41° 23′ N., 7° 39′ W.), town, on Corgo, Traz-os-Montes, Portugal; wine industry. Pop. *c.* 6500.

VILLA RICA (25° 48′ S., 56° 33′ W.), town, Paraguay; agricultural region; noted for tobacco. Pop. *c.* 26,000.

VILLACH (46° 37′ N., 13° 50′ E.), town, on Drave, Carinthia, Austria; lead-mining centre. Pop. 19,250.

VILLAFRANCA DI VERONA (45° 22′ N., 10° 50′ E.), town, Verona, Italy; silk industry. Pop. 10,100.

VILLAGE COMMUNITIES were originally family groups united for defence against hostile neighbours; hence came the tribe, and adjoining tribes united, *e.g.* in Teutonic countries. With feudalism came an overlord, but the land of the village community for nearly 1000 years consisted of open fields; the 'commons' are a survival of this. The break-up of the village common life began in England in late XV. cent., when lords of the manor, finding sheep were more profitable than peasants, set up enclosures. In spite of laws prohibiting enclosures the landowners continued to enclose, pulling down whole villages in the process. All through XVI. cent. the work went on. Agrarian revolt and denunciations of preachers and writers could not save the countryside. The landless peasantry drifted into the towns, or wandered homeless, to be punished by heavy statutes against vagrancy.

The commons enclosed in XV. and XVI. cent's were the open fields cultivated in common by the village. In XVIII. and XIX. cent's the common grazing lands—the 'commons'—were enclosed by Acts of Parliament, and more than a million acres passed into private hands. The economic defence of enclosures in England is the greater profit by the wool trade, and by the large farm. In other words, arable land pays better than tillage, and, whatever the suffering involved, national increase in wealth is generally held to have justified the change. In India, in Russia, and other Slavonic countries v. o's still exist.

Maine, *Village Communities*; Vinogradoff, *Growth of the Manor*; Seebohm, *English Village Communities.*

VILLALBA (43° 18′ N., 7° 40′ W.), town, Lugo, Spain. Pop. 14,300.

VILLANELLE, originally a round song of no specified formula, but which has become limited in form and shaped after a poem by Jean Passerat (XVI. cent.), *i.e.* a poem composed in tercets on two

hymes, the first and third line being repeated alternately in each tercet, and ending in a quatrain the last two lines of which repeat the first and third lines of the first tercet.

VILLANI, GIOVANNI (*c.* 1275–1348), Ital. chronicler; b. Florence. In 1316 he took an active part in the negotiations whereby Pisa, Lucca, and Florence became united, and became prior of the city; app. (1328) to take precautions against the spreading to Florence of the plague which ravaged Italy, and showed great wisdom in his choice of methods. It was this close intimacy with the administration of Florence that enabled him to execute so admirably his great *Chronicle* or History of Florence.

VILLANUEVA DE LA SERENA (39° N., 5° 45′ W.), town, on Guadiana, Badajoz, Spain. Pop. 13,600.

VILLANUEVA Y GELTRU (41° 15′ N., 1° 45′ E.), seaport, on Mediterranean, Barcelona, Spain; manufactures textiles, paper. Pop. 12,200.

VILLARI, PASQUALE (1827–), Ital. historian; wrote *Savonarola and his Times*, *Machiavelli and his Times*, and *First Two Centuries of Florentine History*.

VILLARREAL (39° 55′ N., 0° 7′ W.), town, Castellon de la Plana, Spain; orange-growing district. Pop. 16,100.

VILLARS, CLAUDE LOUIS HECTOR DE (1653–1734), Fr. soldier; served under Condé and Turenne; defeated by Marlborough at Ramillies, 1706, and Malplaquet, 1709, but was military genius of France in War of Span. Succession.

VILLAVICIOSA (46° 34′ N., 5° 24′ W.), small seaport, on Ria de Villaviciosa, Oviedo, Spain.

VILLEFRANCHE-DE-ROUERGNE (44° 21′ N., 2° 2′ E.), town, on Aveyron, Aveyron, France; cathedral; in vicinity, lead-mines, phosphate quarries. Pop. 8400.

VILLEFRANCHE-SUR-SAÔNE (45° 59′ N., 4° 43′ E.), town, Rhône, France; manufactures textiles; was capital of Beaujeais. Pop. 16,200.

VILLEHARDOUIN, GEOFFROY DE (*c.* 1150–*c.* 1212), Fr. historian; little known of his life; appears as marshal of Champagne and helped to arrange 4th Crusade (1202–4), of which he left account in first Fr. literary prose, *Chronique de la conquête de Constantinople*; previously histories were in Lat. or in verse of *chansons de geste* and romances; V. remained in East after crusade, and as grand marshal of Rumania helped to organise Lat. kingdom and received principality in Thessaly.

VILLEIN, VILLEINAGE, see SLAVERY.

VILLÈLE, COMTE DE, JEAN BAPTISTE GUILLAUME MARIE ANNE SÉRAPHIN (1773–1854), Fr. statesman; b. Toulouse; made fortune in West Indies; Minister of Finance, 1821; Pres. of Council and Minister of Foreign Affairs, 1822. An extreme royalist and reactionary, his policy, especially in press restrictions, was one of the provocations of the revolution of 1830; retired, 1828.

VILLENA (38° 36′ N., 0° 48′ W.), town, Alicante, Spain; manufactures silk, salt. Pop. 14,400.

VILLENEUVE, PIERRE CHARLES JEAN BAPTISTE SYLVESTRE (1763–1806), Fr. admiral; commander of combined Fr. and Span. fleets, 1803; Nelson's antagonist at Trafalgar; his ship, the *Bucentaure*, was taken, and he was carried prisoner to England; returned to France and committed suicide.

VILLENEUVE-LÈS-AVIGNON (43° 47′ N., 4° 48′ E.), town, on Rhône, Gard, France; manufactures silk; interesting mediæval remains.

VILLENEUVE-SUR-LOT (44° 23′ N., 0° 40′ E.), town, on Lot, Lot-et-Garonne, France; trade in prunes; remains of mediæval ramparts. Pop. 13,700.

VILLERS LA VILLE (50° 35′ N., 4° 32′ E.), town, Brabant, Belgium; ruined Cistercian abbey (XII. cent.).

VILLIERS DE L'ISLE ADAM, COMTE DE, PHILIPPE AUGUSTE MATHIAS (1838–89), Fr. poet; one of originators of Symbolist movement; in drama, *La Révolte* (1870), he attacked *bourgeois* conventionalism; his *Contes Cruels* (1883 and 1889) are short stories of fantastic and thrilling kind.

VILLIERS, GEORGE, see BUCKINGHAM, DUKE OF.

VILLIERS, GEORGE WILLIAM FREDERICK, see CLARENDON, 4TH EARL OF.

VILLINGEN (48° 5′ N., 8° 30′ E.), town, Baden, Germany; manufactures watches. Pop. (1910) 10,924.

VILLON, FRANÇOIS (1431–*c.* 1490), Fr. poet; b. Paris, of poor parents of name unknown; took name of protector, who had him carefully educated; but V. always led a gay, idle, vicious life, went to prison several times, and only escaped hanging through event of coronation of King Louis XI., 1461. His work is glory of Fr. mediæval poetry; chief poems are contained in *Petit Testament* and *Grand Testament*, legacies, mostly satirical, to friends and others; studded with *ballades* and *rondeaux*, the best known of which is *Ballade des dames du temps jadis*; unredeemed sadness, which is modern note.

R. L. Stevenson, *Familiar Studies of Men and Books*.

VILNA, WILNO (54° N., 26° E.), government, in Lithuania, Russia; surface level; much occupied by woods, lakes, and marshes. Pop. (1910) 1,926,900. Capital, **Vilna,** WILNO (54° 41′ N., 25° 17′ E.), on Vilia; ancient capital of Lithuania; formerly seat of a university; contains an imperial palace, Roman Catholic and Greek cathedrals; exports timber and grain. Pop. (1910) 186,200.

VILVORDE (50° 55′ N., 4° 27′ E.), town, Brabant, Belgium. Pop. 17,000.

VIMEIRO, see PENINSULAR WAR.

VINCENNES.—(1) (48° 49′ N., 2° 25′ E.) fortified town, Seine, France; manufactures chemicals; noted for its castle. Pop. (1911) 38,568. (2) (38° 41′ N., 87° 34′ W.), city, Indiana, U.S.A.; univ. (1806); great manufacturing and railway centre. Pop. (1910) 14,805.

VINCENT DE PAUL, ST. (1576–1660), Fr. priest; founded Lazarists (*q.v.*) and Sisters of Charity, and worked among galley slaves; canonised, 1737.

VINCENT FERRER, ST. (1355–1419), Dominican priest, famous for his preaching.

VINCENT OF BEAUVAIS (d. *c.* 1264), Fr. scholar; supposed to have joined the Dominicans in Paris, and afterwards at Beauvais; reader at monastery of Royaumont near Paris; enjoyed patronage of St. Louis of France and other rulers; wrote *Speculum Majus*, a great encyclopædia of mediæval knowledge, in three parts: (1) *Speculum Naturale*, a compendium of natural history, following order of creation given in *Genesis*; (2) *Speculum Doctrinale*, summary of scholastic knowledge; (3) *Speculum Historiale*, further treatise of sacred and secular history. Some editions include spurious Part IV., *Speculum Morale*.

VINCENT, ST., early Christian martyred for the faith by Diocletian.

VINCENT, ST., OF LERINS (d. *c.* 450 A.D.), monk of L.; wrote *Commonitorium*, wherein occurs famous dictums *quod ubique, quod semper quod ab omnibus creditum est*.

VINCENTIANS, see LAZARISTS.

VINCI, LEONARDO DA, see LEONARDO DA VINCI.

VINDELICIA (48° N., 10° 30′ E.), an ancient Rom. province; included N.E. Switzerland and the S. parts of Baden, Württemberg, and Bavaria.

VINDHYA (23° N., 76° E.), mountain range, India, forming N. boundary of the Deccan.

VINE (*Vitis*), climbing plant, the tendrils representing the modified main axis, the growth of the shoot being continued by the robust lateral branch nearest the apex. *Vitis vinifera*, the grape-v., is cultivated for its fruits, which yield wines and which when dried are raisins. The plant possibly came to England with the Christian era, and has since been grown under glass, especially in the south. V's flourish in all Mediterranean countries. The following selection includes many of the choicest varieties: Alicante, Appley Towers, Black Hamburgh, Black

Prince, Buckland Sweetwater, Duke of Buccleuch, Foster's Seedling, Gros Colman, Gros Guillaume, Lady Downs, Madresfield Court, Mrs. Pearson, Mrs. Pince, Muscat of Alexandria, and Muscat Hamburgh. V's require liquid manure, efficient ventilation, carefully watched temperature. V's are attacked by diseases, *e.g.* the incurable scourge, Phylloxera.

VINE INSECT, see PHYLLOXERA.

VINEGAR, impure, dilute acetic acid ($H.C_2H_3O_2$) generally made by acetons following alcoholic fermentation of the sweet wort of malt. Malt vinegar is brown, contains 3–6 % acetic acid, and yields 5–6 % extract; also made from wine, cider, glucose, etc. 'Wood vinegar' is pyroligneous acid.

VINEGAR HILL, battlefield near Enniscorthy. See IRELAND (HISTORY).

VINELAND (39° 28′ N., 75° 3′ W.), town, Cumberland County, New Jersey, U.S.A.; fruit-growing district; manufactures wine, boots and shoes. Pop. (1910) 5282.

VINET, ALEXANDRE RODOLPHE (1797–1847), Swiss author, theologian, and pulpit orator; founded Swiss Free Church, 1845.

VINGT-ET-UN, card game; one player holds bank; object is to make number 21; ace counts one or eleven, court-card ten; best hand 'natural,' ace and ten or court-card. Bank pays better hands than his own.

VINITA (36° 35′ N., 95° 12′ W.), city, capital, Craig County, Oklahoma, U.S.A.; bricks. Pop. (1910) 4082.

VINLAND, the name applied to a district in E. of N. America which was visited by various Norse explorers in early XI. cent.; first discovered by Bjarni Herjulfsen, who sighted it when driven out of his way by a storm in 986, but did not land. Partly explored by Leif Ericson in 1000; settlements were made in 1002 by Thorwald Ericson and in 1007 by Thorfinn Karlsefne, but owing to the enmity of the aboriginal inhabitants neither of these proved permanent. Received the name from the fact that vines grew wild there. The region is mentioned in various Icelandic works of the XII. and following centuries, and is generally believed to have been situated somewhere in Rhode Island or Massachusetts.

Reeves, *Finding of Wineland the Good* (1890).

VIOL, musical instrument, precursor of violin; had flat back, three to six strings, and deep bends in the sides.

VIOLA, genus of plants, order Violaceæ; species are Pansy or Heartsease (*V. tricolor*), Sweet Violet (*V. odorata*), Dog Violet (*V. canina*).

VIOLACEÆ, order of herbs and shrubs; in flowers calyx has 5 sepals, 5 petals, 5 stamens; Viola is a genus.

VIOLET (*Viola*) includes three Brit. species, *V. canina*, *V. odorata*, and *V. sylvestris*, the ordinary flowers of which seldom set seed, this being produced by cleistogamous forms.

VIOLIN, a musical instrument with four strings, played by a bow, too familiar to require description. Though a comparatively modern instrument, it may be regarded as the perfected evolution of many older forms of its class, such as the mediæval 'vielle' or 'fiddle,' the Troubadour rebec, and the viol. No actual inventor can be named, the fixing of the form having followed after many and varied experiments, carried on from about 1480 to 1530. During the period of development, the making of v's was restricted chiefly to the Tyrol and upper Italy; and it was in the hands of the XVII. and XVIII.-cent. Cremona makers, notably the Amatis, Guarnerius, and Stradivarius, that the instrument attained that perfection which has never since been surpassed. The perfected v.-model presents many points of technical interest—points of form and adjustment, of wood and varnish—which, as they cannot be briefly described, are best studied in expert works devoted to the subject. The first three strings, counting from the highest, are of gut; the fourth is covered with silvered copper wire, or silver or gold wire. The bow, made of horsehair, may be temporarily disused, and the strings plucked by the fingers. This is called *pizzicato* playing. For modifying the tone in a peculiar way, a *mute* is placed on the bridge supporting the strings. From the open note of the fourth to the highest possible note of the first strings there is an available compass of about three octaves and a half. Essentially the v. is an instrument of melody, but, by using one or more of the open strings and by what is technically termed *double stopping*, a limited harmony can be produced. It has long been the foundation instrument of the orchestra, where the division is into first and second v's; and as nearly all the great masters have written for it, its literature is exceptionally rich. The virtuosi of the v. are noticed under their respective names.

Haweis, *Old Violins* (1898); Ragster, *Chats on Violins* (1905).

VIOLLET-LE-DUC, EUGÈNE (1814–79), Fr. architect; restored many ancient buildings in France, and wrote several works, including a monumental *Dictionary of French Architecture*.

VIOLONCELLO, stringed instrument held between knees; signature generally bass clef; compass C of bass clef to A above treble clef.

VIONVILLE, MARS-LA-TOUR (49° 12′ N., 5° 53′ E.), village, Lorraine; scene of a battle between French and Germans, Aug. 1870.

VIPER, see under SNAKES AND SERPENTS.

VIPER'S BUGLOSS (*Echium*), genus of plants, order Boragineæ; Common V. B. (*E. vulgare*) has blue flowers, spotted stem, and prickly leaves.

VIRCHOW, RUDOLF (1821–1902), Ger. pathologist; b. Schivelbein, Pomerania; ed. Berlin (M.D., 1843), and lectured in the univ.; forced through his political views to leave Berlin, went as prof. of Pathological Anat. to Würzburg, but recalled as prof. of Pathological Anat. to Berlin in 1856. V. proved that the cellular theory applied to pathological as well as to physiological processes, made many important anatomical and pathological discoveries, and may be regarded as the founder of the modern science of pathology. He also made valuable researches in anthropology and archæology. An authority on hospital administration, he had a great share in the sanitary reformation of Berlin, and was an active politician, being for several years chairman of the finance committee in Pruss. Lower House, and later leader of the Opposition in the Reichstag against Bismarck.

VIRE (48° 51′ N., 0° 55′ W.), town, on Vire, department Calvados, France; manufactures woollens. Pop. 6500.

VIRGIN ISLANDS (18° 30′ N., 64° 40′ W.), group, W. Indies, belonging partly to Britain, Denmark, and U.S. Pop. of Brit. portion (1911), 5562.

VIRGIN MARY, see MARY (MOTHER OF JESUS).

VIRGINAL, see SPINET.

VIRGINIA (36° 30′ to 39° 28′ N., 75° 13′ to 83° 38′ W.), S. Atlantic state, U.S.A.; bounded N. by Maryland, E. by Maryland and Atlantic Ocean, S. by North Carolina and Tennessee, W. by Kentucky and W. Virginia; area, 40,125 sq. miles. Surface is greatly diversified, general slope being from E. to W.; in E. is a low-lying coastal region known as Tidewater; in centre is the Piedmont country, consisting of a wide plain in E. and a hilly region in W.; farther W. the Blue Ridge extends across the state from S.W. to N.E., highest points being Roger Mt. (5720 ft.) and White Top (5530 ft.). Between the Blue Ridge and the Alleghany Mountains farther W., lies the Great Valley of V., famed for its scenery. Watered by Potomac (with tributary Shenandoah), Rappahannock, York, James, Blackwater, Roanoke, Staunton, and by various affluents of Ohio. Climate varies with elevation, but is generally temperate and healthy, except in the marshy districts in the E. Flora includes oak, pine, cedar, and many valuable timber trees; fauna includes deer, and a great number of game birds.

History.—V. was first explored by Eng. travellers in 1584, and was named in honour of Queen Elizabeth; first permanently colonised by British, 1607, when a settlement was established at Jamestown by a number of emigrants sent out by the London Company, who had obtained a charter from James I. This charter was revoked in 1624, when V. was placed under the Crown. V. took the lead in resisting Lord North's taxation policy in 1765, and in the resulting struggle for independence. Seceded from Union, 1861, and was the scene of a great part of the struggle during the Civil War.

The executive power is vested in the governor, who is assisted by a lieutenant-governor and three officers of state. Legislation is in hands of a Senate and a House of Delegates. The Senate may have between 33 and 40 members, who are elected for 4 years by popular vote, and the Lower House 90 to 100 members, elected in the same way for two years. For purposes of local administration the state is divided into 100 counties. Sends 2 Senators and 10 Representatives to Federal Congress.

Chief towns are Richmond (capital), Norfolk, Roanoke, Portsmouth, Lynchburg, Newport News. Agriculture is carried on, the principal crops being maize, wheat, oats, and potatoes. Tobacco is very extensively cultivated, and cotton grown in considerable quantities. Various fruits are grown, and pea-nuts largely produced. Horses, cattle, sheep, and pigs are raised. There are excellent fisheries. Minerals include coal, iron, manganese, granite, slate, talc. Important industries are flour-milling, lumbering, manufacture of textiles, tobacco, leather, hardware. Railway mileage is about 4500. Education free; Richmond, Charlottesville, and Lexington are univ. towns. Principal religions are Baptist, Methodist, Presbyterian, R.C. Pop. (1910) 2,061,612.

Cooke, *Virginia, a History of the People*, in American Commonwealth Series (Boston, Mass., 1884).

VIRGINIA CREEPER, see AMPELOPSIS.

VIRGINIA, UNIVERSITY OF, opened, 1825, at Charlottesville, Virginia; formed under direction of Pres. Jefferson; received charter, 1819; has about 800 students.

VIRIDIAN GREEN, see PIGMENTS.

VIRTUES, see CARDINAL (CARDINAL VIRTUES).

VISBY, WISBY (57° 39′ N., 18° 6′ E.), seaport town, watering-place, capital, island Gotland, Sweden; an important commercial city in ancient times; later a member of the Hanseatic League; contains a cathedral (1190–1225) and ruined churches, towers, walls; taken by Waldemar III. of Denmark, 1361. Pop. (1911) 10,022.

VISCACHA, PAMPAS HARE (*Lagostomus trichodactylus*), S. Amer. rodent of family Chinchillidæ; gregarious burrow-dweller; *c.* 22 inches long; destroys pasture.

VISCHER, FRIEDRICH THEODOR (1807–87), Ger. author; b. Ludwigsburg; wrote *Aesthetik, Auch Einer* (novel), *Lyrische Gänge* (poems), etc.

VISCHER, PETER (1455–1529), Ger. artist in bronze; executed several notable works. His sons, Hermann, Hans, and Peter, were distinguished in the same line.

VISCONTI, Ital. families.—(1) Ottone, abp. of Milan, 1263; lord of the city, 1277–82; sovereignty of Milan in hands of the V. till 1447. (2) Antiquarian family—Giovanni Battista Antonio (1722–84), successor of Winkelmann; Ennio Quirino, his s. (1751–1818), conservator of Vatican Museum, and later surveyor of Museum of Antiquities, Paris. V. Gasparo, 1461–99, poet, and V. Giuseppe, 1570–1663, liturgist.

VISCONTI-VENOSTA, EMILIO, MARQUIS (1829–1906), Ital. statesman; Foreign Minister, 1863–64, 1866–67, 1869–76, 1896–98, 1899–1901; senator, 1896 onwards; caused Italy's accession to the *Dreikaiserbund*; wrote *Ricordi di Gioventù* (1904).

VISCOSITY, see HYDROMECHANICS.

VISCOUNT *(Lat. vice-comes), originally* **earl's deputy as gov. of county; first bestowed as title of honour (without office), 1440, by Henry VI.; most modern of all ranks in peerage; v's come after earls and before barons; title sparingly conferred.**

VISHNU, see HINDUISM.

VISIGOTHS, see GOTHS.

VISION, the act of seeing, is the function of the sense-organ of sight, or the eye (*q.v.*), and is due to the stimulation by waves of light of the *retina*, the sensory part of the eye, a special development of the nervous system connected by the optic nerve with the brain. Before a ray of light strikes the retina it passes through the *cornea*, the transparent outer coat of the front of the globe of the eye, the *aqueous humour*, a clear, watery fluid filling the anterior chamber of the eye, the *crystalline lens*, a transparent double-convex body, the posterior surface less convex than the anterior, held by ligaments between the anterior and the posterior chamber, and the *vitreous humour*, a soft, gelatinous, transparent substance filling the posterior chamber of the eye.

In front of the lens is the *iris*, which is a thin, pigmented, membranous curtain, perforated in the centre by an opening termed the *pupil*; the iris shuts off those rays of light which fall upon the outer part of the cornea, allowing those falling upon the central part to pass through the pupil and converge upon the lens. The size of the pupil can be increased or diminished according as the intensity of the light is less or greater, the amount of light entering the eye being modified so that the image brought to a focus upon the retina is sharply defined. The eye is accommodated for objects of varying distances, in order that exact images may be focussed upon the retina, by adjusting the lens, which is brought about by changing the curvature of its anterior surface through the ciliary muscles contracting and pulling upon the ciliary processes which suspend the lens. In accommodating the eye for near objects the curvature of the anterior surface and therefore the diameter of the lens is increased, and the pupil is contracted, while in accommodation for distant objects the curvature of the anterior surface and therefore the diameter of the lens is decreased, and the pupil is dilated.

An image is formed by the rays from an object impinging upon the lens, by which their convergence is increased, and an exact, inverted, image of the object is focused upon the retina. The retina is formed of several layers of nervous structures, that which receives the impressions being the layer of *rods* and *cones*, of which there are several millions over the whole extent of the retina, the rods being more numerous than the cones, except in the yellow spot in the centre of the retina, which is the most sensitive to light, and which has cones alone. The rods and cones are connected with the outer granular layer of the retina, and eventually with the optic nerve, by fine fibrils. That part of the retina where the optic nerve enters is insensitive to light, and is known as the 'blind spot.' On the surface of the rods and cones is a layer of cells, containing dark pigment, which send processes down among the rods and cones. When the eye is at rest these processes are very short, but under the stimulus of light they are sent more deeply among the rods and cones, and it is believed that the light causes decomposition of the pigment, the substances thus formed stimulating the rod and cone nerve-endings.

Colour perception is attributed to different colour rays causing different chemical changes and thus producing distinctive stimuli of the nerve-endings. Another explanation of colour perception is that, as the rays of different colours have undulations of varying rapidity, the different colour rays set up different rates of molecular vibration in the nerve-endings, and thus send different stimuli to the brain centres.

DEFECTS OF VISION.—In *myopia*, or short-sightedness, the globe of the eye is lengthened and the rays of light are brought to a focus in front of the retina, and consequently the image is blurred; while in *hypermetropia*, or long-sightedness, the globe of the

eye is shortened and the rays of light are brought to a focus behind the retina, the image in this case also being blurred. In *presbyopia* the ciliary muscle is weakened through old age, and is unable to bring about accommodation of the lens, which is also diminished in elasticity from the same cause. *Astigmatism*, in which the curvature of one meridian of the cornea or lens is greater than that of another, results in indistinct images being thrown upon the retina. All of the above conditions can be corrected by the use of suitable glasses. See EYE, BLINDNESS.

VISIONS, see APPARITION, SPIRITUALISM.

VISOKO (44° N., 17° 8′ E.), town, on Bosna, Bosnia; manufactures leather, carpets. Pop. 5200.

VISTULA, WEICHEL (50° N., 19° E.), river, Europe; rises in Carpathian Mountains, Austrian Silesia, and flowing northward through Galicia, Russ. Poland, and W. Prussia, divides into several branches, two of which empty into Frisches Haff; the main stream, turning westward, enters Baltic near Danzig; length, 650 miles; navigable to Cracow.

VITAL STATISTICS, see STATISTICS.

VITALIST THEORY OF DEVELOPMENT, see under EMBRYOLOGY.

VITEBSK (57° N., 20° E.), government, W. Russia; generally level; contains numerous lakes and marshes; chief river, the Duna. Pop. (1910) 1,833,900. Capital, **Vitebsk** (55° 14′ N., 30° 12′ E.), on Duna; trade in corn, flax. Pop. (1910) 85,800.

VITELLIUS, AULUS (15–69), Rom. emperor; favourite of four successive emperors of the Julian line; overthrew Galba, and after an evil reign of a few months was murdered.

VITERBO (42° 26′ N., 12° 7′ E.), city, Rome, Italy; noted for its fountains; among chief architectural features are the cathedral, containing tombs of several popes, an ancient bp.'s palace, and town hall; in vicinity are sulphur springs and Etruscan antiquities. Pop. 21,700.

VITI LEVU, see FIJI.

VITORIA (42° 52′ N., 2° 37′ W.), town, Álava, Spain; has cathedral, built in XII. cent., Jesuit schools, and some interesting houses; manufactures pottery, paper, woollens. Here the French, under Jourdan and Joseph Bonaparte, were defeated by allied English and Peninsular troops under Wellington, June 21, 1813. Pop. (1910) 32,893.

VITRÉ (48° 7′ N., 1° 12′ W.), town, on Vilaine, Ille-et-Vilaine, France; has a castle founded XI. cent. Pop. 9900.

VITRIFIED FORTS, stone enclosures on the summits of hills in certain parts of Europe, and of which there are several examples in the Brit. Isles. The stones of these forts are fused together with fire. It is difficult to understand the exact object the builders had in view in so consolidating the walls. Some have argued that the fusing is accidental and caused by watch-fires; others, that it indicates volcanic action. There are vitrified forts at Dunnideer and Tap o' Noath, Aberdeenshire, and Knockferrel, near Dingwall.

VITRIOL, see SULPHURIC ACID.

VITRUVIUS, POLLIO, a celebrated Rom. architect who was employed in that capacity and as a military engineer by Augustus. His name survives mainly by the ten books he wrote under the general title of *De Architectura*, the only extant Lat. treatise on architecture. Many editions have appeared from time to time.

VITRY-LE-FRANÇOIS (48° 45′ N., 4° 43′ E.), town, on Marne, Marne, France; manufactures cement, pottery. Pop. 8500.

VITTEL (48° 12′ N., 5° 57′ E.), watering-place, Vosges, France; mineral springs.

VITTORIA (36° 55′ N., 14° 30′ E.), town, Syracuse, Sicily; trade in wine. Pop. 33,000.

VITTORIA, TOMASO LUDOVICO DA (c. 1540–c. 1613), a Span. composer, whose professional life was spent in Rome, where he wrote chiefly masses and motets.

VITTORIO (45° 48′ N., 12° 19′ E.), town, on Meschio, Treviso, Italy; cathedral; silk industries; mineral springs. Pop. 20,000.

VITUS, ST., traditionally martyred in Diocletian persecution.

VITUS'S DANCE, ST., see CHOREA.

VIVERO (43° 37′ N., 7° 31′ W.), seaport, on Bay of Biscay, Lugo, Spain. Pop. 12,500.

VIVISECTION, term applied to experiments on living animals for the purpose of advancing the knowledge of medical science. Such experiments are in Britain regulated by an Act of Parliament (1876), the provisions of which are: every experimenter must hold a licence from the Home Sec., every applicant being recommended by two recognised authorities, such as certain univ. prof's and pres's of certain scientific soc's; all experiments must be carried out in registered places, which must be open to government inspectors. Under the licence the animal must be under an anæsthetic during the whole of the experiment, and if pain is likely to continue after the effect of the anæsthetic has passed away, or if any serious injury has been inflicted on the animal, it must be killed while under the anæsthetic.

As, however, by the first of these provisions, feeding experiments and inoculation by a hypodermic needle could not be carried out except under an anæsthetic, and, under the second, the keeping alive and observation of an animal which has had a secretory gland or a portion of the brain cortex removed (operations carried out under anæsthetics), would be illegal, although the animal is healthy and suffering no pain, supplementary certificates are granted by the Home Sec. to enable such experiments to be carried out, the Act dating from a time when such experiments were not dreamt of. An actual inoculation is not painful, the method being exactly the same as inoculation by a hypodermic needle, or as vaccination, while it is necessary for the success of experiments of the second type that the wound heals cleanly and that the animal recovers and is in a healthy condition, just as a human being after a slight or more serious surgical operation; but the wording of the certificates has given rise to the mistaken idea that painful cutting operations are carried out without anæsthesia and that animals are kept alive and watched in agony, the actual fact being that over 95 % of all experiments are inoculations. A Royal Commission was app. in 1906 to inquire into the whole subject.

Among the more valuable results obtained by experiments on living animals is our knowledge of the circulation of the blood, the working of the heart in health and disease, the physiology of the nervous system, the processes of digestion, the growth of bone; the cause and treatment of anthrax, cholera, diphtheria, hydrophobia, malaria, meningitis, myxœdema and cretinism, plague, sleeping-sickness, tetanus, tuberculosis, yellow fever; the action of such valuable drugs as aconite, amyl nitrite, chloral, cocaine, digitalis, ergot, strophanthus, strychnine, and many others.

The cause of anti-v. has been greatly harmed by ignorant advocates, but the anti-v. agitation has been valuable in curbing and preventing possible abuses. There are numerous anti-v. organisations, while the Research Defence Society defends and justifies experiments on animals in the interests of science.

VIZAGAPATAM (17° 42′ N., 83° 20′ W.), seaport, on Bay of Bengal, Madras, India. Pop. 41,000; (district) 3,000,000.

VIZEU, VISEU (40° 44′ N., 7° 48′ W.), city, Portugal; cathedral; noted annual fair. Pop. 8000.

VIZIADRUG (16° 34′ N., 73° 22′ E.), town, Ratnagiri, Bombay, India.

VIZIANAGRAM (18° 7′ N., 83° 27′ E.), town, *military station, Vizianagram, Brit. India*; has a college; residence of the Maharaja. Pop. 37,000.

VIZIER, VAKIB, see MUHAMMADANISM (INSTITUTIONS).

VIZZOLA (45° 35′ N., 8° 45′ E.), village, on Ticino,

Lombardy, Italy; one of the largest electrical stations in Europe.

VJVIDEK, Neusatz (45° 16′ N., 19° 33′ E.), town, on Danube, Bacs-Bodrog, Hungary; trade in cereals and wine. Pop. (1910) 33,590.

VLAARDINGEN (51° 54′ N., 4° 21′ E.), port, on Maas, S. Holland, Netherlands; centre of herring- and cod-fisheries. Pop. (1911) 22,452.

VLACHS, Wolochs, Walachs, Volokh, a race Latin by language, customs, tradition, and partly descended from Rom. governors of the province, numbering *c.* 10,000,000, dwelling in Rumania, Transylvania, Hungary, South Russia, and various parts of the Balkan Peninsula.

VLADIKAVKAZ (43° 3′ N., 44° 47′ E.), town, fortress, capital, province Terek, Caucasia, Russia; at foot of Caucasus Mountains. Pop. (1910) 72,300.

VLADIMIR (56° 10′ N., 40° 30′ E.), government, Russia; surface undulating; mostly unfertile; drained by Oka and its tributary, the Klyazma; chief minerals, alabaster and iron ore; manufactures cottons, linens; extensive domestic industries. Pop. (1910) 1,895,900. Capital, **Vladimir** (56° 7′ N., 40° 28′ E.), on Klyazma; has two ancient cathedrals; various manufactures. Pop. (1910) 32,710.

VLADIMIR, ST. (*c.* 956–1015), grand-duke of Kiev and of all Russia; youngest s. of Svyatoslav I. and his paramour Malushka. He conquered Kiev (980) and Galicia (981) and was proclaimed prince of all Russia. He committed endless pagan atrocities till he became a Christian in 988. From that day he was as energetic in the propagation of Christianity and civilisation.

VLADIMIR-VOLHYNSKIY (51° N., 24° 20′ E.), town, Volhynia, Russia. Pop. 10,500.

VLADIVOSTOK (43° 10′ N., 132° E.), seaport, naval station, Maritime Province, Russia, on Gulf of Peter the Great (Sea of Japan); naval and mechanical works. Pop. (1910) 90,160.

VLISSINGEN, Flushing (*q.v.*).

VODENA (40° 47′ N., 22° 3′ E.) (ancient *Edessa*), town, vilayet Salonica, European Turkey; manufactures tobacco. Pop. *c.* 13,500.

VOGEL, SIR JULIUS (1835–99), Brit. statesman; emigrated to Victoria goldfields, 1861; member of New Zealand House of Representatives, 1863; Prime Minister of New Zealand, 1870; agent-gen. in England, 1876.

VOGHERA (44° 59′ N., 9° 1′ E.) (ancient *Iria*), town, Pavia, Italy; manufactures silk fabrics. Pop. 21,500.

VOGLER, GEORG JOSEPH, Abt (1749–1814), Ger. organist, composer, and teacher; became Abbé at Rome, 1773; app. Court Chaplain, Mannheim, 1775; established music schools at Mannheim, Stockholm, Darmstadt; operas, masses, chamber-music.

VOGTLAND (Lat. *Terra Advocatorum*), district, Germany, comprising parts of W. Saxony, Reuss, Saxe-Altenburg, and Saxe-Weimar; governed in the Middle Ages by officials called Vogts.

VOICE, see Larynx.

VOIRON (45° 23′ N., 5° 34′ E.), town, on Morge, Isère, France; manufactures cloth. Pop. 13,000.

VOKHNA, see Pavlovskiy Posad.

VOLAPÜK, a so-called 'universal language,' invented by Johann Martin Schleyer, 1879. It has been superseded by Esperanto (*q.v.*).

VOLCANO ISLANDS (25° N., 141° 30′ E.), group of small islands in Pacific.

VOLCANOES are vents in the earth's crust from which molten rock, ashes, and steam are ejected. The lava tends in time to heap up a conical eminence round the vent, thus forming the *crater* or cup. They are of three kinds: (1) *extinct*, (2) *dormant* (*i.e.* temporarily inactive), or (3) *active*. Other minor varieties are *salses*, or mud v's, of the Crimea, *fumaroles*, or steam fissures, and the *solfataras* of Italy, where sulphur fumes escape through vents in the earth. The geysers (*q.v.*) of Iceland denote spent volcanic activity.

Notable active volcanoes are:—

Vesuvius, 4200 ft., 7 miles S.E. of Naples. Its most destructive eruption took place in 79 A.D., burying Pompeii and Herculaneum; in 1771–72 and 1906 serious outbreaks took place.

Etna, in Sicily, highest volcano in Europe; *c.* 10,800 ft.; over 90 eruptions on record; 16 occurring in XIX. cent.; most disastrous that of 1169, Catania and 15,000 inhabitants being destroyed.

The Peak of Teneriffe, 12,000 ft. high; situated on island of Teneriffe.

Stromboli, in Lipari Islands; over 3000 ft.; active since Homer's time; constantly sending out steam and occasionally showers of stones, which generally fall back into the crater.

Mount Pelé, in island of Martinique, was scene of violent eruption, 1902. St. Pierre, the capital, was destroyed and 30,000 perished. The side of the volcano was torn away.

Krakatoa, on K. island, Java, after being quiet for over 1000 years, burst into eruption, 1883, and 30,000 perished; the sound of the explosion was heard over nearly ¼th of the earth's surface, while the dust was carried round the earth many times before being dissipated; caused gorgeous sunrises and sunsets in all parts of the globe.

Mount Hecla, in Iceland, 5000 ft., has been in constant eruption since IX. cent.

There are active v's in Hawaii, in North Pacific Ocean, and in islands of Bourbon, Mada, and Mauritius.

Antarctic v's are: Erebus, 12,500 ft., active; Terror, 11,000 ft., extinct.

Volcanic action is ascribed to internal generation of vapours which have no room for expansion.

VOLCEIUM (40° 35′ N., 15° 20′ E.) (modern Buccino), ancient town, Lucania, Italy; capital of the Volceiani.

VOLCI, Vulci (42° 25′ N., 11° 35′ E.), ancient city, on Armina (*Fiora*), Etruria.

VOLE, see Mouse Family, Microtus Amphibius.

VOLGA (46° N., 48° 10′ E.), Russ. river, longest in Europe (*c.* 2400 miles); rises in Valdai plateau; flows E. as far as Kazan, then turns S. and enters Caspian Sea by innumerable mouths near Astrakhan; chief tributaries, Mologa, Oka, Sura, Sheksna, Sarpa Unsha, Vetluga, Kama, Samara; principal towns, Tver, Jaroslav, Kostroma, Nizhni-Novgorod, Kazan, Simbirsk, Samara, Saratov, Tsaritsyn, Astrakhan. Navigation begins near source; one of chief commercial rivers of the world; connected by fine system of canals with Baltic, Black, and White seas; also with rivers Dnieper, Dniester, Don, etc. Large sturgeon, pike, and other fisheries; ice-bound during winter.

VOLHYNIA (50° 40′ N., 27° E.) government, Russia, bordering Austrian Galicia; hilly in S., low and marshy in N.; forests; drained by Dnieper; produces large crops of grain, sugar-beet, tobacco. Pop. (1910) 3,846,500. Capital, Zhitomir.

VOLITION, see Psychology.

VOLKSRUST (27° 23′ S., 29° 56′ E.), town, Transvaal; agricultural centre.

VOLLENDAM, fishing village, N. Holland, Netherlands, on Zuider Zee, adjoining Edam.

VOLO (39° 24′ N., 22° 58′ E.), seaport town, on Gulf of Volo, Thessaly, Greece. Pop. 23,700.

VOLOGÆSES, the name of five Parthian kings, several of whom made war against the Rom. people. They are identified with Arsaces XXIII., XXVII., XXVIII., XXIX., and XXX. See Tacitus, *Annales*, xiv.

VOLOGDA (62° N., 50° E.), government, Russia; separated on E. from Siberia by Ural Mountains; surface flat; forest-covered; drained by Dvina and Petchora; cereals cultivated; chief mineral products, salt and iron ore. Pop. (1910) 1,625,200. Capital, **Vologda** (59° 12′ N., 39° 56′ E.), on Vologda; trade in flax, linseed. Pop. (1910) 31,520.

VOLSCI, warlike Ital. race, inhabiting Latium, and constantly at war with Latins and Romans from 460 B.C.

to *c.* 310 B.C.; defeated by Tarquins; allied with the Æqui against Rome; finally subdued by Rome, and admitted to enfranchisement towards end IV. cent. B.C.; merged henceforth in Rom. citizens.

VOLSINII, VULSINII (42° 40′ N., 12° E.) (modern BOLSENA), ancient town, Etruria; one of twelve cities of the Confederation; conquered by Romans, 280 B.C.

VOLSK, town, on Volga, Saratov, Russia; iron, flour, leather. Pop. *c.* 28,500.

VOLT, see ELECTRICITY.

VOLTA (7° N., 0°), river, W. Africa; flows S. to Gulf of Guinea at Adda; length, 900 miles.

VOLTAIRE, FRANÇOIS MARIE AROUET DE (1694–1778), Fr. poet and philosopher; s. of Parisian notary, Arouet; imbibed deism from earliest teachers; further ed. at *Collège Louis le Grand* by the Jesuits; imprisoned for a year in the Bastille, 1717, for literary attack on regent; wrote *Œdipe* and commenced *La Henriade*; assumed additional name de V., 1718; after a new imprisonment and release went to England, 1726, where he repub. *La Henriade* (1728), an epic poem on Henry of Navarre; made money and established friendship with Bolingbroke and free-thinking society. V. had written dramatic works in London: *Brutus* (played, 1730); *Eriphyle and Zaïre*, his masterpiece (1732); other noted plays are *La Mort de César* (1731), *Adélaïde du Gueschis* (1734), *Zulime* (1740), *Mahomet* (1741), *Mérope* (1743). In 1731 he pub. his *Lettres philosophiques* (praising Eng. institutions at expense of Fr.), which was burned by the *Parlement de Paris*. V. lived with the Marquise du Châtelet Lomont (1706–49) from 1733 to 1747. She was dau. of Baron de Breteuil, and married in 1725; a linguist, musician, mathematician, and philosopher, she wrote *Institutions de physique*, and translated Newton's *Principia*.

The tales *Zadig* (1747), *Micromégas* (1752), the famous *Candide* (1759), *L'Ingénu* (1767), *L'Homme aux Guarante écus* (1768), *La Princesse de Babylone* (1768), etc., are the best of his writings for wit and style, but imprudently malicious. V. entered Fr. Academy, 1746; he accepted often-repeated invitation to Berlin, 1750, where he pub. his best hist. work, *Le Siècle de Louis XIV.* (1751); the visit ended in quarrel with Frederick the Great; 'within V.,' says Saintsbury, 'there was always a mischievous and ill-behaved child'; one-sided historian, but tells his tale in light, easy manner. Other hist. works are—*History of Charles XII.* (1731), *History of Peter the Great* (1759), *Précis du Siècle de Louis XV.* (1768), *Histoire du Parlement de Paris* (1769), *Essay on the Manners and Spirit of Nations* (1769). V. settled at Ferney, 1760, near Geneva, where he lived until 1778; often called 'The Patriarch of Ferney'; at height of his influence and exercised enormous power over European thought; from Ferney he rehabilitated the memory of Calas, unjustly condemned by the *Parlement* of Toulouse; built model village, where he established watch-making industry, a church (with inscription, *Deo erexit V.*), a theatre, entertained many guests, and never ceased writing. Among works is long poem, *La Pucelle*, of which savour was audacious iconoclasm and happy epigram; literary excellence of V. (allowed by all) not that of poet in any sense, but that of wit and *esprit moquer*; one of leaders of the *Encyclopédists* (*q.v.*) and father of free thought of France; returned to Paris, 1778; tremendous reception hastened his death; left vast *Correspondance* of first-rate kind, in which may be read his character and that of the rationalistic century of which he was the guiding spirit.

Life, by Lord Morley (1886), Tallentyre (3rd edit., 1905).

VOLTERRA (43° 33′ N., 10° 51′ E.) (ancient *Volaterræ*), town, Italy; cathedral; museum with Etruscan antiquities; manufactures alabaster; in ancient times one of chief cities of Etruria. Pop. 13,500.

VOLTMETER, electrical instrument for measuring differences of potential. For high voltages of 1000 or more the instrument—*electrostatic voltmeter*—is, in principle, the quadrant electrometer (*q.v.*) connected idiostatically. For low voltages, the *multicellular voltmeter* is used. This consists of a vertical row of horizontal vanes moving between a similar row of fixed quadrants, so that each vane moves between two quadrants; deflection of the vanes is shown by a pointer and gives required measure of voltage.

VOLTRI (44° 26′ N., 8° 45′ E.), town, Liguria, Italy; iron, shipbuilding, paper, cotton. Pop. 15,200.

VOLTURNO (41° 2′ N., 14° E.) (ancient *Vulturnus*), river, Italy; enters Mediterranean; length, 10 miles.

VOLUNTEERS, originally persons who join an army at their own expense, to serve without pay for the duration of a campaign; amateurs, not professional soldiers. Wellington's army in the Peninsula contained many, and some were granted commissions; later, the term was applied to the body of Brit. civilians who in 1859 took arms when invasion was threatened. A certain number of middle-class men provided themselves with uniforms and were self-supporting, weapons alone being lent by the government. They elected their officers and adopted titles from their place of origin; this force was replaced by citizens unable to pay subscriptions or buy uniform, and gradually the so-called volunteers became a subsidised force. As they reserved many privileges of the original force, including the right to absent themselves from training, they were reconstituted (1907–8) as the TERRITORIAL FORCE, consisting of men regularly enlisted and paid for service. V. of the old type exist in India, Bermuda, Ceylon, the Isle of Man.

VOLUTE, in arch., spiral ornament of Ionic capital.

VOLVOX, genus of Flagellate Protozoa, closely related to simplest plants; form minute globes composed of sometimes as many as 22,000 individuals, in fresh water.

VONDEL, JOOST VAN DEN (1587–1679), Dutch poet; his play, *Lucifer* (1654), is believed by Gosse and other critics to have influenced Milton's *Paradise Lost*.

VORAGINE, DOMINICAN JACOBUS DE, see GOLDEN LEGEND.

VORARLBERG (47° 15′ N., 9° 50′ E.), mountainous province, Austria, bordering Lake of Constance; constitutionally included in Tyrol, of which it forms the W. extremity. Pop. (1910) 145,408.

VORONEZH (51° N., 39° 30′ E.), government, S. Russia; level or undulating; drained by Don; fertile, producing grain, sugar-beets; horses and cattle reared; woollens manufactured. Pop. (1910) 3,355,800. Capital, **Voronezh** (51° 46′ N., 39° 13′ E.), on Voronezh; has a military school; commercial centre; manufactures woollens. Pop. (1910) 90,630.

VORONTSOV, see WORONZOV.

VORÖSMARTY, MICHAEL (1800–55), Hungarian poet and dramatist; composer of Hungarian National Anthem.

VORTEX, see HYDROMECHANICS.

VORTICELLA, see under INFUSORIA.

VORTIGERN (*V.* cent.), Brit. chief traditionally held to have invited aid from Saxons against Picts and Scots.

VOSGES.—(1) (48° 10′ N., 6° 30′ E.) department, E. France, formed chiefly of old province of Lorraine; traversed in E. by Vosges Mountains and in S. by the chain of the Faucilles; forests; numerous mineral springs; saw-mills; textile industries. Pop. (1911) 433,914. Capital, Epinal. (2) (48° N., 7° E.) mountain range in N.E. of France and W. of Germany; highest point, Ballon de Guebioiller, 4680 ft.; W. slopes thickly wooded, E. slopes vine-clad; excellent pasturage; noted for cattle.

VOSS, JOHANN HEINRICH (1751–1826), Ger. poet; b. Sömmersdorf, Mecklenburg; best works are *Luise* (idyllic poem) and excellent translations of Homer's *Odyssey*, Vergil's *Georgics*, etc.

VOSSEVANGEN, Voss (60° 40′ N., 6° 24′ E.), town, Sondre-Bergenhus, Norway; tourist centre.

VOSSIUS, GERHARD JOHANN (1577–1649), Dutch scholar; prof. of History, Amsterdam; wrote *Historia Pelagiana* (1618), an apology for Arminianism.

VOTE, see ELECTION.

VOTING-MACHINES, see ELECTION.

VOTKINSK (57° 20′ N., 53° 40′ E.), town, Vyatka, Russia; manufactures agricultural machinery. Pop. 22,000.

VOW, a solemn promise of a human being to the Deity; has many instances in Old Testament, and recognised in New Testament by St. Paul (*Acts* 18[18]); always obtained in R.C. Church, especially vows of poverty, chastity, and obedience. A *solemn* v. of chastity renders marriage null and void, a *simple* v. makes it unlawful. Dispensations can release from v's in either case.

VOWEL, see ALPHABET.

VOZNESENSK (47° 36′ N., 31° 26′ E.), river port, on Bug, Kherson, Russia; cathedral; distilleries, breweries. Pop. 13,500.

VRANYA, VRANJA (42° 27′ N., 22° 7′ E.), town, on Morava, Servia; rope-making industry. Pop. (1910) 10,487; (district) 257,087.

VRATZA (43° 12′ N., 22° 36′ E.), town, Bulgaria; manufactures wine. Pop. (1910) 15,230; (department) 312,460.

VRYHEID (27° 49′ S., 30° 44′ E.), town, Natal; rich deposits of coal, copper, gold.

VULCAN, see HEPHÆSTUS.

VULCANO, see LIPARI ISLANDS.

VULGATE, see BIBLE.

VULTURE FAMILY (*Vulturidæ*), large day-flying birds of prey (ACCIPITRINES, *q.v.*), with the crown of the head and often the neck bare and destitute of true feathers. An exception is the large BEARDED VULTURE or LAMMERGEIER (*Gypaëtus barbatus*), with well-feathered head, found in the mountains in Southern Europe and Asia, where it feeds mainly on carrion. The true Vultures (*Vultur*, *Neophron*, *Gyps*) are confined to the warm regions of the Old World, four species occurring in Southern Europe. On account of their appearance and their habit of feeding on garbage and carrion, on which they gorge to repletion, they are the most repulsive of birds of prey.

VULVA, DISEASES OF, see GYNECOLOGY.

VYATKA, VIATKA (58° N., 50° E.), government, N.E. Russia; surface is an undulating plateau; low hills in N.E.; much occupied by forests, lakes, and marshes; watered by Vyatka; soil fertile in parts, produces cereals, flax; iron ore found; cattle reared. Pop. (1910) 3,747,000. Capital, **Vyatka** (58° 17′ N., 49° 57′ E.), river port on Vyatka; manufactures leather; trade in corn. Pop. 43,500.

VYAZMA (55° 15′ N., 34° 15′ E.), town, on Vyazma, Smolensk, Russia; cathedral; active trade. Pop. 15,700.

VYERNYI, formerly ALMATY (43° 16′ N., 76° 33′ E)., fortified town, capital, Semiryechensk, Asiatic Russia; trade in cereals. Pop. 26,000.

VYRNWY (52° 47′ N., 3° 4′ W.), river, Wales; rises in N.W. Montgomeryshire; joins Severn above Shrewsbury; the chief reservoir of Liverpool water-supply is on its course.

VYSHNIY-VOLOCHOK, VISHNII-VOLOCHOK (57° 35′ N., 34° 30′ E.), town, on Vyshniy, Tver, Russia; cotton-mills. Pop. 17,500.

W, 23rd letter of alphabet, is a double *u*; its consonantal use remains in *queer*; the Normans, having no *w* in their alphabet, used *gu*, hence Eng. *ward* became Fr. *guard*.

WA, Burmese race, probably aboriginal in N. Siam; formerly great head-hunters, constructing groves of human skulls outside their villages, to protect against evil powers.

WABASH (40° 47′ N., 85° 46′ W.), city, on Wabash, capital, Wabash County, Indiana, U.S.A.; manufactures furniture; ironworks. Pop. (1910) 8687.

WACE, HENRY (1836–), prof. of Ecclesiastical History, King's Coll., London, 1875; principal, 1883; dean of Canterbury, 1903.

WACO (31° 30′ N., 96° 55′ W.), city, on Brazos, capital, M'Lennan County, Texas, U.S.A.; manufactures flour, woollens. Pop. (1910) 26,425.

WAD MEDANI (14° 25′ N., 33° 30′ E.), town, on Blue Nile, Anglo-Egyptian Sudan; dépôt for grain; oil- and soap-works. Pop. 19,000.

WADAI (*c.* 13° 30′ N., 19° 30′ E.), native state, Africa; situated between Darfur on E., and Baghirmi and Lake Chad on W.; area, *c.* 170,000 sq. miles. Surface is generally desert land; several oases and dense forests; capital, Abeshr; inhabited by Arabs and negroes; produces rice, wheat; cattle, camels, and horses raised. Under Fr. protection since 1903. Pop. *c.* 3,000,000.

WADDINGTON, WILLIAM HENRY (1826–94), Fr. diplomatist; Minister of Public Instruction, 1873, 1876–77, of Foreign Affairs, 1877–79; Premier, 1879; ambassador to England, 1883.

WADE, traditional builder of ancient castles and roads of Yorkshire and the Scot. border.

WADE, GEORGE (1673–1748), Brit. general; put down 1715 rebellion, and made military roads in the Scot. Highlands; failed in 1745 revolt.

WADE, SIR THOMAS FRANCIS (1818–95), Brit. ambassador in China; wrote on Chin. empire and speech.

WADEBRIDGE (50° 31′ N., 4° 49′ W.), seaport town, on Camel, Cornwall, England.

WADELAI (2° 40′ N., 31° 20′ E.), village, on Upper Nile, Brit. Uganda Protectorate; was the chief station of Emin Pasha.

WADHWAN (22° 42′ N., 71° 44′ E.), town, capital, Wadhwan state, Kathiawar, Bombay, India. Pop. 15,800; (state) 45,000.

WADI HALFA (21° 53′ N., 31° 20′ E.), town, on Nile, Anglo-Egyptian Sudan, below second cataract. Pop. 3100.

WAFER.—(1) flat disc of isinglass, gummed, for securing flaps of envelopes; (2) thin biscuit eaten with ices. W. sometimes replaces sacramental bread in Eucharist.

WAGER, contract between two persons that one shall pay the other an agreed sum, or some stated object, according as a certain future event will turn out; not enforced by law, hence termed 'debts of honour.'

WAGES are the payment made in return for services or labour. They are paid out of the wealth labour produces, and will rise and fall with supply of labour. W. are a necessary charge on the cost of production. While the tendency is for w. to sink to the level of subsistence, civilisation and social life are raising that level by increasing the common standard of comfort. By the many Truck Acts between 1831 and 1896; w. must be paid in current coin of the realm, without any restrictions or reductions, and no part may be paid in goods. W. may not be paid in public-houses to miners or other workmen (Payment of Wages in Public-Houses Act, 1883). The master of domestic servants is bound to supply in addition the necessary food and lodging, and neglect to do this resulting in loss of health is punishable by penal servitude. In the case of an apprentice the necessary medical attendance must also be supplied. The term w. is restricted to the remuneration of the manual labourer. The clerk and public servant receive a 'salary'; medical or legal advisers take a 'fee'; soldiers and sailors draw their 'pay'; while clergymen receive a 'stipend.' The Brit. Coal Mines Act, 1912, fixes a minimum wage for all miners, and the Labour Party wants to extend the principle to all industries.

F. A. Walker, *The Wages Question and Political Economy*; Arnold Toynbee, *Industrial Revolution*; H. M. Thompson, *Theory of Wages*; A. Marshall, *Principles of Economics*.

WAGGA-WAGGA (35° 10′ S., 147° 18′ E.), town, on Murrumbidgee, Wynyard County, New South Wales; pastoral and gold-mining region. Pop. 5700.

WAGNER, ADOLF (1835–), political economist; ed. Heidelberg; prof. of Political Economy at Vienna, Hamburg, Dorpat, Freiburg, and Berlin, 1870.

WAGNER, RUDOLF (1805–64), Ger. physiologist; b. Bayreuth; prof. of Zool. at Erlangen (1832) and Göttingen (1840); made important researches and observations in anat. and physiology, particularly in embryology, discovering the germinal vesicle of the human ovum; wrote a standard text-book on physiology.

WAGNER, WILHELM RICHARD (1813–83), Ger. dramatic composer; b. Leipzig, d. suddenly at Venice. An atmosphere of the theatre pervaded the family circle, and his first interests were purely dramatic. Awakening to musical sense, he wrote several things now without value; and in 1834 entered on a series of engagements as operatic conductor, which included Magdeburg, Königsberg, and Riga. He conceived the idea of writing a grand opera, and went to Paris with *Rienzi*, only to have it declined. He had m. by this time and was in the direst straits of poverty. *Rienzi* was accepted for Dresden, where he went, 1842, as conductor of the opera, and where, next year, *The Flying Dutchman* was produced. From that time onwards W. and his music were subjects of heated discussion throughout musical Europe, his ideas of opera being conceived on entirely new lines. *Tannhäuser*, *Lohengrin*, *Tristan and Isolde*, *The Mastersingers*, *The Nibelung's Ring* (a colossal work, including the four dramas of *The Rhinegold*, *The Valkyrie*, *Siegfried*, and *The Dusk of the Gods*), and *Parsifal* followed in the order named, 1849–82. In 1848 he became involved in revolutionary politics, and was driven into exile for some years. His prospects were still of the poorest, and he had to depend largely on charity.

In 1864, Ludwig, the 'mad king' of Bavaria, provided him with a home and an income; and presently the festival theatre at Bayreuth, where ideal performances of his great operas could be given, became possible. W.'s professional activity showed itself in two directions: in the reforms he effected on the opera, and in his prose writings, which are more voluminous than those of any other composer.

He created an entirely new form of opera. Hitherto opera had been conventional, designed for displaying 'star' vocalists, pretty costumes, and scenery. Text and music had no necessary connection; and the

librettos were often either absurd or unintelligible. With W. (who wrote all his own librettos), text, music, action, and scenery must unite in a common purpose, so that the drama should stand or fall as one piece. Again, there must be no mere artificial set of arias, duets, quartets, ballets, ensembles, and so on, with breaks for applause or encores. W. also made an essential feature of the 'leading motive'—a short, striking, and easily recognised musical phrase, associated with some particular character or some special idea or incident in the drama. In all these respects he has influenced later composers of grand opera.

Wagner, *My Life*; *Life*, by Henderson (1902), Lidgey (1899); Hadden, *The Operas of W.* (1908); Newman, *A Study of W.* (1899).

WAGRAM, village, a few miles N.E. of Vienna, Austria, where Napoleon severely defeated the Austrians on July 6, 1809, the victory being followed by the Treaty of Schönbrunn.

WAGTAIL (*Motacilla*), genus of Passerine Birds; Pied W. (*M. lugubris*) is a common Brit. species; it feeds on the ground, and runs swiftly; other species are White W. (*M. alba*), Grey W. (*M. melanope*), Yellow W. (*M. rayi*), Blue-Headed W. (*M. flava*).

WAHHABIS, members of Muhammadan religious movement originating in XVIII. cent.; attempted to restore primitive simplicity of Islam.

WAI (15° 57′ N., 73° 56′ E.), town, pilgrimage resort, on Kistna, Satara, Bombay, India. Pop. 13,900.

WAIBLINGEN (48° 50′ N., 9° 20′ E.), town, on Rems, Württemberg, Germany; manufactures silk goods; pottery. Pop. 6930.

WAIGATZ ISLAND, see Novaya Zemlya.

WAINGANGA (22° N., 80° E.), river, Central Provs., Brit. India; unites with Wardhá to form Pranhitá.

WAITZ, GEORG (1813–86), Ger. historian; b. Flensburg; best works are *Jahrbücher des Deutschen Reiches unter Heinrich I.*, *Deutsche Verfassungsgeschichte*, *Schleswig-Holsteins Geschichte*, etc.

WAKE, name given to ancient custom of watching by the dead; a night service in church followed by a festival.

WAKE, WILLIAM (1657–1737), bp. of Lincoln, 1705; abp. of Canterbury, 1716.

WAKEFIELD.—(1) (53° 42′ N., 1° 30′ W.) city, on Calder, W. Riding, Yorkshire, England; manufactures agricultural machinery; trade in grain; cathedral church; grammar school (1591), town hall, fine arts institute, and corn exchange; bp.'s see (1888); scene of a battle between Lancastrians and Yorkists in which Duke of York was slain (1460). Pop. (1911) 51,516. (2) (42° 30′ N., 71° 4′ W.), town, Middlesex County, Massachusetts, U.S.A.; manufactures rattan, boots and shoes. Pop. (1910) 11,404.

WAKEFIELD, EDWARD GIBBON (1796–1862), Brit. statesman; first attached to the British Embassy at Turin, 1814–16, and then at Paris, 1820–26; imprisoned, 1826–29, for abducting an heiress, marriage was annulled by law; for 20 years urged reforms in administration of Australia; emigrated to New Zealand, 1853.

WAKEFIELD, GILBERT (1756–1801), Eng. cleric; Anglican, then Unitarian; a great controversialist.

WAKHAN, see Badakshan.

WAKKERSTROOM (27° 19′ S., 30° 11′ E.), town, Transvaal; agricultural region.

WALACHIA, Wallachia (44° 30′ N., 26° E.), division, Rumania; part of ancient Dacia; united with Moldavia in 1859 to form principality of Rumania.

WALAFRIED STRABO (d. 849), Ger. ecclesiastical writer; abbot of Fulda, 838; wrote *Glosa ordinaria*, a mine of reference to mediæval scholars.

WALCH, JOHANN GEORG (1693–1775), Ger. scholar; prof. of Poetry, Rhetoric, and Theology at Jena.

WALCHEREN (51° 30′ N., 3° 35′ E.), island, Zeeland, Holland; fertile. Area, 81¼ sq. miles.

WALDECK-PYRMONT (51° 18′ N., 8° 50′ E.), principality and state, German Empire; consists of Waldeck, enclosed by Pruss. provinces of Westphalia and Hesse-Nassau, and of Pyrmont, surrounded by Hanover, Lippe, and Brunswick; hilly and mountainous; in basin of Weser; administered by Prussia; capital, Arsolen; Pyrmont is noted for its mineral waters. Pop. (1910) 61,707.

WALDECK-ROUSSEAU, PIERRE MARIE RENÉ ERNEST (1846–1904), Fr. statesman; b. Nantes; Prime Minister, 1899, with composite cabinet for maintaining the Republic; carried amnesty for Dreyfus case, 1900, and Act for Suppression of Religious Orders, 1901. Resigned, 1902.

WALDEGRAVE, SIR EDWARD (1517–61), officer of Queen Mary, imprisoned by Elizabeth; ancestor of James, 1st Earl of W. (1685–1741), and of William W. (1753–1825), first Lord Radstock.

WALDEN, ROGER, treasurer of England, 1395; abp. of Canterbury, 1397–99; bp. of London, 1405.

WALDENBURG (50° 47′ N., 16° 17′ E.), town, on Polnitz, Silesia, Prussia; centre of a coal-mining district; manufactures porcelain. Pop. 16,440.

WALDENSES, religious body living in Waldensian (Fr. Vaudois) valleys, near Turin, since XII. cent. Their origin lies in Manichæism, which came from the East, and produced the Cathari (in E. Europe, IX. cent.). These held a dualistic view of the universe and a view of Church order which struck at the roots of the sacerdotalism of Catholic Christianity. Peter Waldo preached at Lyons in 1170 and had a following. The W. disapproved of oaths, capital punishment, and held the Rom. Church was not Christian. They were persecuted by members of the Dominican Order forming the Inquisition, and they were crushed but not exterminated. Their teaching influenced Wycliffe and Huss, but on the outbreak of the Reformation they were absorbed into the general Prot. movement. Again persecuted in XVII. cent., they were protected by Cromwell, and Milton wrote his famous sonnet about them. They now number *c.* 20,000.

Lea, *History of the Inquisition of the Middle Ages*; Gilly, *Researches on the Waldensians*.

WALDERSEE, ALFRED, COUNT VON (1832–1904), Pruss. general; commander-in-chief of the allied armies in Boxer riots, China, 1900.

WALENSEE, Lake of Walenstadt (47° 7′ N., 9° 12′ E.), lake, between cantons St. Gall and Glaurus, Switzerland; length, 9½ miles; width, 1½ mile.

WALES (*c.* 51° 25′ to 55° 25′ N., 3° to 5° 20′ W.), principality of United Kingdom, projecting from centre of England; bounded N. by Irish Sea, W. by St. George's Channel, S. by Bristol Channel, E. by Cheshire, Salop, Hereford, and Monmouth; area, 7434 sq. miles. Country is divided into N. and S.W., each containing six counties; in former, Flint is smallest and Montgomery largest; and in latter, Radnor is smallest and Carmarthen largest. Most important county is Glamorgan, which contains nearly half the population. In N.W., Anglesey forms an island cut off from mainland by Menai Strait. Only two large towns are Cardiff and Swansea, in Glamorgan. Coast-line broken in N. by opening of Dee and mouths of Clwyd and Conway, on W. by Carnarvon and Cardigan Bays, on S.W. by St. Bride Bay and Milford Haven, and on S. by Carmarthen and Swansea Bays. Drainage is carried off in N. by upper waters of Severn and Dee, and by Clwyd, Conway, and other streams; in W. by Dovey, Teifi; and in S. by upper waters of Wye and Usk, and by Taff, Tawe, and Towy. Anglesey is low and undulating, and there is a good deal of low ground in S.W. peninsula, but elsewhere the country is uniformly hilly, rising to many peaks of from 2000 to over 3000 ft., and reaching extreme height of 3560 ft. in Snowdon, the highest peak in United Kingdom outside Scotland. Climate resembles that of England, except that rainfall is greater.

Arable land covers 800,000 acres, and nearly 1,950,000 acres are under permanent pasture; crops are in rotation—grasses, oats, barley, turnips, potatoes; horses, cattle, and sheep raised. Great wealth lies in minerals and

connected industries, especially in coal; there are two coal-fields, one in N., in Denbigh and Flint, and one in S., in Glamorgan, Carmarthen, Brecon, and Pembroke; there is also large production of slate, limestone, fire-clay, and a small quantity of lead, silver-lead, zinc, gold, and copper; extensive smelting of iron, copper, and tin in S.; flannels manufactured at Newtown and Montgomery; Swansea is centre of tin and copper industries.

History.—The tribes inhabiting the districts of modern W. figured prominently in the wars of the Romans in Britain, and Welsh mineral resources were extensively exploited by Roman speculators. But Welsh history proper begins with the overthrow of the Romano-Brit. states by the Anglo-Saxon tribes (V.–VII. cent.), despite the efforts of Cunedda in the north and Ambrosius Aurelianus and Mælgwn Gwynedd in the west. In 577 West W. fell away with the advance of the West Saxons under Ceawlin, while in 613 Ethelfrith of Northumbria drove the North Welsh behind the Dee by the victory of Chester. Their misfortune plunged the Welsh into chronic anarchy, which was prolonged by the attacks of Mercia, especially under Offa, and the predatory inroads of the Scandinavians in the IX. cent.; although Rhodri the Great (844–78), and Howel the Good (918–50), the Welsh lawgiver, sometimes enforced a transient unity.

The Normans, unable to conquer W. by campaigning, increased disunion by a process of gradual penetration from Chester, Shrewsbury, and Hereford, the prototypes of the Welsh lordships marches. But under Griffith ap Cynan (1075–1137) a consolidating tendency set in, having the warlike and inaccessible kingdom of Gwynedd (Snowdonia) as its nucleus, and Henry I. and Henry II. invaded the country in vain. Griffith's descendants, Owen Gwynedd (1135–70), and especially Llewelyn ap Iorwerth (1188–1240), who obtained special concessions in Magna Carta, ruled over large tracts of middle W. as well as Gwynedd, and established a strong kingdom.

But 'the last of the Welsh Princes,' Llewelyn ap Griffith, who had a wider rule in W. than any post-Norman prince, played into the hands of Edward I. by his restless ambition. He was twice beaten (1277 and 1282), and was killed in a skirmish. W. was incorporated in England and became an appanage of the king's eldest son. Edward also set up the shires of Flint, Anglesey, Carnarvon, Merioneth, Cardigan, and Carmarthen. English influence was secured by castles and boroughs filled with Englishmen, but Welshmen played an important part in the English wars in Scotland and France (they were the first soldiers to wear a uniform), until the oppressions of individuals almost enabled Owen Glendower to regain Welsh independence in the XV. cent. His failure allowed Henry VIII. to finish the work of Edward I. by shiring the whole of W. and giving it parliamentary representation.

Welsh history then became merged into English, although the Welsh national spirit has always remained strong.

The principality is administered with England, and has the same system of education; the Univ. was founded in 1893 and includes three colleges, at Aberystwith, Bangor, and Cardiff. The State Church is the Church of England, but a Bill for its disestablishment was passed by Commons and rejected by Lords (1913), thus coming under operation of the Parliament Act. Most of the inhabitants are Nonconformists. Language belongs to Celtic group, and is generally spoken; it closely resembles the language spoken in Brittany. Pop. (1911) 2,032,193.

WALFISH BAY (22° 30′ S., 14° E.), harbour, on coast of Ger. S.W. Africa, belonging to Britain.

WALKER, FRANCIS AMASA (1840–97), Amer. soldier and political economist; served in the army of the Potomac, 1861–65; general, 1865; author of *Political Economy*—still the text-book at Oxford Univ.

WALKER, FREDERICK (1840–75), Eng. subject-painter; studied in London, and was first known as a wood-engraver. As a painter he worked successfully in both water-colours and oils.

WALKER, GEORGE (*c.* 1618–90), defender of Londonderry; b. Tyrone. Entered the Church, but when the Revolution broke out gathered an army for the defence of Londonderry, and throughout the siege his strenuous bravery upheld the resistance of the inhabitants. He became bp. of Londonderry, but fell in the battle of the Boyne; wrote a book on his experiences, entitled *A True Account of the Siege*.

WALKER, WILLIAM (1824–60), Amer. adventurer; b. Nashville, Tennessee; commanded piratical expedition in N. Mexico, 1853; became Pres. of Nicaragua, 1855. He surrendered to the British, was handed over to his enemies, and shot.

WALL, RICHARD (1694–1778), an Irishman who became a Span. statesman; served in Span. navy, 1718; sec. to the Span. Embassy at St. Petersburg, 1727. After arranging Peace of Aix-la-Chapelle, 1747–48, became Span. ambassador in London; Foreign Minister and Sec. of State, 1754–64.

WALLA WALLA (46° 8′ N., 118° 50′ W.), city, on Mill Creek, capital, Walla Walla County, Washington, U.S.A.; centre of wheat region; agricultural machinery. Pop. (1910) 19,364.

WALLACE, ALFRED RUSSEL (1823–), Eng. traveller and naturalist; has made bot., zool., and geol. his life's work. In 1848 W. travelled and collected on the Amazon, and from 1854 to 1862 in the Malay Archipelago; made important discoveries regarding geographical distribution of animals; formulated theory of the survival of the fittest, and of natural selection as a whole. Wrote *My Life* (1905).

WALLACE, SIR RICHARD, Bart. (1818–90), Eng. art collector; natural s. of Marchioness of Hertford; 4th Marquess of Hertford left him his art collection, bequeathed to nation by W.'s widow, 1897.

WALLACE, SIR WILLIAM (*c.* 1270–1305), Scot. patriot; s. of Malcolm Wallace of Elderslie; organised Scot. insurrection against Eng. Edward I., 1297, and for a time was successful; defeated by Edward at Falkirk, 1298; withdrew to France, 1299, and sought help in vain from France and the pope; engaged in guerilla warfare against England, 1303–5, and outlawed by Edward I.; taken prisoner by treachery, brought to London, and executed as a traitor, 1305.

WALLACE, WILLIAM VINCENT (1814–65), Brit. composer; b. Waterford, Ireland; after adventurous career in the East, settled in Europe, 1853, his opera *Maritana* (1845) is still popular.

WALLACHIA, see WALACHIA.

WALLAROO (33° 57′ S., 137° 56′ E.), seaport, Dalny County, S. Australia; copper-mining centre; large smelting-works. Pop. 4000.

WALLASEY (53° 25′ N., 3° 5′ W.), town, Cheshire, England. Pop. (1911) 78,514.

WALLENSTEIN, ALBRECHT WENZEL EUSEBIUS VON, WALDSTEIN, Duke of Friedland, etc. (1583–1634), Ger. general; s. of a noble but unimportant Bohemian family; served in Rudolph II.'s army in Hungary; m., 1606, an elderly widow whose estates fell to him on her death, 1614; formed regiment for support of Emperor Ferdinand in Thirty Years War, and subsequently raised an army of 50,000 men. Hated by the German princes, W. was dismissed by the emperor (1630); recalled on Gustavus Adolphus's invasion of Germany. W. worked for a united Germany, and saw this could only be done by religious toleration. He entered into negotiations with the Protestants to carry out his own plans, was suspected by the emperor, and murdered at Eger; greatest leader in the Thirty Years War.

WALLER, EDMUND (1606–87), Eng. poet and Royalist. A plot in which he was implicated on the king's behalf miscarried, and Waller betrayed the conspirators, and he himself was banished. His verse is of a light, witty, occasional nature.

WALLER, SIR WILLIAM (*c.* 1597–1668), Eng. soldier; served in Bohemia; sat in Long Parliament;

after commanding with success Parliamentary army in W. England, was removed by 'Self-Denying Ordinance,' 1650; worked for restoration of monarchy; imprisoned by Cromwell.

WALLFLOWER (*Cheiranthus*), genus of plants, order Cruciferæ; Common W. (*C. cheiri*) is yellow when wild.

WALLINGFORD.—(1) (51° 35′ N., 1° 8′ W.) town, on Thames, Berkshire, England; has ruined Norman castle; was a Rom. stronghold. (2) (40° 29′ N., 72° 50′ W.) town, Newhaven County, Conn., U.S.A.; manufactures silver and plated goods. Pop. (1910) 8690.

WALLIS ARCHIPELAGO (13° S., 176° W.), group of islands in S. Pacific, belonging to France.

WALLIS, REV. JOHN, D.D. (1616–1703), Eng. mathematician; b. Ashford; ed. for Church; brilliant career, Cambridge; Parliamentarian during Civil War; prof. of Geom., Oxford; edit. mathematical and musical works of Greeks.

WALLON, HENRI ALEXANDRE (1812–1904), Fr. historian and politician; wrote *History of Slavery in Antiquity*, *Jeanne d'Arc* (crowned by French Academy), and *History of the Tribunal Révolutionnaire*.

WALLOONS, people of Ardennes region of Belgium, descended from the Gallic Belgæ, commingled with Lat. and Teutonic blood. A number fled into Holland, 1581, and formed the Walloon Prot. Church, which still holds its services in French, and now numbers 10,000.

WALLS, frequently built for military purposes, *e.g.* Hadrian's W., from Tyne to Solway Firth; Antonine Wall, from Forth to Clyde. Best example, Great Wall of China, 1500 miles in length.

WALLSEND (54° 59′ N., 1° 30′ W.), town, on Tyne, Northumberland, England, at E. end of Hadrian's Wall; collieries. Pop. (1911) 41,464.

WALMER (51° 12′ N., 1° 23′ E.), watering-place, Kent, England; the Duke of Wellington died here, 1852. Pop. (1911) 5347.

WALNUT (*Juglans regia*), a tree bearing unisexual, catkinate inflorescences; when ripe the kernel is edible, constituting the familiar w. of dessert. The unripe nuts make excellent pickles and a good ketchup. W. wood is esteemed for its beautiful markings, lightness, and its freedom from liability to split or warp.

WALPOLE, HORACE (1717–97), Eng. author; 4th s. of Sir Robert W.; ed. Eton and King's Coll., Cambridge; app. by his father to several sinecures, one in the customs being worth £1000 a year; travelled considerably, and lived the life of a man of literary taste, setting up a private printing-press for pleasure. M.P. for some years, but of no account as politician; chief works were the *Castle of Otranto*, *Memoirs* of reigns of George II. and George III. As a letter writer W. is excellent.

WALPOLE, ROBERT, see Orford, Earl of.

WALPURGIS, ST. (VIII. cent.), of Eng. birth, became abbess of Heidenheim.

WALRUSES (*Odobenidæ*), a family in the Pinnipedia group of Carnivora (*q.v.*). Large seal-like animals with upper canines developed to form huge tusks. They feed chiefly on molluscs, and occur only in the Arctic regions, the most familiar form being the Common W. or Morse (*Odobenus rosmarus*), found in both Old and New Worlds. Their tusks are valued as ivory, their hides for leather, and their bodies for oil.

WALSALL (52° 36′ N., 1° 59′ W.), town, Staffordshire, England; manufactures iron and brass; in neighbourhood of coal, lime, and iron mines. Pop. (1911) 92,130.

WALSINGHAM, SIR FRANCIS (*c.* 1530–90), Eng. statesman; s. of London lawyer; a Prot., he remained abroad in Mary's reign, returned on Elizabeth's accession; became Cecil's confidential agent, and was ambassador in Paris, 1570, working for an alliance with France. In 1573 W. became Elizabeth's Sec. of State, and was M.P. for Surrey till his death; maintained a large army of spies both on the Continent and in England, and was the strongest opponent of Spain and Catholicism. W. was the chief agent in execution of Mary, Queen of Scots.

WALTER, HUBERT (d. 1205), Eng. statesman; companion of Richard I. on First Crusade; Justiciar of England, 1193; compelled to resign by Pope Innocent III.; abp. of Canterbury, 1193–1205.

WALTER, JOHN (1738–1812), Eng. journalist; started *Universal Daily Register*, Jan. 1, 1785, and renamed it *The Times*, 1788. Succ., 1803, by his s. John, whose management lasted till 1847.

WALTHAM (42° 21′ N., 71° 12′ W.), city, on Charles River, Middlesex County, Massachusetts, U.S.A.; watch-making. Pop. (1910) 27,834.

WALTHAM ABBEY, Waltham Holy Cross (51° 40′ N., 0°), town, on Lea, Essex, England; remains of an abbey, said to have been founded by King Harold; gunpowder mills. Pop. (1911) 6796.

WALTHAMSTOW, suburb of London, in Essex, England, 7 miles N.E. of St. Paul's. Pop. (1911) 124,597.

WALTHARIUS, a Latin poem, written by Ekkehard, a monk of St. Gall, and dealing with the exploits of Walter of Aquitaine, a Gothic prince, during his captivity among the Huns.

WALTHER VON DER VOGELWEIDE (*c.* 1170–1230), Ger. mediæval lyric poet and minnesinger; b. Tyrol; lived at Austrian court, Vienna, 1180–98; successfully took part in the great minnesinger contest at the Wartburg, 1204; wrote fine love lyrics, and also political poetry; edit's of his works by Lachmann (1827), Pfeiffer (1864), Wilmanns (1883).

WALTON, BRIAN (1600–61), Anglican divine; famous for Bible in nine languages, 1657; supported by Cromwell; bp. of Chester, 1660.

WALTON, IZAAK (1593–1683), Eng. author and authority on angling; b. Stafford. He seems to have made a modest fortune as a linen-draper. After his retiral he spent most of his life visiting various country parsonages. He wrote an admirable *Life* of his friend Donne. *The Compleat Angler*, his masterpiece, is a dissertation on angling interspersed with entertaining reflections on life and nature.

WALTON-LE-DALE, town, Lancashire, England, 2 miles S.E. of Preston; cotton-mills. Pop. (1911) 12,352.

WALTON-ON-THAMES (51° 23′ N., 0° 25′ W.), market town, Surrey, England. Pop. (1911) 12,858.

WALTON-ON-THE-NAZE (51° 51′ N., 1° 16′ E.), watering-place, Essex, England.

WALTZ, see Dance.

WAMPUM, beads made of shells; in two colours, purple and white, cylindrical shape, the colour deciding the money value; recognised in Massachusetts, 1640; strung together used as belts, etc.

WANDERING JEW, see Jew, the Wandering.

WANDIWASH (12° 30′ N., 79° 30′ E.), town, N. Arcot district, India; scene of victory of British over French, 1760. Pop. 6100.

WANDSBECK, Wandsbek (53° 40′ N., 10° 5′ E.), town, Schleswig-Holstein, Prussia; residence of Claudius (*Asmus*), editor of the *Wandsbecker Bote*. Pop. (1910) 35,212.

WANDSWORTH, suburb of London, England, on Thames, 5½ miles S.W. of St. Paul's. Pop. (1911) 311,402.

WANGANUI (39° 57′ S., 175° 6′ E.), town, port, on Wanganui, N. Island, New Zealand; exports wool, grain. Pop. (1911) 10,929.

WANGARATTA (36° 21′ S., 146° 19′ E.), town, Victoria, Australia; agricultural district, flour-mills. Pop. 3600.

WANSTEAD (51° 35′ N., 0° 2′ E.), town, Essex, England; N.W. suburb of London. Pop. (1911) 13,831.

WANTAGE (51° 26′ N., 1° 26′ W.), market town, Berkshire, England; ironworks; birthplace of Alfred the Great. Pop. (1911) 3628.

WAPITI, see under Deer Family.

WAR is 'the only means by which a nation can assert against challenge its conception of right.'

There are wars of conquest, due to the need of a

growing population to expand and colonise like Cæsar's invasion of Gaul, and there have been purely defensive wars like those waged in the Tyrol by Andreas Hofer, in Russia (1812), and in the Peninsula by the Spaniards against Napoleon. A people's war, peasant war, or other irregular or guerrilla war waged against a disciplined army must be favoured by geography, and thus irregular wars occur usually in mountainous, forest, or desert regions, where nature has set a barrier against the passage of large bodies of troops accompanied by impedimenta. The South African *veldt* proved a greater obstacle than the Boer forces to Lord Roberts' march to Pretoria in 1900.

The methods of war have altered with the development of civilisation, the spread of Christianity, and the invention of firearms. The struggles of nations of tribesmen, shepherds, husbandmen, and hunters in early times were marked by extreme ferocity; nothing short of a complete victory was aimed at; the enemy's country was devastated, its inhabitants carried off into slavery, and its warriors butchered. In Europe the custom of paying a ransom for prisoners survived the Middle Ages, and was only put an end to by the peace of Munster in 1648. By slow stages a method has been evolved of deciding the issue by the theoretical destruction as a fighting machine of the enemy's main army. A modern government if victorious in war will not push matters to extremes and run the risk of a people's war, and if defeated will seek terms of peace before the whole of its resources are exhausted. Turkey's war with Italy and the Balkan States (1912) exemplifies this principle fully. The theory is upheld that military success can always be won eventually at a price, and so warlike operations are meant to ascertain whether the price of potential success will be too great to pay, and in this connection it is an important factor that the population of the invaded country must not be injured in regard to its industries, since the payment of a war indemnity will depend upon the recuperative power of the vanquished. The menace of war is often as effective as war itself, and in order that the threat of hostilities shall not be ignored, governments maintain large armies at a high state of efficiency. The immunity of Britain from attack has been hitherto secured by her assumed naval supremacy.

The preparations to take the field now occupy but a few days, since mobilisation arrangements are completed in peace to the minutest detail, and in W. Europe troops can be massed on the frontiers by railway in a few hours. The degree of completeness of all preparations for war is deemed the real strength of a country, and, according to Goltz, if the French were able to mobilise five days earlier than the Germans, the latter would be reduced to defensive action at the outset. Even in Britain, where the military is subordinated to the naval power, it is understood that within ten days a force of six divisions could be provided complete in every respect to embark for foreign service, and on the Continent probably ten times as large a force could be got ready in the same time.

WARANGAL (17° 58′ N., 79° 40′ E.), decayed town, Hyderabad, India; the ancient capital of Telingana.

WARASDIN, Varasd (46° 18′ N., 16° 20′ E.), town, on Drave, capital, County Warasdin, Hungary. Pop. 12,800.

WARBECK, PERKIN (c. 1474–99), claimed to be the younger of the two princes murdered by Richard III. in the Tower. The pretender was supported by the Duchess of Burgundy, and won over many adherents in Ireland and France. He made several unsuccessful attempts to land in England, but eventually landed in Cornwall, was taken prisoner, and executed in the Tower.

WARBLERS (*Sylviidæ*), a family of thrush-like Perching Birds, distinguished by their smaller size, delicate bills and toes, and duller plumage. They feed on insects, and are very migratory. More than 500 species are scattered over the Old World, to which, with one Alaskan exception, they are confined. Brit. examples are the Whitethroat (*S. rufa*), a spring visitor; the sweet-singing Blackcap (*S. atricapilla*), and many 'Warblers'; the Chiffchaff (*Phylloscopus collybita*), and the Willow- and Wood-W's (*P. trochilus* and *sibilatrix*), known as the Willow Wren and Wood Wren.

WARBURTON, WILLIAM (1698–1779), Anglican divine; dean of Bristol, 1757; bp. of Gloucester, 1759; wrote *Divine Legation of Moses demonstrated on the Principles of a Religious Deist*, and *Doctrine of Grace*.

WARD, see Feudalism, Chancery Division.

WARD, ARTEMUS, see Artemus Ward.

WARD, MARY AUGUSTA, Mrs. Humphry Ward (1851–), Brit. novelist; b. Hobart, Tasmania; grand-dau. of Dr. Arnold of Rugby. In 1872 m. Thomas Humphry Ward, editor of *The English Poets*, etc. Her name was made by the psychological novel, *Robert Elsmere*, the high standard of which she has preserved in most of her subsequent works.

WARD, SETH (1617–89), distinguished mathematician and professor of Astronomy at Oxford; bp. of Exeter, 1662, Salisbury, 1667.

WARD, WILLIAM GEORGE (1812–82), R.C. theologian, of Anglican training; able mathematician and student of philosophy and metaphysics; upheld Ultramontanist as against Liberal Catholic position.

WARDHA (20° 45′ N., 78° 40′ E.), town, Nagpur, Central Provs., Brit. India; centre of cotton trade. Pop. 9900; (district) 400,000.

WARE.—(1) (51° 49′ N., 0° 3′ W.) town, on Lea, Hertfordshire, England; trade in malt. Pop. (1911) 5842. (2) (42° 15′ N., 72° 15′ W.) town, on Ware, Hampshire County, Massachusetts, U.S.A.; manufactures cottons, woollens. Pop. (1910) 8774.

WAREHAM (50° 41′ N., 2° 7′ W.), town, Dorsetshire, England; trade in clay.

WAREHOUSE, BONDED, see Bonded Warehouse.

WARENNE, EARLDOM OF—William de Warenne received title and lands in Surrey and Sussex. William de W., 4th earl (succ. 1202), was a favourite of King John; prominent in reign of Henry III.; his son John (succ. 1240) was a famous soldier.

WAR-GAME (Ger. *Krieg-spiel*), indoor 'game'; officers engage in imaginary operations under rival leaders, using large-scale maps and blocks of metal to represent troops; tactical scheme is drawn up, a military situation is assumed, and a certain time is allotted for each move in the game.

WARGLA, Ouargla (31° 58′ N., 5° 11′ E.), town, Fr. military post, in oasis of Wargla, Algerian Sahara. Pop. 4000.

WARHAM, WILLIAM (1450–1532), Eng. cleric; bp. of London, 1502; abp. of Canterbury and Lord Chancellor, 1504; did not approve of all Henry VIII.'s ecclesiastical legislation, but feared the king.

WARKWORTH (55° 21′ N., 1° 37′ W.), town, at mouth of Coquet, Northumberland, England; interesting remains of antiquity.

WARMINSTER (51° 13′ N., 2° 11′ W.), town, Wiltshire, England; manufactures silk. Pop. (1911) 5492.

WARNER, CHARLES DUDLEY (1829–1900), Amer. author; works include *Lives* of Captain John Smith and Washington Irving.

WARNSDORF (50° 52′ N., 14° 33′ E.), town, Bohemia, Austria; seat of textile industry. Pop. (1910) 23,220.

WARORA (20° 20′ N., 79° E.), town, Chanda district, Central Provs., Brit. India; cotton industry. Pop. 11,300.

WARRANT, an order in writing instructing an officer to bring a person before a court. W's are issued by Privy Council, Judges of the High Court, Justices of the Peace, and Coroners. A w. of arrest cannot be issued for civil debt. Arrests can be made without w. when (1) there is suspicion of felony, (2) a breach of the peace is likely to occur, (3) malicious

injury is being done to property, (4) an indictable offence is being committed at night, (5) street gambling is taking place, (6) by Criminal Law Amendment Act, 1912, when procuration is suspected.

WARRANTY, a promise, expressed or implied, that in case of failure to perform the terms of a contract the party injured shall be entitled to compensation.

WARREN.—(1) (41° 14′ N., 80° 51′ W.) city, on Mahoning, capital, Trumbull County, Ohio, U.S.A.; manufactures iron and steel. Pop. (1910) 11,081. (2) (41° 51′ N., 79° 19′ W.) town, on Allegheny, capital, Warren County, Pennsylvania, U.S.A.; natural gas and oil region; oil refineries. Pop. (1910) 11,080.

WARREN, GOUVERNEUR KEMBLE (1830–82), Amer. general and explorer; distinguished as commander in Civil War; wrote accounts of Dakota and Nebraska.

WARREN, SAMUEL (1807–77), Welsh novelist; famous for his *Ten Thousand a Year* (1841).

WARRENPOINT (54° 6′ N., 6° 15′ W.), seaport, watering-place, on Carlingford Lough, County Down, Ireland.

WARRENSBURG (38° 50′ N., 93° 45′ W.), city, capital, Johnson County, Missouri, U.S.A.; sandstone quarries. Pop. (1910) 4689.

WARRINGTON (52° 23′ N., 2° 36′ W.), town, on Mersey, Lancashire, England; manufactures leather, cotton, iron. Pop. (1911) 72,178.

WARRISTON, ARCHIBALD JOHNSTON, LORD (1611–63), Scot. statesman; helped to frame the Scot. National Covenant; procurator of the Kirk, 1638; became Lord W. as lord of Session, 1641; opposed neutrality in Eng. affairs; prominent in Westminster Assembly, and a member of Scot. Committee in London, 1644. Named King's Advocate by Charles I., 1646; member of Cromwell's House of Lords, and as a leading 'remonstrant' was renamed Lord Clerk Register by Cromwell, 1657. Arrested at Rouen; tried before Scot. Parliament after Restoration, and hanged in Edinburgh.

WARRNAMBOOL (38° 24′ S., 142° 28′ E.), seaport town, on Warrnambool Bay, Villiers County, Victoria, Australia. Pop. (1911) 7010.

WARSAW.—(1) (52° N., 21° E.) government, Russ. Poland, bordering Prussia on W.; surface low and flat. Pop. (1910) 2,482,000. (2) (52° 13′ N., 21° 7′ E.) city of Russ. Poland, on Vistula; capital of government of W., formerly of Poland (*q.v.*); fortified by Alexander Citadel and 15 forts; Cathedral of St. John, XIII. cent.; churches of Holy Virgin, 1419, St. Anne, 1454; former palace of Polish kings; Krasinski, Belvedere, and other fine palaces; national theatre, town hall, univ., etc.; great commercial and industrial centre; machinery, chemicals, musical instruments, silver-plate, leather goods, carriages, tobacco, beer, etc. W. was an important city in Middle Ages as residence of Dukes of Mazovia. Poles defeated by Charles X. of Sweden, 1656; surrendered to Charles XII., 1703; treaty between Russia and Poland, 1768; unsuccessful revolutions, 1830, 1862; serious rioting, 1905–6. Pop. (1910) 855,900. (3) 41° 15′ N., 85° 50′ W.) city, capital, Kosciusko, Indiana, U.S.A.; contains Winona Agricultural and County Technical Institute. Pop. (1910) 4430.

WART (*Verruca*), growth of skin owing to lengthened papillæ; w's on hands generally disappear unaccountably, but acetic acid or silver nitrate (caustic stick) may be applied.

WARTBURG, THE (50° 52′ N., 10° 17′ E.), ancient castle, Eisenach, Germany; once the residence of the Landgraves of Thuringia; Luther spent ten months here, 1521–22.

WARTHE, WARTA (52° 40′ N., 16° 30′ E.), river, Poland and Prussia; joins Oder at Küstrin, Brandenburg; length, 450 miles.

WART-HOGS, see PIG FAMILY.

WARTON, JOSEPH (1722–90), Eng. critic and poet; editor of Pope's works and champion of Elizabethan imaginative poetry against 'Correct' school of Pope.

WARTON, THOMAS (1728–90), Eng. poet-laureate. At Oxford he read widely in mediæval literature, and the romantic influence is seen in his *Poems*. His great work was *The History of English Poetry*, an exhaustive treatise.

WARWICK.—(1) (52° 17′ N., 1° 36′ W.) county town, on Avon, Warwickshire, England; manufactures gelatine and bricks; the famous castle contains many art treasures, including the Warwick vase, from Hadrian's villa, at Tivoli; was an ancient Rom. fortress; rebuilt later by Ethelfleda. Pop. (1911) 11,858. (2) (41° 42′ N., 71° 22′ W.) town, on Narragansett Bay, Kent County, Rhode Island, U.S.A.; manufactures cotton. Pop. (1910) 26,629. (3) (28° 12′ S., 152° 4′ E.) town, on Contadamine, Queensland Australia; agricultural district; wine industries. Pop. 4500.

WARWICK, EARLDOM OF, Eng. title. Henry de Newburgh or Beaumont, a Norman, was 1st earl, cr. by William II. Earldom held by Beauchamp family —8 earls—till 1439. Richard Neville, the 'King-maker,' succ. in right of his wife, 1449; title extinct on execution of Edward, s. of George, Duke of Clarence; revived with John Dudley, Duke of Northumberland, 1502–53; again extinct, 1658. Present earldom dates from 1759, and belongs to Greville family.

WARWICK, RICHARD BEAUCHAMP, EARL OF (1382–1439) Eng. noble; general and ambassador of Henry V.; his dau. m. Richard Neville, 'the King-maker.'

WARWICK, RICHARD NEVILLE, EARL OF (1428–71), called the 'King-maker.' In 1455 he was under the command of the Duke of York, and distinguished himself at the battle of St. Albans. For his services he was made governor of Calais, and subsequently Commander of the Seas. He was again fighting for the Yorkists against great odds in 1459; he joined forces with Edward, Earl of March, in 1460. The combined armies were victorious, and Edward was proclaimed king at London. Warwick subsequently sided with Henry against Edward, and with the help of Queen Margaret had him proclaimed Henry VI. and crowned. But Edward gathered an army, and at the battle of *Barnet* Warwick fell.

WARWICKSHIRE (52° 20′ N., 1° 31′ W.), W. midland county of England; county town, Warwick; bounded by Stafford, Leicester, Northamptonshire, Oxon, Gloucester, Worcester; area of administrative county, nearly 880 sq. miles. Surface is generally flat or slightly rolling, with low hills in S.; drained by Avon, Tame, Alne, Itchen, and other rivers; has canal communication with Severn, Mersey, Trent, Thames; in N. was the Forest of Arden. Was included in kingdom of Mercia in early times; within the county was fought the battle of Edgehill during the Civil War of the XVII. cent. Various traces of Rom. occupation occur, and there are several ruined monasteries. There is a small coal-field, with fire-clay, limestone, ironstone; orchards; agriculture carried on; cattle and sheep raised. Pop. (1911) 408,291.

WASAU (44° 57′ N., 89° 40′ W.), city, on Wisconsin, capital, Marathon County, Wisconsin, U.S.A.; lumber. Pop. (1910) 16,560.

WASH, THE (53° N., 0° 20′ E.), arm of North Sea, between Norfolk and Lincoln, England.

WASHBURN (46° 42′ N., 90° 52′ W.), city, summer resort, on Lake Superior, capital, Bayfield County, Wisconsin, U.S.A.; lumber industries. Pop. (1910) 3830.

WASHINGTON.—(1) (45° 30′ to 49° N., 117° to 124° 20′ W.) N.W. state, U.S.A.; bounded N. by Canada, E. by Idaho, S. by Oregon, W. by Pacific Ocean; area, 66,127 sq. miles. Surface is crossed from N. to S. by Cascade Mountains, to E. of which is a high plateau, while in the W. the country generally is mountainous and heavily wooded, with a number of fertile prairies and valleys; watered by Columbia and its affluents and by a number of less important

streams. The S.E. is of recent geological formation, but in the N. and N.E. Archæan rocks occur, while the W. is of Carboniferous, Cretaceous, and Tertiary formation. Climate varies, generally temperate in W., extreme in E.

Early history of W. is identical with that of Oregon, of which it formed part until 1853. It was then organised as a territory, and in 1889 it was admitted as a state to the Union. Executive is vested in governor, who is assisted by a lieutenant-governor and various officers of state, all of whom are elected for 4 years. Legislative power is vested in Senate and House of Representatives; number of Representatives varies from 63 to 99, and number of Senators may be from one-third to half the number of Representatives. Sends 2 Senators and 5 Representatives to Federal Congress.

Chief towns are Seattle, Spokane, Tacoma, Bellingham, Everett, Olympia (capital). Agriculture is carried on; chief crops—wheat, barley, oats; horses, cattle, and sheep raised; dairy-farming; fruit largely grown; large area forested; lumbering an important industry. There are excellent salmon, oyster, and other fisheries. Minerals include coal, gold, silver, copper, lead, granite, marble. Meat-packing, flour-milling, brewing, fish-canning are important industries.

Education is free and obligatory. Seattle is seat of State Univ. Chief religions are R.C., Methodist, Presbyterian, Lutheran, Baptist. Pop. (1910) 1,141,990.

Meany, *History of State of Washington* (1909).

(2) (38° 53′ N., 77° 2′ W.) city, capital of U.S.A., is situated on the Potomac, in District of Columbia, with which it is coextensive; is regularly laid out on a plan originally designed by Major Pierre Charles L'Enfant in 1791, and its development has been guided so as to leave ample open spaces; has fine wide streets and many splendid public buildings. Almost in the centre stands the Capitol, where Congress meets, Supreme Court sits; it is a fine building of white stone and marble, crowned with a dome supporting a bronze figure of Liberty. Other important buildings are the White House, a simple but dignified two-storey house, the official residence of the President of the U.S.; the Library of Congress, which communicates by an underground passage with the Capitol; and the National Observatory (1842). Many educational institutions, including George Washington Univ., established (as Columbian Univ.) in 1821, Carnegie Institution (1902), Howard Univ. for negroes, Catholic Univ., Georgetown College, and Amer. Univ. There are numerous philanthropic establishments, including a Soldier's Home and various public and private hospitals and asylums. The most important monument is a white marble obelisk dedicated to the memory of George Washington. Fine parks and Botanic Gardens. There are no manufactures. Administered by three commissioners nominated by President of U.S. Pop. (1910) 331,069.

Forbes-Lindsay, *Washington* (1908).

(3) (40° 8′ N., 80° 19′ W.) city, on Chartiers Creek, capital, Washington County, Pennsylvania, U.S.A.; coal and oil region; manufactures iron; seat of Washington and Jefferson Presbyterian College. Pop. (1910) 18,788. (4) (38° 40′ N., 87° 11′ W.) city, capital, Daviess County, Indiana, U.S.A.; agricultural, stock-raising, and coal-mining region; manufactures bricks and tiles. Pop. (1910) 7854. (5) WASHINGTON COURT-HOUSE (39° 30′ N., 83° 19′ W.), city, capital, Fayette County, Ohio, U.S.A.; manufactures furniture. Pop. (1910) 7277.

WASHINGTON, GEORGE (1732-99), 1st Pres., U.S.A.; b. Wakefield, Virginia, U.S.A., 1732; s. of prosperous planter, who d. when the boy was eleven; major of Virginia militia, raised to resist claims of the French, 1754; m. Martha Custis, 1759, became a member of the Virginia legislature, and settled down at Mount Vernon as a country gentleman. Though deprecating revolt against Britain, W. supported the resistance to Stamp Act, 1765, and was a delegate to 1st Congress of Amer. colonies, 1774. After *Lexington* and *Bunker's Hill*, 1775, W. became general of the Amer. army, drove General Howe from Boston, 1776, but was defeated, 1777, and driven back in Pennsylvania. The army was disbanded, 1783, and W. retired to private life at Mount Vernon. W. presided at the convention, 1787, when the constitution of U.S.A. was drawn up, and was elected Pres., 1789. Issued proclamation of Neutrality, on the outbreak of the great European war, 1793, despite an alliance with France, made in 1778. Retired from the presidency after a second term of office, 1796.

Life, by H. C. Lodge (1889), Woodrow Wilson (1897), J. A. Harrison (1906).

WASHSTAND, table to hold washing utensils; came into general use, XVIII. cent.; sometimes fitted with drawers and shelves, or made collapsible.

WASPS.—There are distinguished SOLITARY W'S (*Eumenidæ*), SOCIAL W'S (*Vespidæ*), and FOSSORIAL or DIGGING W'S (*Scoliidæ*, *Pompilidæ*, and *Sphegidæ*), whose names indicate their habits. The first build single cells in walls, claypits, sandstone cliffs, or in plant stems, and lay eggs therein, supplying grubs and caterpillars upon which the larvæ when hatched may feed.

Social W's build papery nests of chewed fragments of wood, within which the larva-bearing combs are built. A w. society lasts only for a year, the queen alone surviving to start a new colony in the succeeding spring.

The habits of the Digging W's differ considerably. The Soleciidæ usually simply lay their eggs on a caterpillar, upon which the young feed, while the remaining two families generally dig burrows, tunnels, or cells, in which eggs are laid, and which are stored with live but paralysed locusts, grasshoppers, crickets, spiders, etc., upon which the larvæ when they develop may feed.

WASTE, Eng. legal term with three distinct usages: (1) 'W. of a manor' is that portion of the estate subject to rights of common; (2) 'Year, day, and w.' was a royal privilege whereby a king attained the profits of freehold property of those convicted of felony and treason for the period of 346 days, with right of diminishing its value; (3) an unauthorised act of a tenant which impairs the value of a freehold estate.

WATCH.—The construction of pocket timepieces was first made possible by the invention of the mainspring as a substitute for suspended weights. The early history of w's is uncertain, but probably they were first made at Nuremberg about the beginning of the XVI. cent. These w's had only an hour-hand, the minute-hand being added late in the XVII. cent. The flat, round form was introduced early in the XVII. cent., and repeating w's were invented in 1676. The practice of setting the pivots in precious stones originated about 1700. The force of a mainspring weakens as the spring uncoils, and, to equalise this force, the 'fusee' was invented about 1530. In most Eng. w's the fusee is now superseded by the going-barrel, which is cheaper to make and more suitable for the popular, keyless type. The motion of a w. is regulated principally by the escapement and balance-wheel. Variations in temperature affect w's even more than clocks, and to compensate for these the balance-wheel is constructed partly of brass and partly of steel, on the lines of the 'gridiron' pendulum (see CLOCK). The vertical escapement was first used, but was found inaccurate owing to the recoil, and was followed by Graham's horizontal escapement. In Eng. w's the lever escapement is largely used. Chronometers are simply w's made with special accuracy, and are usually fitted with the detached escapement. High-class w's are tested at Kew Observatory and certified according to accuracy.

WATER (H_2O), hydrogen monoxide, H : O = 1 : 7·94 weight, 2 : 1 volume; formed by burning hydrogen and substances containing it. Clear, taste-

less, bluish-green in bulk, almost incompressible, bad conductor of heat and electricity, temperature of maximum density 4° C.; M.P. 0° C.; B.P. 100° C. The natural solvent (see SOLUTION); consequently natural w's contain various dissolved impurities, some of which (*e.g.* $Ca(HCO_3)_2$, $CaSO_4$) constitute hardness. Contained in many salts as w. of crystallisation, *e.g.* $Na_2CO_3 + 10H_2O$.

Water Rights, a prescriptive right to the free and uninterrupted flow of water over a neighbour's land may be acquired, when the water flows in a defined permanent channel; and the fact that the channel may be underground does not disturb that right. Such a stream must not be diverted. Where water simply percolates through undefined channels no prescriptive right exists.

Water Supply.—The daily consumption of water by an adult should be on an average three pints, though allowance must be made for variation in the amount of water lost in perspiration and other ways. The amount required in childhood is proportionately greater; hence there should be care in limiting the quantity consumed by a child. Water, by promoting cleanliness, is invaluable in checking the outbreak of infectious disease. Practical sanitarians find that not less than 17 gallons per head should daily be delivered to each house, and that 10 more should be allowed for trade and municipal purposes. The quantity supplied in London greatly exceeds this.

The DANGERS of water are due to its impurities, which include: (1) germs, in especial of typhoid, dysentery, cholera, and some varieties of diarrhœa; (2) eggs of certain parasitic worms; (3) mineral matter in excess—promoting dyspepsia and probably gravel; (4) lead, which may cause lead-poisoning.

The origin of these impurities is due, in cases (1) and (2), to pollution from sewage; (3) is due to the rocks, especially limestone and chalk, through which the water percolates; whilst (4) is caused by lead pipes or a lead cistern. Hard water is not nearly so easily tainted by lead as soft water. The water most easily infected by lead is soft water from a peat district, such water being rich in vegetable acids that dissolve the lead rapidly.

Excessive hardness is diminished by chemical means, and water of such a nature as to make lead-poisoning a danger is treated by filtration through beds of flint and chalk, by which it acquires the necessary hardness. When the water is derived from a river into which sewage has been discharged higher up the stream, it is drawn off as far as possible from the source of pollution, and filtered and aerated under scientific supervision. In all cases care has to be taken that the water does not become polluted after leaving the reservoir. Two sources of danger have to be guarded against: (1) aqueducts and sewers are apt to communicate through slight leaks if they are laid side by side; (2) cisterns are liable to become filthy through neglect, or to be left uncovered.

Water derived from wells is by no means safe from pollution: if a well is shallow the risk of sewage contamination is often considerable. A well should be deep, and have its sides protected by some waterproof material to prevent entrance of surface water. The best wells are those driven right through the first impervious stratum, so as to tap the one lying below. The water thus obtained, by travelling a considerable distance in the earth, has been thoroughly filtered. In London, for instance, by boring through the London clay into the chalk beneath, water is reached which has percolated through the chalk of the Surrey Downs.

The further purification of water drawn from the tap in great towns is unnecessary. When, however, the only water obtainable comes from an unknown or suspicious source, some means of purification is desirable. Three remedies exist: (1) filtration (see FILTER), (2) boiling, (3) chemicals. Alcohol has obvious drawbacks of its own, and many chemicals that kill germs either make the water poisonous or nauseous; thus Condy's fluid has been tried unsuccessfully in the army. The best device is Nesfield's, consisting of a small tablet made in two halves, one of which is coated with gelatine so that its contents are not dissolved by the water until the gelatine has been first absorbed. On dropping this tablet into water one-half at once dissolves and sets free chlorine that kills the germs; within a few minutes the gelatine coating of the other half is dissolved, and this half then acts on the chlorine and changes it to a harmless chloride. The result is that within ten minutes the germs have been destroyed, the chlorine removed, and the water kept safe and palatable.

As a *curative agent* water is used largely both internally and externally. Externally, it is chiefly useful as a means of applying heat or cold. Internally, pure water is a valuable stimulant to the process of excretion. It is the safest diuretic we possess, and is thus largely used in the treatment of gout and of renal disease; its effect differs according to the time of day it is taken: a glass of cold water on rising acts as a laxative; hot water sipped before meals stimulates digestion.

Woodward, *The Geology of Water Supply* (1910).

WATER BEETLES, see under CARABOIDEA.

WATER IN THE HEAD, HYDROCEPHALUS (*q.v.*)..

WATER OR MOOR HEN, see RAIL FAMILY.

WATERBURY (41° 33′ N., 73° W.), city, on Naugatuck, New Haven County, Connecticut, U.S.A.; manufactures brass, and 'Waterbury' watches. Pop. (1910) 73,141.

WATER-CLOCK, see CLOCK.

WATER-CLOSET should be flushed by a special cistern of its own; *pan closets* and *long-hopper closets* are dangerous; *wash-out closets* and *valve closets* are best.

WATER-CRESS, see CRESS.

WATER-CURE, see HYDROPATHY.

WATER-DROPWORT (*Œnanthe*), genus of poisonous plants, order Umbelliferæ; Common W. (*Œ. fistulosa*) and Hemlock W. (*Œ. crocata*) are common Brit. riverside plants.

WATERFALL.—The greatest and grandest w. in the world is the Victoria Falls (*q.v.*), Rhodesia; the second, Niagara (*q.v.*), N. America; these, however, are far exceeded in height by others in America and Europe; the highest w. is the Yosemite Falls, California; in Europe the highest falls are in Norway, Finland, and the Alps. Their water-power is of great commercial value.

WATER-FLEAS, see under ENTOMOSTRACA.

WATERFORD.—(1) (52° 15′ N., 7° 6′ W.) maritime county, Munster, Ireland; surface largely mountainous; chief rivers, the Blackwater and Suir; minerals include copper and marble; cattle-breeding and dairy-farming. Pop. (1911) 83,776. (2) (52° 15′ N., 7° 6′ W.) county town, on Suir, County Waterford, Ireland; has Prot. and R.C. cathedrals; exports agricultural produce; breweries, fisheries; was an ancient Dan. stronghold; taken by Strongbow, 1171. Pop. (1911) 27,430. (3) (42° 47′ N., 73° 42′ W.) village, on Hudson River, Saratoga County, New York, U.S.A.; manufactures paper, knitted goods. Pop. (1910) 3245.

WATER-HEN, see RAIL FAMILY.

WATERING-POT SHELL, see under LAMELLIBRANCHIATA.

WATER-LILY, a term including *Nuphar luteum* (yellow w.-l.) and *Nymphæa alba* (white w.-l.), both characterised by large floating leaves.

WATERLOO (42° 29′ N., 92° 23′ W.), city, on Red Cedar River, capital, Blackhawk County, Iowa, U.S.A.; agricultural region; canning and packing industries. Pop. (1911) 26,693.

WATERLOO, village 11 miles south of Brussels, headquarters of Wellington, 1815, when he encountered Napoleon for the first and last time, and after resisting his attacks from noon till sunset enabled the Pruss. army, under Marshal Blücher, to drive Napoleon from the field. In its tactical aspect it must be considered a very moderate performance, indeed, Wellington himself most aptly described it as a mere 'pounding-match.'

The events of June 1815 may be outlined as follows: Napoleon, having escaped from Elba, took the field at the head of a small but perfectly organised army, with the object of crushing the armies of Wellington and Blücher before they could be supported by those of Austria and Prussia. It was known that Wellington was defending the frontiers of Belgium from the sea to the river Sambre, and that Blücher prolonged the line of defence eastward along the Meuse. Napoleon's plan was to invade Belgium and detach from the Coalition the newly raised Dutch-Belgian army. He hoped to reach Brussels after defeating one or both of the armies immediately opposed to him on June 15, and he succeeded in crossing the frontier at Charleroi, a point which enabled him to interpose between the forces of Wellington and Blücher and thus prevent their aiding each other.

On June 16, Napoleon, with his main army, attacked the Prussians at Ligny, while a detachment under Marshal Ney attacked Wellington's force at Quatre Bras. The battle of Ligny resulted in the retreat of the Prussians, but the battle of Quatre Bras was indecisive. On June 17, therefore, Napoleon sent a detachment under Marshal Grouchy to pursue the Prussians, and himself proceeded with the main army to Quatre Bras, with the object of overthrowing Wellington, who, having ascertained that Blücher was retreating westward from Ligny to Liège, himself made a corresponding movement to the rear by the high road from Quatre Bras to the village of Mont St. Jean. Napoleon, having followed Wellington beyond Genappe, also halted for the night. Both armies prepared for battle on the morrow, and, meanwhile, Blücher had promised to come to Wellington's assistance. Napoleon wrongly believed that Marshal Grouchy had driven Blücher eastward, and that by no possibility could Blücher operate against him on Sunday, June 18. His left wing attacked the country house of Hougomont, which was garrisoned by the British Guards and supported by Wellington's right wing. Napoleon's right wing attacked, with the object of destroying Wellington's left wing astride the high road. Napoleon also attacked Wellington's centre with masses of heavy cavalry, but in no case did the French attacks cause Wellington's army to yield ground; the troops stoically endured heavy losses, while Blücher's army was marching through a difficult country to their assistance.

Napoleon's forces were almost spent when Blücher at last appeared and engaged the French reserve, and by nightfall Napoleon realised that he was defeated at every point; he then quitted the field with his staff and left his army to shift for itself. During the night of June 18, and on the following days, the remnant of the Fr. army was making its way back towards Paris in a state of great disorder, but at the end of the week Marshal Soult succeeded in gathering the force together and some further opposition was made to the advance of the allies on Paris. But, meanwhile, Napoleon's fate had been decided by the Fr. government, and since the war had been waged for Napoleon's overthrow, no political object was to be gained by a continuance of hostilities. A convention was therefore signed by which the Fr. army retired behind the river Loire, while the allies occupied Paris and recalled King Louis, who was again placed upon the Fr. throne.

WATERLOO-WITH-SEAFORTH, watering-place, Lancashire, England, at mouth of Mersey, 4 miles N.W. of Liverpool. Pop. (1911) 26,399.

WATER-MOTORS, instruments for the application of water-power to machinery. This is done by means of water-wheels and turbines. Water-wheels are adapted so as to utilise either the weight of water (*e.g.* a fall) or its momentum (*e.g.* a swift stream). In either case the wheel is rotated and the power transmitted by shafts and driving-belts. The turbine is practically a horizontal water-wheel.

WATER-OUZELS, see DIPPERS.

WATER-POLO, popular swimming-game; sides consist of seven players; the object is to place ball in opponents' goal. Length of play, usually seven minutes each way, with time taken off for interruptions; length of pond, 19–30 yds.; maximum breadth, 20 yds.

WATER-RAT, a Vole; see MICROTUS AMPHIBIUS.

WATER-SOLDIER (*Stratiotes aloides*), aquatic plant of order Hydrocharideæ; flowers are white.

WATERS, TERRITORIAL, see FISHES (FISHERIES).

WATER-SHREW, see SHREW FAMILY.

WATERSPOUT, see WHIRLWIND.

WATER-THYME (*Elodea*), a Canadian fresh-water plant naturalised throughout W. Europe.

WATERTOWN.—(1) (43° 57′ N., 75° 59′ W.) city, on Black River, capital, Jefferson County, New York; carriage and wagon works. Pop. (1910) 20,730. (2) (43° 12′ N., 88° 40′ W.) city, on Rock River, Jefferson and Dodge Counties, Wisconsin, U.S.A.; manufactures agricultural implements; seat of North-Western Univ. (Lutheran). Pop. (1910) 8829. (3) (42° 22′ N., 71° 12′ W.) town, Middlesex County, Massachusetts, U.S.A.; has a U.S. arsenal; manufactures paper; suburb of Boston (*q.v.*). Pop. (1910) 12,875.

WATERVILLE (44° 34′ N., 69° 40′ W.), city, on Kennebec, Kennebec County, Maine, U.S.A.; seat of Colby Univ.; manufactures cottons, woollens. Pop. (1910) 11,458.

WATERVLEIT, formerly WEST TROY (42° 44′ N., 73° 44′ W.), city, on Hudson River, Albany County, New York, U.S.A.; U.S. arsenal. Pop. (1910) 15,074.

WATFORD (51° 39′ N., 0° 24′ W.), town, on Colne, Hertfordshire, England; brewing and malting industries. Pop. (1911) 40,953.

WATKIN, SIR EDWARD WILLIAM, 1st Bart. (1819–1901), Eng. railway manager; chairman of S. Eastern Railway.

WATKINS (42° 22′ N., 76° 58′ W.), village, on Seneca Lake, capital, Schuyler County, New York; mineral springs.

WATLING STREET, great Rom. road in England, which extended from London, *via* St. Albans, Dunstable, etc., to Wroxeter on the Severn.

WATSON, RICHARD (1737–1816), prof. of Chemistry; regius prof. of Divinity, Cambridge; bp. of Llandaff, 1782.

WATSON, THOMAS (*c.* 1557–92), Eng. lyricist pub. Lat. trans. of *Antigone* (1581). His *Passionate Centurie of Love* is a collection of 100 pseudo-sonnets. His best work is *The Tears of Fancy*, or *Love Disowned*.

WATSON, WILLIAM (1858–), Eng. poet; b. Burley-in-Wharfedale, Yorkshire. His first poem of real merit was *Wordsworth's Grave*. In 1898 were published his *Collected Poems* and a new volume entitled *The Hope of the World*.

WATT, JAMES (1736–1819), Scot. engineer; originator of steam-engine; b. Greenock; s. of a merchant; ed. at public schools; app. mathematical instrument maker to Glasgow Univ.; acted as civil engineer, making surveys for the harbours of Ayr, Port-Glasgow, and Greenock, for deepening the Forth and Clyde Canal, and for the Caledonian Canal.

W. invented a letter-copying press, air-pump, condenser, steam jacket for cylinders, double-acting engine, sun and planet motion, expansion principle of double engine, parallel motion, smokeless furnace, and steam-engine governors; went into partnership with Matthew Boulton, 1774, and carried on a successful business at the Soho Iron Works, Birmingham, retiring in 1800. See ENGINE (STEAM-ENGINE).

Life, by Smiles (ed. 1878), Pemberton (1905).

WATTEAU, ANTOINE (1684–1721), Fr. painter; went to Paris, where he endured some hardships; was employed with Audran, the decorator of the Luxembourg, and in 1711 entered the Academy as a student. He became famous for his landscapes, mostly of small size, charming in colour and graceful in design. A large collection of his pictures made by Frederick the Great is now in possession of the Ger. Emperor.

WATTIGNIES (50° 10′ N., 4° E.), village, Nord,

France; scene of defeat of French by Austrians, 1793.

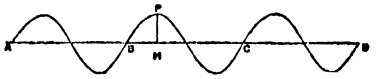
WATTMETER, instrument for measuring electric power, consists of two separate coils, one surrounding the other, of which the inner (a few turns of thick wire) is fixed and the outer (fine wire on a non-metallic frame) movable. A quadrant electrometer (*q.v.*) may serve as a w.

WATTS, GEORGE FREDERICK (1817–1904), Brit. painter and sculptor; b. London, of parents of Celtic origin; was practically self-taught, his real instructors being the Elgin Marbles. He exhibited first at the Academy, 1837. In 1842 he won a prize of £300 for a fresco, and went for four years to Italy, where he learnt the old masters' secrets of brilliant colour and effects. He worked without much recognition for many years, and it was not till 1867 that he was elected an Associate of the Academy. He developed into a master of symbolic painting, and his imaginative pictures, poetic in subject and treatment, deal with the great yet common things of life—love, death, and judgment. As a portrait painter he had many notable sitters, including Gladstone, Browning, Tennyson, Carlyle, George Meredith, and Cardinal Manning.

WATTS, ISAAC (1674–1748), Nonconformist divine, minister in London; famous for his hymns and metrical versions of psalms, many of which are still sung, *e.g.* 'O God, our help in ages past.'

WATTS-DUNTON, WALTER THEODORE (1832–), Eng. critic and novelist; intimate friend of Rossetti and Swinburne; long connected with *Athenæum*; his *Aylwin*, a poetic romance, proclaimed the 'Renascence of Wonder.'

WAUGH, EDWIN (1817–90), Lancashire dialect poet; also wrote humorous prose, e.g. *Besom Ben Stories.*



WAUKEGAN (42° 23′ N., 87° 50′ W.), city, on Lake Michigan, capital, Lake County, Illinois, U.S.A.; mineral springs; manufactures iron. Pop. (1910) 16,069.

WAUKESHA (43° N., 88° 11′ W.), city, watering-place, capital, Waukesha County, Wisconsin, U.S.A.; medicinal springs. Pop. (1910) 8740.

WAUSAU (45° 9′ N., 89° 32′ W.), city, Wisconsin, U.S.A.; leather, paper, machinery. Pop. (1910) 16,560.

WAVE.—This term may be applied generally to any periodically recurring displacement or disturbance from a condition of stable equilibrium. It has, therefore, a large number of applications in physics. In gases, sound w's consist of compressional and rarefactional disturbances of a periodic kind travelling through air or other gaseous medium. There may also occur w's on a large scale, such as those which constitute the diurnal variation of the barometer, and those produced by the explosions at the eruption of Krakatoa in 1883, which travelled thrice round the globe before becoming imperceptible. In liquids, there are the ordinary w's produced by gravitation on the surface of large bodies of water, and also the ripples produced by surface tension. The trains of w's set up by the motion of a ship, and easily observed on a smooth sea, may also be mentioned. The beat of the pulse is another form of liquid w. The tides are a w.-system on a large scale, produced by the gravitational effects of the sun and moon on the oceans. In solids, a variety of w's are possible. We may have w's due to periodical compressional, torsional, or shearing stresses applied to a body. The fact that sound can travel through solids, and that earthquake w's pass through the earth, is evidence of this. There are also displacement w's in the luminiferous medium or ether. When these are extremely short, they are known as ultra-violet light; when longer, they form visible light; longer still, they produce radiant heat w's; beyond that they form the Hertzian w's employed in wireless telegraphy. Another example of w. is afforded if one end of a metallic bar is heated steadily for a given time, then allowed to cool for the same or another given time, and this process of heating and cooling be continued. A series of temperature w's will then pass along the bar. Similarly, if the intensity and direction of an electric current in the bar be made to change periodically, we have an alternating current which is virtually a w.-like motion among the electrons whose steady drift in one direction constitutes a steady current. A telegraphic signal sent through a cable is an example of an isolated w. of electric potential.

All such w.-motions have several features in common, and these may be illustrated by reference to some typical w. Suppose a long rope be fastened at one end to a fixed support, stretched horizontally, while the other end (held in the hand) is given a rapid up-and-down oscillation. A series of displacement w's will be seen travelling along the rope. These can be studied in two distinct ways. We may consider what happens, *first*, to a given point of the rope at different times; *second*, at the same given instant to different points of the rope. The latter is, perhaps, easier of comprehension, for it could be represented by an instantaneous photograph of the whole rope while in a state of vibration. Such a photograph would give a figure such as that shown,

and it will be noticed that any part such as AB can be exactly superposed on other parts such as BC, CD, etc. Each such part forms one w. It has a definite length AB, termed the *wave-length*, which may be defined as the distance from the crest (or trough) of one w. to the crest (or trough) of the next. The extent of the greatest displacement (PM), upwards or downwards, is known as the *amplitude*, popularly known as half the height of the w. The time taken for a single w. to pass any given point (or the time taken by any point of the rope to execute one complete oscillation) is known as the *period*. The speed with which a w. travels is obviously equal to its length divided by its period. These quantities, length, amplitude, and period, are the leading characteristics of any w. The actual shape, or profile, of w's vary of course in different cases. The effects of varying value in the three characteristics may, however, be noted; *e.g.* when sound w's are greater or less in length, they produce notes which are lower or higher in pitch, while an increase in amplitude means a louder sound. The effects of varying length in light w's has already been noted: here, increased amplitude means greater intensity of light. Cases occur in which the amplitude of a w. changes with time. For example, if a stone be thrown into water whose surface is at rest, a ring-shaped w. spreads out from the point at which the stone entered the water. As the w.-circle increases, the energy of the original disturbance is spread over a greater length of w., and consequently the amplitude gradually diminishes. The same is true of the diminished audibility of sound when heard at increasing distances. In suitable conditions, w's may be reflected, refracted, and may interfere with each other, and these phenomena are frequently illustrated by sea w's.

Daniell, *Principles of Physics.*

WAVERLY (42° 2′ N., 76° 40′ W.), village, on Cayuta Creek, Tioga County, New York, U.S.A.; railway centre; coal-mining interests. Pop. (1911) 4855.

WAVRE (50° 43′ N., 4° 36′ E.), town, Brabant, Belgium; scene of a battle between French and Prussians, June 18, 1815. Pop. 8600.

WAX, fatty substances, generally animal or vegetable matter (with exception of paraffin w.); used in candle-making, insulatives, and as basis for various mixtures.

WAX TABLETS, see PALÆOGRAPHY.

WAX-CLOTH, FLOORCLOTH (*q.v.*).

WAXWINGS (*Ampelidæ*), small, silky-plumaged birds, having some wing feathers with a red horny

tip which resembles wax; mostly American, but one species (*Ampelis garrulus*) is a frequent winter visitor to Britain.

WAYCROSS (31° 12′ N., 82° 20′ W.), city, capital, Ware County, Georgia, U.S.A.; railway-shops; manufactures lumber. Pop. (1910) 14,485.

WAYLAND THE SMITH, in Teutonic romance, akin in character to the Gk. Hephæstus as being the hero of the forge. He also bears some resemblance to Dædalus, in that he contrived to fly by means of a feather robe. The legend was for long popular, with numerous variations, in the S. of England.

WAYNE, ANTHONY (1745–96), Amer. soldier; ed. Philadelphia; a brilliant general, under Washington, 1776–82; fought at Brandywine, Germantown, Monmouth, Stony Point, and Green Springs; defeated Indians, 1793–95.

WAYNESBORO (39° 45′ N., 77° 35′ W.), town, Franklin County, Pennsylvania, U.S.A.; manufactures machinery. Pop. (1910) 7199.

WAYNFLETE, WILLIAM (1395–1486), Eng. Churchman; b. Wainfleet, Lincolnshire; ed. Winchester and New Coll., Oxford; founder of Magdalen Coll., Oxford, and second provost of Eton; bp. of Winchester, 1447; treated with Cade at Southwark, 1450, on the close of rebellion; app. chancellor by Henry VI., 1456; actively Lancastrian in Civil War; pardoned by Edward IV., 1466, and compelled to purchase another pardon in 1471. W. supported Richard III., and retired from public life, 1485. Bequeathed money and lands to Winchester, Magdalen, and New Coll., and did much for learning. As chancellor he was upright, and his influence moderated the strife of Wars of Roses.

WAZIRABAD (32° 27′ N., 74° 10′ E.), town, Gujranwala district, Punjab, British India; manufactures steel and iron. Pop. 19,000.

WAZZAN (35° N., 5° 40′ W.), sacred town, Morocco; residence of the Grand-Sherif. Pop. *c.* 10,500.

WEALD, THE (51° 5′ N., 0° 10′ E.), district between the N. and S. Downs, England; comprises portions of Kent, Surrey, and Sussex.

WEALDEN, strata (seen in Weald) of the Lower Cretaceous system; fresh-water and estuarine deposit; fossil remains—fresh-water shell-fish, dinosaurs and pterodactyls, plants and reptiles.

WEALTH, articles that are material, transferable, limited in quantity, and useful; poisons, instruments of destruction, etc., are 'wealth' to the political economist, because there is a demand for them.

WEANING, see BABY.

WEAR (54° 55′ N., 1° 22′ W.), river, Durham, England; flows into North Sea at Sunderland; length, 60 miles.

WEASEL FAMILY (*Mustelidæ*), a family of Carnivora (*q.v.*), the members of which are distinguished by their long, slim, cylindrical bodies, slung between short legs, their long necks and slender heads, and their mode of walking on their toes and not on the sole of the foot proper. Their species, to the number of about 175, are found all over the world except in the Australian region. The true Weasels (*Putorius*) are perhaps the most familiar of Brit. species, the small COMMON WEASEL (*P. vulgaris*) and its close relative, the larger STOAT or ERMINE (*P. erminea*), being found throughout Europe, Northern Asia, and northern N. America. Both are ferocious and bloodthirsty animals, feeding on small mammals, such as rats, mice, moles, and on birds and frogs, and in their northern ranges the fur of both becomes white in winter, that of the latter forming the royal ermine. Similar in habits and distribution is the closely related POLECAT (*P. fœtidus*), an albino variety of which has been domesticated as the FERRET, used in rabbit-hunting. The MINK (*P. lutreola*), which furnishes valuable fur, is semi-aquatic, and has partially webbed feet. Larger than these, and of stouter build, is the WOLVERINE or GLUTTON (*Gulo luscus*), found in the woods of N. Europe, Asia, and America. It is exceedingly strong, and has been known to attack reindeer and even horses.

The MARTENS (*Mustela*) form another group, less active than true Weasels, though none the less bloodthirsty. They are arboreal in habit, and the fur of some—such as the Northern Asiatic SABLE and the AMERICAN SABLE—is very valuable. Martens are confined to the northern hemisphere, the PINE MARTEN being a native of Britain.

Still another group includes the BADGERS (*Meles*) of Europe and Asia, the American SKUNKS (*Mephitis* and *Conepatus*), and the Indian and African RATELS (*Mellivora*). These are heavily built nocturnal animals, given to burrowing, and in the colder areas to hibernation. The Badger is a disappearing member of the British fauna, and like its relatives is carnivorous, insectivorous, or even vegetarian, as necessity arises.

Lastly come the OTTERS, with webbed feet and aquatic habits, whose depredations cause much damage to well-stocked trout and salmon streams, and whose fur is of considerable value. True Otters (*Lutra*) are found almost all the world over, except in Australia, Madagascar, and some smaller islands, but the SEA OTTER (*Latax*) occurs only on the shores of the northern Pacific.

WEATHER, see METEOROLOGY.

WEAVER BIRDS (*Ploceidæ*), a family of Old World finch-like Passerine Birds, with about 500 species, many of which build elaborate, flask-shaped nests; social in habit; especially common in Africa.

WEAVING, the process of interlacing yarn threads or similar flexible filaments by means of a loom, thus producing cloth or other fabric. Two sets of threads are used, crossing each other at right angles, the longitudinal set being called the *warp*, and the transverse set the *weft*. Besides fabrics made from one warp and one weft, there are others with two warps and one weft or two wefts and one warp; two, three, and other ply fabrics constructed from two or more warps and wefts; tapestries and similar fabrics made by intersecting two or more warps and wefts in a special manner; and gauzes in which one part of the warp is twisted round another part. In fabrics such as velvets, plushes, or Turkey carpets, a part of the weft or warp stands up vertically from the ground.

The operation of weaving consists essentially in first setting up the warp, and then working the weft-threads into it by means of a shuttle. The hand-loom consists of a rectangular framework of four vertical posts, strengthened by cross ties. Two rollers are placed at opposite ends of the frame. Upon one, called the 'yarn-beam,' is wound the warp, sufficient of the threads being left unwound to reach the other roller, to which they are attached. This second roller is known as the 'cloth-beam,' and upon it the cloth is wound as it is woven. Every other thread of the warp is raised, and a smooth, wooden rod is inserted between the equal sets thus formed. Each warp-thread also passes through a small loop in the middle of a vertical thread called the 'heald.' In plain weaving there are two sets of healds, the warp-threads passing through one heald alternating with those passing through the other. The raising of one heald lifts up every alternate warp-thread, and the depressing of the other heald pulls down the remaining threads, and this combined action produces a space between the two sets of threads. Through this space, which is called the shed, the shuttle carrying the weft-thread is thrown. The healds are now reversed, so that the upper and lower sets of warp-threads exchange places, and the shuttle passes back again through the shed. After each passage of the shuttle the weft-thread is driven home to the web by the 'reed,' which consists of a narrow frame, having cross wires far enough to allow the passage of a single thread. The weft is wound upon a freely revolving bobbin placed inside the shuttle, the end passing out through a hole in the side of the shuttle. The shuttle was formerly thrown by hand, but in 1738 KAY invented the 'picker' arrangement, in which the shuttle was driven backwards and forwards by pieces of wood called pickers, actuated by the jerking of a cord attached to them. In the power-loom the

shuttle is driven across the warp by a picking-stick connected to a picker by a leather strap, and placed at the end of a box into which the shuttle flies after completing its journey, only to be driven out again immediately, and sent through the shed into the opposite shuttle-box. The power-loom was invented in 1785 by EDMUND CARTWRIGHT, an Eng. clergyman. Modern power-looms embody practically the same principles as the hand-loom. They are provided with arrangements for automatically stopping the loom when a thread breaks, or when the shuttle fails to act properly. There are also automatic contrivances for ejecting empty shuttles, and for bringing into use full ones, or replenishing the empty ones. When two or more colours are to be used in the weft, two or more shuttles are placed in a rotating box, which automatically brings a shuttle of the right colour into position for being thrown at the right time. The most intricate patterns can be woven by the Jacquard loom. In this loom the healds are arranged so that each is independent of the others, in order that any desired combination of warp-threads can be raised or lowered at any time, the actual combination being determined by the arrangement of a series of perforations in an endless band of cards, the holes being pierced in accordance with the pattern to be woven.

WEBB CITY (37° 5′ N., 94° 30′ W.), city, Jasper County, Missouri, U.S.A.; centre of lead and zinc region. Pop. (1910) 11,817.

WEBER, CARL MARIA FRIEDRICH ERNEST VON (1786–1826), Ger. composer; b. Eutin; d. in London. He studied under Abbé Vogler (of Browning's poem), and, in 1821, inaugurated purely Ger. opera, as opposed to the traditional and prevailing Ital. type, with his *Der Freischütz*, a work gaining for him the title, 'Father of the Romantic School'; produced the operas *Euryanthe* (Vienna, 1825) and *Oberon* (London, 1826). He was far advanced in consumption when he travelled to conduct the latter work, and was found dead in bed shortly after the first performance. Buried in London, his remains were removed to Dresden, on Wagner's initiative, 1844. Besides his operas, W. wrote a large number of pianoforte and other compositions, including the *Jubel* overture for the jubilee of Friedrich August.

WEBER, WILHELM EDUARD (1804–91), Ger. physicist; b. Wittenberg; graduated Halle; prof. at Halle, Göttingen, Leipzig; originated system of measuring electrical quantities.

WEBER'S LAW.—A light weight, easily felt by itself, is scarcely noticed if added to a heavy weight; a candle seems scarcely to add to the illumination of sunlight; a voice, audible in quiet, is lost in roaring traffic. Weber's Law states that the least difference of stimulus which will produce a noticeable difference of sensational intensity, bears a constant proportion to the magnitude of the original stimulus—for light $\frac{1}{100}$th, for sounds $\frac{1}{3}$rd, for lifted weights $\frac{1}{30}$th, etc. The law does not hold good of very weak or very intense stimuli.

WEBSTER (42° 4′ N., 71° 53′ W.), town, on French River, Webster County, Massachusetts, U.S.A.; manufactures cottons, woollens. Pop. (1910) 11,509.

WEBSTER, DANIEL (1782–1852), Amer. statesman; b. New Hampshire; ed. as a lawyer; entered Congress, and quickly won fame both at the Bar and in Congress. More than once averted war between Britain and America, and was chiefly responsible, as Sec. of State, for negotiating famous Ashburton Treaty, 1842, which, by settling the frontier between Canada and Maine, made Canada secure. His influence in N. States was weakened by his failure to accept the Anti-Slavery position, but he died before the question reached acutest stage. Although W. accepted, in 1850, the repeal of MISSOURI COMPROMISE (*q.v.*), he made the U.S. jointly responsible, by the *Treaty of Washington*, 1842, for watching and suppressing the African slave trade. W.'s fame rests mainly on his oratory.

H. C. Lodge, *Life* (1886).

WEBSTER, JOHN (fl. 1602–24), Eng. dramatist, about whose life scarcely any authentic facts are known. The first great tragedy he composed was the *White Devil*, a drama of astonishing power and pathos. This was followed by *The Duchess of Malfi*, whose supreme tragic excellence Lamb so well extolled. *The Devil's Law Case* is inferior in plot and style.

WEBSTER, NOAH (1758–1843), Amer. journalist and lexicographer; b. Hartford, Conn.; was admitted to the Bar, 1781, and augmented the proceeds from his legal practice by journalism. His great work is the *American Dictionary of the English Language*.

WECHEL, see under PRINTING.

WEDDERBURN, JOHN (1500–66), Scot. divine; probably wrote most of *Compendious Book of Psalms and Spiritual Songs*.

WEDGE, piece of metal (occasionally wood) triangular in section and tapering; point inserted into wood required to be split; broad end driven in; wood splits with grain.

WEDGWOOD, JOSIAH (1730–95), celebrated for his pottery. He began business at Burslem, Staffordshire, where his father was also a potter; and so improved the materials and the form and decoration of his products that *Wedgwood ware* became famous as the tangible representation of a fine art.

WEDNESBURY (52° 33′ N., 2° 1′ W.), town, Staffordshire, England; iron and coal-mining centre; manufactures iron and steel. Pop. (1911) 28,108.

WEEHAWKEN (40° 47′ N., 74° 2′ W.), town, on Hudson River, Hudson County, New Jersey, U.S.A. Pop. (1910) 11,228.

WEEK, see CALENDAR, CHRONOLOGY.

WEEVILS, see under RHYNCHOPHOROUS BEETLES.

WEIGHING-MACHINES.—The commonest and most accurate type is the equal-armed balance—a beam supported in the middle and carrying at each end a scalepan. The beam is rested upon polished planes by means of knife-edges of hardened steel, and the scalepans hang by chains from hooks also resting upon knife-edges. The beam should be horizontal when the pans are removed, and these, with their chains, should be exactly equal in weight. Other things being equal, the longer the arms of the balance, the smaller the weight of the beam, and the nearer the centre of gravity of the beam to the point of support, the greater will be the sensitiveness of the balance. For retail trade purposes, where rapidity is more important than minute accuracy, the counter machine, which has scalepans above and resting upon two beams cast in one piece or locked together, is most convenient, given free access to the scalepans.

Another common form is the steelyard or unequal-armed balance, also known as the Rom. balance. This consists of a lever moving freely upon a suspended fulcrum. The short arm carries a scalepan, and the long arm has a sliding weight, which is moved along the arm until the lever is horizontal, and the weight of a body is read by means of graduated divisions marked along the arm. There is also a form of steelyard called the Dan. balance, which has the weight fixed at the end of the lever, the fulcrum being movable. The steelyard is used for weighing railway luggage and loaded carts, and in the penny-in-the-slot automatic weighing-machines. The most portable w.-m. is the spring balance, which determines weight by the amount of compression of a spiral spring, as indicated upon a dial by a finger worked by rack and pinion. The spring is usually made with equal parts of right-hand and left-hand spiral, to prevent its turning round its axis; temperature affects the spring and the balance, and readings should be checked frequently. There are also various types of automatic machines for weighing large quantities of goods, totalling the day's weighing, giving value of parcels at so much per pound, etc.

WEIGHTS AND MEASURES.—Measurements of length, area, volume, mass, etc., are made by finding how often the unknown contains a fixed quantity or

unit, really arbitrary. The fixed unit is derived from a *Standard*. Thus the Brit. Standard of Length, the Imperial *Yard*, is the distance between two marks on a platinum bar kept by the *Standards Department* of the Board of Trade. Other standards are the *pound avoirdupois* and the *gallon*, which is the volume occupied by 10 lb. avoirdupois distilled water; the temperature of measurement is 62° F., the height of the barometer 30 inches. In the METRIC SYSTEM, in use in almost every civilised country, the International Standard is the distance between two marks on an X-shaped platinum-iridium bar at 0° C. at Paris. This standard is copied from the original in the Archives, supposed to be one-ten-millionth of the earth's quadrant from the North Pole to the Equator. The international *kilogram* equals one thousand *grammes* where one *gramme* is the mass of a cubic centimetre of distilled water at 4° C. Forty standard copies of the metre and kilogram were made for distribution among the nations.

The chief British systems are :—

Measures of Length.

12 inches (in. or ″)	. =1 foot (ft. or ′).
3 feet . .	. =1 yard.
5½ yards . .	. =1 rod, pole, or perch.
40 poles . .	. =1 furlong.
1760 yards=8 furlongs	. =1 statute mile.

MISCELLANEOUS.—22 yards=100 links of 7·92 inches =1 Gunter's chain; 3 miles=1 league; 1 knot or geographical mile=6082·66 feet; 1 degree=60 knots =69·121 miles; 1 Admiralty knot=6080 feet; 1 nautical mile=1870 yards; 1 nail=2¼ inches; 1 hand=4 inches; 1 palm=3 inches; 1 span=9 inches; 1 ell=1·25 yards.

Measures of Area.

144 sq. inches .	. =1 sq. foot.
9 sq. feet . .	. =1 sq. yard.
30¼ sq. yards .	. =1 sq. rod, pole, or perch.
40 sq. poles. .	. =1 rood.
4840 sq. yards=4 roods	. =1 acre.
640 acres . .	. =1 sq. mile.

For conversion to the metric system :—

1 inch lineal .	. =25·39954 millimetres.
1 sq. foot .	. =0·092898 sq. metres.

Measures of Capacity.

4 gills. .	. =1 pint.
2 pints .	. =1 quart.
4 quarts .	. =1 gallon.
2 gallons .	. =1 peck.
4 pecks .	. =1 bushel.
8 bushels .	. =1 quarter.
36 bushels .	. =1 chaldron.
1728 cubic inches	. =1 cubic foot.
27 cubic feet.	. =1 cubic yard.

Measures of Weight.

16 drams (dr.) .	. =1 ounce (oz.).
16 ounces . .	. =1 pound (lb.)=7000 grains.
28 pounds . .	. =1 quarter.
14 pounds . .	. =1 stone.
4 quarters . .	. =1 hundredweight (cwt.).
20 hundredweights .	. =1 ton=1016·0 kilogrammes.

For gold, silver, and precious stones the troy ounce =480 grains, is used.

Troy Weight.

24 grains . .	. =1 pennyweight (dwt.).
20 pennyweights .	. =1 ounce (oz.).
12 ounces . .	. =1 pound (lb.).
100 pounds . .	. =1 hundredweight (cwt.).

Apothecaries' Measures.

20 grains. .	. =1 scruple (℈ i).
3 scruples .	. =1 drachm (ʒ i).
60 minims (♏)	. =1 drachm.
8 drachms .	. =1 ounce (oz. Apoth.).

In the metric system we have :—

MEASURES OF LENGTH.—1 metre (m.)=1000 millimetres (mm.)=100 centimetres (cm.)=10 decimetres (dm.).

10 metres . . .	=1 dekametre (dam.).
10 dekametres . .	=1 hectometre (hm.).
1000 metres=10 hectometres	=1 kilometre (km.) (=0·6214 mile).

A micron (μ)=·001 mm., a micromillimetre ($\mu\mu$)= ·000001 mm., are used in sciences.

MEASURES OF AREA.—100 sq. millimetres=1 sq. centimetre; 10,000 sq. centimetres=1 sq. metre; 1 million sq. metres=1 sq. kilometre=0·386 sq. mile; 100 sq. metres=1 are; 100 ares=1 hectare=2·4711 acres.

MEASURES OF WEIGHT.—1000 milligrams (mg.)= 100 centigrams (cg.)=10 decigrams (dg.)=1 gramme (gm.); 1000 grammes=1 kilogramme (kg.)=2·20462 lb.; 1000 kilogrammes=1 metric ton=·9842 tons. The *Centner*, the cwt. of several continental countries, is now fixed at 50 kilogrammes.

MEASURES OF CAPACITY.—1000 cubic centimetres= 1 litre=0·8799 quart; 1000 litres=1 cubic metre.

Angular Measurement.

SEXAGESIMAL.

1 right angle .	. =90 degrees (°).
1 degree . .	. =60 minutes (′).
1 minute . .	. =60 seconds (″).

The French CENTESIMAL SYSTEM divides a right angle into 100 grades (g.), a grade into 100 minutes (′), a minute into 100 seconds (″). In CIRCULAR MEASUREMENT the unit is the radian, the angle subtended at the centre of a circle by an arc equal to the radius, and equals 57·2958 degrees.

Units of measurement of velocity, acceleration, work, and other physical quantities involve the fundamental units of length, mass, and time. Of the two systems—the *foot-pound-second* (F.P.S.) and the *centimetre-gramme-second* (C.G.S.)—the former is used in engineering, the latter in general scientific and electrical measurements.

WEIGHT-THROWING, see HAMMER-THROWING, PUTTING THE WEIGHT.

WEI-HAI-WEI (37° 35′ N., 122° 13′ E.), territory, N.E. China, extending 10 miles along the coast-line of Bay of Wei-hai-Wei, and also including several islands in the bay; leased by Britain in 1898; contains the city of Wei-hai-Wei; naval and coaling station. Pop. (1911) 147,177.

WEILBURG (52° 9′ N., 8° 14′ E.), town, on Lahn, Hesse-Nassau, Prussia; has a castle, formerly the residence of dukes of Nassau-Weilburg. Pop. 4000.

WEIMAR (50° 59′ N., 11° 19′ E.), city, on the Ilm, capital of Saxe-Weimar-Eisenbach, Germany; contains grand-ducal palace and Court theatre, in front of which is Rietschel's famous Goethe-Schiller monument; chiefly famous for its associations with Goethe, who lived here (1782–1832), and Schiller, who passed his last years here; has large building containing archives of the two poets. Pop. (1910) 34,582.

WEINHEIM (49° 33′ N., 8° 43′ E.), town, Baden, Germany; manufactures leather. Pop. (1910) 13,896.

WEINSBERG (49° 5′ N., 9° 5′ E.), town, Württemberg, Germany; scene of victory of Emperor Conrad over Count Welf, 1140. Pop. 3270.

WEIR, barrier placed across river to raise the water-level. Used for mill races and purposes of navigation. Saxons used arrangements of stakes and twigs as fish traps and water dams. When water wheels were a source of power w's were used to divert the current to the wheel. W's are generally of three types: *solid*, watertight dams of earthwork, simple, strong, and durable; *drawdoor*, by which the discharge of the river may be regulated by sluice gates; and *movable*, consisting of iron frames in beds of masonry.

WEISMANN, AUGUST (1834–), German biologist; app. prof. of Zool. at Freiburg, 1866;

wrote *Studies in the Theory of Descent* (1882), *Essays on Heredity* (1892), *The Germ-Plasm* (1893), *Evolution Theory* (1904).

WEISS, BERNHARD (1827–), New Testament critic; prof. at Königsberg and Berlin.

WEISSE, CHRISTIAN HERMANN (1801–66), Ger. Prot. theologian.

WEISSENBURG (49° 2′ N., 7° 48′ E.), town, on Lauter, Alsace-Lorraine; manufactures paper. Pop. 6770.

WEISSENBURG-AM-SAND (49° 2′ N., 9° 58′ E.), town, Middle Franconia, Bavaria; mineral spring; various industries. Pop. 7200.

WEISSENFELS (51° 12′ N., 11° 58′ E.), town, on Saale, Pruss. Saxony; manufactures machinery. Pop. (1910) 33,581.

WELD, Wood, Dyer's Rocket (*Reseda Luteola*), plant of order *Resedaceæ*; flowers are yellow, and resemble Mignonette; formerly used in dyeing.

WELDING, the joining of metallic surfaces by pressure while in a partly fused state. The first essential is absolute cleanliness, both chemical and mechanical. The temperature varies with different metals, but in every case it must be high enough to bring the surfaces to a pasty condition, yet not enough to oxidise them. *Thermic* w. depends upon the affinity of powdered aluminium for metallic oxides, sulphides, or chlorides, which may be employed for the reduction of metals with which oxygen, sulphur, or chlorine combine. Finely granulated aluminium is mixed with iron oxides and ignited, and an exceedingly high temperature is produced by the rapid oxidation of the aluminium. The process is used for tramway rails, steel girders, broken castings, etc. In *electric* w. the heat of the electric arc is used. Considerable heat is wasted and the process is slow. In the so-called electric blowpipe the arc is magnetically deflected. The Thomson process is electric w. in which the resistance of the metal itself is utilised. A current of low voltage but extremely high amperage is sent through the pieces to be welded, which are pressed together. By this process almost all metals and alloys can be welded.

WELDON, WALTER (1832–85), Eng. technical chemist; inventor of manganese recovery process.

WELL, see Water, Artesian Wells.

WELLESLEY (42° 18′ N., 71° 18′ W.), town, Norfolk County, Massachusetts, U.S.A.; seat of Wellesley Coll. (for women). Pop. (1910) 5413.

WELLESLEY, MARQUESS OF, Richard Colley Wesley (1760–1842), Brit. statesman; elder bro. of Duke of Wellington; ed. Eton, and Christchurch, Oxford; entered Parliament, 1787; Gov.-Gen. of India, and Baron W., 1797; marquis, 1799. Maintained and extended Brit. predominance in India; recalled, 1805; Lord-Lieut. of Ireland, 1821–28 and 1833–34.

WELLHAUSEN, JULIUS (1844–), theologian and philologist; prof. at Greifswald, 1872, Halle, 1882, Marburg, 1885, Göttingen, 1892; has written brilliant works on Old and New Testament and on Muhammadanism.

WELLINGBOROUGH (52° 19′ N., 0° 42′ W.), town, Northamptonshire, England; manufactures boots and shoes. Pop. (1911) 19,758.

WELLINGTON.—(1) (41° 16′ S., 174° 18′ E.) capital of New Zealand, in N. Island, on Cook Strait; seat of Victoria University College; important trade. Pop. (1911) 70,729. (2) (52° 43′ N., 2° 31′ W.) town, Shropshire, England; manufactures agricultural implements. Pop. (1911) 7820. (3) (50° 58′ N., 3° 14′ W.) town, Somersetshire, England; from it the Duke of Wellington took his title. Pop. (1911) 7634.

WELLINGTON, DUKE OF, Arthur Wellesley, 1st Duke (1769–1852), b. Ireland; s. of Lord Mornington; joined the army under the purchase system and passed through several regiments until at 24 he commanded the 33rd Foot, still known as the Duke of W.'s regiment. His first experience of active service was in the Low Countries under Duke of York; he afterwards accompanied his regiment to India, and through his brother's influence obtained important commands which enabled him to display his great abilities; his name is particularly associated with the battles of *Assaye* and *Argaum.*

He returned in 1805 and was placed in command of an expedition which had for its object the expulsion of the French from Lisbon; he succeeded in defeating Marshal Junot at *Vimiero* and *Rolica*, but was then ordered back to England, and the operations against Napoleon were conducted by Sir John Moore. After Moore's death, in 1808, W. again appeared in the Peninsula with enlarged powers which enabled him to control not only the tactics and the strategy but the policy of the war. He remained until he had expelled the French from Spain and his army was in actual occupation of Fr. territory between Bayonne and Toulouse in 1814, when Napoleon fell from power and the war ended. W. served as ambassador at Paris until Napoleon reappeared at the head of a Fr. army. In 1815, W. was placed in command of the forces maintained by Britain (then in alliance with the Prussians, Austrians, and Russians), with the object of crushing Napoleon's power for ever. He conducted the defensive operations south of Waterloo on June 18, 1815, and, aided by Blücher's army, dispersed Napoleon's forces and occupied Paris.

W.'s later career was associated with politics; he opposed many domestic reforms which have since been carried out; he was a member of the government and Prime Minister in 1828. Among the dignities which had been showered on this great Englishman during his long life was that of Warden of the Cinque Ports; he d. at Walmer Castle and was buried in St. Paul's Cathedral.

WELLS (51° 12′ N., 2° 39′ W.), town, Somerset, England, situated at foot of Mendip Hills; bp.'s see (with Bath); has very beautiful cathedral, dating from XIII. cent.; the west front, with its host of figures, is unsurpassed, and the chapter-house and Lady-Chapel are perfect examples of Early Eng. architecture; has episcopal palace. Pop. (1911) 4655.

WELLS, CHARLES JEREMIAH (1798 ?–1879), Eng. poet; b. in London, and unjustly neglected. The extraordinary richness of imagery and beauty of language of his dramatic poem, *Joseph and His Brethren*, were justly commended by Swinburne.

WELLS, DAVID AMES (1828–98), Amer. economist; chairman of national revenue commission, 1865.

WELLS, HERBERT GEORGE (1866–), Eng. novelist and socialist; began with imaginative fiction, e.g. *The Time Machine, The Invisible Man, The War of the Worlds*; but in later novels—*Kipps, The History of Mr. Polly, Ann Veronica, The New Machiavelli, Marriage*—he proved himself a true humorist and a clever psychologist; his *Mankind in the Making, New Worlds for Old, First and Last Things, A Modern Utopia*, like his novels, deal with sociology.

WELLS, SIR THOMAS SPENCER, Bart. (1818–97), Eng. surgeon; b. St. Albans; ed. St. Thomas's Hospital, London, and elsewhere (M.R.C.S., 1841); surgeon to Samaritan Free Hospital for Women and Children; Hunterian prof. of Surgery and Pathology (1878), and pres. (1882) Royal Coll. of Surgeons; a famous gynæcologist and surgeon, introducing various new operative procedures.

WELLSTON (39° 10′ N., 82° 33′ W.), city, Ohio, U.S.A.; iron and cement works. Pop. (1910) 6875.

WELLSVILLE (40° 41′ N., 80° 42′ W.), city, Columbiana County, Ohio, U.S.A.; coal, gas, and oil region; iron manufactures. Pop. (1910) 7769.

WELS (48° 9′ N., 14° 1′ E.), town, on Traun, Upper Austria; manufactures copper, brass. Pop. 15,470.

WELSBACH MANTLE, see Lighting.

WELSHPOOL (52° 40′ N., 3° 16′ W.), town, on Severn, Montgomeryshire, Wales; near it is Powys Castle (XII. cent.). Pop. (1911) 5917.

WEM (52° 42′ N., 2° 44′ W.), town, Shropshire, England.

WEMBLEY, town, Middlesex, England, 9 miles W.N.W. of St. Paul's. Pop. (1911) 10,697.

WEMYSS, pronounced 'Weems' (56° 9′ N., 3° 5′ W.), parish, on Firth of Forth, Fifeshire, Scotland; contains villages of Buckhaven, East W. and West W., Methil, Innerleven; coal-mining industry. Pop. (1911) 23,104.

WEMYSS, EARLDOM OF, honour held by Scot. family. Sir John W. was created Baron W. of Elcho, 1625; David, Lord Elcho (1721–87), s. of 4th earl, was a Jacobite in '45 rising and was attainted. Francis Charteris, 10th earl (1818–), founded volunteer movement when Lord Elcho.

WENCESLAUS (1361–1419), king of Bohemia and Germany; s. of Emperor Charles IV. In 1363 he was crowned king of Bohemia, and in 1378 he became king of Germany. He roused the enmity of the nobles and was imprisoned; forced to abdicate in favour of his brother Sigismund, 1411.

WÊN-CHOW-FU (28° N., 120° 20′ E.), city, treaty port, Che-kiang, China. Pop. (1910) 100,000.

WENDEN (57° 19′ N., 25° 16′ E.), town, Livonia, Russia; has a ruined castle (XIII. cent.) and a fine mediæval church. Pop. 6700.

WENDOVER (51° 46′ N., 0° 44′ W.), town, Buckinghamshire, England.

WENDS, Slavs of Lusatia (Saxony and Prussia); also called SORBS. At one time occupied territory from the Vistula to the Elbe, and were gradually absorbed by the Germans. Speakers of Wendish grow fewer every year. See SLAVS.

WENDT, HANS HINRICH (1853–), Liberal Prot. prof. of Theology, Heidelberg, 1885, Jena, 1893; voluminous writer.

WENER, LAKE, see VENER, LAKE.

WENLOCK, MUCH WENLOCK (52° 37′ N., 2° 34′ W.), town, Shropshire, England; agricultural district; limestone quarries. Pop. (1911) 15,244.

WENLOCK GROUP, subdivision of Silurian system which underlies the Ludlow rocks (*q.v.*); well developed at Wenlock.

WENS, small cysts on skin of face and scalp; remove by squeezing. See SCALP.

WENSLEYDALE (54° 10′ N., 1° 40′ W.), the part of the valley of the Ure, Yorkshire, England, from its head to Jervaulx Abbey; traversed by a branch of the N.E. Railway.

WENTLETRAP (*Scalaria*), genus of Gasteropoda showing relationship with *Turritella*; native to southern seas; shells, lustrous white, are spiral; shells of Precious W. (*S. pretiosa*), the largest, at one time realised high prices.

WENTWORTH, THOMAS (1501–51), cr. by Henry VIII. 1st Baron W. of Nettlestead; descendant of old Yorkshire family at Wentworth-Woodhouse; ancestor of W's of Oxfordshire, conspicuous on side of Parliament in Civil War, and of Earls of Cleveland. Thomas W., 1st Earl of Strafford, was e. s. of Sir William, elder branch of family.

WENTWORTH, THOMAS, see STRAFFORD, EARL OF.

WEPENER (29° 47′ S., 26° 50′ E.), town, Orange Free State.

WERDAU (50° 44′ N., 12° 23′ E.), town, Saxony, Germany; wool-spinning industry, dyeing, machinery. Pop. (1910) 20,830.

WERDEN (54° 22′ N., 7° 3′ E.), town, on Ruhr, Rhineland, Prussia; manufactures cloth; contains a church of a Benedictine abbey, founded 800. Pop. 12,740.

WEREGILD (O.E. *wer*, 'a man,' and *geld*, 'payment of money'), a sum of money paid, in accordance with early Teutonic law, in expiation of homicide or injury. Payment varied with the injured person's rank. In the case of murder, the relatives of deceased were paid *man-wyrth*. A later phase was the interference of the State, which demanded weregild in addition to that paid to the dead man's relatives. Overlords received *manbote*, i.e. compensation for a vassal slain. W. has some kinship with Vendetta (*q.v.*).

WERGELAND, HENRIK ARNOLDUS (1808–45), Norweg. poet; advocate of emancipation of Jews.

WERMELSKIRCHEN (51° 10′ N., 7° 12′ E.), town, Rhineland, Prussia; textile industries. Pop. 16,380.

WERNER, ABRAHAM GOTTLOB (1750–1817), Ger. geologist; b. Wehrau, Lusatia; prof. of Mineralogy, Freiberg, 1775; a brilliant scientist. See GEOLOGY.

WERNIGERODE (51° 50′ N., 10° 47′ E.), town, on Holzemme, Pruss. Saxony; manufactures cigars and brandy; was capital of Stolberg-Wernigerode. Pop. 18,370.

WERTH, JOHANN, COUNT VON (*c.* 1595–1652), Ger. soldier; b. Büttgen, near Jülich; distinguished cavalry leader in Bavarian army; made a baron and lieut.-marshal after Nördlingen; took part in battles of *Rheinfelden*, *Tuttlingen*, *Jankau*, *Mergentheim*, and *Allersheim*.

WERTHER, see GOETHE.

WERWOLF, WEREWOLF, according to a superstition widely disseminated in Europe in mediæval times, a man who had power to transform himself into a wolf. In such tales the w. is sometimes a powerful warrior and sometimes a bloodthirsty monster who spreads destruction broadcast. Nor is the w. unknown in classical times; in the 8th Eclogue of Vergil, Mœris transforms himself into a wolf by means of magic herbs. Lycanthropy (*q.v.*) has been the subject of much scientific discussion. It has an obvious relation to Metempsychosis and Totemism.

WESEL (51° 39′ N., 6° 36′ E.), fortified town, at junction of Lippe and Rhine, Rhineland, Prussia; manufactures metal goods. Pop. 24,450.

WESEL, JOHANN RUCHRAT VON (d. 1481), Ger. divine; prof. at Erfurt; as 'reformer,' tried and sentenced to imprisonment in a convent.

WESER (53° 42′ N., 8° 18′ E.) (ancient *Visurgis*), river, Germany; formed by union of Werra and Fulda at Münden; flows northwards through Prussia and enters North Sea; length, 270 miles; navigable to Münden.

WESLEY, CHARLES (1707–88), Eng. religious leader; brother of John Wesley (*q.v.*); ed. Westminster and Oxford; wrote over 6000 hymns, best known being *Jesu, Lover of my soul*, and *O for a thousand tongues to sing*.

WESLEY, JOHN (1703–91), Eng. religious leader and founder of Wesleyanism; ed. Charterhouse and Oxford; ordained deacon, 1725, becoming fellow of Lincoln Coll., 1726. For some time he preached in parish churches near Oxford, but his spiritual power only developed gradually. In 1735 he and his bro. Charles went to Georgia and evangelised there. W. pub. his *Collection of Psalms and Hymns*, 1737. His intense conviction of the forgiveness of his own sin took place at London, 1738. His theology was Arminian, not Calvinistic. Gradually his work became separate from the Anglican Church. When he ordained, separation had already began, though he had striven to avert it. His preaching, zeal, and his power of popular appeal were enormous.

Life, by Telford (1899), R. Southey (ed. 1871), Overton (1891).

WESLEYAN METHODISTS, see under FREE CHURCHES.

WESSEL, JOHAN (1420–89), Dutch divine; studied at Deventer, Cologne, Paris, and Rome: prof. at Heidelberg, 1476; opposed to the ecclesiastical corruptions of his time, he in some ways anticipated Reformers' views.

WESSEX, in ancient times, the kingdom of W. Saxons, England; included counties of Somerset, Dorset, Wilts, Hants, and Berks, and in later times, Devon and Cornwall; founded, 519, by Cerdic; converted to Christianity in VII. cent.; in 800 Egbert succeeded as king, and 27 or 30 years later he became ruler of the whole of Britain.

WEST AFRICA.—*British*—NIGERIA, LAGOS, GOLD COAST, ASHANTI, SIERRA LEONE, GAMBIA; *French*—FRENCH WEST AFRICA; *German*—GERMAN SOUTH-WEST AFRICA, KAMERUN, TOGOLAND; *Portuguese*—PORTUGUESE GUINEA, ANGOLA, KABINDA; *Spanish*—FERNANDO PO, RIO DE ORO, SPANISH GUINEA.

WEST BAY CITY, BAY CITY (*q.v.*).

WEST, BENJAMIN (1738–1820), Anglo-Amer. painter; b. Springfield, Pennsylvania. Settling in London, he attained fame by his historical pictures, and was honoured with burial in St. Paul's Cathedral.

WEST BROMWICH (53° 32′ N., 1° 59′ W.), town, Staffordshire, England; manufactures metal goods. Pop. (1911) 68,345.

WEST CHESTER (39° 57′ N., 75° 40′ W.), town, capital, Chester County, Pennsylvania, U.S.A.; dairy-farming; market-gardening; manufactures dairy implements. Pop. (1910) 11,767.

WEST HAM (51° 30′ N., 0° 3′ E.), eastern suburb of London, in Essex, England. Pop. (1911) 289,102.

WEST HAVEN (41° 17′ N., 72° 57′ W.), town, on New Haven Harbor, New Haven County, Connecticut, U.S.A.; manufactures pianos, wire goods. Pop. (1910) 8543.

WEST HOBOKEN (40° 45′ N., 74° 4′ W.), town, Hudson County, New Jersey, U.S.A.; manufactures silk goods. Pop. (1910) 35,403.

WEST INDIES (10° to 27° N., 60° to 85° W.), islands to N. and E. of Caribbean Sea, extending from Yucatan and Florida to Gulf of Paria, N. coast of Venezuela; area, *c.* 96,000 sq. miles; comprise the Bahamas; the four large islands of Cuba, Jamaica, Haiti, and Porto Rico, known as the Greater Antilles; the Virgin, Leeward, and Windward Islands, which form group known as Lesser Antilles; and Trinidad, off Venezuelan coast. Of these, Cuba and Haiti are independent; Bahamas, Barbados, Jamaica, Leeward and Windward Islands, and Trinidad belong to Great Britain; Porto Rico to U.S.A., and others to Denmark, France, and Holland. Most of the islands are mountainous in character, being the projecting summits of a sub-oceanic ridge of mountains running between N. and S. America; others are of coral formation. The climate generally is tropical and the soil fertile. The islands produce and export sugar, cotton, coffee, cocoa, ginger, guano, sponges, arrow-root, tobacco, etc. First discovered by Columbus, 1492; subsequently occupied by Spaniards during XVII. and XVIII. cent's. Inhabitants are Europeans, half-castes, Chinese, Indians, and negroes. Pop. *c.* 7,000,000. For further particulars, see articles on the various islands and groups.

WEST, NICHOLAS (1461–1533), bp. of Ely, 1515.

WEST ORANGE (40° 18′ N., 74° 17′ W.), residential town, Essex County, New Jersey, U.S.A.; manufactures phonographs. Pop. (1910) 10,980.

WEST POINT (41° 23′ N., 73° 58′ W.), village, Orange County, New York, U.S.A.; strongly fortified; has an observatory; chiefly remarkable as the site of U.S. Military Academy (1802); education here is free, and the most rigorous discipline obtains; the buildings of the Academy include a magnificent library, officers' quarters, a riding hall, and a hospital.

WEST PRUSSIA, WESTPREUSSEN (53° 40′ N., 18° 20′ E.), province, on Baltic Sea, Prussia; surface level or hilly, rising in its highest point to 1086 ft.; traversed by Vistula; agricultural region; was Polish possession from 1466 to 1772, when it passed to Prussia. Capital, Danzig. Pop. (1910) 1,703,474.

WEST SPRINGFIELD (42° N., 72° 40′ W.), town, Hampden County, Massachusetts, U.S.A.; railway-shops. Pop. (1910) 9224.

WEST TROY, WATERVLIET (*q.v.*).

WEST VIRGINIA (37° 14′ to 40° 38′ N., 77° 40′ to 82° 36′ W.), eastern state of U.S.A.; bounded N. by Pennsylvania and Maryland, E. and S. by Virginia, W. by Kentucky and Ohio; area, 24,715 sq. miles. Surface is generally mountainous, especially in E., where it is crossed by various ranges of the Allegheny Mountains, reaching an extreme height of 4860 ft. in Spruce Knob; drained by the Ohio (which forms N.W. boundary, separating W. V. from Ohio) and its affluents. The state is chiefly of Carboniferous formation. Climate is healthy and temperate.

W. V. was included in the state of Virginia until the outbreak of the American Civil War; but when Virginia seceded in 1861, the W. part declared its independence of the rest of the state, and remained loyal to Union; organised as a separate state, 1863. Executive power is vested in a governor, who is elected for 4 years and assisted by various officers of state. Legislature consists of Senate of 30 members and House of Delegates of 86 members, elected for 4 and 2 years respectively. Sends two Senators and six Representatives to Federal Congress. For purposes of local administration is divided into 55 counties.

Chief towns are Charleston (capital), Wheeling, Parkersburg, Huntington. Agriculture is important industry; chief crops—wheat, maize, oats, tobacco; fruit cultivated; live stock raised. Large area forested, lumbering being chief industry. Minerals include coal, petroleum, iron, sandstone. Industries include meat-packing, flour-milling, manufacture of leather, hardware, pottery. Education is free and obligatory; State Univ. at Morgantown. Chief religions are Methodist, Baptist, R.C. Pop. (1910) 1,221,119.

WESTALL, RICHARD (1765–1836), Eng. artist; chiefly celebrated for his historical water-colours and book illustrations.

WESTBORO (42° 17′ N., 71° 40′ W.), town, Worcester County, Massachusetts, U.S.A.; manufactures boots and shoes. Pop. (1910) 5446.

WESTBROOK (43° 40′ N., 70° 25′ W.), city, Cumberland County, Maine, U.S.A.; manufactures silks. Pop. (1910) 8281.

WESTBURY (51° 17′ N., 2° 7′ W.), town, Wiltshire, England. Pop. (1911) 3433.

WESTBURY, RICHARD BETHELL, 1ST BARON (1800–73), Brit. statesman; Solicitor-Gen., 1852; Attorney-Gen., 1856; Lord Chancellor, 1861; tried to abolish distinction between law and equity; attacked bp's in 'Essays and Reviews' question.

WESTCOTT, BROOKE FOSS (1825–1901), Eng. bp.; b. near Birmingham; ed. King Edward's School, Birmingham, and Trinity Coll., Cambridge; distinguished career at Cambridge; fellow of Trinity, 1849; assistant master at Harrow, 1852–67; canon of Peterboro', 1869; regius prof. of Divinity, Cambridge, 1870; canon of Westminster, 1883; bp. of Durham, 1890. A member of the company responsible for REVISED VERSION OF THE NEW TESTAMENT. Pub., with Hort, *The New Testament in Greek*, 1881. He encouraged study of social questions in Church of England, and was first pres. of Christian Social Union. Chief publications—commentaries on various books of the New Testament, and sermons.

WESTERLY (41° 23′ N., 71° 49′ W.), town, Washington County, Rhode Island, U.S.A.; granite quarries; manufactures cottons, woollens. Pop. (1910) 8696.

WESTERN AUSTRALIA (13° 30 to 35° S., 112° 51′ to 129° E.), western state of Australia; bounded N. by Indian Ocean, E. by S. Australia, S. by Southern Ocean, W. by Indian Ocean; area, 975,920 sq. miles; coast deeply indented in N.W.; surface is generally a tableland, with mountain ranges on the W. coast, reaching an extreme height of 3640 ft. in Bluff Knolls; drained by Ord, Fitzroy, De Grey, Fortescue, Ashburton, Gascoigne, Murchison, Greenough, and other streams; climate is healthy and dry, very hot in the N.

W. A. was first colonised by British, 1829; obtained responsible government, 1890; two years later the discovery of gold at Coolgardie led to a great influx of population; in 1901 the colony became one of the states of the Australian Federation. The executive is vested in a governor nominated by Brit. Crown and assisted by 8 ministers of state; legislature consists of a Council of 30 members and Assembly of 50 members, who are elected respectively for six and three years by popular vote.

Largest towns are Perth (capital), Fremantle, Boulder, Kalgoorlie, Midland Junction. Agriculture is carried on, chief crops being wheat, oats, and barley, while fruit is cultivated; horses, cattle, sheep, and pigs raised; minerals include gold (chief source of wealth), silver, copper, tin. There are large forests, with much valuable timber. Chief exports are gold, timber, hides, wheat, flour, wool, pearls. Education is free and obligatory. Chief religions, Anglican, R.C., Wesleyan, Presbyterian. Pop. (1911) 283,986.

WESTERN ISLES, see HEBRIDES.

WESTFIELD (42° 3′ N., 72° 46′ W.), town, Hampden County, Massachusetts, U.S.A.; manufactures whips. Pop. (1910) 16,044.

WESTGATE-ON-SEA (51° 23′ N., 1° 22′ E.), watering-place, Kent, England.

WESTHOUGHTON (53° 33′ N., 2° 32′ W.), town, Lancashire, England; textiles, coal. Pop. (1911) 15,046.

WESTMACOTT, SIR RICHARD (1775–1856), Eng. sculptor; prof. of Sculpture, Royal Academy, 1827–56; statues include Pitt, Fox, Addison, in Westminster Abbey; Abercromby, Captain Cook, Collingwood, in St. Paul's. His s. **Richard** (1799–1872) succ. him as prof. of Sculpture; his busts include Lord John Russell and Newman.

WESTMEATH (53° 30′ N., 7° 30′ W.), county, Leinster, Ireland; surface varied with hill, valley, and lake, interspersed with bog; drained chiefly by the Shannon; occupations mainly agricultural. County town, Mullingar. Pop. (1911) 59,182.

WESTMEATH, EARL OF, title held by the family of Nugent since 1621, and with which the marquessate was associated from 1822 to 1871. The marquessate lapsed when the earldom passed from the direct male line to a branch line in 1805.

WESTMINSTER (51° 31′ N., 0° 6′ W.), metropolitan borough, London, extending from banks of Thames to Hyde Park; includes within its bounds Hyde Park, St. James's Park, and the Green Park, and contains the Houses of Parliament, Westminster Hall, Westminster Abbey, the churches of St. Margaret, St. John, St. Martin-in-the-Fields, and others, Buckingham Palace, and St. James's Palace. In former times W. was separated from the City of London by Temple Bar (*q.v.*). The Abbey is one of finest examples of Early Eng. architecture; at the E. end are nine chapels, including the Lady Chapel, built by Henry VIII., and the chapel of St. Edward the Confessor; it is the burial-place of 18 sovereigns of England, and of many of the most distinguished men of the nation. Houses of Parliament were built, 1840. Hitherto St. Stephen's Chapel had been used by the Commons from 1547 on, and House of Commons is still familiarly known as St. Stephen's. Pop. (1911) 160,277.

WESTMINSTER, DUKEDOM OF, held by a noble house dating back to the Conquest. The founder of the family was Gilbert le Grosvenor.

WESTMINSTER, SYNODS OF, embrace ecclesiastical councils held in the Chapter-House of old St. Paul's, the Chapel of St. Catherine, and Westminster Abbey, and include those of Lanfranc, Anselm, etc.

WESTMORLAND (54° 29′ N., 2° 40′ W.), inland county, N. England; bounded N. and N.W. by Cumberland, W. by Lancs., S. by Lancs., E. by Yorkshire and Durham; area of administrative county, 789 sq. miles. Surface is generally hilly, with moorlands and deep valleys between the ridges; highest points, Helvellyn, Bow Fell, Dun Fell; drained by Eden, Kent, Lune, Leven, and other streams; in W. is famous Lake District, with Lakes Ullswater and Windermere on the Cumberland and Lancashire borders respectively, and Grasmere, Rydal Water, and others entirely within the county. County town, Appleby. Principal geological formations are Carboniferous and Silurian rocks. W. produces coal, fireclay, lead, slate, gypsum. Chief crops, oats, barley, wheat; cattle and sheep raised; manufactures woollens. Has ruins of several castles and monasteries. Pop. (1911) 63,575.

WESTMORLAND, EARLDOM OF.—Ralph Neville, 1st earl, 1364–1425; Marshal of England and famous soldier under Henry IV. and Henry V.; earldom became extinct with the death of Charles

Neville, 6th earl, in 1601. Revived, 1624, when Francis Fane, Baron Burghers, was cr. Earl of W. The present earl, Anthony Mildmay Julian Fane, is the 13th of present line.

WESTON-SUPER-MARE (51° 21′ N., 2° 58′ W.), watering-place, on Bristol Channel, Somerset, England. Pop. (1911) 23,235.

WESTPHALIA (c. 51° 42′ N., 8° 15′ E.), province, W. central Prussia; area, 7804 sq. miles; surface mountainous in S., with extreme height of over 2700 ft., and with hills stretching to N., whence they slope down into Great N. German Plain; drained by Ems, Weser, Lippe, Ruhr, and other streams; large area forested; flax and hemp grown; hams produced; coal, iron, zinc, etc.; manufactures of iron, steel, etc. Pop. (1910) 4,125,096. Capital, Münster.

Westphalia, Treaty of (1648), concluded Thirty Years War, making a return on the Continent to the conditions of 1618. General toleration in religion was secured; Protestants and Catholics were to retain possessions held in 1624. This left S. Germany to Catholics and N. to Protestants. The Ger. princes achieved a sovereignty, which left the Empire Austrian. Brandenburg began its march to power, and France obtained the Rhine for frontier, and was left the first military power in Europe.

WESTPORT (53° 48′ N., 9° 31′ W.), seaport, on Westport Bay, watering-place, County Mayo, Ireland. Pop. 3780.

WESTWARD HO, watering-place, Devonshire, England, 2½ miles N.W. of Bideford; named from Charles Kingsley's novel; golfing centre.

WETHERSFIELD (40° 42′ N., 72° 40′ W.), town, Hartford County, Connecticut, U.S.A.; manufactures small tools. Pop. (1910) 3178.

WETSTEIN, JOHANN JAKOB (1693–1754), Swiss divine; devoted himself specially to text of New Testament, collecting MSS.; friend of Bentley; deprived of curacy for unorthodox views, 1730; pub. *Novum Testamentum Græcum*, 1751–52.

WETTER, LAKE, see VETTER, LAKE.

WETTIN, electors of Saxony, 1423; divided, 1485, into Ernestine and Albertine branches; to the former belong grand-dukes of Saxe-Weimar and dukes of Altenburg, Coburg-Gotha, and Meiningen, to the latter the kings of Saxony.

WETZLAR (50° 34′ N., 8° 31′ E.), town, Rhineland, Prussia; cathedral founded XI. cent.; manufactures iron. Pop. 13,390.

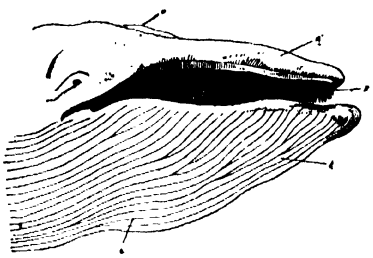
WEXFORD.—(1) (52° 30′ N., 6° 35′ W.) coast county, Leinster, Ireland, with chief town of same name; area, 574,000 acres; surface generally level; highest point, Mt. Leinster; watered by Slaney and other rivers; has excellent grazing and large export of agricultural produce, butter, pigs, cattle, poultry, eggs; valuable fisheries on coast. Pop. (1911) 102,287. (2) (52° 20′ N., 6° 27′ W.) seaport, at mouth of Slaney, county town, County Wexford, Ireland; ship-building; fisheries; trade in agricultural produce; taken by Fitzstephen, 1169; stormed by Cromwell, 1649; was headquarters of the rebels, 1789. Pop. (1911) 11,455.

WEYBRIDGE (51° 22′ N., 0° 27′ W.), residential town, at junction of Wey and Thames, Surrey, England. Pop. (1911) 6286.

WEYLER Y NICOLAU, VALERIANO, MARQUESS OF TENERIFFE (1839–), Span. general and statesman; successively Captain-Gen. of the Canary Islands, Balearics, and Philippines; much criticised for actions in Cuba (1895).

WEYMAN, STANLEY JOHN (1855–), Eng. writer of hist. novels—e.g. *The Gentleman of France, Under the Red Robe, The House of the Wolf, Count Hannibal.*

WEYMOUTH (42° 15′ N., 70° 58′ W.), town, Norfolk County, Massachusetts, U.S.A.; manufactures boots and shoes. Pop. (1910) 12,895.



WEYMOUTH AND MELCOMBE REGIS (50° 37′ N., 2° 27′ W.), seaport, watering-place, on Weymouth Bay, Dorsetshire, England; boat-building; stone quarries; scene of several engagements in Civil War. Pop. (1911) 22,325.

WHALE LICE, see under MALACOSTRACA.

WHALE OIL, see OIL.

WHALEBONE, see under WHALES.

WHALES form two sub-orders of the large Mammal tribe of CETACEA (*q.v.*): (1) The MYSTACOCETI, or *Whalebone W's*, and (2) the ODONTOCETI, or *Toothed W's*. The Whalebone W's, or Right W's, belonging to the family BALÆNIDÆ, found in all oceans, are distinguished by the presence of whalebone, which, far from being bone, consists of horny baleen plates fringed on one border, and hanging down edgewise from the palate. The baleen, of which there may be as many as 300 plates, sometimes 10–15 ft. in length, may be present in the mouth of an adult animal, and serves as a strainer for food. Of other Whales belonging to the Balænidæ, the GREAT RORQUAL W. (*Balænoptera sibbaldi*) may be mentioned; it is the largest animal now in existence, sometimes measuring 80 ft. in length, and in common with the LESSER RORQUAL (*Balænoptera rostrata*) is distinguished by a dorsal fin, a characteristic which has given rise to the sailor's name of Finner Whales. Of the Toothed Whales, or Odontoceti, the SPERM WHALES (*Physeteridæ*) are found in all seas; the best-known species is the great square-headed Sperm W. (*Physeter macrocephalus*), with many large, similar teeth on the lower jaw, although the smaller of the invisible teeth of the upper jaw are sometimes also functional. It frequents the equatorial oceans in schools. The Sperm W. is valued for the spermaceti oil contained in a mass of loose cells on the upper surface of its head, and for ambergris, prized for the manufacture of perfumes. Belonging to the same family, the BOTTLE-NOSED W. (*Hyperoodon rostratus*) is confined to the N. Atlantic and sometimes makes it appearance off British coasts. Baleen W's feed mainly on the minute floating organisms of the sea, such as the Sea Butterflies or Pteropods, and medusan Swimming-Bells, whereas Toothed W's prefer a more substantial diet, the Sperm feeding almost exclusively on Cuttle-fishes.

COMMON RORQUAL OR FIN WHALE (*Balænoptera musculus*), showing eye, upper jaw, lower jaw, and throat-grooves.

Whale fishery is of great antiquity, the Norwegians being expert whale fishers over 1000 years ago, while the French and Spanish were interested in the industry in the X.–XVI. cent's, supplying Europe with oil and whalebone. The Dutch, Eskimos, Japanese, and Americans have all at one time or another engaged in the trade. The whale hunted from X.–XVI. cent's was probably the Atlantic right whale, but so great was the slaughter that they were almost exterminated. In later times Greenland became a popular base for whale fishing. The Dutch had a station there, and in 1680 they had 266 ships and 14,000 men engaged in the trade, but at the close of the XVIII. cent. Dutch whale fishing had almost ceased.

From 1732–1824 the Brit. Government offered a bonus for each ton of blubber, but only 164 Brit. ships were engaged in the trade in 1815. In 1828 89 ships killed 1197 whales, from which 13,966 tons of oil and 802 tons of whalebone were obtained. Whale fishing in the South Seas was at its height in 1790. The vessels were of about 300 tons burden, and were manned by a crew of 28 to 35 officers and men. Each carried

6 boats, with room for 4 rowers, a steerer, and a header. The whale was pursued by the boats, and the header drove home the harpoon and then attacked it with a lance in the vital parts; animal was pulled to side of parent vessel, and the blubber (*q.v.*) cut out and stored in casks. Dundee is the Brit. whale-fishing centre.

WHALLEY, EDWARD (*c.* 1615–75), Eng. regicide; woollen-draper; distinguished officer in Cromwell's army; custodian of Charles I. at Hampton Court, 1648; sat as judge at king's trial and signed the death-warrant; sat in Cromwell's Commons and Lords; escaped to New England, 1660.

WHARTON, EDITH N. (1862–), Amer. novelist; author—*House of Mirth, The Custom of the Country*, etc.

WHARTON, PHILIP WHARTON, DUKE OF (1698–1731), Brit. politician; raised to peerage, 1718, for supporting the Government; joined Pretender; fought on Span. side at siege of Gibraltar.

WHATELY, RICHARD (1787–1863), Eng. theological writer; b. London. At Oxford he met Newman, and in the *Apologia* Newman acknowledges his indebtedness. His first important work was a series of contributions on Logic to the *Encyclopædia Metropolitana*. In 1831 he was made a bp. of Dublin. In his religious views W. was very liberal, favouring Catholic emancipation and unsectarian religious instruction.

WHAUP, see CURLEW.

WHEAT (*Triticum vulgare*), a gramineous plant, the seeds of which form one of the staple sources of food of the civilised world. The flowers are borne in a dense, compound spike, popularly known as an 'ear,' this being composed of a number of spikelets closely packed upon the flower stalk. Each spikelet bears basally two sterile boat-shaped glumes, enclosing from two to five florets, each of which gives rise to a single grain. The origin of cultivated w. is unknown, as it is not connected with any similar wild species. The plant has been cultivated since prehistoric times and was introduced into this country by the Romans. The following are among the most important subspecies grown nowadays: *Triticum durum*, hard w., chiefly cultivated in tropical countries, and characterised by its large proportion of gluten; *T. polonicum*, Polish w.; *T. spelta*, spelt, the type originally grown in the Mediterranean region; *T. monococcum*, *T. dicoccum*, *T. turgidum*, turgid w., and *T. amyleum*, starch w. The subspecies grown in temperate climates, as contrasted with the tropical hard w's, are rich in starch, and the two are often blended in commercial flours.

W.-growing is general throughout the subtropics and the southern half of the temperate zone, as well as in certain parts of the tropics, but is replaced in more northerly latitudes by the hardier oats and rye. A clayey soil is most suitable for its successful culture, with a climate that is neither too damp nor too dry (*e.g.* Canada). Among its more important fungous diseases are 'Rust,' so called from its appearance on infected leaves as orange, or dark brown rusty-looking streaks, and Bunt or Smut, which attacks the ears, causing abortion of the 'berry,' and replacing this by a black evil-smelling mass of spores. Rust has been largely checked by the removal of barberry bushes, on which the parasite lives during one part of its life cycle, whilst bunt is destroyed by treating the seeds, before sowing, with formalin, 1 lb. to 50 galls. of water.

WHEATEAR, see under THRUSH FAMILY.

WHEATSTONE, SIR CHARLES (1802–75), Eng. physicist; b. Gloucester; manufacturer of musical instruments and scientist; prof., King's Coll., London; pioneer of telegraphy; invented stereoscope and many scientific instruments; wrote numerous scientific papers.

Wheatstone's Bridge (instrument for measuring electrical resistance), consists of a uniform iridio-platinum wire, 1 metre long, connected with a known resistance, a battery, and a galvanometer, in such a way as to make the ratio between two lengths of the wire equal to the ratio between the known and unknown resistances. The *Post-Office Box* is a compact form.

WHEEL AND AXLE, see MECHANICS.

WHEELING (40° 3′ N., 80° 48′ W.), town, on Ohio, capital, Ohio County, West Virginia, U.S.A.; coal and gas region; manufactures iron and steel; capital of the state, 1673–70 and 1875–85. Pop. (1910) 41,641.

WHELK (*Buccinum*), the Scot. 'Buckie,' belongs to the GASTEROPODA (*q.v.*).

WHETSTONE, HONE (*q.v.*).

WHEWELL, WILLIAM (1794–1866), master, Trin. Coll., Cambridge; pub. *History of Inductive Sciences* 1837; held that all knowledge develops from experience; induction not only the collection of facts, but their grouping under an appropriate conception, already present in the inquirer's mind.

WHICKHAM (54° 56′ N., 1° 41′ W.), town, Durham, England; collieries, ironworks. Pop. (1911) 18,332.

WHIG, originally 'Whigamore,' a nickname, arising *c.* 1680, for the Presbyterian peasantry of Scot. W. lowlands, who were considered rebels; applied to supporters of Revolution, 1688; supplanted by 'Radical' at time of Reform Bill. See LIBERAL PARTY.

Whig Party, in U.S.A., offshoot of Republican (Democratic) Party, founded by Pres. John Quincy Adams and Henry Clay, 1824–25; chief aims were the maintenance of the republican character of the Union, and the building up of independent and Amer. political institutions and civilisation. The assent to the Fugitive Slave Law by Daniel Webster, and the Whig Convention, 1852, broke up the party, which ceased to exist after 1854. Abraham Lincoln grew up in the W. P.

WHIMBRELS, see under PLOVER FAMILY.

WHIN, see FURZE.

WHINCHAT, see under THRUSH FAMILY.

WHIP SCORPIONS (*Pedipalpi*, an order of ARACHNIDA), small, carnivorous Arachnids found in the warm regions of both hemispheres, some of which have a whip-like 'tail.'

WHIP WORM, see under NEMATODA.

WHIP-POOR-WILL (*Antrostomus vociferus*), species of Goatsucker (*q.v.*); it is 10 inches long, has a white collar, stiff bristles at base of bill; name received from its cry.

WHIRLIGIG BEETLES, see under POLYMORPHA.

WHIRLPOOL, an eddy or vortex in water, caused by bank or another current interfering with course of a current, and by wind.

WHIRLWIND, TORNADO, circular rush of air caused by two winds meeting; of less area and continuance than hurricane (*q.v.*). A w. at sea is known as a *Waterspout*, a rotating pillar of water-spray.

WHISKERS, see HAIR.

WHISKY, see SPIRITS.

WHIST, card game for four players developed from XVI.-cent. game called 'trump,' which in England was elaborated into 'ruff-and-honours,' the direct ancestor of w. 'Long w.,' in which there were ten points for game, was popular till beginning of XIX. cent., when points were reduced to five; still played in U.S.A. Modern 'short' whist is played as follows: after arranging partners by cutting (two highest and two lowest play together), player who draws lowest card deals full pack, and turns up his last card to indicate trumps; dealer's left-hand opponent leads; players must, if possible, follow suit, the penalty for 'revoke' being deduction of three tricks from offending side, or addition of three to opponent's score. Five points constitute game, every trick over six scoring; six tricks called 'book.' Ace, king, queen, and knave of trumps count as 'honours' (separately from tricks); four points for four, two for three; seldom counted in U.S.A. Main rules are—lead from strength, return partner's lead, when second in hand play low, when third, high.

Dummy w., played by three players, with one hand exposed; *progressive w.*, played by several tables, winners generally moving to next table, losers remaining.

WHISTLER, JAMES ABBOT M'NEILL (1834–1903), Amer. artist; b. Lowell, Mass.; studied in Paris; settled in London, and in 1859 began to exhibit at the Royal Academy. He painted many portraits, includ-

ing those of Carlyle, Irving, and Sarasate; many figure subjects and views; worked in pastels; was eminent as etcher, dry-pointer, and purely decorative artist. His style in all departments was strikingly original. Ruskin attacked him savagely in *Fors Clavigera* in 1877, and a libel suit followed. As to this, see Whistler's *The Gentle Art of Making Enemies*.

WHISTON, WILLIAM (1667–1752), Anglican theologian and scientist; prof. of Math's at Cambridge, 1703, but deposed for Arianism; though unorthodox, opposed to rationalism in religion.

WHITBY (54° 29′ N., 0° 37′ W.), seaport, at mouth of Esk, watering-resort, E. Riding, Yorkshire, England; manufactures jet; important fisheries; boat-building; ruins of an abbey founded by St. Hilda, VII. cent. The famous **Synod of Whitby** (664) settled the differences between the Celtic and Rom. Churches. Wilfrid (*q.v.*) persuaded the king to favour Rom. tradition, and the Church of England thus became part of the European religious movement. Pop. (1911) 11,139.

WHITCHURCH (52° 58′ N., 2° 42′ W.), town, Shropshire, England. Pop. (1911) 5757.

WHITE, ANDREW DICKSON (1832–), Amer. diplomat; prof. of History, Michigan Univ., 1857–63; pres., Cornell Univ., 1866–85; U.S.A. ambassador to St. Petersburg, 1892–94, to Berlin, 1897–1903.

WHITE ANTS, see TERMITES.

WHITE, GILBERT (1720–93), Eng. naturalist; b. at Selborne, Hants; ed. Oxford; settled at Selborne as curate, 1755; pub. *Natural History of Selborne*, 1789, a charming book by a keen and kindly observer of nature.

WHITE HORSE, VALE OF, see BERKSHIRE.

WHITE, HUGH LAWSON (1773–1840), Amer. judge of Supreme Court of N. Carolina, 1801–7, 1809–15; commissioner to settle differences with Spain, 1820.

WHITE MOUNTAINS (44° 10′ N., 71° 30′ W.), portion of Appalachian system, New Hampshire, U.S.A.; highest point, Mount Washington, 6279 ft.

WHITE PLAINS (41° 3′ N., 73° 45′ W.), residential village, capital, Westchester County, New York, U.S.A.; scene of victory of British over Americans, 1776. Pop. (1910) 15,949.

WHITE RACES, see RACES OF MANKIND.

WHITE, RICHARD GRANT (1821–85), Amer. Shakespearean scholar.

WHITE, SIR WILLIAM ARTHUR (1824–91), Brit. diplomatist; consul at Danzig, 1864–75, and afterwards envoy to Servia, Rumania, and Turkey; ambassador-extraordinary to Turkey, 1886.

WHITE, THOMAS (1628–98), bp. of Peterborough.

WHITE WHALE, see DOLPHIN FAMILY.

WHITEBAIT, see under HERRING FAMILY.

WHITE-EYELID MONKEYS, see under CERCOPITHECIDÆ.

WHITE-EYES (*Zosteropidæ*), a family of Perching Birds, most of whom have a ring of white feathers surrounding the eye. They are honey-suckers, and occur in Africa, S.E. Asia, and Australia.

WHITEFIELD, STAND, town, Lancashire, England; cotton. Pop. (1911) 6967.

WHITEFIELD, GEORGE (1714–70), Eng. divine; ed. Oxford; joined new Methodist movement; became a very fervid preacher; preached in Scotland and Ireland; sometimes spoke 60 hours a week; d. at Newburyport, Mass., U.S.A.

WHITEFISH (*Coregonus clupei formis*), Amer. lake fish, valuable as a table dainty.

WHITEHALL (43° 35′ N., 73° 23′ W.), village, at S. end Lake Champlain, on Champlain Canal, Washington County, New York, U.S.A.; trade in lumber. Pop. (1910) 4917.

WHITEHAVEN (54° 33′ N., 3° 35′ W.), seaport, near entrance to Solway Firth, Cumberland, England; coal and iron mines. Pop. (1911) 19,048.

WHITEHEAD, WILLIAM (1715–85), Eng. poet-laureate of little merit; succ. Colley Cibber.

WHITELOCKE, BULSTRODE (1605–75), Eng. statesman; b. London; ed. Merchant Taylors' School, and St. John's, Oxford. M.P. in Long Parliament, 1640; prominent in impeachment of Strafford. Commissioner of Great Seal, 1648; ambassador to Sweden, 1653; Speaker of Cromwell's 3rd Parliament. Retired to Wilts at the Restoration. Author of important *Memorial of English Affairs*.

WHITE-THROAT, see WARBLERS.

WHITGIFT, JOHN (1530–1604), prof. of Divinity at Cambridge, 1563; repressor of Puritanism, particularly proceeding against Thomas Cartwright; bp. of Worcester, 1577; abp. of Canterbury, 1583; favourite of Queen Elizabeth.

WHITHORN (54° 44′ N., 4° 25′ W.), town, Wigtownshire, Scotland; ancient ruined cathedral; at one time a famous pilgrim resort.

WHITING (40° 42′ N., 87° 30′ W.), town, shipping point, on Lake Michigan, Lake County, Indiana, U.S.A. Pop. (1910) 6587.

WHITING POUT, see POUT.

WHITLOW, PARONYCHIA, inflammation of the fingers generally leading to suppuration; may be due to pin-prick or other wound; treated by poulticing and incision.

WHITMAN, MARCUS (1802–47), medical missionary in U.S.A.; preached to Amer. Indians; aroused opposition, and was killed together with his wife.

WHITMAN, WALT (1819–92), Amer. poet; b. Long Island; editor of the *Long Islander* (1839), of the *Brooklyn Eagle* (1846), of the *Freeman* at Boston (1851). His book of poems, *Leaves of Grass*, was pub. in 1855, a book of epoch-making originality in thought and style. In 1860 the book was republished with the new section, *Calamus*, added. From 1862 to 1865 he served with great distinction in the Civil War. The new section, called *Drum-Taps*, revealed his keen sympathy with the ideals for which he sacrificed so much. W.'s genius was vast—too vast for any tradition to confine.

WHITNEY, ELI (1765–1825), Amer. inventor; b. Westborough, Mass.; invented the cotton gin—a machine for separating the seed from the cotton, and also made some great improvements in the manufacture of firearms.

WHITNEY, WILLIAM DWIGHT (1827–94), Amer. philologist; b. Northampton, Mass. As a philologist, his most important work is on Sanskrit. His *Sanskrit Grammar* is the best treatise on the subject.

WHITSTABLE (51° 26′ N., 1° 1′ E.), watering-place, on Swale, Kent, England; oyster-beds. Pop. (1911) 7894.

WHITSUNDAY, Christian festival commemorating the coming of the Holy Spirit on the Church, or the Jewish Feast of Pentecost, by which name it is sometimes called.

WHITTIER, JOHN GREENLEAF (1807–92), Amer. poet and man of letters; b. Haverhill, Mass.; became a journalist and strong Abolitionist agitator. His prose, while earnest and forceful, seldom rises above the level of good journalism, but there is a freshness, individuality, and sustained note of truth in his verse which ensures it a lasting place in Amer. literature, even though its quantity be small. Part of it, like most of his prose, is devoted to the political purpose of Slavery Abolition, but in his more spiritual poems he reaches an exceedingly high level. In 1889 a complete edition of his poetical works appeared in 7 volumes, and a reprint was issued in England in 1899.

Life, by Pickard (1899).

WHITTINGTON (53° 16′ N., 1° 26′ W.), town, Derbyshire, England; manufactures earthenware; collieries; ironworks. Pop. (1911) 17,218.

WHITTINGTON, RICHARD (d. 1423), s. of Sir William W., probably of Pauntley, Gloucestershire; mercer in London, 1379; member of Common Council, 1385, 1387; Alderman, 1393; Sheriff, 1394; Lord Mayor, 1397–98, 1406–7, 1419–20. M. Alice, dau. of Sir Ivo Fitzwarren; advanced loans to Richard II., Henry IV., and Henry V.; left considerable benefactions; knighted by Henry V.; the 'cat' legend has no foundation in history.

WHITTLESEA, WILLIAM (d. 1374), bp. of Rochester, 1360, Worcester, 1362; abp. of Canterbury, 1368.

WHITTLESEY (52° 33′ N., 0° 8′ W.), town, Cambridgeshire, England; brick- and tile-works.

WHITWORTH (53° 39′ N., 2° 11′ W.), town, Lancashire, England; cotton, slate. Pop. (1911) 8872.

WHITWORTH, SIR JOSEPH, Bart. (1803–87), Eng. engineer; toolmaker, Manchester, 1833; b. Stockport. Noted experimenter in rifle and cannon manufacture; inventor of compressed steel casting. His business is now represented by the amalgamated company, Armstrong, Whitworth & Co. Ltd.

WHOOPER, see under DUCK FAMILY.

WHOOPING-COUGH, HOOPING-COUGH, highly contagious disease of children; commences like a cold in the chest, and in a fortnight severe coughing with 'whoop' begins; patients are kept in warm room, well ventilated, the bowels are kept open; disease is usually mild, but complications—pleurisy, bronchitis, etc., result from careless treatment.

WHORTLEBERRY, see BILBERRY.

WHYMPER, EDWARD (1840–1911), Brit. explorer; b. London; trained as a draughtsman; sent to sketch Alpine peaks by a London publisher, 1860; climbed the Matterhorn, 1865—till then inaccessible; visited the Andes, 1879–80, and Great Divide Region of Canada, 1901–5.

WHYTE, ALEXANDER (1837–), Presbyterian minister; prof. at New College, Edinburgh, 1909.

WICHITA (37° 42′ N., 97° 12′ W.), city, on Arkansas, capital, Sedgwick County, Kansas, U.S.A.; railroad-shops; meat-packing establishments. Pop. (1911) 52,450.

WICK (58° 27′ N., 3° 6′ W.), county town, seaport, on North Sea, Caithness, Scotland; herring-fishing centre. Pop. (1911) 9086.

WICKLOW (52° 57′ N., 6° 23′ W.), coast county, Leinster, Ireland, with chief town of same name; lies along E. coast, between Dublin and Wexford; area, 781 sq. miles. Surface is generally mountainous, with deep ravines between the hills; several lakes; watered by Liffey, Slaney, and other streams; has good sheep pasture; manufactures cordite; oyster-beds at Arklow in S.E. Pop. (1911) 60,603. **Wicklow,** county town, has chemical works and a good harbour. Pop. *c.* 3000.

WICLIFFE, see WYCLIFFE.

WIDDIN, VIDIN (*q.v.*).

WIDDRINGTON, BARONY OF, Eng. honour; created for Sir William Widdrington, 1643, for his services to Royalist cause; became extinct, 1774.

WIDGEON, see under DUCK FAMILY.

WIDNES, town, Lancashire, England; soap, paint, iron. Pop. (1911) 31,544.

WIDOW, see under MARRIAGE.

WIDUKIND OF CORVEY (late X. cent.), Saxon chronicler; monk of Corvey; wrote *Res Gestæ Saxonicæ.*

WIEDEMANN, GUSTAV HEINRICH (1826–99), Ger. physicist; devoted attention to physical chemistry, and especially to electricity, electrical endosmosis and resistance, and magnetism.

WIELAND, CHRISTOPH MARTIN (1733–1813), Ger. poet; b. Oberholzheim, near Biberach; ed. at the monastery of Bergen, near Magdeburg; lived at Weimar court, 1772 onwards, and formed friendships with Goethe and Herder; best works are *Oberon* (heroic poem), *Die Abderiten, Aristipp,* etc. (historical romances), *Neuste Gedichte* (narrative poems), besides political articles and Gk. and Lat. translations; edit. the *Teutsche Merkur* (review).

WIELICZKA (50° N., 20° 8′ E.), town, Galicia, Austria; salt mines have subterranean town and churches. Pop. 7120.

WIENER-NEUSTADT (47° 48′ N., 16° 7′ E.), town, Lower Austria; manufactures locomotives; contains the ducal castle of the Babenbergs. Pop. (1910) 32,874.

WIENIAWSKI, HENRI (1835–80), Hungarian violinist and composer.

WIEPRECHT, WILHELM FRIEDRICH (1802–72), Ger. musical director; designed an improved contra-bass bassoon, and was joint-inventor of the bass tuba.

WIESBADEN (50° 4′ N., 8° 13′ E.), town, watering-place, Hesse-Nassau, Prussia; hot saline springs. Pop. (1910) 109,002.

WIFE, see under MARRIAGE.

WIG, artificial hair headdress, worn from earliest times as covering for baldness, disguise, or ornament; found on Egyptian mummies; alluded to by classical writers; popular in France from XIV. cent., in Eng. from reign of Queen Anne; long ringlets were worn by nobility, plainer form by bishops and lawyers, horse-hair w's still worn by barristers and judges.

WIGAN (53° 32′ N., 2° 38′ W.), town, on Douglas River, Lancashire, England; collieries; cotton manufactures; foundries, forges. Pop. (1911) 89,171.

WIGHT, ISLE OF (50° 40′ N., 1° 17′ W.), island, in Eng. Channel, off coast of Hants, S. England; separated from mainland by Spithead and Solent; area, *c.* 146 sq. miles; surface generally undulating; reaches extreme height of *c.* 800 ft. in St. Boniface Down; off extreme W. are the high chalk cliffs known as 'The Needles'; drained by Medina. Fine climate, favourite winter and summer resort. Chief towns are Newport, Ryde, Cowes, Ventnor, Shanklin. Produces wheat; sheep raised; manufactures cement. Returns one M.P. Pop. (1911) 88,193.

WIGTOWN (54° 52′ N., 4° 27′ W.), county town, royal burgh, and seaport, on Wigtown Bay, Wigtownshire, Scotland.

WIGTOWNSHIRE (54° 53′ N., 3° 45′ W.), coast county, S.W. Scotland, with chief town of same name; lies along Irish Sea and North Channel; coast broken by Loch Ryan and Luce Bay; area, 487 sq. miles; surface generally low-lying and comparatively level, with low hills in N.; drained by Luce, Bladenoch, Cree, and other streams; many lakes; chief towns, Wigtown (county town), Stranraer, Newton-Stewart, Whithorn. Agriculture is carried on; chief crops, oats and turnips; cattle and sheep are raised; dairy-farming is an important industry; there is no mineral wealth, and manufactures are unimportant. Exports wool, cheese, live stock. Pop. (1911) 31,990.

WILBERFORCE, SAMUEL (1805–73), Eng. bp.; 3rd s. of William W.; B.A., Oxford, 1826; ordained, 1830; chaplain to Prince Albert, 1841; bp. of Oxford, 1845–69; active in revival of convocation; bp. of Winchester, 1869; killed by a fall from his horse.

WILBERFORCE, WILLIAM (1759–1833), Eng. philanthropist; s. of a wealthy merchant; M.P. for Hull, his native town, 1780, and a few years later, on conversion to strong religious views, leader of anti-slavery party. Bill carried for abolition of slave trade in Brit. dominions, 1807, but W. did not live to see bill carried for abolition of slavery itself.

WILDBAD (48° 45′ N., 8° 33′ E.), town, watering-place, Württemberg, Germany, in valley of Ens; thermal springs. Pop. 4070.

WILDE, OSCAR O'FLAHERTIE WILLS (1856–1900), Irish dramatist and poet; went to Oxford, where, influenced by Pater and Ruskin, he became the Apostle of the Æsthetic Movement; works include *Lord Arthur Savile's Crime, Dorian Gray, Intentions* (a volume of essays), and the plays, *The Importance of being Earnest* (1895), *Lady Windermere's Fan* (1894), *Salome* (1893) in French. Imprisoned, 1896–98, for unnatural vice, he wrote in prison the *Ballad of Reading Gaol* and *De Profundis.* W. was a master of words; his plays scintillate with brilliant dialogue and epigram. He was a cruel critic of middle-class stupidity and conventionality.

WILDENBRUCH, ERNST VON (1845–1909), Ger. poet, dramatist, and novelist; wrote historical plays and stories showing knowledge of child-psychology.

WILDERNESS (*c.* 38° 18′ N., 77° 45′ W.), district,

covered with woods, in N. Virginia, U.S.A., to S. of Rapidan R. Here a battle was fought on May 4–6, 1864, between the Federals under Grant and the Confederates under Lee; neither side gained a decisive victory, but the Federal casualities amounted to about 18,000, the Confederate loss being about 11,000.

WILFRID (634–709), saint; Eng. churchman; abp. of York, 664; several times ousted from his see and restored; preached in Frisia; helped to build churches of York, Ripon, Hexham; his work of supplanting Celtic by Roman tradition important. See WHITBY, SYNOD OF.

WILHELMSHAVEN (53° 32′ N., 8° 9′ E.), seaport, watering-place, on North Sea, Hanover, Prussia; station for German North Sea fleet; large dockyard; fine harbours, with a separate section for torpedo-boats; strongly fortified. Pop. (1910) 35,044.

WILKES, CHARLES (1798–1877), Amer. sailor and explorer; b. New York. In an expedition (1838–42) he discovered the Antarctic continent—an expedition he described in his *Narrative*. He also pub. *Western America* (1849) and *Theory of the Winds* (1856).

WILKES, JOHN (1727–97), Eng. politician; ed. Leiden; High Sheriff of Bucks, 1754; M.P., Aylesbury, 1757, 1761; arrested for libel on George III., 1763, for article in No. 45 of the *North Briton* (Wilkes' paper); discharged, but expelled the House of Commons. Thrice elected M.P. for Middlesex, 1768, 1769, 1774, but elections annulled by House of Commons; Sheriff of London and Middlesex, 1771; Lord Mayor, 1774; disreputable in private life, but contributed greatly to freedom of election.

WILKES-BARRE (41° 12′ N., 75° 59′ W.), city, capital, Luzerne County, Pennsylvania, U.S.A., in Wyoming valley, on N. branch of Susquehanna; anthracite coal region; manufactures machinery. Pop. (1910) 67,105.

WILKIE, SIR DAVID (1785–41), Scot. artist; b. Cults, Fifeshire; after studying in Edinburgh and London, had a great success with his picture, *The Village Politicians*, exhibited at the Royal Academy, 1806. In 1809 he was elected A.R.A., and in 1811 R.A. His pictures of Scot. character and manners in humble life, such as *Rent Day*, *Blind Man's Buff*, and *The Penny Wedding*, have long been familiar by engravings. He worked in other styles, but it was this style which chiefly distinguished him.

WILKINSBURG (40° 27′ N., 79° 52′ W.), residential town, Alleghony County, Pennsylvania, U.S.A. Pop. (1910) 18,924.

WILKINSON, JAMES (1757–1825), Amer. soldier and administrator; colonel in Washington's army; endeavoured to set up separate republic in the west through Span. aid, 1788–91; governor of Louisiana, 1805; tried, 1811, for complicity in treason, but acquitted; discharged from Amer. army, 1815.

WILL, TESTAMENT, a person's disposition of property to take effect after his or her death; testator must sign w. in presence of two witnesses, but in Scotland a w. in testator's handwriting is valid without witnesses. Lunatics and infants cannot make valid w's. A w. may be revoked at any time; a testator's marrying after the w. is made revokes the w. A *Codicil* is a supplement to a w. See *Everyday Law* (People's Books, 1913).

WILL, in psychology, the active side of consciousness, as distinguished from feeling and intellect; in a narrower sense, the phase of active consciousness immediately preceding action. Feeling, intellect, will, are in general opposed to each other, *e.g.* strong feeling prevents calm reasoning or regulated action; yet no complete isolation is possible. Willing depends on feeling for its motive, and on knowledge for guidance. The w. develops continuously from the simple to the complex, from immediate responses to sense-impressions, to complex movements involving intricate processes of deliberation and choice, with a corresponding development of feeling and accumulation of knowledge. The fundamental element in w. is desire, either for pleasure or for removal of pain. Desire contains a representative factor (object of desire) and a feeling; it is essentially an active phenomenon, whether mental or physical. To convert desire into a voluntary act of w. (*volition*) the further representation is required of some action leading to the realisation of the desired object; knowledge both of end and means is gained from practical experience. The first movements were spontaneous, purposeless (actions of newly-born children), with no psychical accompaniment; later, reflex actions (breathing, swallowing) arise from sensory stimulation, and involve excitation of both sensory and motor nerves. More complex are instinctive actions (building of cells by bees), distinctively purposive, directed to some end outside the present field of consciousness, and accompanied by some sort of feeling. These primitive forms are developed by imitation and association into definitely voluntary operations. Volition proper is characterised by ideas of end and means to its realisation, and by a strong feeling of the worth of that end. Hence its growth implies increasing foresight and feeling, which, as above, is the impelling force. The motives to action are increased, and rivalry between several impulses leads to deliberation and choice before action. Hence the metaphysical and ethical question of free-will, a discussion complicated by various meanings given to 'freedom.' Freedom may mean absence of political or physical restraints; by Kant is applied to action under the guidance of reason. According to Wundt, freedom equals a capacity to be determined by a reflective choice between motives. With Green, a mere natural want is not a motive, which implies the action of self-consciousness on the want, the adoption of an end by a self-conscious subject, which tries to realise it. Determinism is to be distinguished from fatalism (Westermarck). It regards the person himself as the product of causes; fatalism affirms the constraint of the w. by external causes.

In a metaphysical sense, w. has been taken by Schopenhauer (*q.v.*) as a world-principle, expressed not only in conscious human volitions, but in the ceaseless striving which animates all things.—Stout, *Manual of Psychology*; Green, *On the Different Senses of Freedom*.

WILLAERT, ADRIAN, see MUSIC.

WILLARD, FRANCES ELIZABETH (1839–98), Amer. temperance reformer; one of the organisers of the Prohibition Party.

WILLEMSTAD, see CURAÇAO.

WILLESDEN, suburb of London, Middlesex, England, 7 miles N.N.W. of St. Paul's. Pop. (1911) 154,267.

WILLIAM I., THE CONQUEROR (1027 or 1028–87), king of England; natural s. of Robert the Devil, Duke of Normandy, whom he succ., 1035. On Harold's seizing Eng. throne, which Edward the Confessor had probably promised to William, invaded England; defeated and killed Harold at Hastings, 1066; suppressed several insurrections; reduced York, 1069; put down Hereward's rebellion by successful siege of Ely, 1071; led successful expedition against Malcolm III. of Scotland, 1072; reduced Maine, 1073; suppressed revolt of earls of Hereford and Norfolk, 1075; quarrelled with s. Robert. Compiled Domesday Book; reformed Church; checked power of barons; established central authority, compelling landholders to swear fealty to him.

J. H. Round, *Feudal England* (1895); *Life*, by Freeman (1888), Stenton (1908).

WILLIAM II., RUFUS (*c.* 1056–1100), king of England; succ., 1087; put down risings in Norfolk, Somerset, and rebellion led by Odo of Bayeux, 1087; invaded Normandy and acquired lands there, 1091; invaded Scotland, seized Carlisle and other Scot. territories in Cumberland; defeated and killed Malcolm III. at Alnwick, 1093; tried, unsuccessfully, to conquer Wales; invaded Normandy, 1094; suppressed Eng. baronial rising, 1095; obtained Normandy in pledge, 1096; regained Maine, 1099; quarrelled with Anselm, abp. of Canterbury; killed by arrow in New Forest.

WILLIAM III., OF ORANGE (*c.* 1650–1702), king of England; prince of Orange; s. of W. II. of Orang

and Mary, dau. of Charles I. of England; made Stadtholder after murder of De Wits, 1672; opposed Louis XIV. of France; defeated at St. Omer, 1677, at Mons, 1678; m. Mary, dau. of James II. of England. Invited to deliver England from Stewarts, 1688; landed at Torbay; after James's flight, proclaimed king, 1689; passed Acts of Toleration and Indemnity, 1690; won *Battle of the Boyne*, 1690; victory off Cape La Hogue, 1692. Under him England joined League of Augsburg; led expedition to Netherlands against French; lost Namur; defeated at Steinkirk, 1692; retook Namur, 1695; agreed to peace of Ryswick, 1697; formed Grand Alliance against France, 1701, between emperor, Ger. princes, Holland, and England.

Macaulay, *Essays* and *History*.

WILLIAM IV. (1765–1837), king of England; entered navy; present at battle off Cape St. Vincent, 1780; Lord High Admiral, 1827; became king, 1830. Reign marked by emancipation of slaves, and passing of Reform Bill, 1832, after great political agitation; dismissed Melbourne, 1834; summoned Peel; succ. by niece, Queen Victoria.

WILLIAM I. (1772–1843), 1st king of Netherlands; s. of William, last Stadtholder of Dutch Republic; commanded the army against France, 1793–95. Held commission in Prussian army, was captured at Jena, and fought in the Austrian army. Proclaimed king, March, 1815, by Act of Congress of Vienna; abdicated, 1840, taking title of Count of Nassau.

WILLIAM II. (1792–1849), king of the Netherlands; s. of William I.; studied at Berlin and Oxford, and took part with the Brit. army in Peninsular War. Commander of Dutch army; wounded at Waterloo. Became king, 1840; accepted constitutional changes in direction of democracy, 1848.

WILLIAM I. (1797–1888), king of Prussia and Ger. Emperor; second s. of Frederick William III.; took part in campaigns, 1814–15, against Napoleon. Fled to England, 1848, but was subsequently elected to Pruss. National Assembly; regent, 1858, and king of Prussia, 1861; commanded in war against Austria, 1866, and at Gravelotte and Sedan, 1870. Absolutist in politics; proclaimed Emperor of Germany, 1871. Had Bismarck (*q.v.*) for his minister from 1862.

WILLIAM II. (1859–), 9th king of Prussia and 3rd Ger. Emperor; s. of the Emperor Frederick and Princess Victoria of England; grandson of Queen Victoria; ed. Cassel and Bonn Univ.; succ., 1888, after the short reign of his father, and soon showed that his intention was to rule as well as reign. The dismissal of Bismarck was a sign of the new era. His determination to make Germany a naval power, and to promote colonial expansion, is well known; m., 1881, Augusta Victoria, Duchess de Slesweig-Holstein, a niece of Prince Christian, and has 6 children. Emperor William aims at personal government in a manner unusual in an age of constitutionalism.

WILLIAM I. (1781–1864), king of Württemberg; distinguished in the War of Liberation against France. On his accession to the throne (1816) he adopted a policy which had as its aim the reduction of class privileges and the improvement of commerce and education.

WILLIAM II. (d. 1189), king of Sicily; s. of W. I. and Marguerite of Navarre; at home indulged in a semi-Muslim life at Palermo, but his foreign policy was brilliant and victorious.

WILLIAM (1533–84), Prince of Orange; called William the Silent by reason of his taciturnity concerning his plans and intentions in the struggle of the Netherlands against Spain. He lived to see Holland emerge into national independence, but was assassinated before the end of the struggle with Spain. Joined the Reformed Church, collected an army against Alva in 1568, and became the leader of the Dutch against Spain, acknowledged as Stadtholder by Holland, Zealand, Friesland, and Utrecht, in 1572; commander-in-chief and dictator, 1574. Founded the Dutch Republic by the Union of Utrecht (Holland, Zealand, Utrecht, Gelderland, Friesland, Groningen, Overyssel), 1579—the sovereignty of Philip of Spain being nominally retained until 1581. On William's murder, his s. Maurice succ. him as Stadtholder.

WILLIAM (abp.) **OF TYRE** (*c.* 1130–*c.* 1190), Fr. chronicler; one of the greatest mediæval historians; wrote *Belli sacri Historia* (pub. 1549), a history of the Crusades and Latin kingdom of Jerusalem from 1095 to 1184; chief authority for time in which he lived.

WILLIAM OF MALMESBURY (*c.* 1090–1143), Eng. chronicler; a monk and librarian at Malmesbury Abbey. Author of *Gesta Regum Anglorum*, 1125; *Historia Novella*, 1142; *Gesta Pontificum Anglorum*, 1125; and *De Antiquitate Glastoniensis Ecclesiæ*, 1129–39—all important hist. works.

WILLIAM OF ST. CALAIS (d. 1096), bp. of Durham, 1081; planned Durham Cathedral.

WILLIAM OF WYKEHAM (1324–1404), Eng. Churchman and statesman; b. Wickham, Hampshire; ed. Winchester, and entered the service of Edward III. as king's chaplain; became joint-surveyor of Windsor forest, and chief warden and surveyor of royal castles of Windsor, Leeds, Dover, and Hadleigh, 1359; prebendary of Lichfield the same year; Keeper of the Privy Seal, 1364; bp. of Winchester, 1367–1404; chancellor, 1368–71. Prominent in opposition to John of Gaunt in 'Good Parliament,' 1373. Charged unjustly with malversation and misgovernment during his chancellorship by the Council at Westminster, where his Lancastrian enemies prevailed. W. was deprived of his temporal rights, 1373; on the accession of Richard II. he was at once pardoned; obtained a papal bull for the endowment of Winchester Coll., 1378, and issued a charter for the foundation of New Coll., Oxford, which was built and finished by 1386. Placed on the commission of regency, 1386, he took no part in the proceedings; chancellor for the second time, from 1389 till 1391, when he retired from political life. A generous, warm-hearted man, more a statesman than a man of learning, yet a noble servant of education.

G. H. Moberley, *Life of Wykeham*; A. F. Leach, *History of Winchester*.

WILLIAM THE LION (1143–1214), king of Scotland; succ. his bro., Malcolm IV., in 1165. Henry II. had compelled Malcolm to cede Northumberland, and W., in order to recover the territory, joined the rebellion of the Eng. barons. W.'s plans failed, and he was compelled to hold Scotland as a vassal. Richard I. released him from this burden.

WILLIAMS, JOHN (1582–1650), Anglican divine; promoted by James I., tried to mediate between Charles I. and Puritans; abp. of York, 1641; in Civil War, Royalist then Parliamentarian.

WILLIAMS, JOHN (1796–1839), Eng. Nonconformist divine; went as missionary to Society Islands, 1816; murdered in New Hebrides.

WILLIAMS, ROGER (*c.* 1604–83), Eng. clergyman; b. Wales; ed. Charterhouse, and Pembroke, Cambridge; minister at Salem; preacher of toleration. Banished for unorthodoxy, he settled amongst the Indians, from whom he purchased Rhode Island. Obtained charter from England, 1644. Pres. of colony, 1654–58.

WILLIAMS, ROWLAND (1817–70), Anglican divine; lecturer at St. David's Coll., Lampeter; prosecuted for literal views on Biblical criticism.

WILLIAMSBURG (37° 13′ N., 74° 36′ W.), independent city, between James and York Rivers, formerly capital, James City County, Virginia, U.S.A.; seat of William and Mary Coll.; was capital of Virginia, 1705–79; scene of defeat of Confederates, 1862.

WILLIAMSON, WILLIAM CRAWFORD (1816–95), Eng. geologist, zoologist, and botanist, whose researches on Palæozoic and Mesozoic plants gave impetus to the study of Brit. palæobotany; solved the relationships of several groups of plants.

WILLIAMSPORT (41° 13′ N., 77° 8′ W.), city, summer resort, on W. branch of Susquehanna, capital, Lycoming County, Pennsylvania, U.S.A.; extensive lumber industry. Pop. (1910) 31,860.

WILLIAMSTOWN.—(1) (37° 52′ S., 144° 55′ E.) town, port, at mouth of Yarra Yarra, Bourke County, Victoria, Australia; shipbuilding; meat-freezing works; suburb of Melbourne. (2) (42° 43′ N., 73° 13′ W.) town, summer resort, Berkshire County, Massachusetts, U.S.A.; seat of Williams College; manufactures cottons, woollens. Pop. (1910) 3708.

WILLIBRORD, ST. (657–738), Eng. missionary; preached to Frisians for 50 years; abp., 696.

WILLIMANTIC (41° 46′ N., 71° 58′ W.), town, on Willimantic, Windham County, Connecticut, U.S.A.; manufactures thread. Pop. (1910) 11,230.

WILLIS, NATHANIEL PARKER (1806–67), Amer. author; b. Portland, Maine. His best work was contributed to the *Home Journal*, a paper which he mainly established. His style is easy and graceful.

WILLIS, THOMAS (1621–75), Eng. physician; ed. Christ Church, Oxford (M.B., 1646); Sedlian prof. of Natural Philosophy, 1660; practised med. in London, 1666, with much success; made observations on anat. of the brain (in which the arterial circle of Willis is called after him).

WILL-O'-THE-WISP, JACK-O'-LANTERN, IGNIS FATUUS, pale-bluish light seen over graveyards and swamps; probably gas from decaying animal matter.

WILLOW (*Salix*), an arborescent dicotyledon with lanceolate leaves. The numerous species are extremely variable, with many intermediate hybrid forms. The tree prefers a moist situation, and propagates freely by means of suckers. The catkins are exceptional, possessing nectaries and being insect-fortilised.

WILLOW WREN, see WARBLERS.

WILLOW-WARBLER, see WARBLERS.

WILLS, WILLIAM JOHN (1834–61), see AUSTRALIA (HISTORY).

WILMINGTON.—(1) (39° 45′ N., 75° 35′ W.) city, port of entry, at junction of Brandywine and Christiana Creeks with Delaware, capital, New Castle County, Delaware, U.S.A.; manufactures leather, gunpowder. Pop. (1910) 87,411. (2) (34° 17′ N., 77° 59′ W.) city, port of entry, on Cape Fear River, capital, New Hanover County, North Carolina, U.S.A.; largest and most commercial city in the state; exports cotton, lumber, naval stores. Pop. (1910) 25,748.

WILSON, ALEXANDER (1766–1813), Scot. ornithologist; resided in America; pub. the *Amer. Ornithology*, an elaborate work of 9 volumes.

WILSON, SIR DANIEL (1816–92), Scot. archæologist; works include *Prehistoric Man* (1862), *Caliban: the Missing Link* (1877), *Anthropology* (1885).

WILSON, HENRY (1812–73), Amer. statesman; as Abolitionist and Republican became U.S. senator, 1855; vice-pres., 1873; wrote *History of the Rise and Fall of the Slave Power in America.*

WILSON, HORACE HAYMAN (1786–1860), Eng. scholar; prof. of Sanskrit, Oxford.

WILSON, JAMES (1742–98), Amer. statesman; b. Scotland; emigrated, 1763; sat in Pennsylvania Convention, 1775, and signed Declaration of Independence; director of Bank of N. America, 1781; member of Congress, 1775, 1785–90; helped to draw up constitution; prof. of Law, Philadelphia, 1790.

WILSON, JOHN, 'CHRISTOPHER NORTH' (1785–1854), Scot. man of letters; friend of Wordsworth, Coleridge, Southey, De Quincey, Scott, Ettrick Shepherd, etc.; b. Paisley; ed. Glasgow and Oxford; losing most of private means, went to Edinburgh, joined staff of *Blackwood's*, and held chair of Moral Philosophy; earlier writings, verses and stories. For many years W. was life and soul of 'Maga,' contributing imaginative and spirited essays, best-known examples being series of dialogues, *Noctes Ambrosianæ* (1822–35).

WILSON, JOHN MACKAY (1804–35), Scot. writer; famous for *Tales of the Borders*, issued weekly.

WILSON, RICHARD (1714–82), Brit. landscape painter; celebrated for his *Niobe*, and a *View of Rome from the Villa Madama.* Nine of his pictures are in the National Gallery, London.

WILSON, SIR ROBERT THOMAS (1777–1849), Brit. soldier; M.P. for Southwark, 1818, 1826, 1830; governor of Gibraltar, and Commander-in-Chief, 1842; wrote various military works and an autobiography.

WILSON, THOMAS WOODROW (1856–), 28th Pres. of U.S.A. (Democratic; elected Nov. 1912); b. Staunton, Virginia; of Scoto-Irish descent; s. of Presbyterian divine; graduated, Princeton, 1879; LL.B. of Virginia Univ., 1882; distinguished in oratory; Ph.D., Johns Hopkins Univ.; wrote *Congressional Government*, 1886; prof. of Political Science, Bryn Mawr Coll. (Penn.), 1886–88; prof. of History and Pol. Economy, Wesleyan Univ., Middletown, Connecticut, 1888–90; pub. *The State—Elements of Historical and Practical Politics*; prof. of Jurisprudence and Pol. Economy, Princeton Univ., 1890–1902; wrote *History of Amer. People* and other standard works; pres. of Princeton Univ., introducing many reforms, 1902–10. Leaving academic field and entering politics, he stood as Democratic candidate for governorship of New Jersey and won by force of character and sincerity, quickly undeceiving Democratic 'bosses,' who thought to find him a pliant tool. As recognised champion of social reform, purity of administration, and truly popular government he rose to fame with amazing rapidity, and was chosen Democratic candidate for Presidency of U.S.A., 1912. The split in the Republican ranks owing to Mr. Roosevelt's breaking with Mr. Taft helped to ensure Dr. Woodrow Wilson's triumph, already prepared by his eloquence, ability, and integrity, and discontent with long Republican régime (1897–1912). The Pres. advocates a low tariff for revenue purposes only, not Protection; war against 'graft,' political corruption, injurious trusts; and real government for the people, by the people. His tenure of office marks a new epoch in Amer. politics.

WILSON, SIR WILLIAM JAMES ERASMUS (1809–84), Eng. surgeon; b. London; ed. St. Bartholomew's Hospital and at Aberdeen; specialised in skin diseases; advocated bathing, and helped to introduce Turk. bath into Britain; founded chair of Dermatology in Royal Coll. of Surgeons, and Pathology in Aberdeen Univ.; brought Cleopatra's Needle from Egypt to London.

WILTON (51° 4′ N., 1° 52′ W.), town, Wiltshire, England; manufactures carpets.

WILTSHIRE (51° 18′ N., 1° 55′ W.), inland county, England; bounded N. by Gloucester, E. by Berks and Hants, S. by Dorset, W. by Somerset and Gloucester; area of administrative county, 1350 sq. miles. Surface is generally undulating; crossed by various ranges of hills, including the Marlborough Downs; among highest points are Inkpen Beacon (1010 ft.) and Alfred's Tower (800 ft.). Drained by head-waters of Thames, and by Salisbury Avon, Bristol Avon, Kennet, and other streams. Chalk is the principal formation. Agriculture is carried on; chief crops are wheat and barley; cattle, sheep, and pigs extensively raised; bacon-curing and dairy-farming are carried on. Manufactures include woollens, silks, carpets. Minerals include iron, freestone. W. was part of Rom. Britain, and was frequently invaded by Danes in IX. and XI. cent's; took part in the Civil War of the XVII. cent., and in the Revolution of 1688. There are ruins of several religious houses in the county, which also contains the famous stone circles at Stonehenge. Pop. (1911) 286,876.

WILTSHIRE, EARL OF, WILLIAM LE SCROPE (c. 1350–99), s. son of 1st Lord Scrope; plotted on behalf of Richard II.; executed.

WIMBLEDON (51° 26′ N., 0° 14′ W.), town, Surrey, England; its common was the meeting-place of the Rifle Association, 1860–89; scene of victory, Ceawlin of Wessex over Ethelbert of Kent, 568. Pop. (1911) 54,876.

WIMBORNE-MINSTER (50° 48′ N., 1° 59′ W.), town, at junction of Allen and Stour, Dorsetshire, England; noted for its minster. Pop. (1911) 3711.

WINBURG (28° 29′ S., 27° 2′ E.), town, Orange Free State, Union of S. Africa; trade centre for a grain and cattle district.

WINCHCOMB (51° 58′ N., 1° 58′ W.), town, Gloucestershire, England; flour- and paper-mills.

WINCHELSEA (50° 55′ N., 0° 43′ E.), decayed town, on English Channel, Sussex, England; one of the Cinque Ports.

WINCHELSEA, ANNE FINCH, COUNTESS OF (d. 1720), Eng. poetess; chief poem, *Spleen*, appeared, 1701.

WINCHELSEA, ROBERT (d. 1313), Eng. ecclesiastic; student at Paris and Oxford; abp. of Canterbury, 1292; quarrelled with Edward I., reconciled, 1297; after king's death opposed Edward II.; noble character.

WINCHESTER.—(1) (51° 3′ N., 1° 19′ W.) town, Hants, England; bp.'s see; has large cathedral, dating in part from XI. cent., and remarkable for the splendour of its interior decorations; has an old episcopal palace now used as Diocesan Church House; site of W. public school, established by William of Wykeham, 1387; there are remains of Wolvesey Castle and of an old royal castle, both of which were ruined during the Civil War of Charles I.'s reign, and of Hyde Abbey, the burial-place of King Alfred. In the neighbourhood is the hospital of St. Cross (XII. cent.). W. was capital of England in Saxon and Norman times, and parliaments were held here at various dates in the XIII., XIV., and XV. cent's; it was much damaged by Roundheads in Civil War. Pop. (1911) 23,380. (2) (42° 27′ N., 71° 8′ W.) residential town, Middlesex County, Massachusetts, U.S.A.; manufactures leather. Pop. (1910) 9309. (3) (37° 58′ N., 84° 12′ W.) town, capital, Clark County, Kentucky, U.S.A.; seat of Kentucky Wesleyan Coll.; manufactures flour. Pop. (1910) 7156. (4) (39° 8′ N., 78° 8′ W.) independent city, seat of justice of Frederick County, Virginia, U.S.A.; scene of several engagements in Civil War. Pop. (1910) 5864.

WINCHESTER, EARLDOM AND MARQUESSATE OF.—The title of Earl of W. was created by King John, 1207, and conferred on Saier de Quincy; the earldom reverted to the Crown (1264); was revived (1322), and again reverted (1326). The title was given to Louis de Bruges, 1472, but was surrendered in 1499. The marquessate was created, 1551, and first borne by William Paulet, a favourite of four sovereigns. The title has descended in the male line, and the present marquis, Henry William Montague Paulet, is the sixteenth possessor. The 5th marquess, John Paulet (1628–74) is remembered for his great zeal in the cause of Charles I.

WINCKELMANN, JOHANN JOACHIM (1717–68), Ger. art critic; wrote *Anmerkungen über die Baukunst der Alten* (1762), on ancient architecture, and *Geschichte der Kunst des Alterthums* (1764), a history of ancient art, a book of great influence.

WIND.—All weather processes depend ultimately on air-motion, *i.e.* wind, and w. naturally blows from regions of high barometric pressure to those of low pressure, but not directly. If pressure is set out on isobars the w. is almost parallel to them, but slightly inclined to the regions of lower pressure. The force of w. is measured on the Beaufort scale from 1 to 12, the lowest and highest grades being easy to assess, but the intermediate demand experience. Speed of w. is detected by the anemometer; a speed of 40 miles per hour would cause damage to property, w's of beyond 70 miles per hour are rarely experienced in Gt. Britain. Wind force is inversely proportional to the distance between isobars. The upper air has been increasingly studied in recent years (see METEOROLOGY).

Dry and wet seasons in India follow the *monsoons*—the prevailing w. in the N. Indian Ocean being N.E. in January causes the dry season, and the S.W. wind of July with the S.W. monsoon causes the wet season. The *mistral* is a strong N.W., cold, dry wind in Gulf of Lyons and neighbourhood; the *simoon* (called in Algiers *sirocco*), a hot, dry wind in deserts of Africa and Arabia, which raises great clouds of dust and almost suffocates wayfarers. See also SQUALL.

WIND INSTRUMENTS, general name for that section of the orchestra where the tone is produced by blowing. They are spoken of familiarly as 'wood winds' and 'brass winds,' according to the material of which the instrument is made.

WINDAU, VINDAVA (57° 23′ N., 21° 33′ E.), seaport, on Baltic, Courland, Russia. Pop. 15,400.

WINDERMERE (54° 20′ N., 2° 56′ W.), largest lake in England; on borders of Westmoreland and Lancashire; length, 10½ miles; greatest width, 1 mile.

WINDFLOWER, WOOD ANEMONE (*Anemone nemorosa*), a delicate white flower tinged with purple, is a species of genus Anemone, order Ranunculaceæ; grows in Brit. woods.

WINDHAM, WILLIAM (1750–1810), Eng. statesman; ed. at Eton, Glasgow Univ., and Univ. Coll., Oxford; Chief Sec. for Ireland, 1783. War Sec. under Pitt, 1794–1801; War and Colonial Sec. under Grenville, 1806–7.

WINDMILL, mill which utilises wind-pressure as motive-power for mechanical work, such as grinding corn, pumping water, or sawing wood. The wind gives a rotary motion to four sails mounted on tower. Sails are fixed to shaft, which transfers motion by cogwheels to vertical main shaft. Sails always face wind by automatic device, top of mill rotating. W's have been displaced in modern times by steam-engine and other automatic power, but in Holland, America, and Australia they are still extensively used for pumping purposes. In the two latter countries steel has replaced wood in construction of w's.

WINDOW, orifice in wall to admit air and light; in ancient times small; either closed with shutters or furnished with plates of horn or mica; classical temples were without windows, lighted by apertures in roof; window-glass introduced, IV. cent.; Norman architecture characterised by small, stunted w.; the long-pointed Gothic w. familiarised by ecclesiastical use; glazed paper still used in China and Japan instead of w.-glass.

WINDPIPE, or trachea, the tube conveying air from the larynx to the bronchi and lungs.

WINDSOR.—(1) (51° 28′ N., 0° 36′ W.) town, on Thames, Berkshire, England; site of Windsor Castle, which was built (or rebuilt) in reign of William the Conqueror, restored and enlarged by William of Wykeham in reign of Edward III.; additions were made from time to time by various sovereigns, and it was completely restored and renovated in reigns of George IV. and William IV.; it includes the Round Tower, two courts known as the Upper and Lower Wards, St. George's Chapel, containing many royal tombs, and the Albert Chapel, restored by Queen Victoria in memory of Prince Consort. W. is connected with Eton by a bridge across river. Public buildings include town hall, dating from 1686. Pop. (1911) 12,681. (2) (42° 20′ N., 83° 9′ W.) city, on Detroit, port of entry, Essex County, Ontario, Canada; agricultural and fruit-growing region; salt industries. Pop. (1911) 17,829. (3) (41° 52′ N., 72° 39′ W.) town, on Connecticut, Hartford County, Connecticut, U.S.A.; manufactures cigars, paper.

WINDTHORST, LUDWIG (1812–91), Ger. politician; b. Kaldenhof, Westphalia; leader of Ultramontanes in Hanover against Pruss. domination; pres. of Lower House of Hanover, and Minister of Justice, 1851–53, 1862–65. On incorporation of Hanover in Prussia, led the opposition, and was chief of Catholic Centre Party.

WINDWARD ISLANDS (14° N., 63° W.), group forming part of the Lesser Antilles, West Indies; belong to Britain principal are Grenada, St. Vincent, St. Lucia. Pop. (1911) 157,264.

WINE.—The fermented product of grape juice or of any fruit or plant, such as ginger, date, plum, etc., but when any of these latter varieties of w. are spoken of, they are referred to by the association of the particular fruit, as 'date w.'; the word w. used alone always means the product of the juice of the grape.

History.—Art of viniculture for purpose of making w. is of very ancient origin—in fact, it dates back as far as historical records exist. The Nabateans were not allowed to cultivate the vine for fear they should depart from their traditional nomadic habits. Most celebrated w's of early times were Chalybon, manufactured near Damascus; the Lesbos, Chios, and Cos w's, from the Gk. Islands; and the Falernian and Cecuban w's of the Romans. The vine was probably brought to Spain by the Phœnicians and to Italy by the Greeks. In these early days w. was held in skins or hides, later in earthenware vessels, and in modern times in wooden casks and glass bottles. W.-making at the present time is much in advance of the art of olden days, for then foreign properties were often introduced into the liquid, such as salts, spices, etc., whereas the w. of to-day is unpolluted—except, of course, in the case of sham w's, which are generally nothing more nor less than crude spirit sweetened and coloured. W. is distinguished by colour, hardness or softness to palate, bouquet or aroma, flavour, and stillness or effervescence. Quality depends largely on the locality in which vine is grown, the species of vine, climate, treatment of grapes, and mode of manufacture. The vine is grown in practically all places where climate and soil are suitable, in countries extending from California to Persia and from Germany to the Cape. Each district has its own characteristics; for instance, the w's of Italy and Greece possess great strength, while those of France and Germany are noted for their flavour and delicacy.

Wine-making is a complicated process, though not so complicated as the making of beer or spirits. When the grapes are ripe they are gathered by hand and the stalks removed. They are then taken to the press-house, where is situated the w.-press. Presses are of all varieties, from the early wedge and lever press to the powerful hydraulic press of modern times. Sometimes presses are dispensed with, and the juice of the grapes pressed out by workmen who trample them underfoot. Again, very special w's, such as the celebrated essence of Tokay, are made by allowing the weight of grapes above to press out the juice of those underneath. When the liquid has been squeezed out it is known as '*must*,' and is a viscid fluid of sweet taste. The must is now allowed to ferment; this takes place quite spontaneously, without the addition of any fermenting agent whatever. If the w. is to be a red one, the grape skins—from which the colour is obtained—are left in the juice while fermenting, but in white w's they are removed. Fermentation requires much time and attention; at first the process is a slow one, but as time goes on it rapidly quickens. Sweet w's—such as Tokay, port, etc.—have the fermentation stopped when they reach a certain stage, by the addition of raw spirits. The first fermentation being finished, the w. is run into casks or vats, so that the second fermentation may take place. This is even a slower process than the first; carbonic acid gas is given off and escapes through the bung-hole or by means of a water valve, which allows the escape of gases from the vat while preventing any from entering from outside. Deposits are also thrown down by the w., and these are known as *argol* or *lees*. They are mainly composed of cream of tartar and albuminous matters. All sediment sinks to the bottom, thus leaving the w. more or less clear. After four or five months in the vats it is 'racked,' or separated from the deposits, and poured into clean casks which have been carefully sterilised. This process of racking is repeated four or five times with an interval of a few months between each. Even then the w. is not absolutely free from particles, and often gelatine or isinglass is added to make it brighter.

After these processes are completed, the w. is matured for three or four years, and is then ready for bottling. Some w's, such as port, are not bottled as a rule, but kept in the wood.

Varieties of Wine.—WHITE WINES are free from both colouring matter and tannin, and are in consequence less likely to upset the digestion; for this reason they are often recommended for medicinal purposes. W's in which all the sugar has been changed to alcohol before bottling are called *dry w's*. Those in which fermentation continues after bottling are *effervescing w's*—and to this class champagne belongs. The bouquet or aroma of a w. is caused by the compound ethers the w. contains; they develop as it matures, and medical men say it is these rather than the alcohol that cause gout. W's may be classified as follows:—

(1) *Spirituous w's*, rich in alcohol and sugar, as port, sherry, Madeira, Marsala, and containing about 15 % of alcohol.
(2) *Liqueur w's*, rich in sugar; alcohol between 10 % and 15 %, as Tokay, Malaga.
(3) *Acid w's*, rich in acid tartarate of potash; alcohol about 10 %. The red w's with tannin include claret, Bordeaux, and Burgundy, while the white wines, without tannin, are hock, Moselle, and Chablis.
(4) *Sparkling w's*, rich in sugar and carbonic acid, as champagne and sparkling hock.

Much of the port and sherry on the market is sham wine, being crude spirit coloured and sweetened.

Wine-producing Countries.—The total w. produce of the world per annum is roughly 3000 million gallons. *France* has an average yield of something like 1000 million gallons, and no less than 77 departments are engaged in the industry, of which Bordeaux is the centre. A remarkable variety of wines are obtained, including the red wines of Gironde and Burgundy, and the white wines of Sauternes, Graves, and Chablis. *Spain* is characterised by three main types—sherry, Tarragona (Spanish port), and wines of the claret type. *Portugal* is chiefly noted for the production of port, which is made in the locality of Oporto, hence the name. *Germany* is famous for the Rhine wines and moselle; *Italy* produces wines of a poor quality. *Hungary* is chiefly known by its Tokay, of which the finest variety is the *essence*. Wines from the *Cape* and *U.S.A.* are of fair quality, chiefly because scientific methods are employed in their production. The red wines of *Australia* resemble the wines of France, being something of the claret or Burgundy type; Australian white wines resemble the Sauternes or Chablis wines.

Diseases of the Vine are many, and due to a variety of causes, including micro-organisms, moulds, bacteria, and insects. The commonest is *phylloxera*, which is a most destructive pest, being caused by an insect of the green-fly type, which destroys, not only the vine leaves, but the roots as well. A great epidemic ran through the French vineyards in 1882–85.

Diseases of Wine.—Commonest is perhaps *tourne* or *casse*, caused by the wine being made from mildewed grapes (see also FERMENTATION).

WINEBRENNER, JOHN (1797–1860), founded religious community called Church of God.

WINER, GEORG BENEDIKT (1789–1858), New Testament philologist; prof. at Leipzig, 1832.

WINFIELD (47° 10′ N., 97° W.), city, capital, Cowley County, Kansas, U.S.A.; manufactures flour. Pop. (1910) 6700.

WINGATE, SIR FRANCIS REGINALD (1861–), Brit soldier; Sirdar, Egyptian army, and Gov.-Gen. of Sudan since 1899.

WINGED SNAIL, see GASTEROPODA.

WINKELRIED, ARNOLD VON, Swiss patriot; a leader in the struggle for national independence. According to tradition, at battle of Sempach, near Lucerne, 1386, the Austrians formed a phalanx the

Swiss could not break. W. rushed on the Austrian spears, and, by giving his life, made an opening for his comrades.

WINNIPEG.—(1) (49° 59′ N., 97° W.) chief town, Manitoba, Canada, at confluence of Assiniboine and Red R.; seat of provincial Parliament; has Anglican and R.C. cathedrals, and univ. Centre of rail and river trade; has great grain elevators and flour-mills; chief workshops of Canadian Pacific Railway between Montreal and Pacific are here. Pop. (1911) 135,430. (2) (53° N., 98° W.) lake, Manitoba and Keewatin, Canada; length, 250 miles; breadth, 55 miles; drained by Nelson into Hudson Bay. (3) (50° N., 97° W.) river, Manitoba, Canada; issues from the Lake of the Woods, flows W. to Lake Winnipeg.

WINNIPEGOSIS, Little Winnipeg (52° 20′ N., 100° 30′ W.), lake, Canada, W. of Lake Winnipeg, into which it empties.

WINONA (44° 6′ N., 91° 38′ W.), city, on Mississippi, capital, Winona County, Minnesota, U.S.A.; exports grain, lumber. Pop. (1910) 18,583.

WINSFORD (51° 7′ N., 3° 34′ W.), town, Cheshire, England; salt works. Pop. (1911) 10,772.

WINSLOW, EDWARD (1595–1655), Eng. colonial governor; sailed with the Puritan exiles, 1620, for America, and became their elected governor; wrote several pamphlets.

WINSOR, JUSTIN (1831–97), Amer. historian; author of *Columbus* (1891), *Memorial History of Boston* (1880–81), *The Narrative and Critical History of America* (8 vols., 1884–90).

WINSTED (41° 55′ N., 73° 5′ W.), town, Litchfield County, Connecticut, U.S.A.; manufactures cloth. Pop. (1910) 7754.

WINSTON-SALEM (36° 4′ N., 80° 8′ W.), city, capital, Forsyth County, North Carolina, U.S.A.; manufactures tobacco; Winston and Salem are contiguous towns. Pop. (1910) 17,167.

WINTERFELDT, HANS KARL VON (1707–57), Pruss. soldier; b. Pomerania; personal aide-de-camp to Frederick William I., and friend of the crown prince, afterwards Frederick II.; commanded grenadiers at Mollwitz and Rothscloss, 1741; confidential staff officer to Frederick, and disliked by Prince William (Frederick's brother), Zieten, and other generals. Killed in a skirmish near Görlitz.

WINTERGREEN (*Gaultheria procumbens*), N. Amer. plant of order Ericaceæ; red berries are used for flavouring beer, for hair-washes, tooth-powders; *Oil of W.*, a tonic, is used in perfumery.

WINTERTHUR (47° 29′ N., 8° 44′ E.), town, canton Zürich, Switzerland; important commercial and manufacturing centre; cottons, machinery, wine. Pop. (1912) 25,700.

WINTHROP (42° 22′ N., 70° 58′ W.), town, summer resort, on Massachusetts Bay, Suffolk County, Massachusetts, U.S.A. Pop. (1910) 10,132.

WINTHROP, JOHN (1588–1649), Eng. administrator; b. Suffolk, England; appointed governor of Massachusetts by the company in London; founded Boston, 1630; strong Puritan; governor, 1637–40, 1642–44, 1646–49; pres. of New England confederation.

WINTHROP, JOHN (1606–76), administrator; obtained union of Connecticut and New Haven and formation of United Colonies of New England.

WINZET, NINIAN, Wingate (1518–92), Scot. cleric; controversialist on R.C. side; *Certain Tractates* reprinted, 1891, by Scot. Text Soc.

WIRE, a thin, long, circular metal rod, used in innumerable ways; its manufacture is limited to few metals and alloys, the principal being brass, copper, gold, iron, platinum, silver, steel; made by drawing or pulling the metal through a plate or die made of hard steel and having a hole of the requisite size, or by drawing the metal through a series of such dies, in each of which the hole decreases in size continuously. Wire-drawing was introduced into England in XVII. cent.

WIRE-WORM, a name most commonly applied to the round, hard-skinned larvæ, or grubs, of the Click Beetle (*Elateridæ*), which live underground and cause much damage to crops by gnawing their roots. A species of Millipede destructive to crops, also known as 'wire-worm,' can be readily distinguished from the 'grub' by its many pairs of legs.

WIRKSWORTH (53° 5′ N., 1° 35′ W.), town, Derbyshire, England. Pop. (1911) 3888.

WISBECH (52° 40′ N., 0° 7′ E.), town, river port, on Nen, in Isle of Ely, Cambridgeshire, England.

WISCONSIN (42° 30′ to 47° 3′ N., 86° 50′ to 92° 54′ W.), N. central state, U.S.A.; bounded N. by Lake Superior, Michigan State, E. by Lake Michigan, S. by Illinois, W. by Iowa and Minnesota; area, 56,040 sq. miles. Surface generally is an undulating plain with an elevation of from 600 to 1000 ft.; in the N. are mountains reaching a height of c. 18,000 ft., and in the S. are prairie lands; drained mainly by Mississippi on W. boundary, and its tributaries, St. Croix, Chippewa, Black, and Wisconsin; there are numerous lakes, of which the largest is Lake Winnebago in the E., others being Lake Poygan, Green Lake, and those in Madison County, noted for beautiful scenery. The greater part of state belongs to a very old geological period; most of the N. is Archæan, while in the S. Silurian and Cambrian rocks occur. The climate is not subject to great extremes, although the winters are both long and cold. Annual rainfall is from 30 to 31 inches. Flora includes a number of coniferous trees.

W. was first visited by Fr. explorers in the first half of the XVII. cent., and a Fr. mission was established on the N. coast, 1665. The region came into the possession of Great Britain in 1763, and after the close of the War of American Independence was included in the dominions of the U.S. It was organised as a territory in 1836, and admitted to the Union as a state in 1848. It remained faithful to the Union during the Civil War, when it contributed over 91,000 troops to the Federal force. Executive power is vested in a governor, who is assisted by a lieutenant-governor and three other officials of state; legislature consists of a Senate of 33 members elected by popular vote for 4 years, and an Assembly of 100 members elected in the same way for 2 years. Sends 2 Senators and 11 Representatives to Federal Congress.

The chief towns are Madison (capital), Milwaukee, Superior, Racine, Oshkosh, and La Crosse. Agriculture is an important industry; large crops of wheat, maize, oats, and barley are produced, and potatoes, rye, sugar-beet, and tobacco are cultivated; cattle, sheep, horses, mules, and pigs are raised in large numbers. There are dense forests, with pine, oak, and other valuable timber trees. Minerals found include zinc, lead, granite, petroleum, graphite, limestone, sandstone. Principal manufactures are flour, butter and dairy produce, hardware, lumber products, agricultural tools, furniture, leather, malt liquors, paper, textiles; and meat-packing is carried on. Railway mileage about 7400.

Education is free and obligatory; Madison, Appleton, and Milwaukee are univ. towns. Chief religions are R.C., Lutheran, Methodist, Congregationalist, and Baptist. Pop. (1910) 2,333,860.

Thwaites, *Story of Wisconsin* (1890); Campbell, *Wisconsin in Three Centuries* (1906).

WISCONSIN, UNIVERSITY OF, at Madison, U.S.A.; opened 1850; great increase of students since 1885; co-educational throughout; coll's of Letters and Science, Law, Agriculture, and Engineering; free tuition to all students from the state of Wisconsin, except for Law; more than 5500 students; twenty large buildings and famous library.

WISDOM LITERATURE, the name given to a group of writings consisting of Proverbs, Job, and Ecclesiastes in the Old Testament, Ecclesiasticus and the Wisdom of Solomon in the Apocrypha (*qq.v.*). They are a distinct branch of Hebrew lit., differing markedly in standpoint and treatment from the prophetic books. Their theme is the problem of human life and conduct.

Solomon had been renowned for his 'wisdom'; in later Jewish thought 'Wisdom' was personified.

Wisdom, Book of, often called 'Wisdom of Solomon,' one of most important of apocryphal books of Old Testament; shows influence of Gk. philosophy on later Hebrew thought; falls into two parts, chapters 1–9 and 10–19, possibly by different authors; written in Greek, but tinged with Hebrew expressions; written about time of Christ, and referred to in New Testament.

WISE, ISAAC MAYER (1819–1900), introduced reforms in Judaism in U.S.A.

WISEMAN, NICHOLAS PATRICK STEPHEN (1802–65), cardinal abp. of Westminster; b. Seville, of Irish parents; ed. at Ushaw, and at the Eng. Coll., Rome; ordained priest, 1825; helped to found the *Dublin Review*, 1836; pres. of Oscott, and bp., 1840; diplomatic envoy from Pius IX. to Palmerston, 1848; vicar-apostolic, 1849; abp. of Westminster and cardinal, 1850; won considerable reputation, not only as an ecclesiastic, but as a lecturer on social and literary subjects. Had considerable influence on the Oxford High Church movement, and in the revival of Catholicism in England.

WISHART, GEORGE (*c.* 1511–46), Scot. martyr; schoolmaster at Montrose (1538), and charged with heresy for teaching Gk. New Testament; spent some time abroad, and wrote *The Confession of Faith of the Churches of Switzerland*; in 1543 resided in Corpus Christi Coll., Cambridge; returned to Scotland, 1543, preached often, and, being arrested at Ormiston, was tried at St. Andrews and there hanged and burned by Cardinal Beaton's orders.

WISHAW (55° 47′ N., 3° 55′ W.), town, Lanarkshire, Scotland; coal-mines; ironworks. Pop. (1911) 25,263.

WISMAR (53° 52′ N., 11° 28′ E.), seaport, on Baltic, Mecklenburg-Schwerin, Germany; excellent harbour; contains several Gothic churches and the Renaissance Fürstenhof; was an important Hanse town; belonged to Sweden, 1648–1803. Pop. (1910) 24,378.

WISTARIA, genus of climbing plants, order Leguminosæ; flowers are blue and in racemes; varieties are *W. chinensis* and *W. frutescens*.

WITAN, WITENAGEMOT, Anglo-Saxon national council; bp's, ealdormen, the king's thanes, abbots (and abbesses), and (in the earliest days) all free men were invited. All laws, civil and ecclesiastical, grants of land, peace and war, the raising of taxes, were settled at the W.

WITCHCRAFT, the art of producing malignant supernatural effects by the agency of evil spirits. Belief in the reality of w. is very ancient, and is still prevalent amongst many savages. It was not until the Renaissance that judicial proceedings with torture were taken against witches. The bull of Pope Innocent IV., 1484, encouraged the Inquisition to take action, and, later, Protestants were equally alert. It is estimated that 300,000 persons were put to death as witches in 200 years. Puritan Scotland and New England were particularly conspicuous in persecution of witches in XVII. cent., and disbelief in witches was accounted atheism as late as 1768 by John Wesley. The last trial for w. in England took place in 1712, the last execution in Scotland, 1722; statute of 1603 repealed, 1735.

WITHAM (51° 48′ N., 0° 38′ E.), town, Essex, England. Pop. (1911) 3480.

WITHER, GEORGE (1588–1667), Eng. satirist and poet; b. Bentworth, Hampshire. For *Abuses Stript and Whipt*, he was imprisoned, and wrote the delightful pastoral, *Shepherds Hunting*, during his imprisonment. His finest poem is *Fair Virtue, or The Mistress of Philarete*, but W. is popularly remembered by his lyric beginning, 'Shall I, wasting in despair?'

WITHERSPOON, JOHN (1723–94), Scot. theologian; went to America, 1768, becoming pres. of Coll. of New Jersey; after Declaration of Independence held various political appointments.

WITNESS, one who gives sworn testimony in court of law; evidence of children and lunatics, if taken, is considered of little weight. The accused cannot be called as a witness for the prosecution in a criminal charge, but may be a witness for the defence, if he wishes to be called. The husband or wife of an accused person can only be compelled in certain cases (*e.g.* treason, injuries inflicted by other party, rape, indecent assault) to give evidence for the prosecution, but may always be called for the defence. They may be cross-examined, but cannot be compelled to disclose confidential communications made to them by their consorts during marriage.

WITNEY (51° 47′ N., 1° 29′ W.), town, on Windrush, Oxfordshire, England; manufactures blankets. Pop. (1911) 3529.

WITOWT, WITOLD (1350–1430), grand-duke of Lithuania; fluctuated between alliance with Poland and with the Teutonic order; finally confirmed agreement with Poland, 1401; crushed Teutonic Knights at Tannenberg, 1410; and made Poland-Lithuania a great power.

WITT, JAN DE, see DE WITT, JAN.

WITTE, SERGE JULIEVICH, COUNT (1849–), Russ. statesman; b. Tiflis; managed transportation of troops in Russo-Turk. War, 1877–78; chief of Imperial Railway Dept., 1888; Minister of Communications and Minister of Finance, 1892; conducted peace negotiations with Japan on behalf of Russia, 1905; Prime Minister, 1905–6.

WITTELSBACH, Ger. noble family, dating from X. cent. Otto V. settled at Wittelsbach, and took the name of the place, 1124 A.D. His descendants held the Palatinate of the Rhine and upper Palatinate of Bavaria from 1329, and included Maximilian I. of Bavaria, 1799, margraves of Brandenburg, kings of Sweden, and three kings in Germany—Louis IV., Rupert, and Charles II.

WITTEN (51° 27′ N., 7° 20′ E.), town, on Ruhr, Westphalia, Prussia; manufactures iron and steel. Pop. (1910) 37,450.

WITTENBERG (51° 52′ N., 12° 39′ E.), town, on Elbe, Prussia, Saxony; manufactures machinery; famous for its connection with Luther and the Reformation (1517); the Schlosskirche contains the tombs of Luther and Melanchthon; was capital of the Electorate of Saxony; stormed by the Prussians, 1814; its once famous univ. was united with that of Halle, 1815. Pop. 22,410.

WITTENBERGE (53° N., 11° 59′ E.), town, on Elbe, Brandenburg, Prussia; railway workshops. Pop. 20,610.

WITTENGAU, TREBON (49° N., 14° 43′ E.), town, Bohemia; the castle of Prince Schwarzenburg contains valuable archives. Pop. 5280.

WITU, VITU (2° 10′ S., 41° E.), sultanate, Brit. E. Africa, on coast, at mouth of Tana. Pop. 16,000. Capital, Witu; trade in rubber. Pop. 6500.

WITWATERSRAND, see JOHANNESBURG.

WIVELISCOMBE (51° 3′ N., 3° 19′ W.), town, Somersetshire, England.

WLADISLAUS I., LADISLAUS, WLADISLAW (1260–1333), king and reconstructor of Poland, which was split up into a number of independent principalities; chosen, 1296, while prince of Cujavia, to rule, it was not till 1305 he achieved any unity; crowned king, 1320, after a long struggle with the Teutonic order.

WLADISLAUS II., JAGIELLO (1350–1434), s. and successor of the grand-duke of Lithuania, 1377; married Jadwiga, Queen of Poland, 1386 (thereby becoming ruler of Poland); established Catholicism in Lithuania; succeeded in raising Poland to a great power, after breaking strength of the Teutonic order.

WLADISLAUS III. (1424–44), s. of W. II.; king of Poland, elected king of Hungary, 1440; led successful crusade against Turks, 1443, but was slain and his army destroyed, 1444.

WLADISLAUS IV. (1595–1648), s. of Sigismund and Anne of Austria; king of Poland, 1632; warred successfully against Russia, but failed to rouse Poland to its dangers.

WOAD (*Isatis*), genus of plants, order Cruciferæ;

Dyer's W. (*I. tinctoria*) was much used by early Britons for dyeing their bodies blue.

WOBURN.—(1) (51° 59′ N., 0° 37′ W.) town, Bedfordshire, England; near it is Woburn Abbey (XII. cent.), now seat of Duke of Bedford. (2) (42° 49′ N., 71° 12′ W.) city, Middlesex County, Massachusetts, U.S.A.; manufactures leather. Pop. (1910) 15,308.

WODEN, ODIN, chief god of early Teutons; ruler of heaven and earth and god of war; Frigga was his queen and Balder his son.

WÖHLER, FRIEDRICH (1800–82), Ger. chemist; worked with Liebig on the radical 'benzoyl,' prepared urea artificially; first prepared pure aluminium.

WOKING (51° 18′ N., 0° 33′ W.), town, Surrey, England; crematorium. Pop. (1911) 24,810.

WOKINGHAM (51° 25′ N., 0° 49′ W.), town, on border Windsor Forest, Berkshire, England. Pop. (1911) 4352.

WOLCOT, JOHN, PETER PINDAR (1738–1819), Eng. writer of poetical satires and pamphlets, e.g. *The Lousiad.*

WOLCOTT, ROGER (1679–1767), Amer. soldier and governor; successful in business; J.P., 1710; commissary of Connecticut forces in expedition against Canada, 1711, and commanded Connecticut forces against Louisburg, 1745; chief judge of Supreme Court, 1741, and deputy governor; governor, 1750–54.

WOLF, see DOG FAMILY.

WOLF, FRIEDRICH AUGUST (1759–1824), Ger. critic and philologist, and greatest classical scholar of his age; b. Hainrode, near Nordhausen. His masterpiece was his *Prolegomena ad Homerum*, in which he expounded his ballad theory of epic origin.

WOLF, HUGO (1860–1903), Austrian composer; studied at Vienna Conservatoire, 1875; became musical critic to Vienna *Salonblatt*, 1886; d. insane; song-writer with exceptional poetic power and remarkable style; composed 51 *Goethe Lieder*, 20 *Eichendorf Lieder*, *Italienisches Liederbuch*, etc.

WOLFE, CHARLES (1791–1823), Irish clergyman; author of *The Burial of Sir John Moore.*

WOLFE, JAMES (1727–59), Brit. general; b. Westerham, Kent; served in the Rhine campaign, in the rising of the 'Forty-five,' and in the Flanders campaigns. But his fame rests on his brilliant victory and noble death on the Heights of Abraham in the Quebec expedition.

WOLFENBÜTTEL (52° 9′ N., 10° 31′ E.), town, on Oker, Brunswick, Germany; has an ancient castle and a famous library; scene of defeat of Austrians by Swedes, 1641. Pop. (1910) 18,934.

WOLFF, CASPAR FRIEDRICH (1733–94), Ger. anatomist and physiologist; b. Berlin; ed. Halle; lectured on anat. and physiology in St. Petersburg Academy; his researches on the development of the chick founded the science of embryology.

WOLFF, CHRISTIAN (1679–1754), Ger. philosopher and mathematician; b. Breslau; prof. at Halle. Systematised and modified doctrines of Leibnitz; denied perception to all monads except souls; pre-established harmony only a permissible hypothesis, natural interaction of soul and body possible; adhered to optimism and determinism of Leibnitz.

WOLFF, JOSEPH (1795–1862), Anglican divine; originally Ger. Jew, converted, 1812; preached in East; f. of Sir Henry Drummond W. (1830–1908).

WOLF-FISH, see BLENNIES.

WOLFRAM VON ESCHENBACH (1170–1220), Ger. mediæval poet; b. near Anspach, Bavaria; enjoyed the patronage of Landgrave Hermann of Thuringia; wrote the famous epic *Parzival*, besides *Willehalm* (completed by Ulrich von Türheim), *Titurel* (2 fragments), and love songs; translated into modern High Ger. by Simrock (1883), Sante-Marte (1886).

WOLFSBANE, see ACONITE.

WOLGAST (54° 3′ N., 13° 44′ E.), seaport, on Peene, Pomerania, Prussia; formerly fortified; manufactures tobacco. Pop. 8210.

WOLLASTON, WILLIAM HYDE (1766–1828), Eng. chemist and physicist; worked on platinum; isolated palladium and rhodium; investigated columbium (niobium); observed dark lines in solar spectrum, and electromagnetic phenomena; invented reflecting goniometer.

WOLLIN (53° 32′ N., 14° 33′ E.), island, Pomerania, Prussia, at mouth Oder. Chief town, Wollin. Pop. 4550.

WOLLONGONG (34° 22′ S., 150° 52′ E.), seaport, Camden County, New South Wales; exports coal. Pop. 4000.

WOLLSTONECRAFT, MARY, see GODWIN, MARY.

WOLSELEY, GARNET JOSEPH WOLSELEY, 1ST VISCOUNT (1833–1913), Brit. soldier; b. Dublin County; entered Brit. army, 1852; wounded in Burmese War, 1852–53, and in Crimean War; captain in Ind. Mutiny, and lieut.-colonel in Chin. expedition, 1860; commanded Red River (Canada) expedition, 1870, and in Ashanti War, 1873–74; organised government in Zululand, 1880; defeated Arabi Pasha at Tel-el-Kebir, 1882; in command of Sudan campaigns, 1884–85; field-marshal, 1894; Commander-in-Chief, 1895–1900. Author of several books, military and autobiographical. Buried in St. Paul's Cathedral.

WOLSEY, THOMAS (*c.* 1475–1530), Eng. churchman and statesman; by repute s. of a butcher at Ipswich; graduated at Oxford, and elected a fellow of Magdalen, 1497; chaplain to Henry VII., 1507; almoner to Henry VIII., 1509, and early admitted to the king's counsels. Abp. of York, 1514, and chief statesman in England; cr. cardinal, 1515, and app. Lord Chancellor; attended Henry to the Field of the Cloth of Gold, and worked for the treaty of alliance with France; unable to prevent the war that followed, he was responsible for the advantageous treaty at its close; hated by Anne Boleyn, and by the lords for his pomp and magnificence, and unable to assist Henry in divorcing Catherine of Arragon, he fell from royal favour, 1529, and resigned the Great Seal. A bill of attainder was passed against him, and he was arrested; but sickness delayed his journey to London, and he died at Leicester Abbey.

Life, by Creighton (1888).

WOLVERHAMPTON (52° 37′ N., 2° 8′ W.), town, Staffordshire, England; centre of coal- and iron-mining district; manufactures hardware, machinery. Pop. (1911) 95,333.

WOLVERINE, see WEASEL FAMILY.

WOLVERTON (52° 3′ N., 0° 50′ W.), town, Buckinghamshire, England; railway-works.

WOMB, see REPRODUCTIVE SYSTEM.

WOMBATS, see under MARSUPIALS.

WOMBWELL (53° 42′ N., 1° 24′ W.), town, W. Riding, Yorkshire, England; collieries. Pop. (1911) 17,538.

WOMEN.—In law, by the Interpretation Act, 1889, words in any Act of Parliament passed after 1850 signifying the masculine gender apply equally to the feminine unless the contrary is declared. Factory and Workshop Acts referring to 'women' mean women of eighteen years of age or upwards. All employment of w. in mines in Great Britain is illegal.

Various public offices may be held by w.; notably parish sexton, churchwarden, governor of a workhouse, overseer or guardian of the poor, membership of county, borough, and parish council, and of a school board in Scotland. A woman may be chosen mayor or appointed magistrate; Dr. Garrett Anderson was the first woman mayor in England, at Aldborough, 1908. In the Middle Ages w. have been sheriffs and high constables; and as landed proprietors, with the rights of the lordship of the manor, or as abbesses, they were certainly summoned to the king's council. A woman may be queen, and a peeress in her own right, and may appoint to Church of England benefices. She may vote (if a householder) at municipal elections, and may be chairman of a municipal council, board of guardians, or school board. But she is expressly excluded from the

parliamentary franchise by the Act of 1832, and may not even vote for a member of Parliament of a Scot. University of which she is a graduate. Throughout Australia and New Zealand, in certain of the United States, Finland, and Norway, w. now possess the parliamentary vote.

The medical profession is now open to women in the United Kingdom (the restrictions being withdrawn, 1876–1908), as it is in America, the Colonies, and in all the chief European countries. But the law is closed to her, except in France, U.S.A., Finland, Norway, Netherlands, and Queensland. The pulpit is open to w. in certain Prot., Congregational, Primitive Methodist, and Unitarian Churches, and the Religious Orders in the Catholic Church have always offered an alternative to life in the world.

While all the modern univ's accept w. on equal terms with men as students and as graduates, Oxford and Cambridge only permit w. to sit for examination, and still refuse degrees.

A. R. Cleveland, *Women under English Law*; J. S. Mill, *Subjection of Women*; C. C. Stopes, *British Free Women*.

WONDERS, SEVEN, see SEVEN WONDERS.

WOOD, ANTHONY A, (1632–95), Eng. antiquary; b. Oxford; life was devoted to antiquarian studies of Oxford. His *History and Antiquities of the University of Oxford* was bought and translated by the University. He then recast the work in two parts.

WOOD GREEN, suburb of London, in Middlesex, England; 7 miles N. of St. Paul's. Pop. (1911) 49,372.

WOOD, MRS. HENRY, ELLEN PRICE (1814–87), Eng. novelist; best-known work is *East Lynne* (1861), a melodramatic novel.

WOOD, SIR HENRY EVELYN (1838–). Brit. soldier; fought in Crimea, Ind. Mutiny, Ashanti War (1874), Zulu War (1879), Transvaal War (1880–81).

WOOD WREN, see WARBLERS.

WOODBINE, see HONEYSUCKLE.

WOODBRIDGE (52° 7′ N., 1° 15′ E.), market town, on Debden estuary, Suffolk, England. Pop. (1911) 4623.

WOODBURY (39° 40′ N., 75° 9′ W.), city, capital, Gloucester County, New Jersey, U.S.A.; manufactures paper, glass. Pop. (1910) 4642.

WOODCOCK, see under PLOVER FAMILY.

WOODFORD (51° 36′ N., 0° 1′ E.), town, Essex, England. Pop. (1911) 18,497.

WOOD-LICE, SLATERS, flattened Crustacea which live on land and breathe air; common in damp places, under stones and bark. See MALACOSTRACA.

WOODPECKERS, insect-eating birds with powerful beaks by means of which they can excavate holes in trees for nesting, food, etc.; long tongue with hooked tip and sticky saliva for searching bark crevices, and stiff, fanlike tail; often brightly coloured with metallic, lustrous plumage.

WOODRUFF (*Asperula*), genus of plants, order Rubiaceæ; Sweet W. (*A. odorata*) has small white flowers, and in Germany flavours *May-drink*.

WOODS, LEONARD (1774–1854), Amer. divine; prof. at Andover Theological Seminary; f. of **Leonard W.** (1807–78), theologian and philologist.

WOODSTOCK.—(1) (51° 52′ N., 1° 22′ W.) town, on Glyme, Oxfordshire, England; manufactures gloves; formerly a royal residence; near it is Blenheim Park. (2) (43° 10′ N., 80° 46′ W.) town, port of entry, on Thames, Oxford County, Ontario, Canada; manufactures musical instruments. Pop. 10,000.

WOOD-WARBLER, see WARBLERS.

WOOL is a species of hair, distinguished by its fine, soft, and wavy structure. Sheep were domestic animals in Britain at a very early date, but the manufacture of w. was introduced by the Romans. Brit. w. became celebrated for its fineness and was much sought after by continental weavers, who were more skilful than the Eng. workers. From time to time expert Flemish weavers settled in England, and the industry gradually improved. Edward III. forbade the export of Eng. w. with the object of assisting the native industry, but he only succeeded in partially crippling the trade and in encouraging smuggling. In Elizabeth's reign export restrictions were removed, but in 1660 export again was stopped, and this state of things continued until 1825, when the prohibition was finally removed. Sheep were introduced into America in 1609, but the woollen industry was not really established until the end of the XVIII. cent. Spanish merino sheep, which produced specially fine wool, were taken to America about 1802. A few years earlier, merinos were introduced into Australia, and after some early failures the breed became thoroughly established. Since then Australian w.-farming has developed with extraordinary rapidity. At first the sheep were valued simply for their w., but when the frozen meat trade sprang up more attention was given to the carcass. Larger-bodied sheep resulted, and inferior cross-bred w. took the place of merino w., but more recently the quality of the w. has been greatly improved. South America runs Australia very close as a w.-producing country. Merinos were introduced there rather later than to Australia, and the growth of the meat trade has had similar results in each country. Merinos were taken to South Africa by the Dutch. W.-growing has not developed so rapidly in South Africa as in Australia and South America, but it undoubtedly has a promising future. Eng. w. is characterised by its length and its lustre, but by crossing with merinos a finer, shorter w. also has been produced. Welsh w. is used for flannels, Cheviot w. for tweeds, and Scotch w. for carpet yarns. Shetland w. is noted for its specially soft nature. White w. is the commonest and most suitable for manufacture, but there are also grey, yellow, brown, and black w's. Under the microscope w. is distinguished from hair by its serrated structure. In the finest w's there may be as many as 2800 serrations to the inch, while poor w's may have as few as 500.

The first step in woollen manufacture is the sorting or 'stapling' of the raw w. The stapler works at a frame covered with wire netting, through which the dirt falls while the w. is being sorted into different qualities. It is then put through a 'scouring-machine,' which cleanses it thoroughly by means of a hot soap solution. It is then spread over a framework of wire netting and dried by hot air. Drying-machines are often used to obtain more rapid and uniform drying. The w. is now teased in a 'willeying-machine,' in which two sets of teeth, working in opposite directions, disentangle it and throw it out in loose fibres. At this stage some w's require treatment by dilute sulphuric acid or in a 'burring-machine,' to remove burrs, seeds, or other adhering vegetable matter. The w. is then blended with other w's, or more commonly with cotton and other materials, oiled and beaten, and is then ready for carding. This is done by passing it through a 'scribbling-machine,' an intermediate, and a 'condensing-machine,' during which treatment it becomes perfectly interblended. It comes from the condensing-machine in the form of fluffy strips called 'slivers,' which are ready to be spun into yarn in the spinning-mule. This machine draws out the slivers, at the same time twisting them slightly to strengthen them and prevent them from breaking, gives the final amount of twist, and winds the yarn thus produced on spindles. This single yarn is now ready for weaving in the loom. The dividing-line between woollen and worsted yarns is not always well defined, but, generally speaking, woollen yarns are made from short, and worsted yarns from long, lustrous w's. Again, in the preparation of woollen yarn the fibres are crossed and interlaced, but in worsted yarn they are brought into a uniform parallel condition. In preparing worsted yarns the long w., after scouring, goes through a process called 'gilling,' which consists in passing it through a number of gill-boxes containing gills or combs which separate and straighten the fibres, and the w. comes out in a long

sliver. It is then put through a 'combing-machine,' from which it issues in a fine sliver called 'top.' This is then drawn out to a fine roving, from which is spun the yarn. On leaving the loom (see WEAVING) the woollen fabric is mended and scoured, and then soaped and milled by beating with large hammers or by compression in a 'milling-machine,' to eliminate the thread structure. It is again scoured, and taken to the 'tentoring-machine,' where it is hooked, while damp, to a frame which passes into a heated room, and dried while thus stretched. It is then teased to raise the pile, steamed, and pressed. Worsted cloth is finished on very similar lines. The centre of the woollen industry is in Yorkshire, Leeds, and Bradford district. West of England all-w. cloth is still made, and Scotch tweeds are made in the Hawick and Galashiels district.

WOOLMAN, JOHN (1720–72), Amer. preacher; persuaded Quakers to abandon slavery; wrote *Journal*.

WOOLNER, THOMAS (1825–92), Brit. sculptor and poet; executed several ideal works, and statues or portrait busts of many of his distinguished contemporaries. His volume of poems, *My Beautiful Lady*, has gone through several editions.

WOOLSACK, seat of Lord Chancellor in House of Lords; name believed to originate from a bag of wool being placed for the Chancellor in Edward III.'s reign to remind him of England's chief wealth.

WOOLSORTERS' DISEASE, see ANTHRAX.

WOOLSTON, THOMAS (1669–1731), Eng. deist; considered Bible allegorical; became a bitter controversialist; d. in prison.

WOOLWICH (51° 29′ N., 0° 3′ E.), town, on Thames, London, England; chief arsenal in Great Britain; contains factories for guns, gun-carriages, torpedoes, and ammunition; vast storehouses; barracks and military hospital; seat of a royal college for engineering and artillery. Pop. (1911) 121,403.

WOOLWICH AND READING BEDS, argillaceous and sandy deposits of Lower Eocene system found in London and Hampshire basins.

WOONSOCKET (42° N., 71° 31′ W.), town, on Blackstone, Providence County, Rhode Island, U.S.A.; manufactures cottons, worsteds. Pop. (1910) 38,152.

WOOSTER (40° 50′ N., 81° 58′ W.), city, on Killbuck Creek, capital, Wayne County, Ohio, U.S.A.; seat of Wooster Univ.; manufactures foundry products. Pop. (1910) 6136.

WOOTTON BASSETT (51° 32′ N., 1° 53′ W.), town, Wiltshire, England; agricultural trade.

WORCESTER.—(1) (52° 11′ N., 2° 12′ W.) county town, on Severn, Worcestershire, England; bp.'s see since VII. cent.; has fine cathedral, principally Early English and Perpendicular in architecture, and dating in part from XI. cent.; several old churches, and two grammar schools of Tudor foundation; manufactures porcelain, chemicals, gloves, iron goods; was scene of Cromwell's final defeat of Charles II., 1651. Pop. (1911) 47,987. (2) (42° 16′ N., 71° 49′ W.) town, Massachusetts, U.S.A., 44 miles W.S.W. of Boston; seat of Clark Univ. (1887); some fine public buildings and many beautiful parks; railway centre; important manufactures of wine, boots and shoes, metal goods, machinery, carpets, and other woollens. Pop. (1910) 145,986. (3) (32° 50′ S., 20° 50′ E.) town, Cape Colony; wine-growing region; tanning and wagon-building. Pop. (1911) 7963.

WORCESTER, EARLDOM AND MARQUISATE OF.—Sir Thomas Percy was 1st Earl of W., 1397; but present line is descended from Charles Somerset—a Beaufort—1514. Marquisate cr., 1642. Forty years later the Marquis of W. became Duke of Beaufort.

WORCESTER, JOHN DE TIPTOFT, EARL OF (1427–70), Lord Deputy of Ireland (1467–68); Chamberlain of the Exchequer (1470); author of learned works; beheaded as Yorkist.

WORCESTERSHIRE (52° 17′ N., 2° 13′ W.), inland county of W. central England, with county town of same name; bounded by Salop, Stafford, Warwick, Gloucester, and Hereford; area, 738 sq. miles; surface varied; crossed by several ranges of hills; watered by Severn, Avon, Stour, Teme, and other rivers; agriculture and market-gardening are important industries; chief crops are wheat and barley; cattle and sheep raised. Minerals include coal, iron, salt, limestone; manufactures iron and steel goods, china, carpets, glass, gloves, etc. W. was part of kingdom of Mercia; it supported king in Civil War of XVII. cent., and suffered greatly at hands of Parliamentarians. Has several ruined monasteries. Pop. (1911) 427,064.

WORDSWORTH, CHRISTOPHER (1774–1846), Anglican clergyman; master of Trinity Coll., Cambridge, 1841.

WORDSWORTH, CHRISTOPHER (1807–85), headmaster of Harrow, 1836–44; bp. of Lincoln, 1869.

WORDSWORTH, DOROTHY (1771–1855), Eng. writer; sister of William Wordsworth (*q.v.*). Her *Journal* has been an invaluable storehouse of information on the inner life of her bro., and the importance of her influence on his literary taste cannot be exaggerated.

WORDSWORTH, WILLIAM (1770–1850), Eng. poet; b. (April 7) Cockermouth, Cumberland; solicitor's son; ed. Hawkshead Grammar School (Lancs) and St. John's Coll., Cambridge; a moody child and bookish youth; visited France, 1790, 1791–92, and enthusiastically upheld Fr. Revolution. A legacy (£900 from his friend, Raisley Calvert), the post of distributor of stamps for Westmoreland (1813–42), a Civil List pension, 1842, and the Poet Laureateship (1843–50) enabled W. to live a long, quiet, meditative life, the only 'events' being several visits to Scotland and the Continent, and the publication of his books. With his talented and devoted sister, Dorothy W. (*q.v.*), he settled at Grasmere, 1799; in 1802 he m. Mary Hutchinson (his 'Phantom of Delight'); from 1813 till death he lived at Rydal Mount. From the start W. dedicated his life to poetry; *Descriptive Sketches* and *Evening Walk* (1793) appeared when he was only twenty-three; *The Borderers*, a tiresome tragedy, followed, 1795; then *Lyrical Ballads*, written in conjunction with his new friend, Coleridge (*q.v.*), 1798 (republished in 2 vol's, 1800); two vol's of miscellaneous verse (including 'Intimations of Immortality,' 'Sonnet to Liberty,' and other masterpieces), 1807; *The Excursion*, 1814, part of meditated larger work, *The Recluse* (begun 1799); *White Doe of Rylstone* (long narrative poem), 1815; *Peter Bell*, 1819; *The Prelude* or *Growth of a Poet's Mind* (part of *The Preludes*) was published posthumously.

Chief of the Lake poets and Leader of the Romantic Movement, W. made Nature—and Man as part of Nature—his great poetic theme. Poetic diction he banned; the poet, he held, should prefer the language of peasants. Poetry he defined as 'emotion recollected in tranquillity.' Few poets have produced such perfect gems; perhaps no great poet has fallen to such depths of banality. He succeeded best when he forgot his theories. W. is pre-eminently the poet of the contemplative lover of nature.

Matthew Arnold's *Selection*; *Works*, edit. by Knight (1896); Legouis, *Early Life of Wordsworth*; Monographs by Myers (1885), Raleigh (1903), Rosaline Masson (1913); Hereford, *Age of Wordsworth* (1897).

WORK, see under ENGINE.

WORKHOUSE, see POOR LAW.

WORKINGTON (54° 38′ N., 3° 33′ W.), seaport, at mouth of Derwent, Cumberland, England; iron and steel manufactures; coal mines. Pop. (1911) 25,099.

WORKMEN'S COMPENSATION ACT, see EMPLOYERS' LIABILITY ACTS, COMPENSATION, LABOUR.

WORKSOP (53° 18′ N., 1° 8′ W.), town, Nottinghamshire, England; chief industry, malting. Pop. (1911) 20,387.

WORLD, see PLANET.

'WORM,' general name for number of related animals—see PLATYHELMINTHES (*Flat-Worms*); TURBELLARIAN WORMS; TREMATODE WORMS (*Flukes*);

TAPEWORMS (*Cestoda*); NEMATOMORPHA (*Hair-Worms*); and CHETOPODA (*Bristle Worms*, including *Sea Worms* and *Earth Worms*).

WORMS occur in intestines of children; presence of small thread-worms leads to wasting, itching of anus, irritation at the nose, and a strong salt-and-water enema is given every second night for a week; if no improvement, castor oil is necessary; mercurial ointment is applied to anus. Round-worms may be 10 inches long; the symptoms are much the same as above, and a doctor must be summoned.

WORMS (49° 39′ N., 8° 21′ E.), town, on Rhine, Hesse-Darmstadt, Germany; has magnificent Romanesque cathedral, dating from XII. cent., and other old churches. Has important river trade; manufactures Liebfrauenmilch wine, artificial wool, bone dust, tobacco, patent leather, furniture, machinery. W. was one of Charlemagne's residences. Here in 1521 Luther defended his theological position at *Diet of W.* Pop. (1910) 46,819.

WORMWOOD, an aromatic extract obtained from *Artemisia absinthium*, a composite; used in preparation of absinthe and as a tonic.

WORONZOV, MIKHAIL, VORONTSOV (1714–67), Russ. imperial chancellor under Elizabeth and Catherine II. His nephew, ALEXANDER ROMANOVICH (1741–1805), was ambassador and afterwards imperial chancellor. Another nephew, SEMEN ROMANOVICH (1744–1832), was ambassador in London; and his s., MIKHAIL SEMENOVICH (1782–1856), was a brilliant soldier and successful administrator of southern provinces.

WORSBOROUGH (53° 31′ N., 1° 28′ W.), town, W. Riding, Yorkshire, England; iron- and steel-works; collieries. Pop. (1911) 12,754.

WORSLEY (53° 30′ N., 2° 23′ W.), town, Lancashire, England; cotton, coal. Pop. (1911) 13,906.

WÖRTH (48° 56′ N., 7° 44′ E.), village, Alsace, Germany, where on Aug. 6, 1870, the Germans under Frederick William, Crown Prince of Prussia, defeated the French under MacMahon.

WORTHING (50° 49′ N., 0° 22′ W.), watering-place, Sussex, England. Pop. (1911) 32,320.

WOTTON, SIR HENRY (1568–1639), Eng author; ed. Winchester and Oxford; ambassador at Venice, 1604–12, 1616–19, 1621–24; diplomatic envoy at Paris, 1612, The Hague, 1614, Vienna, 1620. Author of poems (notably *Character of a Happy Life*), etc.

WOUND may be *incised*, a clean-cut opening in which the length is greater than the depth, and bleeding is usual; *lacerated*, in which the opening is irregular, the edges torn, and bleeding less; *punctured*, in which the depth is greater than the length, and danger may arise from injury to deep structures in the vicinity; *gunshot*, in which the opening of entrance is smaller than the opening of exit, and danger depends on the structures involved, bleeding being usually slight. W's are treated by cleaning with carbolic lotion, removing dirt, etc., stopping bleeding, dressing with gauze, and bandaging. *Bruises* are injuries to deeper layers of the skin or tissues, but without open wound; treated with ice, massage, lead and opium lotion.

WOUNDWORT, see STACHYS.

WOUWERMAN, PHILIP (1619–68), Dutch painter of cavalry scenes; famous for 'white horse' in many pictures.

WRANGEL, FRIEDRICH HEINRICH ERNST, COUNT VON (1784–1877), Pruss. soldier; distinguished in Napoleonic wars; commanded in Schleswig-Holstein, 1848, during Berlin riots, 1848, and nominally in Denmark, 1864.

WRANGLER, SENIOR, one passing highest in maths. in Cambridge B.A. exam.

WRASSES (*Labridæ*), thick-lipped, rock-loving, brightly coloured bony fishes, with strong, crushing teeth; distribution world-wide; over 500 species known, 7 being British.

WRAXALL, SIR NATHANIEL WILLIAM (1751–1831), Eng. hist. writer; wrote *Hist. Memoirs of My Own Time* (1815), *Memoirs of Valois Kings* (1777).

WRAY, JOHN, see RAY, JOHN.

WRECK.—Only goods cast upon the land, after a shipwreck, are 'wreck'; at sea they are not 'wreck,' but are within the jurisdiction of the Admiralty. By the Merchant Shipping Act of 1894, all 'jetsam, flotsam, and derelict found in or on the shores of the sea or any tidal water' are 'wreck,' and are to be handed over to the proper custody of district receivers. The claims of the owners are recognised for a year, and the Crown has a title to unclaimed wreck, except where royal licence has given a revenue of wrecks, a thing frequently done in the past. To plunder or steal goods from vessels wrecked or cast on shore is a felony, and persons in possession of shipwrecked goods are liable to imprisonment. The coroner certifies whether there has been a wreck or not, and who is in possession of the goods.

WREDE, KARL PHILIPP, PRINCE VON (1767–1838), Bavarian general; led Bavarian contingent in Napoleon's army until 1813; after Bavaria's desertion headed contingent of allies.

WREN, SIR CHRISTOPHER (1632–1723), Eng. architect; was devoted as an Oxford student to mathematics, astronomy, chemistry, and anatomy. Architecture came, however, to engage his chief interest, and he had his great opportunity when London was laid in ruins by the fire of 1666. He was the architect of the new St. Paul's Cathedral, and of some 50 other churches to replace those destroyed. Many other notable structures, including Temple Bar (*q.v.*), were of his design.

WRENS (*Troglodytidæ*), a family of minute Perching Birds, almost 300 in number. Although most abundant in S. America, several species occur in N. America, Europe, and Asia. The Common Wren (*Troglodytes vulgaris*) is British.

WRESTLING, ancient and widespread sport, mentioned frequently in classical lit.; prominent feature of Olympic games. Various styles practised in Britain; commonest is Lancashire style, known as *catch-as-catch-can*; both shoulders on ground at the same time constitute a throw; in Cumberland mode the competitor who falls first loses; in Cornish, two hips and a shoulder, or a hip and two shoulders, must be on the ground simultaneously for a throw. The Japanese have a peculiar style of wrestling, *Ju-jitsu* (q.v.).

WREXHAM (53° 2′ N., 3° W.), town, Denbighshire, Wales; breweries, tanneries. Pop. (1911) 18,379.

WRIGHT, THOMAS (1810–77), Eng. antiquary; helped to found Brit. Archæological Association, Percy Soc., Shakespeare Soc.; voluminous writer.

WRIST, the joint uniting the hand with the forearm. See SKELETON.

WRIT, the legal instrument for enforcement of authority of a court of law, and the judicial process for summoning an offendor. The commencement of every action in the High Court is by the issue of a w. of summons, which may be issued in London or at District Registries, which are established in provincial towns to facilitate proceedings in cases which arise outside the Metropolitan area, and they are under the direction of the District Registrar. W's are issued on the application of the plaintiff or his solicitor. In London the place of issue is the W. Department, at the central office of the High Court of Justice. The fee is 10s. The w. is issued in duplicate, the duplicate being filed at the Court. The form of the w. is prescribed, and on the back of it there must be an endorsement, usually very brief, setting forth the ground of complaint, or the nature of relief which the plaintiff seeks. A true copy of the w. of summons must be served personally on each defendant at any hour of day or night, except on Sundays. The w. commands the defendant to 'cause an appearance to be entered' within eight days, and must be obeyed either by the defendant or his solicitor. A w. of elegit is issued when land is taken to satisfy a judgment. A w. of sequestration is used to enforce the judgments of the Court of Chancery. A w. of

attachment requires the sheriff to arrest and lodge the defendant in gaol.

WRITER'S CRAMP, see CRAMP.

WRITERS TO THE SIGNET, Scot. solicitors who prepare Crown writs; formerly prepared all summonses and writs of the Supreme Court of Justice.

WRITING, the earliest type of w. among primitive peoples is pictorial. Those who are prevented by distance or time from communicating their ideas to others by word of mouth naturally resort to the use of symbolical pictures. Soon these pictorial symbols become conventional, and each word has its definite symbol. A great step is taken when an attempt is made to represent grammatical changes. New symbols are then invented to express syllables. Finally the symbols become phonetic, *i.e.* individual sounds are represented by individual letters. But while verbal and syllabic symbols are common achievements among primitive peoples, the creation of the phonetic alphabet is a rare invention. The oldest known alphabet is the Semitic, dating from about 1000 B.C., and from it most known alphabets are derived.

WROTHAM (51° 19′ N., 0° 17′ E.), town, Kent, England. Pop. (1911) 4169.

WRY-NECK, TORTICOLLIS, is a deformity caused by an affection of the sterno-mastoid muscle, and may be *acute*, due to exposure to cold; *congenital*, due to arrested development or to injury to the sterno-mastoid muscle at birth—treated by massage, and, if necessary, division of the muscle; or *spasmodic*, due to nervous derangement—treated by bromides and application of electricity.

WUCHANG (30° 27′ N., 114° 46′ E.), city, on Yangtse-kiang, Hu-peh, China; cotton mills. Pop. *c.* 66,000.

WUCHOW (23° 30′ N., 111° 15′ E.), treaty port, on Si-kiang, Kwang-Si, China. Pop. (1911) 59,000.

WUHU (31° 20′ N., 118° 30′ E.), treaty port, on Yangtse-kiang, Ngan-hui, China; exports rice. Pop. (1911) 122,000.

WULFENITE, mineral consisting of lead molybdate; found in lead ore.

WULFSTAN (d. 1023), bp. of Worcester, 1003–1016; abp. of York, 1003–23; various homilies bear his name.

WULFSTAN, ST. (1012–75), bp. of Worcester, 1062; last Anglo-Saxon bp.

WUNDT, WILHELM MAX (1832–), Ger. philosopher; b. Neckarau; studied med., and lectured at Heidelberg; assistant prof. (1864); prof. of Philosophy at Zürich (1874) and Leipzig (1875), where he founded an Institute of Experimental Psychology; wrote on physiology, psychology, logic, and ethics, *System der Philosophie* (1899).

WUNTHO (23° 56′ N., 95° 45′ E.), petty native state, Upper Burma; came under Brit. administration, 1891. Pop. 160,000. Capital, Wuntho.

WUPPER (51° 13′ N., 77° E.), river, Rhineland, Prussia; joins Rhine below Cologne.

WÜRTTEMBERG (47° 35′ to 49° 35′ N., 8° 15′ to 10° 30′ E.), kingdom, S. Germany; bounded N. by Baden and Bavaria, E. by Bavaria, S. by Switzerland, W. by Baden; area, 7534 sq. miles. Surface is generally undulating, reaching an extreme height of over 3780 ft. in Mt. Baiersbronn in the Black Forest region in W.; drained by Danube, Neckar, and other streams; large area forested.

W. was raised to a duchy for Eberhard I. by the Emperor Maximilian, 1495; became an electorate, 1803; and, having supported France against Austria, was raised to the rank of a kingdom by the Treaty of Pressburg, 1805. Constitution is a limited monarchy reigning sovereign, Wilhelm II. (1848–), king since 1891; legislative power is vested in a Parliament of two chambers. W. is represented by four members in the Bundesrath and seventeen members in the Reichstag. Its military force, of about 24,500 men, forms the XIII. corps of German army.

Chief towns are Stuttgart (capital), Ulm, Heilbronn, Esslingen. Chief industry is agriculture; live stock is extensively raised; wheat, oats, rye, potatoes, turnips, and other crops cultivated; minerals include salt, iron, limestone; manufactures textiles, paper, leather, hardware, tobacco, beer, spirits, firearms, gunpowder, etc. Exports cereals, live stock, timber, gunpowder, textiles, etc.

Education is free and obligatory; Tübingen is seat of a univ. Religions are Prot., R.C., Jewish. Pop. (1910) 2,437,574.

WURTZ, CHARLES ADOLPHE (1817–84), Fr. chemist; discovered phosphorus, oxychloride, and phosphorous acid; converted alkyl isocyanates into amines; showed sodium action on alkyl halides; prepared ethylene oxide and glycols; explained constitution of glycerine; studied condensation of aldehyde to aldol.

WÜRZBURG (49° 47′ N., 9° 56′ E.), town, on Main, Bavaria, Germany; dates from VII. cent.; famous cathedral (XI. cent. onwards), Romanesque Church of St. Burkart, Neumünster (XI. cent.); royal castle (1720–44), univ. (refounded, 1582), with celebrated medical school; mathematical, surgical, and musical instruments, machinery, printing-presses, breweries, tobacco. Pop. (1910) 84,496.

WURZEN (51° 22′ N., 12° 44′ E.), town, on Mulde, Saxony; manufactures machinery. Pop. 17,200.

WYANDOTTE (42° 12′ N., 83° 10′ W.), city, on Detroit, Wayne County, Michigan, U.S.A.; shipyards; manufactures salt, chemicals. Pop. (1910) 8287.

WYANDOTTE CAVE, cave, 5 miles N.E. of Leavenworth, Crawford County, Indiana, U.S.A.; noted for its immense chambers and its stalagmites and stalactites.

WYATT, SIR THOMAS (1503–42), Eng. poet and diplomatist; held court appointments under Henry VIII.; P.C., 1533; lover of Anne Boleyn; ambassador to Charles V., 1537–39; imprisoned in Tower, but released, 1541. Author of 'Certain Psalmes' done into English metre, 1549, and many rondeaus and lyrics, pub. as *Songes and Sonettes*, 1557; introduced sonnet from Italy, and with Surrey (*q.v.*) reformed Eng. verse.

WYATT, SIR THOMAS (d. 1554), Eng. rebel who led the national opposition to Queen Mary's marriage; advanced with troops as far as Ludgate Hill, but was forced to disband; beheaded.

WYCHERLEY, WILLIAM (c. 1640–1716), Eng. dramatist; b. Clive; ed. Oxford, admitted to Inner Temple; entered army, and may have seen service at sea against Dutch; m. (secretly) Countess of Drogheda; lost court favour; a friend of Pope and other literary lions of his day. W. is one of the leading Restoration dramatists; a master of intrigue, but less brilliant and imaginative than Congreve. His best comedies are *Love in a Wood* (1671), *The Gentleman Dancing-Master* (1672), *The Plain Dealer* (1674) (adapted from Molière's *Le Misanthrope*), and *The Country Wife* (1675). A collection of poems appeared, 1704; and posthumous works were pub., 1728.

Edition by Ward (1893).

WYCLIFFE, JOHN (*c.* 1320–84), Eng. Reformer; b. near Richmond, Yorkshire; fellow and master of Balliol Coll., Oxford, 1356–60; presented to the Crown living of Lutterworth, 1374; recognised as a popular preacher in London, and as the friend of John of Gaunt; hostile critic of Papacy in State matters; pub. *De civili dominio*, in which he maintained that Church should not meddle with temporal affairs, the clergy should not hold property, it was lawful for the State to deprive unworthy clergy of property. W. was summoned to appear before the abp. of Canterbury at St. Paul's, 1377; John of Gaunt's supporters broke up the trial, and a riot ensued. Pope Gregory XI. condemned 18 'conclusions' from W.'s writings, 1378. Meantime W. had been engaged (with Nicholas Hereford and John Purvey) on an Eng. translation of the Bible from the Lat. Vulgate, and in organising

a band of secular priests as itinerant preachers. In 1379 he pub. *De officio regis*, declaring the king's to be above the pope's jurisdiction. Two years later in *De eucharistia* he questioned doctrine of Transubstantiation. (For the Peasant Revolt in 1381 W. cannot be held responsible. His works were in Lat., and were unknown to the peasant leaders, who, however, were hotly opposed to John of Gaunt, W.'s protector.) In 1382 a court, called by the abp. of Canterbury, and consisting of bishops and theologians, condemned 10 articles in W.'s works as heretical and 14 as erroneous, but W. was unmolested. He retired to Lutterworth, and d. there of a stroke while hearing Mass. His followers were few, and his influence in England had ceased within a hundred years. But in Bohemia John Huss was a disciple, and made a national religion of W.'s doctrines.

G. M. Trevelyan, *England in the Age of Wycliffe*; Gairdner, *Lollardry and the Reformation*.

WYCOMBE, Chepping or High Wycombe (51° 38′ N., 0° 45′ W.), town, Buckinghamshire, England; manufactures chairs. Pop. (1911) 20,390.

WYE (51° 57′ N., 2° 37′ W.), river, England; rises in Plinlimmon; joins estuary of Severn; length, 130 miles.

WYKEHAM, WILLIAM OF, see William of Wykeham.

WYLIE, ALEXANDER (1815–87), missionary in China and learned in Chinese lore.

WYMONDHAM (52° 34′ N., 1° 7′ E.), town, Norfolk, England.

WYNAAD, Wainad (11° 45′ N., 76° E.), tableland of W. Ghats, Malabar, Madras, Brit. India; gold mines; tea and coffee plantations.

WYNTOUN, ANDREW OF (d. *c.* 1420), Scot. rhyming chronicler; his *Orygynale Cronykle of Scotland* is of great value philologically.

WYOMING (41° to 45′ N., 104° 3′ to 111° 3′ W.), one of the N.W. centre states of the U.S. Bounded N. by Montana, E. by S. Dakota and Nebraska, S. by Colorado and Utah, W. by Utah, Idaho, and Montana; area, 97,914 sq. miles; the surface on either side of the Rocky Mountains (main range, 12,200 to 13,800 ft.) forms plateau of from 7000 to 8000 ft. above sea-level; chief ranges are the Wind River, Teton, Salt River, Owl Creek, and Laramie Mountains, and among the highest peaks are Frémont Peak (13,790 ft.), Grand Teton (c. 13,700 ft.), Gannett Peak (13,770 ft.), and Chauvenet Peak (13,000 ft.); watered by Green, Snake, Yellowstone, Big Horn, Powder, N. Platte, and other streams. There are pine forests among the hills, and in the N.W. is Yellowstone National Park (*q.v.*). The climate is temperate and healthy in the lower districts, more severe in the mountains.

W. was not permanently settled by white men until the second half of the XIX. cent.; the discovery of gold caused a great influx of population in 1867–68, and the country was organised as a territory, 1869; admitted to Union as a state, 1890. Executive power is vested in a governor, assisted by various officers of state; legislative power is in hands of a Senate of 27 members and a House of Representatives of 56 members, elected for four and two years respectively by popular vote.

Chief towns are Cheyenne (capital), Laramie, Sheridan. Large area is covered with valuable timber; there is excellent grazing land, and large numbers of cattle and sheep are raised. Mining is most important industry, minerals found including coal, gold, silver, copper, iron, tin, soda, limestone, salt, petroleum. Railway mileage about 1620. Education is free and obligatory. Principal religions are R.C., Mormon, Protestant Episcopal. Pop. (1910) 145,965.

Raine, *Wyoming* (New York, 1909).

WYOMING VALLEY (41° N., 104° W.), fertile valley, Luzerne County, Pennsylvania, U.S.A.; 20 miles long and 3–4 miles wide; traversed by the N. branch of the Susquehanna; contains anthracite coal deposits; scene of Campbell's 'Gertrude of Wyoming.'

WYSE, SIR THOMAS (1791–1862), Irish statesman; m. Lætitia, dau. of Lucien Bonaparte; worked for R.C. emancipation and other patriotic measures; Brit. ambassador to Greece, 1849.

WYTTENBACH, DANIEL ALBERT (1746–1820), classical scholar; b. Bern; ed. Marburg, Göttingen, and Leiden. At Leiden he fell under influence of Ruhnken; app. prof. of Greek at the Coll. of the Remonstrants in Amsterdam, 1771; prof. of Philosophy at the Athenæum, 1779; succ. Ruhnken at Leiden, 1799. His wife, who survived him, wrote several books, and in 1827 was given the degree of Doctor in Philosophy at Marburg. W.'s chief works include an edition of Plutarch's *Moralia* (pub. Oxford), *Life of David Ruhnken* (in Lat.), an edition of Plato's *Phædo*. Mahne, *Life* (1823).

X, 24th letter of alphabet; descended from Semitic *Samech* through Gk. *xi*; pronounced *ks*, but *z* when initial consonant, e.g. *Xenophon*.

XANTHI, Eskije (41° 12′ N., 24° 53′ E.), town, on Eskije, vilayet Adrianople, European Turkey; noted for tobacco. Pop. *c.* 13,000.

XANTHIC ACID ($C_2H_5O.CS.SH$), heavy organic acid, decomposing at 25° C.; the cupric salt is yellow, whence name (Gk. *xanthos*, yellow).

XANTHINE, Xanthin ($C_5H_4N_4O_2$), is an organic substance found in muscle, the liver and pancreas, and in urine; oxidises to urea when treated with HCl or $KClO_3$; when oxised with chromic acid it gives **Xanthone** ($C_{13}H_8O_2$),—white crystalline needles; M.P. 174° C.; B.P. 350° C.,—which is the parent of several dyestuffs.

XANTHIPPE, wife of Socrates; traditionally notorious as a virago.

XANTHOXYLUM, genus of trees and shrubs, order Rutaceæ; species is Prickly Ash or Toothache Tree (*X. fraxineum*).

XANTHUS (36° 20′ N., 29° 25′ E.), ancient city, on Xanthus, Lycia, Asia Minor; besieged and destroyed by the Persians under Harpagus, *c.* 545 B.C., and by the Romans under Brutus, 43 B.C.

XAVIER, FRANCIS (1506–52), Catholic saint, of Span. birth; ed. Paris; became friend of St. Ignatius Loyola; set sail for India, 1540; preached at Goa, Travancore, Ceylon, Malay Archipelago, Japan, Malacca, Singapore; d. of fever on St. John Island; canonised, 1621; miracles were attributed to him; in person he was short and fair, and like other mystics was very practical; of undoubted power of evangelisation.

XENARTHRA, a sub-order of the Edentates (*q.v.*).

XENIA (39° 40′ N., 83° 52′ W.), city, capital, Greene County, Ohio, U.S.A.; seat of Xenia Theological Seminary; manufactures cordage, twine. Pop. (1910) 8706.

XENOCRATES OF CHALCEDON (396–314 B.C.), Gk. philosopher; disciple of Plato, on whose death he accompanied Aristotle to the court of Hermeias of Atarneus and Assus; returning to Athens, he succ. Speusippus as head of the Academy.

XENOPHANES OF COLOPHON (fl. VI. cent. B.C.), a satiric poet who attacked the anthropomorphism of popular religion; sometimes, but without sufficient reason, regarded as the founder of the Eleatic school (*q.v.*).

XENOPHON (*c.* 430–355 B.C.), Gk. historian; joined Gk. mercenaries, who followed Cyrus against Persia. Cyrus was slain and Xenophon led the 'Retreat of the Ten Thousand' through Armenia to the Black Sea; subsequently attached himself to Agesilaus, king of Sparta. Late in life wrote his masterpieces—mainly reminiscences: the *Anabasis*, a narrative of the retreat of the 10,000; the *Memorabilia*, reminiscences and memorials of Socrates — whom he revered; *Agesilaus*, a memoir; and *Hellenica*, which covers 49 years of Gk. history.

XENOPHYOPHORA, see under Rhizopoda.

XERES, see Jerez de la Frontera.

XERXES I. (*c.* 519–465 B.C.), king of Persia (485); led the great expedition against Greece, which was withstood at Thermopylæ by the immortal 300. The Persian fleet was destroyed at Salamis, and he retired after destroying Athens; murdered by Artabanus, he was succ. by his s., X. II.

XIMENES DE CISNEROS, FRANCISCO, Jimenes (1436–1517), Span. (Castilian) ecclesiastic and statesman; chaplain to Cardinal Mendoza, 1480; became Franciscan monk, 1483; famous for austerities; confessor to Queen Isabella, 1492; provincial of Franciscan order, 1494; reformed monastic system; abp. of Toledo, 1495; regent, 1506; cardinal, 1507; subsequently inquisitor-gen.; led expedition to N. Africa, captured Oran, 1509; regent of Castile, 1516; dismissed by Charles V., 1517.

XIPHOSURA, see Arachnida, King-Crab.

X-RAYS, see Röntgen Rays.

XYLOCOPA, see Carpenter Bees.

Y, 25th letter of alphabet; derived from Gk. *upsilon*; ȝ in M.E. *g* and *y* were confused, hence use of *y* as consonant in *yard* (O.E. *geard*).

YABLONOI (53° N., 115° E.), range of mountains, E. Siberia, extending from Urga, N.E. to Chita; highest point, Mount Sokhondo, 8040 ft.

YACHOW-FU (29° 58′ N., 102° 55′ E.), town, on Ya, Sze-chuen, China; tea. Pop. 38,000.

YACHTING, cruising or racing in boat built for pleasure; first known yacht was built for Queen Elizabeth (1588) at Cowes; first race on record was between Charles II.'s yacht and the Duke of York's (1662); first club founded was *Cork Harbour Water Club* (1720), existing still as the Royal Cork Yacht Club The *Yacht Club* was founded at Cowes, 1812, and became the Royal Yacht Squadron, 1820. There are now nearly 50 yacht clubs in Great Britain, and the sport has spread to France, U.S.A., Germany, Belgium, Spain, and other countries. In 1844 the New York Yacht Club was formed, which has remained the leading Amer. club. The type of boat used as a racer has gradually changed, especially since 1850; the schooner has given place to the cutter both for racing and cruising. The chief European racing centres are Cowes, Kiel, the Clyde, Nice, Ostendo, and San Sebastian. The chief international race is for the America Cup, won in 1851 by the *America*. Repeated unsuccessful attempts have been made since to bring back the cup to Britain, notably by Lord Dunraven (1893–94–95) and Sir Thomas Lipton (1899, 1901–3). The latter's challenge has again been accepted by America, 1913.

Steam has largely displaced sails for large cruising yachts, or has been added as an auxiliary.

Latterly, motor boats of considerable size have come into favour for cruising, and for some years past Monte Carlo has been famous for its motor-boat races. Yachting has produced a large literature both of books and treatises, and of periodicals, the leading ones being *Yachting*, *Le Yacht*; see also the annual Lloyd's *Yacht Register* and *The Yacht-Racing Calendar*.

YAK, see Ox Group.

YAKUB KHAN, see Afghanistan.

YAKU-SHIMA (30° 20′ N., 130° 30′ E.), island of Japan, S. of Kiushiu.

YAKUTSK (54° to 72° 30′ N., 104° to 170° E.), province, Siberia; area, 1,520,253 sq. miles; bounded N. by Arctic Ocean, W. by Yeniseisk, Irkutsk, S. by Transbaikalia, Amur, E. by Primorskaya. Surface level in N., mountainous in S.; drained by Lena and its affluents, Yana, Indighirka, Kolyma; produces rye, barley; cattle raised; exports furs, walrus-teeth; minerals include gold, salt, iron. Pop. (1910) 315,600. Capital, **Yakutsk** (61° 58′ N., 129° 44′ E.), near Lena; furs. Pop. 7500.

YALE UNIVERSITY, New Haven, Connecticut, U.S.A.; founded 1701; named after Elihu Yale, a Boston benefactor, in 1718; third oldest univ. in U.S.A. Calvinistic theology was the doctrinal basis of teaching; half the corporation is still clerical, and daily attendance at prayers is obligatory. The second professorship of Math's and Natural Philosophy was established, 1770, Medical School, 1813, Modern History, 1847, Law School, 1843. There are now 4 chief departments: arts, theology, med., and law. Degrees were thrown open to women, 1892. The arts and medical course each take 4 years, divinity and law, 3 years. There are also schools of forestry (2 years) and science (5 years, for engineering). The number of tutors, lecturers, etc., is 496, and there are 3000 students.

YALTA (44° 28′ N., 34° 7′ E.), seaport, resort, Taurida, Russia. Pop. 15,100.

YALU (40° 23′ N., 125° E.), river, forming boundary between Korea and Manchuria. For Battles of Y., see Japan (Russo-Japanese War) and China (History).

YAM, tuberous root of species of *Dioscorea*, used as food in tropics.

YAMBOLI (42° 29′ N., 26° 33′ E.), town, on Tunja, Bulgaria; agricultural district. Pop. (1910) 15,956.

YAMETHIN (20° 27′ N., 96° 9′ E.), district, Upper Burma. Pop. 245,000. Capital, **Yamethin**. Pop. 9200.

YANAON, Yanam (16° 44′ N., 82° 15′ E.), Fr. settlement, Godavari, Madras, India; area, 5 sq. miles. Pop. 5200.

YANCEY, WILLIAM LOWNDES (1814–63), Amer. barrister, newspaper editor, and member of Congress; active supporter of secession policy in S. States; sent as commissioner to Europe, 1861–62, to obtain recognition of Confederate States; sat in Confederate Senate, Richmond.

YANG-CHOW-FU (32° 25′ N., 119° 22′ E.), city, on Grand Canal, Kiang-su, China. Pop. *c.* 100,000.

YANGTSE-KIANG (31° 15′ N., 121° 45′ E.), largest river of China and chief commercial highway of the country; rises in the mountains of Tibet; traverses all the central provinces of China, and after a tortuous course of 3200 miles enters the Yellow Sea above Shanghai; receives numerous tributaries; communicates by the Grand Canal with Hoang-ho River; navigable to I-chang.

YANINA, see Janina.

YANKEE, supposed corruption of word 'English' by N. Amer. Indians; term applied to New Englanders during War of Amer. Independence; now slang for native of U.S.A.

YANKTON (42° 57′ N., 97° 20′ W.), city, on Missouri, Yankton County, S. Dakota, U.S.A.; grain-elevators; seat of Yankton Coll. Pop. (1910) 3787.

YAPOCK, see under Marsupials.

YARD, see Weights and Measures.

YARKAND (38° 24′ N., 77° 22′ E.), town, on Yarkand Darya, Chin. Turkestan; rich oasis; important trade centre; manufactures leather. Pop. *c.* 95,000.

YARMOUTH.—(1) Great Yarmouth (52° 36′ N., 1° 44′ E.), port, on Yare, Norfolk, England; has fine parish church; great centre of herring and deep-sea fishing; noted for Y. bloaters. Y. Roads is a large anchorage off the port, protected by sandbanks. Pop. (1911) 55,808. (2) (50° 42′ N., 1° 29′ W.) small seaport, on Solent, Isle of Wight, England. (3) (43° 49′ N., 66° 6′ W.) seaport, port of entry, Yarmouth County, Nova Scotia, Canada. Pop. 6600.

YARN, fibrous matter made into thread for weaving, by process of cleaning, bleaching, spinning into 'hanks,' and finally by dehydrating; warp y. stronger and more elastic than weft y.; best cotton yarn weighs 1 lb. for every 588,000 yds. of thread; ordinary, 250,000 yds. per lb.; fine linen thread weighs 1 lb. for 180,000 yds.; ordinary, 60,000 yds. per lb.; woollen thread is much heavier.

YAROSLAVL (58° N., 39° E.), government, central Russia; consists of a broad depression traversed by Volga; much occupied by marshes and forests; soil not very fertile; flax widely grown; manufactures cotton, linen, flour, tobacco. Pop. (1910) 1,218,300. Capital, **Yaroslavl** (50° 36′ N., 40° 12′ E.), at junction of Volga and Kotorost; cotton-mills. Pop. (1910) 81,100.

YARRELL, WILLIAM (1784–1856), Brit. natural-

ist; b. London; entered business as newspaper agent; wrote *History of British Fishes* (1836), *History of British Birds*; famous as angler and shot.

YARROW (55° 33′ N., 3° 3′ W.), stream, Selkirkshire, Scotland; issues from St. Mary's Loch and joins Ettrick near Selkirk.

YASSY, see JASSY.

YATES, EDMUND (1831-94), Eng. novelist and journalist; founder of *The World*.

YATSAUK, LAWKSAWK (21° 15′ N., 96° 50′ E.), Shan State, Burma. Pop. *c.* 27,800. Capital, Yatsauk (Lawksawk).

YATUNG (28° N., 88° 40′ E.), trade-market, on Sikkim frontier, Tibet.

YAUCO (18° N., 66° 50′ W.), city, Porto Rico; coffee and tobacco region. Pop. 28,000.

YAWS, contagious tropical disease, characterised by a granulomatous eruption, running a very chronic course and caused by a micro-organism, *Spirochæta pertenuis*; the first symptoms are fever, digestive disturbances, and pains, then the eruption appears in the form of papules, which grow and burst through the surface of the skin, having a raspberry appearance and a white slough around them, the eruption appearing in successive crops; the treatment is isolation of patient, antiseptic dressings on eruption, hot baths to bring eruption out, and potassium iodide, arsenic, or iron internally.

YEADON (53° 52′ N., 1° 41′ W.), town, Yorkshire; wool. Pop. (1911) 7442.

YEAR, see CALENDAR, CHRONOLOGY.

YEAST, see BREWING.

YEATS, WILLIAM BUTLER (1865-), Irish author; s. of artist; b. Dublin. He is one of the leaders of the 'Celtic' movement, and has established an Irish literary theatre.

YECLA (38° 36′ N., 1° 6′ W.), town, Murcia, Spain. Pop. 20,000.

YEDO, TOKYO (*q.v.*).

YEISK (46° 38′ N., 38° 18′ E.), town, on Sea of Azov, Kuban, Russia; exports grain, flax. Pop. (1910) 46,310.

YELL, see SHETLAND ISLANDS.

YELLOW FEVER, acute specific disease occurring in tropical climates and sometimes in seaports, characterised by fever, jaundice, gastro-intestinal disturbances, and a state of prostration; caused by a specific micro-organism, conveyed by a mosquito, while unhealthy conditions predispose to the disease. The incubation period is short and the onset usually sudden, the temperature rising and remaining elevated for three or four days; albumen is present in urine; jaundice and vomiting, both of which may be very severe, come on soon; symptoms usually begin to diminish about 4th day, and recovery takes place in 2 or 3 weeks, but patient may become prostrated, symptoms increase in severity, and death ensues. Treatment consists in first clearing the bowels with a laxative, and then administering salines; a light fluid diet is given, milk and water only, at first; ice is given for the vomiting, and stimulants, *e.g.* brandy diluted with water, may be necessary; a serum which kills the micro-organisms must be given in early stages of the disease to have successful results.

YELLOW RACES, see RACES OF MANKIND.

YELLOW RIVER, see HOANG-HO.

YELLOW-HAMMER, see EMBERIZIDÆ.

YELLOWSTONE NATIONAL PARK (*c.* 44° 35′ N., 110° 30′ W.), in N.W. corner of Wyoming, a wonderful region of cañons, cataracts, hot springs, geysers, and mud volcanoes; Yellowstone River passes through Grand Cañon, and near it towards S. of park stands a calcareous mass of terraces with many-coloured rocks, known as White Mountain. Geysers are finest in world, and are most remarkable feature of district. Most of area is thickly forested. Region was set apart as a national park by Congress, 1872, and a body of cavalry is employed to prevent destruction of forests and wild animals; result is that many species of animals which have elsewhere been exterminated have found refuge here.

YEMEN (12° 30′ to 17° 30′ N., 42° 30′ to 46° E.), S.W. province, Arabia, Asiatic Turkey; area, 73,800 sq. miles; borders on Red Sea. Surface is generally mountainous, with low plains along Red Sea coast; chief towns are Mocha, Sana, Damar, Hodeida. Live stock raised; produces coffee. Has been nominally subject to the Porte since 1872. Pop. *c.* 750,000.

YENIKALE, see KERCH.

YENIPAZAR, see NOVIBAZAR.

YENISEI (67° N., 87° E.), river, Siberia; rises in N.W. part of Mongolia and flows generally N., to Arctic Ocean; length, 3000 miles.

YENISEISK (52° to 77° N., 79° to 115° E.), government, Siberia, lying between Arctic Ocean and Mongolia; area, 981,607 sq. miles. Surface is level or undulating in N., mountainous in S.; watered by Ob, Yenisei, and other streams; large area covered with dense forests; has gold and silver mines; produces cereals Pop. (1910) 859,100. Capital, **Yeniseisk** (58° 27′ N., 92° 16′ E.), on Yenisei; gold-mining centre. Pop. 12,500.

YEOLA (20° 4′ N., 74° 31′ E.), town, Nasik, Bombay, Brit. India; cotton manufactures. Pop. 17,200.

YEOMAN, a freeholder, but sometimes free or customary tenant; estimated at 35,474 in Domesday Book; diminished in XVI. and again in XVIII. cent. when enclosures and large holdings squeezed out the small proprietor.

YEOMANRY, IMPERIAL, Brit. volunteer cavalry force now part of Territorials; each regiment has 4 squadrons and a machine-gun section. See ARMY, VOLUNTEERS.

YEOMEN OF THE GUARD.—A candidate for appointment must have served in the army as a warrant-officer or N.C.O. not under the rank of sergeant; he must be of exemplary character, under 50 years of age, not less than 5 ft. 10 in. in height, and in possession of at least one medal for field service. On state occasions the Yeomen of the Guard, dressed in the uniform of Henry VIII.'s time, form part of the royal procession. Permanent employment is afforded to many of the Yeomen at the Tower of London, where they act as guides to visitors; are popularly known as 'The Beefeaters.'

YEOTMAL (20° 23′ N., 78° 11′ E.), town, Berar, India. Pop. 12,000; (district) 600,000.

YEOVIL (50° 57′ N., 2° 37′ W.), town, on Yeo, Somersetshire, England; manufactures gloves. Pop. (1911) 13,760.

YETHOLM (55° 33′ N., 2° 16′ W.), village, on Bowmont Water, Roxburghshire, Scotland; headquarters of a tribe of gipsies.

YEW (*Taxus baccata*), a coniferous tree with poisonous evergreen foliage; female flower on fertilisation produces a hard seed surrounded by a red, succulent aril; timber of considerable value and formerly used for bows; attains great age; common in churchyards.

YEZD (32° 5′ N., 54° 46′ E.), city, capital, province Yezd, Persia; on several important caravan routes; manufactures silk, cotton. Pop. *c.* 55,000.

YEZO, Ezo, HOKKAIDO (41° 30′ to 45° 30′ N., 139° 50′ to 146° 8′ E.), one of main islands of Jap. empire, lying between Sakhalin and Hondo; area, 36,299 sq. miles; surface generally mountainous, reaching extreme height of *c.* 8200 ft. in Tokachi-Dake, in N. Has some active volcanoes; covered with thick forests; chief towns, Hakodate, Otaru. Produces coal, gold; game abundant. Administered by governor. Pop. 1,150,000.

YIDDISH, see HEBREW LANGUAGE.

YO-CHOW-FU (29° 28′ N., 113° E.), city, on Yangtse-kiang, Hu-nan, China. Pop. *c.* 21,000.

YOKOHAMA (35° 30′ N., 139° 35′ E.), treaty-port, on Tokyo Bay, E. coast of Hondo, Japan; large trade. Pop. 395,000.

YOKOSUKA, YOKOSHA (35° 10′ N., 139° 40′ E.),

seaport, naval station, on Hondo, Japan; shipbuilding yards, arsenals, dockyards. Pop. 75,000.

YOLA (9° 10′ N., 12° 11′ E.), province, Brit. Nigeria Protectorate; fertile; watered by Benue. Pop. *c.* 320,000. Capital, Yola.

YONGE, CHARLOTTE MARY (1823–1901), Eng. novelist; popular works are *Heir of Redcliffe*, *Daisy Chain*.

YONKERS (40° 59′ N., 73° 54′ W.), city, on Hudson, Westchester County, New York, U.S.A.; residential suburb of New York; carpets, sugar, hats. Pop. (1910) 79,803.

YONNE (47° 50′ N., 3° 30′ E.), department, France, formed from parts of ancient Burgundy, Champagne, and Gâtinais; hilly and undulating; forests in N.; chief river the Yonne; very fertile, producing cereals, wine. Pop. (1911) 303,889. Capital, Auxerre.

YORCK VON WARTENBURG, COUNT, HANS DAVID LUDWIG (1759–1830), Pruss. soldier; broke alliance with France, and withdrew the Pruss. army from invasion of Russia, 1812; conspicuous in the campaigns against France, 1813–14, notably at Dannekow, Bautzen, Wartenburg, and Leipzig; retired after Waterloo.

YOREDALE SERIES, part of Lower Carboniferous rocks of N. England; typically developed in Yoredale, Yorkshire.

YORK.—(1) (53° 58′ N., 1° 4′ W.) county town, W. Riding, Yorkshire, England, standing at junction of Foss and Ouse; still has its old walls and several old gates; abp.'s see; fine cathedral dating in part from XII. cent., and has some mediæval stained glass in the east window; several other interesting old churches, and ruins remain of Benedictine monastery; archiepiscopal palace is at Bishopthorpe, 3 miles to S. Y. is important railway and agricultural centre; manufactures flour, beer, hardware. In Rom. times Y. (*Eboracum*) was capital of the N., a position it continued to hold in Middle Ages; during Civil War of XVII. cent. it was besieged by Roundheads, to whom it eventually surrendered in 1644. Pop. (1911) 82,297. (2) (39° 54′ N., 76° 49′ W.) city, capital, York County, Pennsylvania, U.S.A.; manufactures agricultural implements, cars. Pop. (1910) 44,750. (3) (40° 50′ N., 97° 38′ W.) city, capital, York County, Nebraska, U.S.A.; manufactures flour, foundry products. Pop. (1910) 6235. (4) (43° N., 70° 40′ W.) town, summer resort, on Atlantic coast, York County, Maine, U.S.A.

YORK, DUKEDOM OF.—Edmund, 5th s. of Edward III. was cr. Duke of Y. in 1385, and his s. Edward succ. to the title. Richard, the s. of Edward's younger bro. Richard, on Edward's death at Agincourt succ., and as he was the nephew of Edmund Mortimer, great-grandson of Lionel, Duke of Clarence (3rd s. of Edward III.), he inherited a nearer title to the throne than Henry VI. (great-grandson of the 4th s. of Edward III.). His claim, in a period of misgovernment, gave rise to the WARS OF THE ROSES, and Richard fell at Wakefield, 1460. The HOUSE OF YORK began in him, and the YORK DYNASTY in his s. Edward IV., the dynasty becoming merged in the HOUSE OF TUDOR by the marriage of Henry VII. with Edward's daughter.

YORK, EDWARD, DUKE OF (*c.* 1373–1415), eld. s. of Edmund, Duke of York; chief adviser of Richard II. and was implicated in the murder of Gloucester; involved in several plots during the reign of Henry IV. and was killed at Agincourt.

YORK, FREDERICK AUGUSTUS, DUKE OF (1763–1827), second s. of George III.; cr. Duke of York and Albany and Earl of Ulster, 1784; m. Princess Frederica of Prussia, 1791; became commander-in-chief, 1798.

YORK, RICHARD, DUKE OF (1411–60), claimant to Eng. throne. His first important command was as lieutenant-general of France and Normandy, but he resigned command as the home-support did not further his efforts (1437); took up the command for a second time, 1441, but with the same result. By the death of Humphrey of Gloucester, Y. became heir-apparent, and in 1450 asserted his claims by arms, but was reconciled to the king. At the birth of a prince of Wales, Y. became protector; followed up his victories at St. Albans, etc., with moderation, but he had to reassert his position with force until he was proclaimed heir-apparent (1460). He was, however, finally surprised at Wakefield by the Lancastrians and slain.

YORKE, CHARLES (1722–70), Eng. lawyer; Bencher of Lincoln's Inn, and K.C., 1754; M.P., 1747; Attorney-Gen., 1762; resigned, 1763; left Pitt for Rockingham Whigs, and again Attorney-Gen., 1765–67; Chancellor, 1770.

YORKSHIRE (53° 18′ to 54° 40′ N., 0° 10′ E. to 2° 39′ W.), largest county of England; bounded N.W. by Westmoreland, N. by Durham, E. by North Sea, S. by Lincoln, Notts, and Derbyshire, S.W. by Cheshire, W. by Lancashire; area, 6067 sq. miles. Surface undulates upwards from coast to extensive stretches of moorland stretching westward to the Pennine Chain, which has here an extreme height of nearly 2600 ft.; the centre of the county is a plain known as the Vale of York; drained by the Hull, Derwent, Swale, Ure, Nidd, Yorkshire Ouse, Wharfe, and Aire (all of which belong to the basin of the Ouse itself), and by the Don, both Ouse and Don entering Humber estuary; in N. a small portion drains to Tees, and along N.E. some small streams flow direct to sea. County is divided into three Ridings (from O.E. *thridding*, 'third part'); in E. Riding the industries are mainly centred about Hull; in N. Riding there is coal, iron, salt, lead, barytes; and W. Riding has a large coal-field, with manufactures of woollens, linen, cutlery, hardware, as well as iron-smelting. Agriculture is carried on, especially in E. Riding; chief crops are oats, barley, and wheat; horses, cattle, and sheep are raised. Chief towns are York (capital), Leeds, Sheffield, Bradford, Huddersfield; chief ports, Hull, Whitby, Middlesborough, Scarborough. Y. was conquered by Romans in I. cent.; suffered from Dan. invasions in IX. and XI. cent's, and at hands of Normans at the Conquest; was scene of various battles in Wars of the Roses and Civil War of XVII. cent. Has many remains of religious houses. Pop. (1911) 2,054,729.

YORKTOWN (37° 8′ N., 76° 37′ W.), town, on York River, capital, York County, Virginia, U.S.A.; scene of surrender of Cornwallis to Washington, 1871.

YORUBALAND (6° 20′ to 9° N., 2° to 6° E.), region, S. Nigeria, W. Africa; comprises the old kingdoms of Itschin and Ife; area, *c.* 70,000 sq. miles; produces palm oil, ivory, cotton, shea butter; chief port is Lagos, whence a railway runs to Jebba in N. Nigeria. Natives are negroes of low stature. Pop. *c.* 2,000,000.

YOSEMITE (37° N., 118° W.), valley, in W. slope of Sierra Nevada Mountains, California, U.S.A.; length, 6 miles, width, ½–1 mile; enclosed by walls of rock rising 3000–6000 ft.; traversed by Merced; magnificent scenery; discovered, 1851; granted as a State park, 1864.

YOUGHAL (51° 57′ N., 7° 51′ W.), seaport, watering-place, on Blackwater, County Cork, Ireland; exports corn; fisheries. Pop. 5350.

YOUNG, ARTHUR (1741–1820), Eng. agricultural writer. In actual practice his experiments were very unsuccessful, but through his writings agriculture was raised to the level of a science. His more notable works are *A Six Months' Tour through the North of England* and *The Farmer's Calendar*. He was editor of *The Annals of Agriculture*.

YOUNG, BRIGHAM (1801–77), see under MORMONS.

YOUNG, EDWARD (1683–1765), Eng. poet; b. Upham, Hampshire. His first poem of consequence was an *Epistle* to George Grandville, which is saturated with his characteristic flattery. In 1719 his bombastic tragedy, *Busiris*, was produced at Drury Lane, and at this period he was financed by the dissolute Marquis of Wharton. In 1721 his tragedy, *The Revenge*, was pro-

duced, with little success. His *Satires* were much more successful. But it is as the author of *Night Thoughts* that he is now remembered.

YOUNG, JAMES (1811–83), Scot. industrial chemist; produced oil from bitumen and shale.

YOUNG, THOMAS (1773–1829), Eng. physician and physicist; discovered interference of light; contributed much to undulatory theory and theory of colour perception.

YOUNG MEN'S CHRISTIAN ASSOCIATION (Y.M.C.A.), founded in London, 1844, by Sir George Williams; membership about 500,000; its members have to be orthodox Christians and of good character.

YOUNGSTOWN (41° 7′ N., 80° 42′ W.), city, on Mahoning, Mahoning County, Ohio, U.S.A.; iron and steel manufactures. Pop. (1910) 79,066.

YPRES (40° 50′ N., 2° 53′ E.), town, on Yperlée, W. Flanders, Belgium; cathedral; manufactures linen, lace. Pop. 16,900.

YPSILANTI (42° 15′ N., 83° 40′ W.), city, on Huron, Washtenaw County, Michigan, U.S.A.; seat of State normal coll.; manufactures paper. Pop. (1911) 6230.

YPSILANTI, ALEXANDER, HYPSILANTI (1725–1805), a Phanariot Greek, hospodar of Wallachia and Moldavia, was executed at Constantinople. His s. CONSTANTINE, and grandson ALEXANDER, were actively anti-Turkish, and the latter proclaimed independence of Greece, 1821, but d. in exile at Vienna. DEMETRIUS (1793–1832) commanded the Gk. army, 1828–30.

YSAŸE, EUGENE (1858–), Belg. violinist; app. prof., Brussels Conservatorium, 1890; the greatest violinist in the world.

YSTAD (55° 25′ N., 13° 44′ E.), seaport, on Baltic, län of Malmöhus, Sweden. Pop. (1911) 11,459.

YSTRADYFODWG, RHONDDA (*q.v.*).

YTTERBIUM, NEOYTTERBIUM (Yb=172·0), a rare earth metal.

YTTRIUM (Yt=89·0), rare earth metal; oxide Yt_2O_3, fractionated into different components by Crookes.

YUCATAN (17° 30′ to 21° 40′ N., 87° to 92° 30′ W.), peninsula, Mexico, Central America; area, *c.* 53,290 sq. miles; surface generally flat, with Sierra de Y. crossing centre; few rivers; produces maize, rice, cotton, tobacco, sisal hemp, sugar cane; has fine forests, with mahogany and other valuable trees; capital, Merida. Y. was formerly a state, and is now divided into the two states of Y. and Campeachy. Pop. (1910) 339,613; Campeachy, 86,706.

YUCCA, a tree-like liliaceous plant growing in the drier parts of Mexico and Central America.

YUCHI, YUE-CHI, YUEH-CHIH, a nomadic, warlike Asiatic tribe; called also Indo-Scythians; conquered Bactria in II. cent. B.C.; a confederacy of five tribes, including the Kushans; annexed N. India *c.* A.D. 150, but were subsequently driven back; found in Afghanistan, A.D. 430. Much of their history is conjecture.

YUKON.—(1) (63° N., 135° W.) territory, Canada, N. of Brit. Columbia; created a district when the extensive gold deposits were discovered in the valley of Klondike (*q.v.*); more or less mountainous; drained by Yukon. Capital, Dawson City. Pop. (1911) 8512. (2) (65° N., 140° W.) river, Alaska; formed by the union of Lewes and Pelly at Fort Selkirk; flows N.W., then S.W.; empties by delta into Bering Sea; receives Stewart, M'Queston, Indian, and Klondike; length, 1500 miles.

YULE, old name for Christmas (*q.v.*).

YULE, SIR HENRY (1820–89), Brit. Orientalist; sec. to Indian Public Works Department, 1858–62; works include *Book of Ser Marco Polo*, *Hobson-Jobson, an Anglo-Indian Glossary.*

YUN-NAN (24° 40′ N., 101° E.), province, S.W. extremity, China; central part consists of a lofty plateau sloping towards S.E. and studded with lakes; very mountainous in N. and W.; traversed by Yang-tse-kiang, Mekong, Salwin, and Songkoi; rich mineral resources (copper, tin, coal, etc.); agricultural products include rice, maize; manufactures iron and steel, textiles. Pop. *c.* 12,100,000. Capital, Yun-nan Fu.

YUN-NAN FU (25° 2′ N., 102° 45′ E.), walled city, capital, Yun-nan, China; active commerce. Pop. *c.* 50,000.

YURIEV (formerly DORPAT) (58° 17′ N., 26° 47′ E.), town, Livonia, Russia; seat of a univ. (1632). Pop. (1910) 43,940.

YUZGAT, YOZGAD (39° 50′ N., 35° E.), town, vilayet Angora, Asia Minor; noted for its horses. Pop. *c.* 16,000.

YVERDON (46° 46′ N., 6° 38′ E.), town, Vaud, Switzerland; has old castle used by Pestalozzi (*q.v.*) as school; sulphur baths. Pop. 8630.

YVETOT (49° 37′ N., 0° 45′ E.), town, Seine-Inférieure, France; manufactures cotton goods; formerly seat of a petty monarchy. Pop. 6300.

Z, last letter of Eng. alphabet, corresponding to the Gk. *zeta* and the Semitic *Zayin*. It occurs very seldom in English, except in words of Gk. or Hebrew origin.

ZAANDAM, Saardam (52° 26′ N., 4° 49′ E), town, on Zaan, N. Holland, Netherlands; paper-works; noted for numerous windmills. Pop. (1911) 25,305.

ZABERN, Saverne (48° 45′ N., 7° 40′ E.) (Rom. *Tres Tabernæ*), town, Alsace-Lorraine, Germany; manufactures agricultural implements. Pop. 8600.

ZABRZE (50° 48′ N., 18° 47′ E.), town, Silesia, Prussia; coal mines. Pop. (1910) 63,373.

ZACATECAS (23° N., 103° W.), state, Mexico, belonging to the central plateau; rich in minerals, silver, gold, iron. Pop. (1910) 477,556. Capital, **Zacatecas** (22° 47′ N., 102° 27′ W.); silver mines. Pop. (1910) 25,905.

ZACHARIÄ VON LINGENTHAL KARL SALOMO (1769–1843), Ger. jurist; prof. of Law at Wittenberg and Heidelberg (1797–1807); important legal works.

ZACHARIAS, ST., pope, 741–52; his correspondence with St. Boniface, which has been preserved, is of historical importance.

ZAGAZIG (30° 30′ N., 32° E.), town, capital, province Sharkia, Egypt. Pop. 36,000.

ZAHRINGEN (47° 59′ N., 7° 51′ E.), village, Baden, Germany; ancient seat of the Dukes of Zahringen.

ZAILA, Zeyla (*q.v.*).

ZAIRE, former name of the Congo River.

ZAISAN, Zaisansk.—(1) (48° N., 84° E.) town, Semipalatinsk, Russ. Central Asia. Pop. 5000. (2) (48° N., 84° E.) lake, Russ. Central Asia; length, 70 miles; the Irtysh issues from it.

ZALEUCUS (fl. *c.* 660 B.C.), Gk. lawyer; traditional drawer-up of first Gk. code of laws, so strict as to become proverbial.

ZALMOXIS, ancient Thracian hero.

ZAMAKHSHARI (1074–1143), Arab scholar.

ZAMBEZI, large river, E. Africa; generally regarded as northern limit of S. Africa; rises in N.W. Rhodesia, near Congo and Portug. frontier, in 11° 21′ 3″ S., 24° 32′ E.; general course S.E.; flows through Portug. W. Africa, Rhodesia, Portug. E. Africa; enters Ind. Ocean by several branches (most important Chinde). Length over 2000 miles; navigable for *c.* 1700 miles; navigation is interrupted by Supuma Cataract, Gonye Falls, Katima Molilo Rapids, Victoria Falls (*q.v.*), in Rhodesia; Kebrabasa Rapids, in Portug. E. Africa, and silting at mouths. Principal tributaries are: Lungwebungu, Luanginga, Lumbi, Machili, Kwando, Ungwesi, Shiré; different parts of Z. known as Jambeshe, Liambeshe, Liambai, etc. Explored by Livingstone, 1851, 1853, 1856, 1858–60; Serpa Pinto, Rankin, St. Hill, Gibbons. Maugham, *Zambezia* (1910).

ZAMBOANGA (7° 11′ N., 122° 2′ E.), town, port of entry, Mindanao, Philippine Islands. Pop. 3600.

ZAMINDAWAR (32° 30′ N., 64° 30′ E.), district, on Helmund River, Afghanistan; chief town, Musa Kala.

ZAMORA (41° 40′ N., 5° 40′ W.), province, in Leon, Spain; generally level. Pop. (1910) 273,045. Capital, **Zamora** (41° 32′ N., 5° 47′ W.); fine cathedral; wine, wheat. Pop. 16,500.

ZAMOYSKI, JAN, Zamojski (1541–1605), Polish soldier and statesman; commander-in-chief of Polish army against Russia, 1580–82; defended the frontiers against Turks, Cossacks, and Swedes. Patron of lit. and author.

ZANARDELLI, GIUSEPPE (1826–1903), Ital. statesman; took part in rising against Austria (1848–49); assisted Garibaldi.

ZANDER, see Perches.

ZANESVILLE (39° 57′ N., 81° 59′ W.), city, at junction of Licking and Muskinghum, capital, Muskinghum County, Ohio, U.S.A.; manufactures pottery; was capital of the state, 1810–12. Pop. (1910) 28,026.

ZANGWILL, ISRAEL (1864–), Eng. novelist and playwright; pres., Jewish Territorial Organisation.

ZANTE (37° 47′ N., 20° 55′ E.) (ancient *Zacynthus*), island of the Ionian group, Greece; surface is a fertile plain with hills in W.; produces currants, olives; subject to earthquakes. Pop. 45,500. Capital, **Zante,** on E. coast. Pop. 13,500.

ZANZIBAR.—(1) (6° S., 39° 20′ E.) Brit. protectorate, off Ger. E. Africa, consisting of islands of Z. and Pemba; area, 1020 sq. miles (Z., 640 sq. miles; Pemba, 380). Of coral formation; surface generally undulating; chief town, Zanzibar; climate hot and damp; hot season, Jan. to March; soil fertile; produces cloves, copra, lemons, bananas, and other fruits; exports wax, hides, rubber, ebony, cloves, copra, orchil, copal, tortoise-shell. Has been under Brit. protection since 1890, and is administered by Brit. officials nominated by the native Sultan. Pop. (1911) 198,914. (2) (5° S., 38° 30′ E.) town, on W. coast of Z. island, capital of above; principal port on E. seaboard of Africa; excellent harbour; contains the palaces of the Sultan, fort and barracks, hospitals, Prot. and R.C. missions; exports cloves, ivory. Pop. *c.* 37,000.

ZAPUS, Jumping Mice, see Jerboas.

ZARA (44° 7′ N., 15° 14′ E.) (Rom. *Jadera*), seaport, on Adriatic, capital, Dalmatia, Austria; manufactures maraschino; cathedral (XIII. cent.); seat of Catholic abp. and Gk. bp. Pop. (1910) 36,595.

ZARAFSHAN, see Bokhara.

ZARAGOZA, see Saragossa.

ZARATHUSTRA, see Zoroaster.

ZARHUN, sacred town, Morocco, 9½ miles N. of Mekines; near it is the tomb of Mulai-Idris.

ZARIA (11° 5′ N., 7° 18′ E.), town, capital, Zaria, Brit. Protectorate, N. Nigeria; cotton-producing region. Pop. 260,000.

ZARLINO, GIOSEFFO (1517–90), Ital. musician; b. Chioggia; *maestro di capella* of St. Mark's, Venice.

ZEA, see Ceos.

ZEALAND, Seeland, Sjaelland (55° 30′ N., 12° E.), largest island, Denmark, between Cattegat and Baltic; surface level or undulating; fertile and well-cultivated; contains Copenhagen, and is divided into 5 amter. Pop. 980,000.

ZEBRA, see under Horse Family.

ZEBU, Brahmin Ox (*Bos indicus*), Indian ox having hump on withers; used as beast of burden. Sacred bulls of Hindus are of this breed.

ZECHARIAH, Old Testament prophet; his book, in the minor prophets, falls into two portions of different authorship—chapters 1–8 and 9–14. 1–8 are the work of Z. himself and written under Darius Hystaspis of Persia, 520–18 B.C., and are visionary and symbolic. 9–11 are a prophecy which may belong to the VIII. cent., but more probably IV. cent., and 12–14 are probably also post-exilic. 9–14 are attributed by scholars to a compiler.

Minor Prophets, vol. ii. (*Century Bible*).

ZECHSTEIN, see Permian.

ZEEHAN (42° S., 145° 20′ E.), town, Montagu County, Tasmania; centre of a silver-lead mining district. Pop. 5300.

ZEELAND, Zealand (51° 30′ N., 3° 50′ E.), pro-

vince, Netherlands; comprises islands of Schouwen, Duiveland, N. and S. Beveland, Walcheren, and others, together with a strip of land along W. bank of Scheldt; surface flat and mostly below sea-level; soil fertile. Pop. 235,000. Capital, Middelburg.

ZEERUST (26° 36′ S., 26° 6′ E.), town, Marico, Transvaal; in neighbourhood of lead, zinc, silver, and gold mines.

ZEITUN (37° 40′ N., 36° 42′ E.), town, vilayet Aleppo, Asiatic Turkey; iron mines. Pop. *c.* 10,500.

ZEITZ (51° 4′ N., 12° 9′ E.), town, on White Elster, Pruss. Saxony; manufactures textiles. Pop. (1910) 33,093.

ZELAYA, see MOSQUITO COAST AND RESERVE.

ZELLER, EDUARD (1814–1908), Ger. philosopher; returned to Kant in epistemology; author of a recognised text-book on Gk. philosophy.

ZENANA, part of house where Indian women are secluded; cf. Harem of Muslims.

ZEND, see PERSIA (LANGUAGE and LITERATURE).

ZEND-AVESTA, see AVESTA.

ZENGG, SENJ, SEGNA (44° 59′ N., 14° 55′ E.), town, on Adriatic, Lika-Krbava, Croatia-Slavonia, Hungary. Pop. 3300.

ZENITH, point in heavens directly above spectator.

ZENJAN (36° 21′ N., 48° 32′ E.), town, on Zenjan, Khamseh, Persia; trade in carpets. Pop. *c.* 25,500.

ZENO OF CITIUM, see STOICS.

ZENO OF ELEA, see ELEATIC SCHOOL.

ZENOBIA, Queen of Palmyra after her husband's death; asserted independence of Rom. suzerainty, and claimed to be 'Queen of the East,' A.D. 266; defeated and brought to Rome by Emperor Aurelian.

ZENTA (45° 57′ N., 20° 7′ E.), town, on Theiss, Bács-Bodrog, Hungary; scene of victory of Imperialists over Turks, Sept. 1697. Pop. (1910) 29,666.

ZEOLITES, mineral group; hydrated silicates of alkalies; generally contain alumina; found in basalt, porphyrite, granite, and gneiss in numerous varieties.

ZEPHANIAH, Old Testament prophet; his book, one of the minor prophets, was written during the reign of Josiah. Chapter 1 prophesies a 'Day of Jehovah'—a judgment on Israel for its sins, in which the heathen will triumph. In 2 and 3 the prophet prophesies like judgment on the heathen nations; then a denunciation of the sins of Jerusalem; at the end is the divine promise for the faithful remnant.

Minor Prophets, vol. ii. (*Century Bible*).

ZEPHYRINUS, ST., pope, 198–217.

ZEPPELIN, COUNT VON (1838–), see under BALLOON.

ZERBST (51° 58′ N., 12° 4′ E.), town, on Nuthe, Anhalt, Germany; manufactures jewellery, machinery. Pop. (1910) 19,210.

ZERMATT (46° 2′ N., 7° 44′ E.), village, at foot of Matterhorn, canton Valais, Switzerland; tourist centre.

ZEULENRODA (50° 38′ N., 12° E.), town, principality Reuss-Greig, Germany; manufactures hosiery. Pop. (1910) 10,389.

ZEUS, the greatest of the Gk. gods, corresponding to Rom. Jupiter or Jove. All three words, with parallels in other Aryan languages, signify 'bright,' and have to do with the day. Hence Zeus is the sky-god; his worship is very old, undoubtedly dating before the coming of the Hellenes into Greece; Z. is supreme among the gods in Homer. In Crete his worship was assimilated to an older deity corresponding to Dionysus. His worship in Greece was never monotheistic, but had many noble conceptions in it. On its lower side it was connected with various animal worships which show traces of old sacrificial cults—particularly with the wolf and the ox. In early times human sacrifice was offered to him. At Dodona he was worshipped at the sacred oak—a feature of old Aryan religion. His worship declined before the end of paganism.

Farnell, *Cults of the Gk. States*.

ZEUXIS (fl. 420–390 B.C.), a celebrated Gk. painter; he excelled with female figures, his masterpiece in this line being the *Helen* painted for the city of Croton.

ZEYLA, ZEILA (11° 18′ N., 43° 24′ E.), town, on Gulf of Aden, Brit. Somaliland, Africa. Pop. *c.* 6000.

ZHELEZNOVODSK (44° 10′ N., 43° E.), village, health-resort, Stavropol, Russia; warm mineral springs.

ZHITOMIR (50° 15′ N., 28° 43′ E.), town, on Teterev, capital, Volhynia, Russia; seat of a Gk. abp. and R.C. bp.; trade in corn, timber; manufactures tobacco. Pop. (1910) 78,300.

ZHOB (31° 30′ N., 69° E.), river and valley, Brit. Baluchistan; gives name to a district controlled by a political agent.

ZIARAT (36° 40′ N., 54° 30′ E.), town, sanatorium, Baluchistan; mineral springs.

ZIERIKSEE (51° 39′ N., 3° 56′ E.), port, on island of Schouwen, Zeeland, Holland; salt refineries. Pop. 7006.

ZIETEN, HANS JOACHIM VON (1699–1786), Pruss. field-marshal of Frederick the Great; won fame in Silesian and Seven Years Wars.

ZIMBABWE, remarkable ruins in Mashonaland, near Salisbury, S. Africa; according to theory of Bent and Hall the work of pre-Muhammadan Arabians; according to M'Iver about XVI.-cent. work. (Bent, *Ruined Cities of Mashonaland*, 1902; M'Iver, *Medi-æval Rhodesia*, 1906.)

ZINC, SPELTER (Zn=65·37), metallic element allied to magnesium, occurring as *calamine* ($ZnCO_3$) and blende (ZnS).

METALLURGY.—Ores are roasted to oxide, which is reduced by carbon whilst the metal distils.

PROPERTIES AND USES: bluish white, crystalline, ductile, and may be rolled into foil between 100° and 150° C.; brittle and may be powdered at 205° C.; S.G. 6·9, M.P. 419° C., B.P. 918° C.; vapour monatomic, burns with bluish white flame forming oxide; divalent; dissolved by dilute and concentrated mineral acids, slowly attacked by dilute sulphuric and hydrochloric acids when pure; dissolved also by caustic soda, hydrogen being evolved. Gradually attacked by moist air with formation of basic carbonate. Used for making brass, galvanising iron, desilverising lead, for preparation of hydrogen ($Zn+H_2SO_4=ZnSO_4+H_2$), for electric batteries, for precipitating gold in the cyanide process, as zinc dust for reducing purposes.

COMPOUNDS: oxide (ZnO), zinc white, used as a pigment and medicinally; chloride ($ZnCl_2$), waxlike, used as a caustic, as a dehydrating agent, and for weighting cotton. Basic chloride solution dissolves silk; sulphide (ZnS), a white precipitate, crystals are phosphorescent; sulphate ($ZnSO_4+7H_2O$), white vitriol, crystalline, soluble, used as emetic; carbonate, a white precipitate, generally basic.

ZINCITE, crystalline mineral consisting of zinc-oxide.

ZINDER (13° 47′ N., 8° 42′ E.), town, capital, Zinder district, Fr. Sahara; trade in cottons, silks; military post. Pop. 15,500.

ZINNIA, in botany, genus of compositæ; white, yellow, scarlet, crimson, and purple.

ZINZENDORF, NICOLAUS LUDWIG, COUNT VON (1700–60), Ger. reformer; founder of the famous Moravian settlement at Herrnhut; bp. of Lutheran Church; sent missionaries to Greenland, 1730; travelled through N. America and W. Indies, and visited England, founding Moravian missions; banished for some years from Saxony. Author of hymns and short religious works.

ZION, Hebrew word, of uncertain derivation, applied to citadel of Jerusalem (now known to be E. and not S.W. part of city), thence to Jerusalem as a whole, and metaphorically for Israel.

ZIONISM, name to Jewish movement aiming at the return to Palestine and the setting up of a Jewish national state. Jewish Messianic hope has always been bound up with national feeling, but in the Middle Ages, when the Jews were persecuted, there was no real hope of returning to the Holy Land. The idea took shape in the XVI. and XVII. cent's. Sabbatai Zevi claimed Messiahship at Smyrna in 1666, and had a large

following, but he proved an impostor. Another movement was started by Moses Mendelssohn in 1778. His work was continued by Sir Moses Montefiore and others. National Jewish feeling was encouraged by fanatical outbursts of anti-Semitism. Schemes were suggested of starting a Jewish settlement in Palestine with the consent of the Ottoman government. Fresh impetus was given by Dr. Herzl (d. 1904). Zionist congresses were held, 1897–1910. The Brit. government offered land in East Africa for a Jewish state, but the scheme fell through. A 'Jewish Territorial Organisation' was founded by Mr. I. Zangwill, but Z. tends to be given up as impracticable.

ZIRCON, mineral composed of silicate of zirconium; found in Ceylon. Varieties: hyacinth, jargon, *noble or precious z.*, a gem stone occurring in basic eruptive rocks; colourless, red, brown, or green.

ZIRCONIUM (Zr=90·6), rare metal in tin group, occurring as zircon (*q.v.*), ($ZrSiO_4$); S.G. 4·08, very hard; oxide ZrO_2 (employed for Nernst lamp), basic and acidic; other compounds $ZrCl_4$, $Zr(SO_4)_2$, $Zr(NO_3)_4$, Na_2ZrO_3.

ZIRKEL, FERDINAND (1838–), Ger. geologist; prof., Lemberg (1863), Kiel (1868), Leipzig (1870).

ZITHER, a musical instrument, with from 30 to 42 strings, stretched over a flat sound-box. The Tyrol is its native country.

ZITTAU (50° 53′ N., 14° 47′ E.), town, Saxony, Germany; manufactures damasks; coal mines in vicinity. Pop. (1910) 37,078.

ZITTEL, KARL ALFRED VON (1839–1904), Ger. geologist and palæontologist; awarded Wollaston medal by Geological Soc., London, 1894.

ŽIŽKA VON TROCNOW, JOHN (c. 1376–1424), Bohemian Hussite; leader of Taborite section of Hussites; defeated Emperor Sigismund, 1420 and 1422; waged war against other Hussites (Calixtines), and destroyed monasteries; d. of plague while besieging castle of Pribslav; ferocious and skilful soldier.

ZLATOUST (55° 30′ N., 59° 40′ E.), town, Ufa, Russia; cathedral; observatory; mining centre; ironworks. Pop. 21,000.

ZNAIM (48° 53′ N., 16° 3′ E.), town, on Thaya, Moravia, Austria; has remains of the castle of the Margraves of Moravia; manufactures pottery. Pop. 17,000.

ZODIAC, a belt of the sky bounded by circles about 9° on each side of the ecliptic or apparent path of the sun, contains also the paths of the moon and the principal planets. It is divided into 12 *signs*, each 30°, corresponding to 12 full moons in the year, and the stars in each are grouped into *constellations*. One excepted, these are named after living things (Greek *zodion*=a little animal), and with their symbols are in order from west to east; north of the celestial equator —*Aries* (Ram) ♈, *Taurus* (Bull) ♉, *Gemini* (Twins) ♊, spring signs; *Cancer* (Crab) ♋, *Leo* (Lion) ♌, *Virgo* (Virgin) ♍, summer signs; south of the equator —*Libra* (Balances) ♎, *Scorpio* (Scorpion) ♏, *Sagittarius* (Archer) ♐, autumnal signs; *Capricornus* (Goat) ♑, *Aquarius* (Water-bearer) ♒, *Pisces* (Fishes) ♓, winter signs. At the spring equinox the sun is said to be at the first point of Aries. This position does not now lie in Aries, but in Pisces, due to the shift of the series westward by precession (Gyroscope, *q.v.*). The old Chin. z. has 12 sections also, the Mexican 20. The history of our z. is obscure. The symbols appear about the X. cent. A.D., but Assyrian inscriptions and astronomical evidence date its construction not later than 2000 B.C.

There is also a lunar z. of Hindu origin with 27 or 28 divisions named after the Vedic deities and dating back to c. 2000 B.C. The Hindu system influenced the later Chin. z. and the Arab. mansions of the moon.

The zodiacs are associated with astrology rather than with astronomy.

Zodiacal Light, a luminous tract of elongated triangular shape, lying nearly on the ecliptic, its base being on the horizon, and its apex at varying altitudes, seen at certain seasons of the year either in W. after sunset or in E. before sunrise. After sunset in spring it may often be seen about latitude 40° N. as a faint cone of light proceeding from the place where the sun has set, and reaching 70° or 80° eastward. It appears with greatest brilliance within the tropics, where it sometimes rivals the *Milky Way*, and has been seen to stretch right across the sky. Its spectrum is a faint, continuous one. Its cause is supposed to consist of a ring of meteoric or nebulous matter surrounding the sun and shining by reflected sunlight.

ZOISITE, rock-forming mineral of basic calcium and aluminium silicate.

ZOLA, ÉMILE ÉDOUARD CHARLES ANTOINE (1840–1902), Fr. novelist; s. of Ital. engineer by Fr. woman; publisher's clerk until his first book, *Contes d Ninon*, was accepted, 1864. First vol. of *Rougon-Macquart* series appeared, 1871; Z. conceived idea of family as an artistic as well as pathological unity, and the 20 separate novels in this series are linked by chief characters of family of Rougon-Macquart; rest of life is history of continuous literary labour (which met with immense success) until his support of Dreyfus led to his flight to London, 1898–99; returned for second trial; accidentally asphyxiated.

Z. was a mixture of sciontist, realist, social reformer, and poet; the first three aspects are sometimes predominating, as in *Lourdes*, *Rome*, *Paris*, *Nana*; *Lourdes* is a patient and painful description of diseases, *Nana* a monotonous laying bare of social sores, *Paris* a long study of political conditions; in none of them is there any attraction of romance or beauty; but in the *Rougon-Macquart* series, despite the study in heredity, there are characters and situations of the highest art; in year of producing *La Terre* (1888), Z. wrote *Le Rêve*, delicate romance with mediæval background; *La joie de vivre* is blend of imagination and pathology; into none of his writings, however, has mirth any entrance; pessimistic outlook on social conditions; in private life honest, courageous, self-sacrificing reformer.

Monograph, by Sherard (1893); Vizetelly, *With Z. in England*.

ZÖLLNER, JOHANN KARL FRIEDRICH (1834–82), Ger. astronomer; wrote on comets, photometry, and spectrum analysis.

ZOLLVEREIN, see GERMAN EMPIRE (HISTORY).

ZOMBOR (45° 46′ N., 19° 3′ E.), town, Bács-Bodrog, Hungary; centre of trade in cereals and cattle. Pop. (1910) 30,593.

ZOOGLŒA, see BACTERIOLOGY.

ZOOLOGICAL GARDENS, areas set aside for the exhibition of living animals, which may represent in the main the wild fauna of the country in which the garden is situated, or may afford a consensus of the animal life of the world. Z. g's, besides affording spectacular show, offer the only means of studying the development and habits of many kinds of wild creatures, and give to the artist otherwise unattainable opportunities of sketching life poses and movements. In the older gardens, erected often in crowded areas of large cities, it was the custom to exhibit the inmates in pens or cages scarcely larger than was necessary to give the animal moving room, but a new development endeavours to place each creature in its own appropriate natural setting. Great z. g's are those in London and New York, which in the past have mainly followed the old style, while the later development finds expression in Hagenbeck's garden near Hamburg, and will form the main feature of a garden in process of being created in Edinburgh. The great natural reservations of wild animals in America and Africa display the ideal of a national zoological garden on an infinitely grand scale.

ZOOLOGY (Gk. *zoon*, 'animal'; *logos*, 'science, account'), the comprehensive science which deals with animals and their lives. Along with the science of plants—Botany—it forms the great science of life—Biology.

The study of animals must have been one of the earliest to which man, almost unconsciously, turned his attention, for the necessities of finding food must have determined that he who best acquainted himself with the habits of deer or of wild ox became the most efficient and most prosperous hunter. The accuracy and acuteness of the observations of prehistoric man are amply proved by the relics still left to us in cave pictures, and in the wonderful carved bones and antlers from the caves of Vasère and Dordogne, whereon are depicted fishes, birds, ponies, and even the mammoth, the last scratched on the ivory of the great creature's tusks. This period of random and haphazard observation, which continued for long ages, was succeeded by a classical period when zoology first became the object of systematic study. Its greatest representatives were ARISTOTLE (384–322 B.C.), the 'father of natural history,' who, during a comparatively short residence on the Ægean coast, began observations which resulted in the description of some 500 different animals; and PLINY THE ELDER (23–79 A.D.), who collected indiscriminately all manner of current animal lore in his *Historia Naturalis*. Following the Classical Period came a period of decline—the Legendary Period—when absurd scraps of folklore and impossible travellers' tales passed as current z. Typical of this period are the volumes of allegorical stories known as *Bestiaries*, and the more or less symbolical figures of animals sculptured by the early Christians on standing stones scattered throughout the north-eastern areas of Scotland.

It was not till the Renaissance and the invention of printing in the XV. cent. that a period of revival was initiated which laid the foundations of present-day z. Fact and fancy were still inextricably mixed, but the keynote of the revival was an earnest attempt at fresh and first-hand investigation.

So successful has this search after knowledge been that the facts of z. have become too many for any single man to compass, and accordingly the science has been split into several branches each dealing especially with a particular aspect of animal life. Thus we have EMBRYOLOGY (*q.v.*), dealing with the early stages in development; MORPHOLOGY (*q.v.*), with crude structure, the forms of animals; HISTOLOGY, with the fine structures of cell tissues; PHYSIOLOGY (*q.v.*), with the internal workings of animals; PALÆONTOLOGY (*q.v.*), or more strictly palæozoology, with their fossilised remains; Bionomics, with their habits; and Ecology, with their life relationships to their neighbours or environment; while the great branch which endeavours to arrange animals in natural groups, to classify them, is known as SYSTEMATIC Z. But there is a constant interchange between these many branches, for none is independent of the others, and all are involved in the theoretical unities of zoological facts, which are sometimes included in the term 'philosophic z.'

It is interesting to remember that the development of zoological knowledge has followed a natural evolution along the two closely connected lines of structure and function. First was studied the external form of an animal, and with this was associated its life habits; then followed the closer study which distinguished organs, and the part they played in life; further discrimination discovered tissues in the organs, and with a particular tissue-structure peculiar functions came to be associated; the microscope revealed cells as the basis of tissues, and the study of cell-activities followed; and finally attention became focussed on the active cell-substance, the living protoplasm, and its properties of change or METABOLISM.

Mention must also be made of the latest advance of the science—the rapid development of ECONOMIC Z.—a branch especially valuable in that it is concerned with animal life only so far as this relates to the welfare of man. Economic z. may be divided into constructive economics and destructive economics. In the former division falls such a study as that of fisheries, whereby through the scientific investigation of fish habits, artificial culture of fishes, etc., attempts are made which aim ultimately at the increase of the fish-supply of the world. Into the latter class fall researches concerning the harmful parasites of man and of his domestic stock, and concerning those creatures which damage his crops or possessions—the former study being known as Parasitology, the latter falling mainly under the head of Economic Entomology. Such investigation is of economic value only so far as it leads to knowledge which will enable man to cope with the pests, by reducing chances of infection, by checking their ravages, or by utterly destroying them. See ANIMALS.

ZOOPHYTES, see under HYDROMEDUSÆ.

ZOO-PLANKTON, see under PLANKTON.

ZORNDORF (52° 41′ N., 14° 37′ E.), village, Brandenburg, Prussia; scene of defeat of Russians by Prussians, 1758.

ZOROASTER, founder of religion Zoroastrianism, was a Persian prophet; the original form of his name is *Zarathustra*. His religion is known to us from several sources—the Gathas, the later Zend-Avesta, and notices in classic writers. Owing partly to the legends in later accounts, partly to the distance of time at which he was placed by Gk. writers who misunderstood Persian chronology, his historicity has been doubted by Darmesteter and others, but without adequate reason. Like other great religions, Zoroastrianism must have had a personality behind it. His date is uncertain, but must be between 1000 and 600 B.C. His system is dualistic—a good power, Ahura Mazda, and an evil, Angra Mainyu. It is a lofty monotheism with future rewards and punishments. The spirituality of the founder was not maintained, and Zoroastrianism degenerated. It was the dominant religion of Persia till the Muhammadans overthrew the native power in XVII. cent. A.D. It has now only a few followers in Porsia, but is represented in India by the Parsees. Its thought was mainly derived from ancient Aryan sources. It had some influence on later Judaism, owing to the captivity under a Persian (and Zoroastrian) power, and therefore through that on Christianity.

Jackson, *Zoroaster* (1899).

ZOSTEROPIDÆ, White-Eyes (*q.v.*).

ZOUAVES, body of Fr. troops; name derived from Zwawa, a tribe of Kabyles in Algeria; practice of enlisting Frenchmen and Kabyles in same regiment ceased in 1840, and Z. are now Frenchmen in semi-Moorish uniform.

ZOUTPANSBERG (23° S., 31° E.), district, Transvaal; goldfields. Chief town, Pietersburg.

ZRINYI, MIKLÓS (NIKLAS), **COUNT** (1620–64), Hungarian soldier, poet and statesman; presided over Croatian diet, and was a brilliant Lat. scholar of European fame; defeated Turks several times; killed by wild boar.

ZSCHOKKE, JOHANN HEINRICH DANIEL (1771–1848), Ger. writer; b. Magdeburg; wrote *Bilder aus der Schweiz* (stories), *Stunden der Andacht* (poems), besides numerous other works.

ZSCHOPAU (50° 44′ N., 13° 4′ E.), town, on Zchopau, Saxony; iron foundries; textile industries. Pop. 7000.

ZUCCARO, the name of two Ital. painters. TADDEO (1529–66) painted several undistinguished frescoes and easel pictures. His bro. FREDERIGO (1543–1609) decorated the Escorial for Philip II. of Spain; executed many frescoes in Florence and elsewhere; and painted, among others, portraits of Queen Elizabeth and Mary Queen of Scots.

ZUG.—(1) (47° 9′ N., 8° 30′ E.) canton, Switzerland; mountainous in S. and S.E.; highest point, the Kaiserstock (8258 ft.); watered by Reuss and Sihl; inhabitants mainly German-speaking and R.C.; entered the Confederation, 1352. Pop. (1910) 28,156. (2) (47° 9′ N., 8° 30′ E.) (ancient *Tugium*), town, capital, canton Zug, on Lake of Zug; manufactures enamel and metal articles. Pop. 8040. (3) (47° 9′ N., 8° 30′ E.) lake, in S.W. of canton Zug; discharges by the Lorze into the Reuss; length, 9 miles; width, 2¼ miles.

ZUIDER ZEE (52° 35′ N., 5° 30′ E.), inlet of North Sea, Netherlands; originally a small inland lake (Rom. *Flevo*); united to North Sea by inundations in XIII. cent.; length, 80 miles; greatest width, *c.* 35 miles.

ZULA (15° 12′ N., 39° 36′ E.), town, on Red Sea, Eritrea; occupies site of ancient *Adulis*.

ZULULAND (26° 51′ to 29° 13′ S., 30° 35′ to 32° 55′ E.), N.E. province of Natal, Africa; includes Amatongaland, and has area of *c.* 10,400 sq. miles. Surface generally mountainous with low plains in N. and E. Drained by Tugela, which forms part of S.W. boundary, Umfolosi, Umkuzi, Pongola, and other streams. Chief lake, St. Lucia. Climate unhealthy on coast.

Importance dates from early XIX. cent., when the Zulus waged war against and conquered great number of surrounding tribes. Under Chaka, king, 1800–28, the conquered tribes were welded together into a strong and united nation, and Zulu control was established over whole country between Cape Colony and Zambezi. In 1838, Dingaan, bro. and successor of Chaka, excited hostility of early Boer settlers in Natal by his treacherous murder of many of their number. War ensued, resulting in complete Zulu defeat in Dec. 1838; and two years later Dingaan was deposed in favour of his bro., Panda, and was murdered. Panda, who reigned until 1872, made an agreement in 1843 yielding certain districts to Britain. Both he and his successor, Cetywayo, engaged in various boundary disputes with Boers of Transvaal.

In 1879 war broke out between Zulus and British, on occasion of Cetywayo's failure to reply to an ultimatum sent by Sir Bartle Frere, in Dec. 1878, demanding various concessions which were designed to reduce Zulu power. British, under General Thesiger, invaded country in Jan. 1879, in which month Zulus gained great victory at Isandula; but they were defeated at Ulundi in July, upon which they submitted to British. Brit. government, however, refused then to annex country, part of which was subsequently taken by Boers; in 1887 the remainder was annexed to Britain, being incorporated with Natal in 1898. In 1906 a Zulu rising was suppressed.

Produces cereals, sugar, coffee, tobacco; cattle and sheep raised. Gold and coal exist, but are little worked. There is a railway line of about 100 miles. Inhabitants chiefly Zulus. Pop. *c.* 245,000.

ZUMALA-CARREGUI, THOMAS (1788–1835), Span. soldier; entered Span. army under Mina, 1808, on Fr. invasion; joined Quesada, 1822, in cause of Don Carlos, and became commander-in-chief. After many victories died of wounds at siege of Bilbao.

ZURBARAN, FRANCISCO (1598–1662), Span. painter; dealt mainly with religious subjects. His greatest work is an altar-piece in the museum at Seville.

ZÜRICH.—(1) (47° 30′ N., 8° 40′ E) canton, Switzerland; contains a large part of Lake of Zürich and several smaller lakes; belongs to basin of Rhine; surface hilly (highest point, 3012 ft.); fertile valleys; manufactures cotton, silk; inhabitants mostly German-speaking Protestants; joined the Confederation, 1351. Pop. (1910) 503,915. (2) (47° 22′ N., 8° 33′ E.), chief commercial and industrial city of Switzerland, capital of Z. canton, on Lake Z., consists of Grosse and Kleine stadt, separated by river Limmat. Old part with narrow streets and lofty houses presents a picturesque appearance. New part contains broad streets, fine buildings, and extensive quays along lake. Among chief features are Grossmünster (Romanesque cathedral, begun XI. cent.); Fraumünster (founded IX. cent.); Wasserkirche (containing old town library); St. Peter (XIII. cent.); national museum (with rich Swiss antiquities of art collection); town hall and Postalozianum; univ.(opened, 1833) and Polytechnic; fine bridges, etc.; grand panorama of Alps from Ütliberg. Chief industries are silk-weaving, cotton-spinning machinery, paper mills, etc. Originally a lake-dweller settlement, Z. was founded by Romans; free imperial city, 1210; joined Helvetian union, 1351; long struggled against Austria; Zwingli preached Reformation, 1516; French, under Masséna, defeated Russians, 1799; by treaty of Z., 1859, Austria ceded Lombardy and paved way for Ital. union; birthplace of Pestalozzi (*q.v.*). Pop. (1912) 192,200. (3) (47° 22′ N., 8° 34′ E.) lake, Switzerland, chiefly in canton Zürich; length, 25 miles; greatest width, 2½ miles.

ZUTPHEN, ZUTFEN (52° 8′ N., 6° 12′ E.), town, Gelderland, Holland; tanneries; trade in grain, timber. Pop. 19,500.

ZVENIGORODKA, town, Kiev, Russia; tobacco. Pop. 17,000.

ZWEIBRÜCKEN, Fr. DEUX-PONTS (40° 15′ N., 7° 21′ E.), town, Rhine Palatinate, Bavaria; formerly capital of the duchy of Zweibrücken. Pop. 15,000.

ZWICKAU (50° 43′ N., 12° 30′ E.), town, on Zwickauer Mulde, Saxony, Germany; coal-fields; manufactures machinery, chemicals; birthplace of Schumann. Pop. (1910) 73,542.

ZWINGLI, HULDREICH (1484–1531), Swiss reformer; ed. Basle and Vienna and ordained a Catholic priest; attracted to Luther's teaching, and converted Zürich to the Prot. Confession of Faith while preacher in the cathedral, 1524; soon joined by the chief towns of N. Switzerland; at variance with the Lutherans on the questions of the Eucharist and Baptism, holding that the sacrament of the Lord's Supper was merely a symbolical rite, and denying the efficacy of baptism. A republican in politics, Z. laboured to establish a Swiss confederacy. In 1531 the R.C. cantons and the Prot. cantons of Zürich and Bern were at civil war, and in a skirmish a few miles from Zürich, Zwingli, marching with his fellow-citizens, was slain. A powerful and influential preacher in his day, Z.'s theological system was less definite than Calvin's, and more radical than Luther's.

ZWITTAU (49° 46′ N., 16° 27′ E.), town, Moravia, Austria; linen, cotton. Pop. 9660.

ZWOLLE (52° 31′ N., 6° 7′ E.), town, Overyssel, Netherlands; manufactures cotton; boatbuilding; Thomas à Kempis died here, 1471. Pop. (1911) 33,727.

ZYGOBRANCHIATA, an order of GASTEROPODA (*q.v.*).

ZYMOTIC DISEASES, term applied to certain more common infectious diseases, including cholera, diphtheria, erysipelas, measles, scarlet fever, smallpox, typhoid fever, typhus fever, whooping-cough.
